MAXWELL, George Troupe, of Jacksonville, Fla., was born in Bryan county, Ga., August 6, 1827, his father being Col. John Jackson Maxwell, planter, who repeatedly represented his county in the State Senate. His maternal grandfather was Col. John Baker, an officer distinguished in the Revolutionary War, and after whom Baker county, Ga., was named. His ancestors, both paternal and maternal, were intimately associated with the early history, Colonial and State, of Georgia. His preliminary education was received at Chatham Academy, Savannah, from whence he proceeded to the University of New York, taking his degree of M. D. in the medical department of that institution in 1848. He established himself in practice at Tallahassee, where he remained until 1857, when he was appointed Surgeon to the Marine Hospital at Key West. In 1860 he was elected Professor of Obstetrics and Diseases of Women and Children in Oglethorpe Medical College, and upon accepting the position removed to Savannah. In April, 1861, he entered the Confederate army as a private, serving for four months in the First Florida Regiment. At the expiration of his term of service he was commissioned major of cavalry, and in 1862 was raised to colonel. In the fall of 1863 he organized and commanded the Florida brigade, serving under Gen. Bragg in the Army of the Tennessee until the battle of Mission Ridge, when he was captured, sent north and imprisoned on Johnston's Island until March, 1865. When captured, he was recommended for promotion to the rank of brigadier-general, and was appointed, while in prison, colonel of a Florida Regiment, formed by the consolidation of six skeleton regiments, a position which he was prevented from filling by the termination of the war. In 1865 he was elected a delegate from Leon county to the convention held under the call of President Johnson, for the purpose of remodeling the constitution and reorganizing the State government of Florida, taking an active part in the deliberations of that body. The succeeding winter he was elected a member of the State Legislature. In 1871 he removed to New Castle, Del., where he resided until his final

removal to the city of his present residence. He was a member of the Delaware Medical Society, was its vice-president in 1874, and its secretary in 1875-76. He has contributed to various medical journals, his most important papers being "An Exposition of the Liability of the Negro Race to Yellow Fever;" "A Demonstration of the Non-digestive Powers of the Large Intestines," and "A History of His Invention of the Laryngoscope," the latter first read before the Delaware Medical Society, and subsequently published in the *Medical Record of New York*, fall of 1872. "This invention was accomplished in 1869, the instrument being actually used in November of that year, or several months before Czermak had published his invention. While the laryngoscope of Dr. Maxwell has no claim to priority, it has entirely valid claim to originality, and he has the honorable distinction of having been first of all American physicians to see, and with his own instrument, the vocal chords in a living subject." It was but a short time before this period of his life that the editor of this work formed his pleasant acquaintance at Tallahassee, Fla. Dr. Maxwell was not only recognized as a skillful physician and surgeon, but a man of diversified talent and extraordinary ability. His social qualities and brilliant conversational powers made a lasting impression upon all with whom he was associated.

MAY, John Frederick, of Washington City, D. C., was born May 19, 1812, and died May 1, 1891. His ancestry were of the early New England colonists and patriots of the Revolution. The father of Dr. May was a distinguished physician, who graduated at Harvard College in 1795, and settled in the same year in the then infant capital of the United States. The subject of this sketch received a collegiate education at Columbia College, and took his medical degree from the same institution, in 1834. Shortly after this, he went to Europe, where he spent more than a year in professional study in the leading hospitals of London and Paris. In this way he familiarized himself with all the latest advances in medicine and surgery. After an extended tour through Europe, the West Indies, and the United States, he began to practice in his native city. He joined the Medical Association of the District of Columbia, in 1838, his father being president of that body at the time. In 1840, he became a member of the Medical Society of the District. This organization his father assisted in founding, his name appearing in the original charter of 1819, and also in the amended charter of 1838. In 1839, Dr. May was elected to the chair of Anatomy and Physiology, in the Columbian College. In 1841, he was transferred, by the consent of the faculty, to the chair of the Principles and Practice of Surgery. This position he filled most acceptably until his resignation, in 1858. He was honored, about the same time, with the professorship of surgery in the University of Maryland, which he filled for two years without vacating his college duties in Washington, and to the satisfaction of his associates in both faculties. He became also a member of the Section of Physiology and Medicine of the National Institute, in Washington, a scientific organization, antedating the existence of the Smithsonian Institute of that city. This association of physicians was active in 1843, and for a number of years sent delegates

to the American Medical Association. Eventually, however, it was merged into, or its functions were absorbed by, the Smithsonian Institute. The Pathological Society of the District of Columbia was formed about 1846, Dr. May taking an active and influential part in its discussions. The family of the Mays have been noted for generations for their fine physical development, bright intellects, and honorable traits of character. In 1847, Dr. May became a member of the American Medical Association, being a delegate from the Medical Department of the Columbian College. In 1858, he was elected to the Chair of Surgery in the Shelby Medical College, at Nashville, Tenn., which he filled very acceptably until the breaking out of the Civil War. Although Dr. May is best known by his splendid record as a surgeon, he was, throughout his professional career, a general practitioner, and was equally astute, strong and able in each and all the departments of medicine. He took, it is true, great pains to qualify himself as a surgeon, making special studies in anatomy, and equipping himself with the best instruments devised for the different operations, obtainable either at home or abroad. Being a man of fine physique, over six feet in stature and well proportioned, calm and self-possessed, with clear convictions and steady nerve, he was every way suited for the duties and responsibilities of that branch of the profession. His skill in surgery speedily attracted attention, and placed him in the very front rank of this field of practice in the United States. He was one of the first surgeons of America to amputate, with success, at the hip joint, and the first in Washington to perform ovariectomy. His skill in surgery was widely recognized, so that for years most of this kind of practice in the city of Washington fell to his care. He was Surgeon to the Washington Infirmary, which was conducted under the auspices of the faculty of the National Medical College, in which he was the Professor of Surgery. Dr. May was punctilious in his intercourse with his professional brethren and with the public, but he was at the same time the soul of honor. He was always ready, on a proper basis, to render service to the afflicted and to advise and assist the young practitioner in difficult cases. He loved his profession, and esteemed the man who, by his merits, won the approbation of the medical fraternity. It is said that he was not only a good surgeon and physician, but an excellent financier, attentive to business matters, making good investments and accumulating a large and productive estate. He was earnest and zealous in whatever engaged his attention, whether it was his profession or his business investments. In all his affairs he brought a clear, strong judgment to bear, and wasted nothing on sentiment. Shortly after the war Dr. May removed to the city of New York. He continued, however, to spend much of his time in Washington, attending to his real estate and other interests. His family, however, returned to reside in that city about 1880. In 1884 he was elected surgeon on the consulting staff of Garfield Memorial Hospital. He served there faithfully and as president of the medical staff for five years, when the necessity for lessening his duties, owing to the accumulation of his years, induced him to resign. One of his sons, William May, is treading in the footsteps of his father, having studied

medicine and being now in full practice, with a predilection for surgery.

MAYS, Thomas J., of Philadelphia, Pa., was born in Lebanon county, that State, January 10, 1846. He was graduated at Jefferson Medical College in 1868, and practiced his profession at Williamsport and Upper Lehigh, Pa., until 1885, when he moved to Philadelphia. In 1882 and 1883, he spent nine months in medical work under the tuition of Kronecker, Grawitz, Fränkel, and Baumann in Berlin, and in the Brompton Hospital for Consumption in London. His principal object in going abroad was to familiarize himself with the latest methods of pharmacological, therapeutical and pathological investigation, and to specially study diseases of the lungs and heart. Immediately after locating in Philadelphia he became associated with the Polyclinic of that city, being elected professor of diseases of the chest in 1888, a position which he has held ever since. He also assisted in organizing the Rush Hospital for Consumption of Philadelphia in 1890, in which institution he holds the appointment of visiting physician. He is also one of the Visiting Physicians to St. Mark's Home for Aged Women in Philadelphia, and one of the Consulting Physicians to the Institution for Feeble-minded Children in Vineland, New Jersey. He is a member of numerous medical societies, and his practice is devoted exclusively to diseases of the chest. His experimental work consists largely of original observations, among which the following are the most important: on the fundamental difference between the contraction of the heart and of the skeleton muscles; the action of the principal alkaloids, glucosides, alkalies, and acids; on the frog's ventricle, in which he was the first to demonstrate experimentally the contrary effects of minimum and maximum doses of these drugs; the antagonism of drugs; the nasal reflex; a new method of determining the sensory action of drugs; the nutritive value of beef extracts; the action of kreatin and kreatinin and their allies; and the differential action between theine and caffeine. To him also belongs the credit of first showing experimentally the difference between the breathing movements of the civilized and the Indian female. He has contributed about one hundred and twenty-five articles to the medical press, most of which are devoted to a consideration of chest diseases and therapeutic subjects. Besides he has written the following named brochures: "The Therapeutic Forces," "Theine in Neuralgia," and "Pulmonary Consumption a Nervous Disease."

MEACHAM, Franklin Adams, of Salt Lake City, Utah, was born in Cumberland county, Ky., October 28, 1862. He is a son of the late Dr. Franklin Meacham, major and surgeon United States Army. Dr. Meacham is a member of the Military Order of the Loyal Legion of the United States, by inheritance from his father. He was prepared for college at Phillips Academy, Andover, Mass., and was graduated with honors as A. B. from Yale University in 1887. Then studying medicine, he received his degree as M. D. from the Medical Department of the University of Virginia, in 1889. He located in Salt Lake City, where he is engaged in general practice. He was appointed Assistant Surgeon to the Holy Cross Hospital. June 30, 1890, Dr. Meacham was appointed City Physician and a member of the

F. A. Meacham.

Board of Health of Salt Lake City, the first Gentile that ever held that office in that city. He was also appointed United States Examining Surgeon for Pensions. He is a member of the Salt Lake County Medical Society and Salt Lake Academy of Medicine.

MEIGS, James Aitken, of Philadelphia, Pa., was born in that city July 31, 1829, and died there November 9, 1879. He was of English and Scotch ancestry on his father's side, and Scotch and German through his mother. Having received his primary education from private tutors, he entered, in 1843, the Mount Vernon grammar school, from which, after attaining the required proficiency, he passed to the Central High School of Philadelphia, from which he was graduated in February, 1848, beginning in April of that year the study of medicine in the office of Drs. F. G. Smith and J. M. Allen, his studies under whom he supplemented by attending a course of lectures on various medical subjects in the schools of anatomy, after which, in October of the same year, he was matriculated in Jefferson Medical College, from which he was graduated in March, 1851, receiving at the same time the certificate annually conferred by the corps of lecturers of the Philadelphia association for medical instruction on those students who passed successfully the examinations upon the lectures delivered by the association. The subject of his thesis on the occasion of his graduation was "The Hygiene and Therapeutics of Temperament." He began practice in his native city, where he remained until his death. For several years he acted as assistant to the Professor of Physiology in the Pennsylvania College, and engaged in the examination and preparation of students for graduation. In 1854 he delivered, by appointment, the semi-annual address before the Alumni

Association of the Central High School, the address being published by a committee of the association. In September of the same year he was appointed lecturer on climatology and physiology at the Franklin Institute for the promotion of the mechanic arts, holding the position for eight years, during which he also lectured frequently on physiological and ethnological subjects at the different mechanics' institutes in Philadelphia, and before various literary associations in neighboring cities. In 1855 he was elected physician to the department of diseases of the chest in the Howard Hospital and Infirmary for Incurables, a position which he filled for thirteen years. In the following year he became librarian of the Academy of Natural Sciences of Philadelphia, the duties of which office he discharged for several years until increasing professional duties compelled him to resign it. In 1857, by invitation of the Faculty and Board of Corporators of the Philadelphia College of Medicine, he accepted the Chair of Institutes of Medicine in that institution, and continued to occupy it until April, 1859, when he was transferred to the professorship of institutes in the medical department of Pennsylvania College, previously held by Prof. F. G. Smith, for whom the chair was originally created by the trustees of the parent institution at Gettysburg. While in the latter school he delivered two systematic courses of lectures on physiology, illustrating them with an extensive series of vivisectional demonstrations, which attracted much attention at the time, as no sustained, systematic effort to teach physiology experimentally had been made before in either of the four medical schools then existing in Philadelphia. In November, 1859, while still connected with the Pennsylvania College, he was elected by the board of guardians Consulting Physician and Clinical Lecturer to the Philadelphia Hospital at Blockley. On the breaking out of the Civil War in 1861, he, in company with his colleagues, resigned from the Pennsylvania College, and for a number of years following devoted himself exclusively to medical and obstetric practice. In 1866, a spring course of lectures having been established by the faculty of Jefferson College, with the object of extending the facilities of instruction so as practically to lengthen the regular winter course, he delivered in this special course, at the request of the faculty, a series of lectures on the physiology and pathology of the blood and circulation. In June, 1868, on the resignation of the late Prof. Robley Dunglison, he was elected, by the board of trustees of Jefferson Medical College, Professor of the Institutes of Medicine and Medical Jurisprudence, his application for the chair having been supported by the medical profession of Philadelphia, and recommended in letters addressed to the board by Prof. Henry, of the Smithsonian Institution; the late Dr. J. C. Nott, of Mobile; Professors Wilson, of Toronto; Owen, of the British Museum; Turner, of the University of Edinburgh; Broca, of the Academy of Medicine, of Paris; Von Döben, of the Carolinska Institute, of Stockholm; Pruner-Bey, of Cairo, and other distinguished physicians and scientists of America and Europe. In August of the same year the board of managers of the Pennsylvania Hospital chose him, without the usual canvass, one of the physicians to that institution. These two positions he retained until

his death. He was a member of the Philadelphia County Medical Society, of which he was elected recording secretary in 1857, and a year later corresponding secretary, to which latter office he was twice re-elected, becoming in 1867, moreover, one of the vice-presidents, and in 1871 the president; the Franklin Institute; the Academy of Natural Sciences; the College of Physicians; the State Medical Society of Pennsylvania and the American Medical Association, in both of which his membership was permanent; the State Historical Society of Wisconsin; the Biological Department of the Academy of Natural Sciences; the American Association for the Advancement of Science; the Medico-Legal Society of New York; the Numismatic and Antiquarian Society of Philadelphia; the New York Lyceum of Natural History; the Linnean Society of Pennsylvania College at Gettysburg; the Société d' Anthropologie de Paris; the Ethnological Society of London; the Anthropological Society of London; the Societas Medicorum Svecanæ of Stockholm, and the International Congress of Prehistoric Archeology. He also was a delegate to the International Medical Congress held in Philadelphia during the Centennial Exposition. In 1877 he was elected a member of the Board of Trustees of the Polytechnic College of the State of Pennsylvania to fill the vacancy created by the death of the late Dr. Condie. While a student of medicine and for some time after his graduation, he contributed to the *Medical Examiner* clinical reports of cases treated at Jefferson College and the Pennsylvania Hospital, the discussions of the Philadelphia county Society, and papers on the mortuary statistics of Philadelphia. In 1855 he published in the journal of the Franklin Institute an article on the physiology of stammering and its treatment by mechanical means. In the same year he read before the Academy of Natural Sciences a paper on the "Relation of Atomic Heat to Crystalline Form," which was published in the journal of the academy. In 1856 he prepared an appendix to the first American edition of Carpenter's work on the microscope. The following year, being chairman of the standing committee on anthropology, he arranged and classified the extensive collection of human crania in the Academy of Natural Sciences, and prepared a systematic catalogue of the collection, which was published by the academy. He also contributed during this year to Nott and Gliddon's "Indigenous Races of the Earth," an essay on the "Cranial Characteristics of the Races of Men," presenting a general survey of human skulls in their ethnical relation; and edited an American edition of "Kirke's Manual of Physiology." To the proceedings of the Academy of Natural Sciences, the reports of the Smithsonian Institution, and other like publications he contributed, at various times, many original articles on craniography, prominent among which may be mentioned, "Hints to Craniographers upon the Importance and Feasibility of Establishing some Uniform System by which the Collection and Promulgation of Craniological Statistics and the Exchange of Duplicate Crania may be Promoted;" "Description of a Deformed Fragmentary Human Skull found in an Ancient Quarry Cave at Jerusalem;" "Observations on the Form of the Occiput in the Various Races of Men;" "On

the Mensuration of the Human Skull;" and "Observations on the Cranial Forms of the American Aborigines." He likewise contributed numerous reviews, on a great variety of physiological, medical and scientific subjects, to the *Medical Examiner*, the *North American Medico-Chirurgical Review*, and the *American Journal of Medical Sciences*, and prepared for Prof. Gross' "American Medical Biography" the memoir of Dr. Randolph. In 1868, as introductory to his course of lectures on physiology in Jefferson College, he delivered an inaugural dissertation on the "Correlation of the Physical and Vital Forces," of which two editions, of over a thousand copies each, were published. In October, 1872, he delivered an address at the laying of the corner-stone of the new edifice of the Academy of Natural Sciences, which was published by the academy. Besides attending to his private practice, he lectured annually in Jefferson College, on diseases of the nervous system, in September; on physiology, from October to March; and also on clinical medicine, during January and February; having had charge as attending physician, furthermore, of the medical wards of Pennsylvania Hospital, from May to August, throughout which period, in addition to his daily visits, he delivered, twice a week, a series of clinical lectures, which made a part of the course of instruction given for eight months of the year by the faculty, hospital staff and corps of special lecturers of Jefferson Medical College.

MEISENBACH, Albert H., of St. Louis, Mo., was born of German parents in St. Louis, June 3, 1852. Because of general ill-health, the family moved to Northern Illinois, where he was educated in the public high school of Mendota and the Wesleyan Seminary. He began the study of medicine at the age of eighteen. It was the desire of his father to fit him for mercantile pursuits, and he was started in business. This not being congenial to his tastes, he, during the three years engaged in business, devoted a great part of the time to medical and scientific reading. At the age of twenty-one, deciding to adopt the medical profession, he entered the office of Dr. E. P. Cook, of Mendota, with whom he read medicine for over a year. Dr. Cook being a well-qualified practitioner and able surgeon, with a large practice, he enjoyed superior advantages, so that when he attended lectures he was well grounded in the elementary branches of medicine. He attended lectures at the St. Louis Medical College, being graduated from that institution in March, 1876. He entered the competitive examination held by the board of health for position as Assistant Physician to the Female and City Hospitals, and being one of the successful candidates, received an appointment as Assistant Physician to the Female Hospital. Serving three months in that institution, he was transferred to the position of Assistant Physician at the City Hospital. He enjoyed the advantages offered there until May, 1877, when he resigned and entered private practice, locating in Mascoutah, Ill. He soon established a good practice, but after two years, finding country practice not congenial and the sphere limited, he concluded to settle in St. Louis, to which place he removed May 1, 1880. Locating in a part of the city where many factories are situated, he soon began to establish a surgical practice and gain a reputa-

tion as a skillful surgeon and enjoying a lucrative practice. He immediately became identified with the St. Louis Medical Society, taking part as one of its active working members, and contributed many reports of surgical cases. After fifteen years of uninterrupted hard work, in the spring of 1889 he concluded to take a rest, and to enjoy, with his wife and three children, a year's vacation in Europe. Although seeking rest, it was impossible for him to keep away from medical work, and we find him during the summer visiting the principal art and medical centers and the hospitals of Belgium, Holland, Germany, Italy and France, taking notes of his observations and communicating his experiences to the medical public

A. H. Meisenbach

through the columns of the *St. Louis Medical Review*. Having spent the summer in traveling over Europe, he located permanently in Berlin. Here he found ample opportunities for satisfying his desires for further study and improvement, devoting all of his time to the study of bacteriology, histology, pathology and operative surgery, enjoying superior advantages in these departments of medical science. Upon his return to St. Louis he was called to the chair of Anatomy and Clinical Surgery in the Marion-Sims College of Medicine, which he acceptably filled for two years, after which he was elected to the chair of Clinical Surgery and Surgical Pathology, which position he still occupies.

MENDOZA, Francis Felix, of Key West, Monroe county, Fla., is an American citizen of Cuban descent, having been born in Guines, near Havana, Cuba, July 10, 1851, where he remained until six years of age, and began his earlier and elementary education in the best public schools. In 1857, he entered the Subizarreta's School, a very creditable college of Havana, in which he remained three years. From 1861

to 1863, he continued his studies in the High School of his birth-place, and in this period was editor of the infantile (manuscript) newspaper, *El Progreso* (?). From 1865 to 1868, he continued his studies of the course of Bachelor in Science, Literature, and Latin, inclusive, in the High School of the first grade, Sto. Angel, dean, Prof. E. Sotolongo, and in the same class, Royal College of Belen, S. J., with honors and prizes from all these colleges. He then commenced the study of medicine and pharmacy, with Dr. Masnata, and in the S. Ignacio's drug store. Since then he has devoted the most of his time to medical studies. From 1869 to 1870 he was at Paris, France, attending the hospitals and clinics, which was discontinued on account of war between France and Germany. Moving to Osnabrueck, Hanover, he took courses in botany, chemistry, physics, physiology, and anatomy, in the High School of Professor Noelle, and others, till the end of 1871, when he returned to Cuba, where he continued his medical studies with Dr. Masnata, of Havana, for three years. In 1873, he went to New York, and attended the clinics of the colleges and hospitals of that city until 1876. He then went to Spain, and received his medical degree from the regular Spanish Medico-Surgical Academy, and was made a member of the Spanish Anatomical Society. From 1876 to 1885, he practiced in Pinar del Rio and Guines, Cuba, with high credit, and from 1885 to 1888, he practiced in Mexico, at Vera Cruz, Puebla, and other places, and was the physician of many prominent people. In Guines he was manager of the Municipal Hospital, treasurer of the board of city commissioners and of public instruction. In Vera Cruz, Mexico, he was auxiliary physician of the port (quarantine), and of the Lazaretto. In 1888, he went to Key West, Fla., where he has since been engaged in the general practice of his profession, and has performed many surgical operations of importance.

MERRIAM, Laureston Alphonso, of Omaha, Neb., was born in Malone, Franklin county, N. Y., December 7, 1843. (His father, of English descent, was born in New Hampshire. His mother, of Scottish and English descent, was born in Vermont.) He received a classical and scientific education at Franklin Academy, Malone, N. Y., and was graduated therefrom in 1867. He began the study of medicine in 1868 under H. G. Pope, M. D., at Berlin, Wis., accepting soon after the position of principal of Waukau High School for the period of two years, when he resigned to again enter upon his medical studies, at Berlin, Wis., under Mile Mix, M. D., as preceptor, and continued his studies at the medical department of Michigan University from 1870 till 1872, and 1872-73, and was graduated therefrom with the degree of M. D., March 26, 1873. He located in Cresco, Howard county, Iowa, and became a member of the North Iowa Medical Society, being honored successively with the offices of secretary, treasurer, vice-president and president of the same. In 1876 he became a member of the Iowa State Medical Society, and was elected delegate to the American Medical Association. In the spring of 1879 he went to New York City to spend a year in the hospitals and special study of nervous and mental diseases. He matriculated at Bellevue Hospital Medical College and the University of the City of New York in 1879

and 1880, pursuing special studies, and located in Omaha, Neb., July 1, 1881. He became a member of the Nebraska State Medical Society May, 1883, was elected corresponding secretary of the same May, 1887, which position he held until May, 1892, each year giving a complete and extended review and criticism of the doings and papers of other State medical societies. In 1883 he was elected Professor of the Principles and Practice of Medicine in the University of Nebraska College of Medi-

L. L. Merriam.

cine, which position he held until the summer of 1887. He is also an active member of "Omaha Medical Society," "The Medical Society of the Missouri Valley," and "The Nebraska Academy of Sciences." Among his frequent contributions to medical literature may be especially mentioned his study of disease in the light of modern evolution, in a paper entitled, "Degeneration the Law of Disease," *St. Louis Courier of Medicine*, 1884; "What is Disease," see *Transactions Nebraska State Medical Society*, 1886; and "The Jugulation of Acute Diseases," *Transactions Nebraska State Medical Society*, 1889.

MERRILL, Cyrus Strong, of Albany, N. Y., was born at Bridport, Vt., September 21, 1847. His mother was a Strong, and both the Merrill and Strong families were prominent in the Colonial and Revolutionary period. He was educated at Amherst College, graduating with honor in 1867. He studied medicine at the College of Physicians and Surgeons, in New York City, where he graduated in 1871, after which he served as House Surgeon for a year at the Brooklyn Eye and Ear Hospital, and then went abroad for two years to study his specialty of diseases of the eye and ear. Having studied in the hospitals of Zurich, Vienna, Heidelberg, Paris and London, he returned in 1874 and settled at Albany, where he rap-

idly gained a large practice and the reputation of being a very skillful operator. In 1876 he was appointed Professor of Diseases of the Eye and Ear in the Albany Medical College, which position he still holds. He is Ophthalmic and Aural Surgeon to the Albany Hospital, St. Peter's Hospital, the Child's Hospital and the Troy Hospital. He is a member of the American Ophthalmological and Otological Societies, and of the New York State Medical Society. He has contributed various articles to the current journals.

MICHEL, William Middleton, of Charleston, S. C., was born in that city, January 22, 1822. He is of French and Scotch ancestry, his father, Dr. William Michel, being of direct French origin and wholly educated in France, while his mother was a South Carolinian, a Miss Fraser, and a lineal descendant of Simon Fraser, Lord Lovat, of Scotland. Two years of his early life were passed at school in Paris, after which he returned to Charleston, again spending five years in Paris, at the Ecole de Médecine, from 1842-46. In March, 1847, he graduated from the medical college of the State of South Carolina, and began practice in Charleston. He was a private pupil of, and dissected for, Cruveilhier, in his laboratory, for two years, and afterwards was in the private laboratory at the College de France, as private pupil of Coste. During this term of residence in Paris, in 1844, he delivered a private course of lectures on anatomy, in the French language, to a class of eighteen Frenchmen at the Ecole Pratique, in conjunction with Prof. Richet, then interne of Prof. Velpeau. He was the founder in 1848, and the conductor until 1861, of the Summer Medical Institute of Charleston, a private school, in which he delivered lectures on anatomy, physiology and midwifery to perhaps the largest classes ever assembled in the South—at one time numbering 150 students; it was not a chartered school, and was independent of any assistance or patronage from the medical college. In his practice the most notable cases have been: Trephining for epilepsy: cure; elephantiasis scrofi (immense), operated on: cured; ligature of subclavian, et.-scaleni, for gunshot wound: cured; removal of parotid: death; ligature of carotid, twice, on the same side, in the same patient, for secondary hemorrhage: death; and removal of cystic tumor of thigh of entire region. Among his contributions to medical literature may be mentioned: "Organogeny; or, the Science of Organization;" "Corpus Luteum Coinciding with Menstruation;" "Early Human Ovum;" monograph on "Pathology of the Pituitary Body;" "Researches on Black Vomit, Yellow Fever;" "Spontaneous Healing of Gunshot Wounds;" "Anatomy of Bullet Track;" "Epithelioma of Lower Lip;" "Gunshot wounds of Face;" "Hare-Lip in Negro;" and "Fibroma Moluscum." He was editor of the *Confederate States Medical and Surgical Journal* in 1863 and 1864, and the *Charleston Medical Journal*. During the war he was consulting surgeon to the Confederate hospitals at Richmond, Va., with Drs. Charles Bell Gibson and J. B. Read, and surgeon to the South Carolina hospitals at Richmond, Va. He is professor of physiology and medical jurisprudence in the medical college of the State of South Carolina. He is an ex-President of the Medical Society of South Carolina, and a member of

the Academy of Science, Philadelphia; of the American Association for the Advancement of Science, and a corresponding member of the Imperial Society of National History, Paris. Among his other contributions to science should be noted his researches on the "Development of the Opossum," which attracted the attention of Dr. George Morton, who, of his own motion, nominated and elected Dr. Michel a member of the Academy of Science, Philadelphia, and which also led to a tilt with Prof. Agassiz, in a debate of an hour, before the American Association for the Advancement of Science. His diploma as corresponding member of the Imperial Society of National History, Paris, was brought to him by Prof. Agassiz, when he first visited the United States.

MILLS, Charles Karsner, of Philadelphia, Pa., was born at the Falls of the Schuylkill, in Philadelphia county, Pa., December 4, 1845. He was graduated from the Central High School, of Philadelphia, in 1864. While a student at this school, in 1862, and again in 1863, he volunteered for the defense of the State, and served in the ranks of the Thirty-third Regiment of Pennsylvania Volunteer Militia. He graduated from the medical department of the University of Pennsylvania in 1869, and in 1871 received the degree of Ph. D. from the same institution. He has been a member and officer of numerous scientific and medical associations; among other positions, holding those of president of the Philadelphia Branch of the American Society for Psychical Research, of the American Neurological Association, of the Medical Jurisprudence Society of Philadelphia, and of the Philadelphia Neurological Society; and chairman of the Section of Neurology and Medical Jurisprudence of the American Medical Association. Soon after graduation in medicine he began to interest himself in neurology, but continued to be actively engaged in general practice until 1885, when increase of special work made it necessary for him to devote his entire time to nervous diseases and insanity. He has held various teaching positions in the medical institutions and colleges of Philadelphia: as lecturer on Electro-Therapeutics in the University of Pennsylvania, 1877-82, and since then lecturer on mental diseases; for several years lecturer on, and since 1891, Clinical Professor of Nervous Disease in the Woman's Medical College of Pennsylvania; professor of Diseases of the Mind and Nervous System in the Philadelphia Polyclinic and College for Graduates in Medicine, of which he was one of the founders, in 1882. He has been connected with numerous medical institutions; among others, with St. Mary's Hospital, the Episcopal Hospital, the Hospital of the University of Pennsylvania, the Philadelphia Hospital, and the Howard Hospital; the State Hospital for the Insane at Norristown, Pa.; the Pennsylvania Training School for Feeble-minded Children at Elwyn, Pa.; St. Joseph's Hospital, Philadelphia; the New Jersey Home for the Education and Care of the Feeble-minded; the Home for Crippled Children, Philadelphia; the Woman's Hospital, Philadelphia; the West Philadelphia Hospital for Women, and the Hospital for Epileptics of Philadelphia. The neurological department of the Philadelphia Hospital, which is unequalled in this country and scarcely equaled abroad, for the opportunities

which it affords for studying and treating nervous and mental disease, was founded by him in 1877. He has frequently represented the medical societies of Philadelphia in the State and national medical organizations. He is the author of numerous medical monographs and papers, chiefly neurological; his articles covering a large range of subjects, clinical and pathological, and include reports on many cases of brain tumor; numerous clinical lectures and reports on the affections of the nervous system; articles on hypnotism; medico-legal papers; the Toner Lecture on Mental Overwork and Premature Disease among Public and Professional Men, published by the Smithsonian Institution; articles on Hysteria, Hystero-Epilepsy, Catalepsy and Ecstasy, in the American System of Practical Medicine; and in the same work, Tumors of the Brain and its Envelopes, and Tumors of the Spinal Cord and its Envelopes (with Dr. J. Hendrie Lloyd; numerous reports on cases of insanity; and biographical sketches of Benjamin Rush and Isaac Ray. Since 1878 he has contributed many observations and papers on the subject of cerebral and spinal localization. At the Congress of American Physicians and Surgeons held in Washington, in September, 1888, he opened an important discussion on "Cerebral Localization in its Practical Relations," with a paper which was expanded into a monograph of about 100 pages. He is author of a school book on Physiology and Hygiene, and of a manual on the Nursing and Care of the Insane. In 1892 he edited the first volume of the Philadelphia Hospital Reports. He is associate editor of several journals devoted to neurology and psychiatry; was one of the collaborators of the Annual of the Universal Medical Sciences, and a contributor to Keating's Cyclopedia of the Diseases of Children, and to Hare's System of Therapeutics. In the Review of Insanity and Nervous Disease he has published an elaborate monograph on Aphasia and other Affections of Speech in their medico-legal relations. He is frequently engaged in practical medico-legal work in the courts, and has testified in many noted cases.

MILTENBERGER, George Warner, of Baltimore, Md., son of the late Gen. Anthony J. W. Miltenberger, who held a commission in the War of 1812, was born March 17, 1819. His primary education was obtained at Boissieu Academy, Baltimore, and his classical and literary education at the University of Virginia. He studied medicine in the University of Maryland, graduating M. D. in 1840, and settling in general practice in Baltimore. In the last-named year he was elected Demonstrator of Anatomy in the University of Maryland, a position he held till 1852. He also commenced a course of lectures in the same institution, and these he continued till 1847, and completed the course on Anatomy which had been left unfinished by reason of the death of (his preceptor) Dr. William Baker. In 1847 he was placed in charge of the surgical wards of the Infirmary, a position previously restricted to one of the faculty. In the same year he was elected Lecturer on Pathological Anatomy. In 1849 he became one of the attending physicians to the Baltimore City and County Almshouse. In 1852, he was elected to succeed Professor Chew (who had been transferred to the chair of Theory and Practice

of Medicine), in the chair of *Materia Medica*, Therapeutics and Pathology. This position he held till 1858, when he was elected Professor of Obstetrics, a position he held for many years. In 1855, he had been chosen dean of the faculty of the university. The above duties, together with his ever-increasing practice, compelled him, in 1858, to discontinue his private class, which up to that date had been largely attended. He is now Consulting Physician to Johns Hopkins Eye and Ear Institute and Woman's Hospital, Baltimore, and Emeritus Professor of Midwifery in the University of Maryland. Dr. Miltenberger is, perhaps, the oldest and most widely known physician in Baltimore, having been engaged in the active duties of his profession in that city for more than fifty years.

MITCHELL, John Kearsley, of Philadelphia, Pa., was born in Jefferson county, Va., May 12, 1798, and died April 4, 1858. He received his early education at Ayr and Edinburgh, Scotland, whither he had been sent at the age of eight, and on his return to this country, studied medicine under the preceptorship of Dr. Nathaniel Chapman, and was graduated at the medical department of the University of Pennsylvania, in 1819. Impaired health induced him to accept the appointment of ship surgeon, and he made three voyages to China and the East Indies, but in 1822 he settled in Philadelphia, where he became eminent, both in the treatment of nervous diseases and in the general practice of his profession. In 1824 he was chosen to lecture on the Institutes of Medicine and Physiology, at the Philadelphia Medical Institute, and in 1826 was made Professor of Chemistry in that School. In 1833 he was also appointed to the same chair at the Franklin Institute, and for five years thereafter delivered annually courses of lectures on chemistry applied to medicine and the arts. In 1841 he was called to the chair of the Theory and Practice of Medicine, in Jefferson Medical College, which position he retained until his death. He was Visiting Physician to the Pennsylvania and City Hospitals, and his services during seasons of pestilence were twice rewarded by municipal gifts. Dr. Mitchell contributed numerous papers to medical periodicals, and he was the author of many popular lectures on scientific subjects which were published in magazines. He was also the author of "Saint Helena," a poem "by a Yankee," 1821; "On the Wisdom, Goodness and Power of God, as Illustrated in the Properties of Water," 1834; "Indecision, a Tale of the Far West, and Other Poems," 1839; "On the Cryptogamous Origin of Malarious and Epidemic Fevers," which was a theoretical anticipation of the recent views as to the microphytic or bacterian development of many diseases, 1849, and "Five Essays on Various Chemical and Medical Subjects," 1858, issued after his death.

MITCHELL, Samuel Weir, of Philadelphia, Pa., was born February 15, 1829. He is of Scottish descent, and is a Virginian by birth. His father, the late Dr. John K. Mitchell, however, practiced for many years in Philadelphia, where he stood at the head of his profession. The literary education of the subject of this sketch was acquired at the University of Pennsylvania. His medical degree was conferred by the Jefferson Medical College, in 1850. He early adopted the treatment of dis-

eases of the nervous system as his chosen specialty, in which line of practice he has gained a world-wide reputation. Referring to the subject of this sketch, a recent writer has said: Philadelphia is full of points of interest for an intellectual inquirer, but there is no place in it better worthy of visit, if such privilege can be obtained, than the house in Walnut street, where an unobtrusive plate on the window still announces the professional adode of Dr. S. Weir Mitchell. In Dr. Mitchell's office you will be most courteously received by the doctor's secretary, a lady of gracious presence, who, by a quiet gesture, offers you a comfortable seat and calmly resumes her work in a corner of the room. The first thing which strikes you is that, though this is the Doctor's day off, the room is half full of people, of both sexes and various ages. These people are well worthy of notice. They are sufferers from nervous diseases who have come from such a long distance to see Dr. Mitchell that he can not find it in his heart to refuse them. Sunk in a capacious sofa, with the latest number of the *Graphic*, one can observe without intruding. It is a room one could willingly live in—but not with the people who are in it now. There are exceptions, however. Two of the gentlemen are very pleasant-looking fellows and are making themselves most agreeable to the others. They are chatting with them in low tones, but in quite a lively way, and their friendliness puts even the most timid at their ease. Certainly if these young men are suffering from nervous trouble they do not show it. One of them, the tall, fair-haired one with the winning smile, is "young Dr. Mitchell," and the other, the dark one, with the glasses and the fresh complexion, is also a rising light of the profession. They are Dr. S. Weir Mitchell's assistants, and their present function is to make friends with the patients, allay their excitement, and get from them as clear a statement of their symptoms and sensations as they can. This preliminary application of sympathy and delicate kindness by trained, vigilant and acute assistants, is part of Dr. Mitchell's treatment, and a very important part in many cases. By the time the patients meet the great specialist himself, they have not only said all they have to say about themselves—a vast saving of time and trouble to him—but they have got into a state of comparative tranquility, which enables him to examine them much more effectively than he otherwise could. When the last of the patients has been thus disposed of, the assistants take their departure, and Dr. Mitchell comes out and conducts his visitor to an easy chair in front of a glowing wood fire in his own room. It is another library, crammed with books and pictures, and sculptures, and souvenirs of a high and scholarly life, reminding one of nothing so much as the study of some Oxford don. The central figure in the scene is entirely in harmony with the surroundings. Dr. Mitchell is a very tall man, considerably over six feet, and his erect bearing and well-knit figure display the whole of his height. He has abundance of grey hair, and a full, grey beard, slightly peaked, after the manner of the poet Browning, whom he resembles not a little. He carries his sixty years well, though the intensely arduous nature of his work shows itself in his visage, and in several peculiarities that are not

easily described. Dr. Mitchell makes it, as far as possible, a rule to take no part in literary work during the busy period of his overwhelming practice. Every summer, like a wise man, he gives himself a long holiday, not a long spell of idleness, but rather a change of occupation whilst in close contact with nature. For several summers past he has gone to the Restigouche river in Canada. He takes with him all the materials for his literary work, and it is to this open-air habit of writing that we owe his delightfully easy scientific treatises, as well as those dryly philosophical novels, fairy tales and poems which have given him an eminent place in literature. Referring to phases of specialism, this noted neurologist is quoted as saying, that in a strict sense there does not exist any special science of nervous diseases aside from general pathology, and that specialism is or should be merely a matter of division of labor. "It first arose by the wholesome and gradual evolution of the individual specialist out of the general practitioner; but to-day the special physician is too apt to select his branch too early. He would be a better doctor if he had behind him more years of general clinical labor. Sometimes one branch of medical science is in advance of the rest, and sometimes another; and a man who narrows himself down to a specialty is likely to lose a great deal of knowledge which is as necessary for his branch as for others. The various fields of medical investigation overlap each other, and no man can be a really good specialist who is not also a good general practitioner. The physical system is so complex that the parts act and react upon each other in a wonderful way. Nervous phenomena may be only symptoms of an organic disease; or organic phenomena may be only symptoms of a nervous disease. The real value of specialism to science is that it perfects knowledge in particular branches, which knowledge afterward spreads through the whole body of medicine, and so all branches are refreshed by new, advanced and precise ideas. The general practitioner is apt to see only the beginnings of diseases, without correctly interpreting them or asking counsel early enough to be useful. He confuses with rheumatism the neuralgias due to the faint beginnings of spinal disease, or he vainly tries to allay headache by drugs, when a specialist would tell him in an hour that it is the result of defective sight, or ear trouble, or nasal disease. But specialism ought to be as broad as possible, and the specialization of practice is to be feared in proportion as it tends to become narrow. Even specialists in insanity, Dr. Mitchell thinks, instead of living in eternal contact with the insane, ought to come into relation with neurologists and others. He even goes so far as to say that insane asylums ought to become hospitals, with an outside staff of attending physicians; and that we can not safely permit any class of specialists to drift away from general and frequent contact with the rest of us. As to specialism in surgery, and most particularly as to the use of the knife, which has been the subject of such fierce discussion lately, Dr. Mitchell holds strong views and expresses them freely. The precision of instruments in modern times, by greatly diminishing the peril of life in operations, has created a vast temptation for the younger surgeons. This remark applies with

peculiar force to female complaints, in which it seems so easy and so safe to restore health by removing a part; that too often and too promptly the gynecologist resorts to but one drug, namely, steel in the trenchant form, and deprives the patient of the inestimable possibilities of the wife and mother when they might be preserved by patient medical treatment." Dr. Mitchell considers it established beyond dispute that nervousness is the characteristic malady of the American nation, growing upon them in a frightfully accelerated ratio every year, and threatening them with disaster at no distant date which the mind shrinks from contemplating. The number of deaths from this cause is already appalling and is steadily and rapidly increasing. In some of the busy centers the tables of mortality show that the proportion of nerve death has multiplied more than twenty times in the last forty years and that now the nerve deaths number more than one-fourth of all the deaths recorded. What is most shocking in these returns is, that this fearful loss of life occurs mainly among young people of both sexes. This means that the Americans are fast becoming a very short-lived people; and, if they were shut in on themselves for only a few years, and without any influx of vitality by immigration, the publication of the census would send a pang of horror and alarm throughout the land. Dr. Mitchell is clearly of the opinion that the first and most potent cause of this is the climate; and says the operation of climatic conditions in relation to health in this country is mysterious; but he is quite persuaded that the development of a nervous temperament is one of the race-changes which are also giving the Americans the facial, vocal and other peculiarities derived from none of their ancestral stocks. That even the changes of the seasons and the weather have curious effects on the nervous system, which are not noticed in other countries. He considers it proved that the paralysis of childhood—acute anterior *myelitis*—a sadly common affliction, is a disease of the summer months, and he is so much impressed by the relation of the nervous affection called *chorea* to the weather curves, and of traumatic neuralgia to storms, that he has prepared special treatises for medical use on both of those subjects. As to the comparative effect of the American climate on the different races of mankind, he is quoted as saying it is too early to form any very confident judgment. "But this much is certain. White races are affected more than colored. Full-blood negroes are found to be entirely exempt from some of the worst and most prevalent forms of nervous disease, and even a slight trace of color seems to be a safeguard. The Anglo-Saxon Americans are the greatest sufferers from the national disease, and especially those in the higher walks of life. Females are more under the influence of this terrible scourge than males, and town dwellers than country folk. The prevalence of the more serious nervous diseases is shown to be in almost exact proportion to the congestion of population. There is no surer test of the nervous condition of any people than this—can the women, when they become mothers, nurse their children themselves? In America it is found that, whereas in the rural districts, from seven-tenths to nine-tenths of the women can do so, in the cities the pro-

portion is not more than one-half, and Dr. Mitchell declares that he would not be believed if he were to say how many even of these are unfit to be wives or mothers at all!" Americans, however, are not responsible for the climate. That is one of the evils they have to bear in compensation of the thousand blessings and advantages they enjoy in the possession of this mighty tract of marvelously productive land. But they are responsible, almost criminally responsible, for aggravations of the effects of the climate by their habits of life, which multiply the number of victims tenfold, and must, in the long run, degrade and attenuate the race. The two most formidable factors that impair the national health are over-education and the struggle for wealth. The former attacks particularly females, the latter males, but both sexes are more or less exposed to the malign influence of both evils. "The flower of American womanhood is wilted by over-culture before it comes fully into bloom. The long hours, the multiplicity of studies, the number of teachers—each striving to get the utmost out of the pupils—the craving rivalry to be well-graded, the all-devouring ambition to command a means of living, the hurried or neglected meals, the want of exercise and the fatal irregularity that it entails, and the gnawing worry that murders sleep—it is these, and these alone, that condemn tens of thousands of American women to a life of misery and uselessness before they have ceased to be children. Dr. Mitchell deliberately maintained that, for all the best purposes of female society, it would better that American girls were not educated at all until they were seventeen, than that they were over-wrought as they are at present. They study seven or eight hours a day, when two or three would be sufficient to keep their intelligence in training—and all for what? To spend their after years on a sofa or in a sick room, and to be a burden, instead of a help, to those who are dearest to them." It is a tremendous saying, from one speaking with authority, that as much domestic unhappiness is caused in America by domestic nervousness among women as by dram-drinking among men. Yet such is Dr. Mitchell's verdict. He holds that every girl ought to be examined as to her nervous temperament when about to go to school, and at frequent intervals afterward, that leisure, exercise and wholesome meals ought to be insisted upon, and that studies ought to be compulsorily diminished, or discontinued altogether, the moment the well-known signs of over-strain appear. If girls are maintained in normal nervous condition until they are seventeen, they may study almost as hard as they please afterward without imperiling their woman's life. But let there be no mistake about it, over-work and unnatural worry, from eight or nine to seventeen, mean ruin and wretchedness from seventeen till early death. "As for the latter influence, its power is manifested in that wide-spread complaint which physicians call cerebral exhaustion. The American male stands the racket of the school much better than the female. He takes more exercise and he has not the troubles of puberty to contend against. But he meets his fate very shortly afterward. He goes to business far too young, and he straightway consumes his vital energy till nothing is left but dust and ashes. It is often pointed out with pride that

America is the country of young men, and so it is. We quite usually see here labors and responsibilities borne by mere boys, which nowhere else would be undertaken by many under middle-age." That is very striking and interesting to the casual observer. But what it means to such observers as Dr. Mitchell is that America is the country of young invalids, young wrecks, young drug victims, young inebriates, young maniacs, young suicides. The prematureness of business responsibility and the frantic haste to be rich and powerful, produces in plain sight what is nothing short of a frightfully general social evil. The most appalling cases of nervous diseases that the doctor meets with are those of young men in the highest posts, who entered business life too early and suddenly encountered periods of excessive anxiety and grave responsibility. It would have been a mercy to them if they had been street sweepers or coal porters, instead of railroad presidents or bank managers. A volume might be written on this one aspect of the subject, and every line of it quick with the thrilling romance of real life. But what would be the use? Dr. Mitchell believes that to preach to the present generation of American business men, for their own salvation, is as the voice of one crying in the wilderness. His warnings are as the prophecies of Cassandra—disregarded in proportion as they are fatefully true. But, he says, "there is hope for the future. If our business men have no care for their own health or happiness, their hearts are not altogether made of bank paper. Let them feel for their sons and their sons' sons who are to be the Americans of the coming century. For the sake of humanity, for the sake of morality, for the sake of patriotism, let them give the youth of the great Republic a chance to live while they live, to be heirs to something more than piles of white and yellow metal, to know the joys of high thinking and high living, the dignity and nobleness of a healthy mind in a healthy body. Let them secure for their successors in the boundless wealth and energy of this marvelous country such a strength of nerves, that they may know how to bind the 'dollar-devil' with chains and make it their obedient servant instead of their cruel and remorseless tyrant." We have presented these extended views of Dr. Mitchell in regard to what is termed the national disease of this country. Upon such a subject it would be futile to cite the opinion of any foreigner, nor is there any need to do so. In every part of the world where advanced science has any footing at all, the name of S. Weir Mitchell is not only known and honored, but carries with it the greatest weight of authority. No man knows more about Americans than he does; and no man knows more about the nervous system. Americans, therefore, may take it with good grace from their own famous specialist that the national disease of this mighty Nation is nervousness in all its forms. Dr. Mitchell is president of the Medical Society of Pennsylvania; a member of the National Academy of Science of the United States, and of numerous other scientific institutions, both at home and abroad. He has been a voluminous writer, as the following list of his books and essays contributed to various medical journals will amply testify: "On the Various Forms of Uric Acid Crystals, and on the Mode of their Formation," 1852;

"The Relations of the Pulse to Conditions of Fixed or Extreme Inspiration and Expiration," 1854; "Bibliographical Notices of American Memoirs upon Physiological Subjects," "Observations on the Blood Crystals of the Sturgeon *Acipenser Brevirostrum*," Proceedings of the Biological Department of the Academy of Natural Sciences, with colored plates, "On the Inhalation of Cinchonia and its Salts," "Notes upon the Effects of Alcohol, Glycerine, Water, Gum, Ammonia, and the Vacuum upon the Excised Hearts of the Frog, Turtle, and Sturgeon," 1858; "Experimental Researches Relative to Corroval and Vao, two New Varieties of Woorara, the South American Arrow Poison," by Wm. A. Hammond, M. D., and S. Weir Mitchell, M. D., Biological Department Academy of Natural Sciences, with wood-cuts; "An Experimental Examination of the Toxicological Effects of Sassy Bark, an Ordeal Poison from Liberia, West Africa," by S. Weir Mitchell, M. D., and Wm. A. Hammond, M. D., Biological Department Academy of Natural Sciences, Philadelphia, "On the Production of Cataract in Frogs by the Administration of Saccharine Substances," Biological Department Academy of Natural Sciences, 1859; "On the Physical and Chemical Characteristics of Corroval and Vao, two Recently Discovered Varieties of Woorara, and on a New Alkaloid, Constituting their Active Principle," by Wm. A. Hammond, M. D., and S. Weir Mitchell, M. D., Proceedings Academy of Natural Sciences, Biological Department, "Researches upon the Venom of the Rattlesnake, with an Investigation of the Anatomy and Physiology of the Organs Concerned," Smithsonian Contributions to Knowledge, accepted for publication, July, 1866, wood cuts, with full bibliography, and an enumeration of genera and species, by E. D. Cope; "On the Treatment of Rattlesnake Bites, with Experimental Criticisms upon the Various Remedies now in Use," 1861; "Experiments and Observations upon the Circulation in the *Chelonura Serpentina* (Snapping-Turtle), with Especial Reference to the Pressure of the Blood in the Arteries and Veins," Memoirs of the American Philosophical Society, April, 1862; "Researches on the Anatomy and Physiology of Respiration in the *Chelonina*," by S. Weir Mitchell, M. D., and George R. Morehouse, M. D., Smithsonian Contributions to Knowledge, accepted for publication, March, 1863, with wood cuts; "Reflex Paralysis" (Circular No. 6 of Surgeon-General's Office, 1864), by S. Weir Mitchell, M. D., Geo. R. Morehouse, M. D., and Wm. W. Keen, Jr., M. D.; "Gunshot Wounds and other Injuries of Nerves," by S. Weir Mitchell, M. D., Geo. R. Morehouse, M. D., and Wm. W. Keen, Jr., M. D., in charge of United States Army Wards for Diseases and Injuries of the Nervous System, Turner's Lane Hospital, Philadelphia; "On Malingerers, Especially in Regard to Simulation of Diseases of the Nervous System," by Wm. W. Keen, Jr., M. D., S. Weir Mitchell, M. D., and Geo. R. Morehouse, M. D., in charge of United States Army Hospital Wards for Diseases and Injuries of the Nervous System, Turner's Lane Hospital, Philadelphia, "An Inquiry into the Correctness of the Belief that Prof. Bibron was the Inventor of the Antidote which bears his name," 1863; "Arsenical Albuminuria," "On the Antagonism of Atropia and Mor-

phia," founded on observations and experiments made at the United States Army Hospital for Injuries and Diseases of the Nervous System, by S. Weir Mitchell, M. D., Wm. W. Keen, Jr., M. D., and Geo. R. Morehouse, M. D., 1865; "Paralysis from Peripheral Irritation," 1866; "On Retrogressive Motions in Birds, Produced by the Application of Cold to the Cervical Spine, with remarks on the use of that agent as an aid in Physiological Investigations," 1867; "On the Production of Reflex Spasms and Paralysis in Birds, by the Application of Cold to Definite Regions of the Skin," "Experimental Contributions to the Toxicology of Rattlesnake Venom," 1868; "Researches on the Physiology of the Cerebellum," "On Certain Forms of Neuralgia, Accompanied by Muscular Spasm and Extravasations of Blood, and on Purpura as a Neurosis," "Effects of Chloral, Chloroform and Ether Hypodermically Employed," "On the Insusceptibility of Pigeons to the Toxic Action of Opium," 1869; "On the Effect of Opium and its Derivative Alkaloids," "Observations on Poisoning with Rattlesnake Venom," "On the Use of Bromide of Lithium," "Gunshot Wound of Lungs," a report of a case of rapid respiration, with John H. Brinton, M. D., "Ulceration of the Skin, as an Effect of the Use of the Bromides," "On the Use of Skimmed Milk as an Exclusive Diet in Disease," 1870; "On the Growth of the Nails as a Prognostic Indication in Cerebral Paralysis," 1871; "Wear and Tear—Hints for the Overworked," "Cases Illustrative of the use of Ophthalmoscope in the Diagnosis of Intra-Cranial Lesions," with Wm. Thomson, M. D., "The Influence of Rest in Locomotor Ataxia," "The Influence of Nerve Lesions on Temperature," Archives Science and Practice of Medicine, "Anal and Perineal Neuralgia," 1873; "The Supply of Nerves to the Skin," "Emboli of the Right Middle Cerebral Artery; Left Hemiplegia and Death," "Traumatic Neuralgia; Section of Median Nerve," "Headaches, from Heat-Stroke, from Fevers, after Meningitis, from Over-Use of Brain, from Eye-Strain," "The Nervous Accidents of Albuminuria," "Post-Paralytic Chorea," 1874; "The Headaches of Childhood," "On the Use of Nitrite of Amyl in Various Forms of Spasm, and on its Value as an Aid to Diagnosis," "On the Spasmodic Diseases of Stumps," "Spinal Arthropathies," "Rest in the Treatment of Nervous Disease," 1875; "On Some of the Disorders of Sleep," "Notes on Headache," "Neurotomy," by S. Weir Mitchell, M. D., with "An Examination of Three Regenerated Nerves, and Notes on Neural Repair," by R. M. Bertolet, M. D., "Headaches from Eye-Strain," "Cases Illustrating Local Injuries of Nerves, and their Trophic Consequences, with Comments," 1876; "The Relation of Pain to Weather, being a Study of a Case of Traumatic Neuralgia," "Clinical Lectures on Traumatic Neuralgia, Chorea, Palsies," "Hysteria," "Vertigo," "Nervous Exhaustion," "Clinical Lectures on Nervousness in the Male," "The Annual Oration before the Medical and Chirurgical Faculty of Maryland," "Fat and Blood, and How to Make Them," "Nurse and Patient, and Croup Cures," 1877; "Diseases of the Nervous System, especially of Women," 1881. Dr. Mitchell first turned his attention to fiction during

the Civil War, when he wrote "The Children's Hour," the sales of which were in aid of the Sanitary Commission Fair in Philadelphia. Afterward he wrote short stories for the Children's Hospital in that city, and in 1880 published his first novel. Since then he has also produced several volumes of verse. Of these works may be mentioned "The Wonderful Stories of Fuz-buz, the Fly, and Mother Grabem, the Spider," 1867; "Hephzibah Guinness," "Thee and You," and "A Draft on the Bank of Spain," 1880; "The Hill of Stones, and Other Poems," 1882; "In War Time," 1884; "Roland Blake," 1886; "A Masque, and Other Poems," 1887; "Prince Littleboy, and Other Tales out of Fairyland," 1888. He has since written "Doctor and Patient, a Series of Essays," and made other important contributions to general literature.

MITCHILL, Samuel L., of New York City, was born in North Hempstead, formerly Plandome, Queen's county, Long Island, N. Y., August 20, 1764, and died September 7, 1831. This distinguished individual, so long and familiarly known to the citizens of the United States, and so highly appreciated by the enlightened of Europe, merits a record of his character and labors, as the pioneer philosopher in the promotion of natural science and medicine in America. His father, Robert Mitchill, of English descent, was an industrious farmer, of the Society of Friends. He died in 1789, leaving behind him six sons and two daughters, most of whom he lived to see respectably settled in life. Samuel was the third son, who was remarkable for those habits of observation and reflection which were destined to elevate him to an enviable distinction among his contemporaries; and, fortunately for mankind, his talents and laudable ambition met a discerning and liberal patron in his maternal uncle, Dr. Samuel Latham, a skillful and intelligent medical practitioner in his native village. Young Mitchill received his classical education under the direction of the learned and accomplished Dr. Leonard Cutting; the elementary principles of medicine under his uncle Latham; and completed his professional studies in New York, with the erudite Dr. Samuel Bard, with whom he continued three years—a devoted pupil. Referring to this period of his life, his biographer, Dr. J. W. Francis, has written as follows: The condition of affairs in New York, owing to the occurrences of the revolutionary contest, and the occupancy of this city by the British, led young Mitchill to avail himself of the advantages held out by the University of Edinburgh, where he arrived in 1783, and which was at that time adorned by the talents of Cullen, Black, Duncan, and Monro. Here he enjoyed the gratifying intercourse of many remarkable students, and among his fellow-companions were the late Sir James Mackintosh; the excellent Dr. Caspar Wistar; Richard S. Kisson, the popular surgeon; William Hammersly, long a professor in Columbia College; and Thomas Addis Emmet, still so well remembered as pre-eminent at the New York Bar. Upon his return to his native country, the young physician, richly laden with stores of professional and general information, devoted a portion of his leisure to acquire a knowledge of the laws and Constitution of the Republic, under the direction of Robert Yates, at that time Chief Justice of the State

of New York. His medical career, his professional labors, and his contributions towards the natural history and science of his country, will be best comprehended by those who investigate the progress those departments of knowledge have made in this country. "The universal praise which Dr. Mitchill enjoyed in almost every part of the globe where science is cultivated, during a long life, is demonstrative that his merits were of a higher order. A discourse might be delivered on the variety and extent of his services in the cause of learning and humanity. Dr. Mitchill's character had many peculiarities; his knowledge was diversified and most extensive, if not always profound. Like most of our sex, he was married, but, as old Fuller would say, the only issues of his body were the products of his brain. He advanced the scientific reputation of New York by his early promulgation, when first appointed professor in Columbia College, of the Lavoisierian system of chemistry. His first scientific paper was an essay on Evaporation; his mineralogical survey of New York, in 1797, gave Volney many hints; his analysis of the Saratoga waters enhanced the importance of these mineral springs." About this time, he published "An Account of the State of Learning in Columbia College." His ingenious theory of the doctrine of septon and septic acid gave origin to many papers, and impulse to Sir Humphrey Davy's vast discoveries; his doctrines on pestilence awakened inquiry from every class of observers throughout the Union; his expositions of a theory of the earth and solar system captivated minds of the highest qualities. His speculations on the phosphorescence of the waters of the ocean, on the fecundity of fish, on the decortication of fruit trees, on the anatomy and physiology of the shark, swelled the mystery of his diversified knowledge. His correspondence with Priestley is an example of the delicious manner in which argument can be conducted in philosophical discussion. His elaborate account of the fishes of our fresh and salt waters adjacent to New York, comprising 166 species, afterwards enlarged, invoked the plaudits of Cuvier. His reflections on somnium—the case of Rachel Baker—evinced psychological views of original combination. His numerous papers on natural history enriched the annals of the Lyceum, of which he was long president. His researches on the ethnological characteristics of the red man of America, betrayed the benevolence of his nature and his generous spirit. His fanciful article, "Fredonia," intended for a new and more appropriate geographical designation for the United States, was at one period a topic which enlisted a voluminous correspondence, now printed in the proceedings of the New York Historical Society. He increased our knowledge of the vegetable materia medica of the United States, and he wrote largely on the subject to Barton, of Philadelphia; Cutler, of Massachusetts; Darlington, of Pennsylvania; and Ramsey, of South Carolina. He introduced into practice the sessamum orientale. He wrote amply to Percival, of Manchester, and to other philosophers in Europe, on noxious agents. He largely seconded the views of Judge Peters, on gypsum as a fertilizer. He cheered Fulton when he was dejected; encouraged Livingston in appropriation; awakened new zeal in Wilson, when Tomkins, the governor of the State, had

high paralyzed him by his frigid and unfeeling reception; and with John Pintard, Cadwallader D. Colden, and Thomas Eddy, was a zealous promoter of that system of internal improvement which has stamped immortality on the name of Clinton. He co-operated with Jonathan Williams in furtherance of the Military Academy at West Point; and, for a long series of years, was an important Professor of Agriculture and Chemistry, in Columbia College, and of Natural History, Botany, and Materia Medica, in the College of Physicians and Surgeons, of New York. His letters to Tilloch, of London, on the progress of his mind in the investigation of septic acid—oxygenated azote—is curious as a physiological document. Many of the leading papers from his pen are to be found in the *London Philosophical Magazine*, and in the *New York Medical Repository*, a journal of wide renown, which he established with Miller and Smith; yet he wrote in the *American Medical and Philosophical Register*, the *New York Medical and Physical Journal*, the *American Mineralogical Journal*, of Bruce, the "Transactions of the Philosophical Society of Philadelphia," and supplied several other periodicals, both abroad and at home, with the results of his cogitations. He accompanied Fulton on his first voyage in a steamboat, in August, 1807; and, with Williamson and Hosack, he organized the Literary and Philosophical Society of New York, in 1814. He was associated with Griscom, Eddy, Colden, Gerard, and Wood, in the establishment of the Institution for the Deaf and Dumb; and, with Eddy and Hosack, may be classed with the first in New York City, in respect to time, who held converse with the afflicted mute by means of signs. With Dr. Townsend and Sylvanus Miller, he disinterred a mammoth, at the Walkill, in Orange county, in 1818; and constituted a prominent member of a convention, held at Philadelphia, in 1819, for preparing a National Pharmacopeia. He was one of the commissioners appointed by the general government for the construction of a new naval force, to be propelled by steam—the steamer "Fulton the First." While he was a member of the United States Senate, he was unwearied in effecting the adoption of improved quarantine laws, and aided Dr. Richard Bayley in the undertaking; and, among his other acts important to the public weal, was strenuous to lessen the duties on the importation of rags, in order to render the manufacture of paper cheaper, the better to aid the diffusion of knowledge by printing. Ancient and modern languages were unlocked to him, and a wide range of physical science, the pabulum of his intellectual repast. An essay on composts, a tractate on the deaf and dumb, verses to septon, or to the Indian tribes, might be eliminated from his mental alchemic within the compass of a few hours. He was now engaged with the anatomy of the egg, and now deciphering a Babylonian brick; now involved in the nature of meteoric stones; now in the different species of brassica; now in the evaporation of fresh water; now in that of salt; now scrutinizing the geology of Niagara; now anatomizing the tortoise; now offering suggestions to Garnet, of New Jersey, the correspondent of Mark Akenside, on the angle of the windmill; and now concurring with Michaus on the beauty of the black walnut as ornamental for parlor

furniture; now, with his conchological friend, Akerly, in the investigation of bivalves; and now with the learned Jewish Rabbi, Gershom Seixas, in exegetical disquisitions on Kennicott's Hebrew Bible. Now he might be waited upon by the indigent philosopher, Christopher Colles, to countenance his measures for the introduction of the Bronx River into the city; and now a committee of soap-boilers might seek after him, to defend the innoxious influence of their vocation in a crowded population. For his services in this cause of the chandlers, Chancellor Livingston assured him, doubtless facetiously, by letter, that he deserved a monument of hard soap; while Mitchill, in return, complimented Livingston, for his introduction of the merino sheep, as chief of the Argonauts. In the morning he might be found composing songs for the nursery; at noon dietetically experimenting and writing on fishes, or unfolding to admiration a new theory on terrene formations; and at evening addressing his fair readers on the healthy influence of the alkalies, and the depurating virtues of whitewashing. At his country retreat, at Plandome, he might find full employment in translating, for his mental diversion, Lancisi, on the fens and marshes of Rome, or in rendering into English poetry the piscatory eclogues of Sannazarius. One day, in workmanlike dress, he might have been engaged, with his friend, Elihu H. Smith, on the natural history of the American elk, or perplexed as to the alimentary nature of tadpoles, on which, according to Noah Webster, the people of Vermont almost fattened, during a season of scarcity; another, attired in the costume of a native of the Fiji Islands—for presents were sent him from all quarters of the globe—he was better accoutred for illustration, and for the reception, at his house, of a meeting of his philosophical acquaintances; while again, in the scholastic robes of an LL.D., he would grace the exercises of a college commencement. His detailed narrative of the earthquakes, which occurred on the 16th day of December, 1811, and which agitated the parts of North America that lie between the Atlantic Ocean and Louisiana, and of subsequent occurrences of a like nature, is a record of physical phenomena well worthy of notice, but which seem to have escaped the attention even of the distinguished philosopher, Dr. Maury, the famed author of the Physical Geography of the Sea. This elaborate paper of Dr. Mitchill is to be found in the Transactions of the New York Literary and Philosophical Society. Of Dr. Mitchill's collegiate labors in the several branches of knowledge, which he taught for almost forty years, his biographer, Dr. Francis, says: His appearance before his class was that of an earnest instructor, ready to impart the stores of his accumulated wisdom for the benefit of his pupils, while his oral disquisitions were perpetually enlivened with novel and ingenious observations. Chemistry, which first engaged his capacious mind, was rendered the more captivating by his endeavors to improve the nomenclature of the French savants, and to render the science subservient to the useful purposes of agriculture, art, and hygiene. In treating of the *materia medica*, he delighted to dwell on the riches of our native products for the art of healing, and he sustained an enormous correspondence throughout the land, in order to add to his own practical observa-

tions the experience of the competent, the better to prefer the claims of our indigenous products. As a physician of that renowned institution, the New York Hospital, he never omitted, when the opportunity presented, to employ the results of his investigations for clinical appliances. The simplicity of his prescriptions often provoked a smile on the part of his students, while he was acknowledged a sound physician at the bedside. His anecdotal remarks on the theories and systems at once declared that he was fully apprised of previous therapeutical means, from the deductions of Hippocrates and Pliny, Boerhaave and Hoffman, to the fanciful speculations of Brown and Darwin. He was filled with the precepts of the Salernian code. But his great forte was natural history. Here his expositions of that vast science, in its several ramifications, gave the best proofs of his capacious stores of bookish wisdom and personal knowledge. He may fairly be pronounced the pioneer investigator of geological science among us, preceding McClure by several years. He was early led to give his countenance to the solidity of the Wernerian theory, but had occasion to announce his belief, from subsequent investigation in after-life, that the Huttonian system was not wholly without facts deduced from certain phenomena in this country. His first course of lectures on natural history, including geology, mineralogy, zoology, ichthyology and botany, was delivered, *in extenso*, in the College of Physicians and Surgeons, in 1811, before a gratified audience, who recognized in the Professor a teacher of rare attainments and of singular tact in unfolding complex knowledge with analytic power. Few left the lectures without the conviction that an able expositor had enlisted their attention. He, in fact, was a great teacher in that faculty which included Hosack, Post, Macneven and Mott. There was a wholesome natural theology, blended somewhat after the manner of Paley, with his prelections, and an abundance of patriotism, associated with every rich specimen of native mineral wealth. It would have proved difficult for him to have found adequate language to express his gratification, at the present day, of our California treasures. His manner throughout, as an instructor, was calculated to attract the attention of the students by his intelligible language and pleasing elucidations. His confidence in his expositions was not always permanent—new facts often led to new opinions—but the uncertainties of geological doctrines, not yet removed, gave him sometimes more freedom of expression than rigid induction might justify; and when he affirmed as his belief that the American continent was the Old World, and that the Garden of Eden might have originally been located in Onondaga Hollow, he imposed a tax on credulity too onerous to bear. Jefferson, indeed, considered the red men of America of more remote antiquity than those of Asia, and the Abbé Clavigero thought that the first American people descended from different families after the confusion of tongues. In contemplating his investigations on fishes, Mitchill thought he had enlarged the boundaries of science, and his exclamation, "Show me a scale, and I will point out the fish!" was not thought too hyperbolic for his scholars. But even in the warmth of such utterance, he did

not outvie the assertion of John Bell, the great surgeon of Edinburgh, who, in a conversation held with him on American natural history, affirmed that, with a mammoth bone, he could form a new theory of the earth. Pages might be appropriated to a record of the career of this American philosopher, and his various occupations with men of all ranks and of every profession. His popular address; his unpretending demeanor; his cordial feelings to advance the interests of all classes, blended with his well-known and acknowledged merits, constituted him an oracle among his fellow-citizens. He held converse with the way-faring man; could amuse an old soldier by the recital of martial deeds, and excite the admiration of a Radcliffian professor of philosophy. Almost every projector of a new device sought his judgment and asked his decision. This was in an especial manner the case with artists and mechanical men. Some new American pigment; some modification of a gridiron; some newly-devised rudder, was sure to summons the doctor's artistic or practical powers; and scarcely an indigenous author sprung up, who was willing to overlook him, without first securing his approbation to his yet unfledged thoughts. Anomalous products in creation; monstrous formations in animals; hybrid plants; literary curiosities of remote nations; Indian hieroglyphics and illustrations of Indian mounds—all were subjected to his critical knowledge for opinion. His personal acquaintance with authors, travelers, and particularly naturalists, was almost unbounded, and among those of this last designation, Bartram, of Pennsylvania, and Volney, the French savant, were the themes of his warmest admiration. Our earlier poets, Freneau and Barlow, Humphreys and Alsop, were among those who held him in estimation for his sprightly conversation on all topics; but his own gratification was most ample when Correa de Serra or Muhlenberg dealt out the treasures of their natural science. Mitchill was imaginative and poetical, but preferred the Georgics to the *Æneid*. He deservedly classed Rush with the highest medical writers of his native land. He knew no North—no South; the Union, with him was one family. His cabinet boasted of few golden coin; but his collection of unclassified specimens, of divers sorts, was imposing, and his herbarium worthy of consultation. The whole after his demise were presented to the New York Lyceum. The proudest day of his life was that in which, at the canal celebration, in October, 1825, when he, with Clinton, Colden, Eddy, and others, united in "indissoluble marriage" the waters of our inland lakes with the ocean. It is manifest that Dr. Mitchill from early life aimed to secure a name in letters and science, and that his multifarious pursuits ever kept him alive as a close observer. That he accomplished much is also demonstrative. His industry was unintermitting. He mingled with all classes. Though a medical man by profession, it may be justly inferred, that, saving as a physician to some of our charities, he early abandoned private practice. His utilitarian principles led him incessantly into the field of physical inquiry; and when we contemplate the ample scope of his knowledge in physical investigation, not yet even approached by any other philosopher in our annals of science, we need not wonder that every

day opened to Mitchill new subjects of study. There was something of the exalted Franklin in Mitchill. The indigenous wheat which his intimate friend De Witt Clinton had described; the Fezzan ram of Davis; our native Fire-fly; the trilobites of Trenton Falls,—all provoked new inquiry on his part, and De Kay and Torrey and Cooper often summoned by new specimens his geological and botanical resources. He was the delight of a meeting of naturalists; the seed he sowed gave origin and growth to a mighty crop of those disciples of natural science. He was, emphatically, a great living ichthyologist. The fishermen and fishmongers were perpetually bringing him new specimens; they adopted his name for our excellent fish, the streaked bass, and designated it generically as the *perca Mitchilli*. When he had circumnavigated Long Island, the light-house at Sands' Point was called the Mitchill, and the topographers announced the highest elevation of the Neversink Hills as Mount Mitchill. His courtesy among all ranks, and the adulation he almost hourly received, rendered him a social friend among them, and an interpreter to all their queries. To an interrogatory put to him, what season would prove most advantageous in their business to catch blackfish, he replied with the promptitude of an Italian improvisatore:

When chestnut leaf is large as thumb-nail,
Then bite blackfish without fail;
But when chestnut leaf is as broad as a span
Then catch blackfish—if you can.

These lines, he said, were but stray feathers from his poetical pinions. The records of State legislation and of Congress must be consulted to comprehend the extent and nature of his services as a public representative of the people. He manfully stood by Fulton in all his trials, when navigation by steam was the prolific subject of almost daily ridicule by the Solons at Albany; and when the purchase of the Elgin Botanic Garden, by the constituted authorities, was argued at the Capitol, he rose in his place, and won the attention of the members, by a speech of several hours' length, in which he gave a history of gardens, and the necessity for them, from the primitive one of our first parents down to the last institution of that nature, established by Roscoe, at Liverpool. It is probable that no legislative body ever received more instruction in novel information than the eminent philosopher poured out on that occasion; and even the enlightened Regents of the University may have imbibed wisdom from his exposition. With his botanical Latinity occasionally interspersed, he probably appeared more learned than ever. Van Horne, a western member of the House, was dumbfounded at the Linnean phraseology, and declared such knowledge to be too deep for human powers to fathom. De Witt Clinton, only an hour or so before the learned Doctor's speech, had intimated to him the topic of his address, as best fitted to impress the Legislature with the value of the purchase, and Mitchill, in a barber's shop, digested the substance of his effective discourse. Dr. Mitchill was eminently a practical man. Nature was the altar at which he worshiped. His ambition developed itself among all the incongruities of his busy life. He could neither forget nor bear to be forgotten. He felt more comfortable when presiding over a gooseberry society than when occupying a seat as a sitting mem-

ber of an archeological association. While a student at Edinburgh, he was decorated with the insignia of fellowship of the order of the Roman Eagle, by the celebrated Brown, the founder of the Brunonian system of medicine, and honors without number steadily flowed in upon him to the time of his death, from his own and remotest nations. His diplomas and scientific distinctions might have demanded a cart team for their conveyance. He said they were burdens ever imposed on the shoulders of the learned. It is questionable whether he ever suffered a morbid hour, or lost, by unoccupied faculties, any serious portion of his time. He deemed it imperative that each day should be marked by some service in the cause of science or humanity. Public attention must be aroused by some fresh suggestion, in theory or in practice; for, according to him, the echo of notoriety must perpetually reverberate around the heads of public men. The quality of his scientific productions can not here be pointed out. Yet how elaborate are his speculations in the promulgation and defence of his theory of septon; what an inspiration in his doctrine of the omnipresence of hydrogen: a doctrine afterward better comprehended by the brilliant achievements of Sir Humphrey Davy. And most assuredly his science and his ingenuity abated not in public estimation from his forensic display in the still well-remembered case of "a whale is not a fish." He could argue constitutional law when Kent and Spencer were in the ascendant. He had great resources at command for illustration, and great independence in reasoning. Though the love of fame was with him a ruling passion, he neither sought nor desired the ostentatious displays of luxurious and fashionable life. He was indifferent to the appropriations of extravagant expenditure; but the simplicity of his habits was best comprehended by all who best knew him. I never encountered, continues Dr. Francis, one of more wonderful memory. When quite a young man he would return from church service and write out the sermon nearly *verbatim*. There was little display in his habits or manners; his means of enjoyment corresponded with his desires, and his Franklinian principles enabled him to continue superior to want. He often observed that he had seen many who, in aiming to live in lofty edifices, had built themselves out of house and home. The great Dr. Black saw beauty in a crucible. The little violet, or an Indian skull, gave Mitchill more delight than the fashionable baubles of the day. By choice his legs were in general his carriage, and this was in conformity to his notions of health and his early botanical life. His pedestrian tours often embraced many miles. He might, on these occasions, stray alone, or be accompanied by Masson or Michaux, or Le Conte, or Pursh. He thus studied nature in lawns and in forests, at brooks and at rivers, in her original attire, and plucked knowledge at its source. He was wont to revisit the scenery of the spot where the apostle of Quakerism, George Fox, more than a century before, had given utterance to his inspirations, and under the famous oaks at Flushing hold communion with creation, with a volume of Cowley or of Pope, his most esteemed poet. At other times, tenaciously impressed with early associations, he would enter the memorable building, hard by, erected

in 1661 by the primitive John Bowne, the Quaker victim of the persecuting spirit of the Dutch governor of the colony, Peter Stuyvesant, but who was subsequently honorably liberated by the authorities of Holland; and here, with some of his once juvenile friends, discuss the blessings of religious toleration. Thus constituted, no place was uninhabited to him. His instructor was everywhere. He was a gratifying specimen of those excellent practices which so peculiarly designated the Knickerbockers of the "olden times;" fidelity in fiscal concerns, and a scrupulous observance of the *meum* and *tuum*. Exact in pecuniary matters, yet willing to advance his competency, he never forgot the old currency of his youth, "that a pound demanded the payment of twenty shillings." With all his official honors and scientific testimonials, foreign and native, he was ever accessible to everybody—the counsellor of the young, the dictionary of the learned. Even the captious John Randolph called him the Congressional library. To the interrogatory, why he did not, after so many years of labor, revisit abroad the scenes of his earlier days for recreation, his reply was brief: "I know Great Britain, from the Grampian Hills to the chalky cliffs of Dover; there is no need of my going to Europe; Europe now comes to me." The inhabitants of New York will long bear him in grateful recollection, and the Historical Society cherish his memory for the distinction he shed over that institution; for his unassuming manners, his kind nature, and the aid he was ever ready to give to all who needed his counsel. For their collections he furnished a eulogium on the great jurist, Thomas Addis Emmet; on Dr. Rush; also on Dr. Samuel Bard, and De Witt Clinton. His "Discourse on the Botanical Writers of North and South America" is printed in their Transactions. Other addresses might be mentioned, abounding in curious facts and historical interest. For public occasions he was ever ready for any emergency. He addressed the Black Friars and glorified St. Tammany, whose genealogy he elaborated with antiquarian research. The Krout Club and the Turtle Club he enlightened by his gastronomic knowledge and natural science; while the naturalists of Long Island, at Prince's Garden, were stimulated to renewed efforts by his laudatory strains in behalf of botany and the knight of the polar star, the world renowned Linnæus. Dr. Mitchill has not unjustly been pronounced the Nestor of American science. It might prove too hasty a generalization to conclude that the high qualities of Dr. Mitchill's mind, thus specified, would be acknowledged by all. He had his detractors, and his peculiarities were such as not to be comprehended by every one. The masses were his friends and admirers, and a contemplative student, with knowledge of men and things, could analytically class him among remarkable individuals. It has already been observed that he was long a professor in Columbia College. Three of the presidents of that institution, who may be justly thought to have become well acquainted with him, either while he was a member of the faculty or subsequently, have given their opinions concerning him. The classical scholar and grave bishop, Dr. Benjamin Moore, pronounced him a chaos of knowledge; but it demanded an intellect better stored with philosophical research to

arrive at a just estimate of the scientific claims of Dr. Mitchill. The harmony of the Gospels, however edifyingly fitted for the pulpit, was hardly the best criterion by which to test the scientific acquisitions of a distinguished savant. President Duer has frankly recorded of the Doctor, that he was more of a natural philosopher than a physician; he states that, upon the arrival from Europe of the Doctor, he was the lion of the day, not only in the medical and literary, but in the fashionable circles; that his various learning was more valuable to others than to himself; that he was used by others as a living encyclopedia; that, upon the whole, he was more of a professor than a practitioner, shone more as an epicurean or a peripatetic than as an experimental or moral philosopher, and is remembered more for the goodness of his heart than the strength of his head. Those who are dissatisfied with this portrait will bear in memory that it is drawn by one who, though rich in the graces of elegant literature, had done little in the natural sciences, and was, moreover, somewhat a severe censor on such characters as Fulton, and Colden, and Clinton. A more generous estimate of Dr. Mitchill seems to have influenced the opinion of President King, of Columbia College; he personally knew the Doctor long and well. With a kinder impulse, he pronounced him a man renowned for much and various learning, and of rare simplicity of character; a genius, prompt in execution and original in combination; a successful promoter of physical science. He was highly esteemed by that enlightened and accomplished philosopher of the age, Louis Agassiz. None who knew Dr. Mitchill ever doubted his Herculean memory. Those most familiar with him were often delighted with the original train of thought which would rapidly spring up from the subject-matter before him, and the actual science he unfolded in the classification of new materials. It may be somewhat difficult to harmonize these conflicting opinions of contemporaries, enlightened and intelligent as they unquestionably were. But Dr. Mitchill long stood alone as the recognized devotee to physical studies in our population of that day, and sustained a foreign reputation little understood at home, either as to its causes or extent. Indifferent as he was to the aids which often contribute to the increase of renown, his self-sustained reliance cast aside the displays of personal importance, and in the plenitude of his acquisitions, his simple manners, his beaming countenance, his cordial approach, and his frank utterance, proved effective substitutes for any deficiencies. What else was left to the beholder, but wonder and admiration to witness this unsophisticated disciple of nature, in the public walks of the city, giving counsel for humanity's sake to an infirm beggar as to the easiest method by which he might carry his burden, while perhaps he himself might be returning homeward with his pockets freighted with a flattering correspondence from the most eminent savants of Europe. The man had a heart as well as a head. In the prime of his manhood Dr. Mitchill was about five feet ten inches in height, of comely, rather slender and erect form; in after life he grew more muscular and corpulent, and lost somewhat of that activity which characterized his earlier days. He possessed an intelligent expression of counte-

nance, an aquiline nose, a gray eye, and full features. His dress at the period he entered into public life was after the fashion of the day, the costume of the times of the Napoleonic consulate—blue coat, buff-colored vest, smalls, and shoes with buckles. He was less attentive to style of dress in his maturer years, and abandoned powder and his cue. From a hemorrhagic tendency of his chest, at the age of seventeen years, he adopted exercise on horseback, and was fortunate enough to avert the progress of pulmonary evils. His personality, however, varied in advanced life with the cogitations of his graver years, and he might at times be seen without hat or overcoat, exposed to the vicissitudes of inclement weather. His robustness preserved his full features, and to the last not a wrinkle ever marked his face, nor did lapse of years modify his thirst for knowledge, or his cordial and prompt and sprightly utterance; thus setting at naught the declaration of the poet:

"Old age doth give by too long space,
Our souls as many wrinkles as our face."

He died in the sixty-eighth year of age. His funeral was a great demonstration for a private citizen. His colleague, friend, and faithful biographer, the late Dr. Francis, was of the multitude that attended, and lingered at the grave until all save the sexton had withdrawn. Not being recognized by that official, he inquired whom he had just buried? "A great character," he answered; "one who knew all things on earth, and in the waters of the great deep."

MONMONIER, John F., of Baltimore, Md., was born in that city April 4, 1813, is the eldest son of Francis Monmonier of Paris, and grandson of Charles de Monmonier, Chevalier Sconbecque, of France. His mother's ancestors were early English settlers of Bohemia Manor, Md., near the Delaware line. His early education was obtained at a private academy in Baltimore, and then at St. Mary's College, under the control of the Society of St. Sulpice. After five years spent here he entered the private anatomical school of Dr. Duncan Turnbull, then pursued a three years' course at the University of Maryland, graduating in March, 1834, and settling in Baltimore. In 1838, he was elected physician to the Maryland penitentiary, and served four years. In 1849 he was appointed physician to the Board of Health, and also ex-officio president of the Board, serving in that capacity for a term of two years. In 1867, he aided in the organization of the medical department of the Washington University, was its professor of physis, till 1875, and then professor of diseases of women and children in the same institution. He is a member of the Medical and Chirurgical Faculty of Maryland, and has been for years chairman of its executive committee, and its president in 1870; has been frequently its delegate to the American Medical Association, and was representative to the International Medical Congress at Philadelphia in 1876; is a member of the Baltimore Medical Association, its vice-president in 1875, and was, in 1878, a member of its committee of honor. In 1836 he was elected to the Baltimore City Councils, and also one of the Board of School Commissioners, occupying the latter position sixteen years, and being for several years its president. During his administration the school system was much improved and its usefulness

extended; he was one of the organizers of the Merchants' and Mechanics' Fire Insurance Company, and its director previous to its loss of capital by the Chicago fire; and has been a director of the Central Savings Bank for the poor and persons of moderate means. Dr. Monmonier is one of the oldest and most widely known members of the profession in the city of Baltimore, where he was not only born but where he has continued his professional work for a period of sixty years. In August, 1837, he married Catharine, daughter of Captain John Hooper, of Dorchester county, Md. Two of his sons became physicians—one, Dr. John N. Monmonier, having been Professor of Anatomy and Operative Surgery in Washington University.

MONTGOMERY, William T., of Chicago, Ill., was born in Gibson county, Ind., August 12, 1843. His parents both dying when he was about ten years old, he was adopted by an uncle, a farmer, with whom he lived until the breaking out of the war. In August, 1861, he enlisted in Company F, Thirty-third Indiana Volunteers, and served until the close of the war. After the close of the war he attended school and college, and taught school until 1868, when he began the study of medicine with Dr. William T. Kirk, of Atlanta, Ill. Graduating from Rush Medical College in 1871, he was elected "Interne" to Cook County Hospital, and served from July, 1871, to March, 1873. He has practiced medicine in Chicago ever since, doing a general practice for eight years, and for the past twelve years confining his practice to diseases of the eye and ear. In 1874 he was appointed oculist and aurist to Cook County Hospital; in 1879 Professor of Ophthalmology and Otology in Woman's Medical College, Chicago, and in 1880 surgeon of the Illinois Charitable Eye and Ear Infirmary. In 1883 he visited Europe, taking special courses of study in London and Vienna. He is a clear and impressive teacher and a successful practitioner in his specialty. Among his contributions to current medical literature are the following: In 1874 "Complications and Sequelæ of Typhoid Fever." In 1880 "Report on Diseases of the Eye and Ear." In 1885 "Jequirity in the Treatment of Chronic Granular Conjunctivitis." In 1887 "After-treatment of Cataract Extractions."

MOORE, Jehiel T., of Minneapolis, Minn., was born in County of Oxford, Province of Ontario, Canada, in 1848. He is of Scotch descent on his father's side, and English-German on his mother's side. He received his preliminary education at the Canadian Literary Institute, Woodstock, Canada; also partly at the Collegiate Institute in Galt, Canada. Dr. Sylvanus Joy, of Tilsonburg, Canada, was his private medical preceptor. He graduated from the medical department of McGill University, Montreal, in 1874. He practiced for two years in Port Burwell, Canada. Thence he removed to Tilsonburg, where he practiced for about seven years. The large country practice proving too much for his constitution, he removed to Minneapolis, in 1882. Not only has he been identified with the leading hospitals of that city, but his time and talents have been freely given toward the advancement of medical education. He has been Dean of the Minneapolis College of Physicians and Surgeons and has lectured on theory and practice of medicine since 1883. In 1886 he made the

first resolution, which was passed by the State Medical Society, looking to the advancement of requirements for medical education in the State, and, with others, labored with the Legislature until it became a law. His name has been identified with medical education from the first year of his residence in the United States.

MOREHOUSE, George Read, of Philadelphia, Pa., was born in Mt. Holly, N. J., March 25, 1829. He received the degree of A. M. from Princeton, in 1851, and the degree of M. D. from the Jefferson Medical College in the same year, and later the same degree from the University of Pennsylvania. In 1892, he received from the College of New Jersey the honorary degree of Doctor of Philosophy. Dr. Morehouse for many years has been one of the leading physicians of Philadelphia. Referring to Dr. Morehouse, a recent writer in the *University Magazine* (New York) says: Although independent in fortune, his love for his profession, its benevolent field, and its ever-advancing stimulus to new thought and work, still holds him to its active pursuit. He has not been a profuse writer, although his pen has added many very important contributions, both to medical and scientific literature. Probably his best known work is that appertaining to diseases of the nervous system, made during the Civil War, while in association with Drs. Weir Mitchell and Keen, in charge of the special hospitals for nervous diseases, instituted at that time by the surgeon-general. These hospitals, established to command expert service, and to distribute the results of their experience to the various military hospitals of the country, were unique in the world's history, in the opportunity afforded for special study. Gunshot injuries of nerves, aggregating almost every nerve in the human body, were nerve wounds pure and simple, and occurring in healthy soldiers, their study was free from the clouding influence of concurrent or previous general disease. The issue of this work revealed much that was new in nerve distribution, and especially those slowly-developed atrophic changes of tissue, following injuries of the nerves by which they were supplied. Again, in comparative anatomy, it is rare to find an example of original research more complete and convincing than in the volume styled, "Researches on the Anatomy and Physiology of Respiration in the Chelonia," published by the Smithsonian Institute, the joint work of Dr. Morehouse and Dr. Mitchell. The function of respiration, so important in classification, was generally accepted as being of the same type in batrachia and chelonia, having been so determined by Cuvier, and afterwards by Agassiz, in his folio work on the "Testudinæ of North America." The absence of ribs in the frog, and their immobile and rudimentary condition in the turtle, separated both of these classes from the higher mammalian type, and probably suggested their association. These researches, however, brilliantly established the fact that the mechanism of respiration in these two classes is radically different. In the frog the function is essentially cephalic, the nasal valves and possible air-tight mouth being necessary factors, while, in the turtle, the head is not at all concerned, the mechanism being well-defined muscles of expiration and inspiration located in the body. The slight variation in

the insertion of the expiratory muscle in different species of turtles beautifully determines the relative position of any given species in the scale of development. These illustrations of originality of thought and sound judgment in the subject of our sketch, indicate his facility to acquire the eminent position he now holds.

MORGAN, John, of Philadelphia, Pa., was born in that city in 1736, and died there, October 15, 1789. His father, Evan Morgan, emigrated from Wales to Philadelphia and engaged in mercantile pursuits until his death, in 1763. Dr. Morgan acquired his literary education at the "College of Philadelphia," from which he received the degree of A. B. in 1757, with the first class which was graduated. He studied medicine with Dr. Redman, and upon the expiration of his indentures entered the Provincial army as a surgeon. This was at the conclusion of the French War, which terminated by the expulsion of that nation from Canada. In 1760, having resigned his commission in the army, he sailed for Europe with the view of perfecting his medical knowledge. On his return to Philadelphia, when speaking of himself with reference to this period, he states: "It is now more than fifteen years since I began the study of medicine in this city, which I have prosecuted ever since without interruption. During the first years I served an apprenticeship with Dr. Redman, who then did, and still continues to enjoy a most justly acquired reputation in this city for superior knowledge and extensive practice in physic. At the same time I had an opportunity of being acquainted with the practice of other eminent physicians in this place, particularly of all the physicians to the hospital, whose prescriptions I put up there above the space of one year. The term of my apprenticeship being expired, I devoted myself for four years to a military life, principally with a view to become more skillful in my profession, being engaged the whole of that time in a very extensive practice in the army amongst diseases of every kind. The last five years I have spent in Europe, under the most celebrated masters in every branch of medicine, and spared no labor or expense to store my mind with an extensive acquaintance in every science that related in any way to the duty of a physician; having in that time expended in this pursuit a sum of money of which the very interest would prove no contemptible income. With what success this has been done others are to judge, and not myself." During Dr. Morgan's residence in London, he experienced the benefit of the instruction of the Hunters, and of Hewson. With the latter, as appears from his correspondence, he was on intimate terms. He graduated as M. D. at Edinburgh in 1763, his thesis being written upon the formation of pus, and when published was dedicated to the Medical Society of Edinburgh. In this essay the doctrine is maintained that pus is a secretion from the vessels, and in this he anticipated Mr. Hunter. Dr. James Curry, lecturer at Guys Hospital, gives the credit of priority in this statement to him, and says: "I could not avoid giving that merit to Dr. Morgan, who discussed the question with great ingenuity in his inaugural dissertation on taking his degree at Edinburgh in 1763. Whilst I could find no proof that Mr. Hunter had taught or even adopted such

an opinion until a considerable later period." (See *London Medical and Physical Journal*, 1817.) While in England, Dr. Morgan became proficient in the art of injecting organs with wax, and preparing them by subsequent corrosion. Carrying with him to the Continent the evidences of his skill, he acquired such a reputation as to procure his admission as a member to the Academy of Surgery of Paris. While there residing, and attending the lectures of the distinguished anatomist, M. Sue, he prepared a kidney by this process, which led to the distinction specified. Besides this honor, he was elected a member of the Royal Society of London, admitted as a Licentiate of the College of Physicians of London, and as a member of the College of Physicians of Edinburgh. He was also admitted to membership of the Society of Belles Lettres, of Rome. When in Italy, Dr. Morgan visited Morgagni, at Padua. Dr. Rush says, in his notice of Morgan, that "this venerable physician, who was the light and ornament of two or three successive generations of physicians, was so pleased with the Doctor that he claimed kindred with him from the resemblance of their names, and on the blank leaf of a copy of his works, which he presented to him, he inscribed with his own hand the following words: *Affini suo, medico preclarissimo Johanni Morgan, donat auctor.*" These volumes were placed by Dr. Morgan in the library of the College of Physicians of Philadelphia. Dr. Morgan, while in Europe, appears to have constantly revolved in his mind the course he would pursue. In writing from London, November 10, 1764, to Dr. Cullen, he remarks: "I am now preparing for America, to see whether, after fourteen years' devotion to medicine, I can get my living without turning apothecary or practitioner of surgery. My scheme of instituting lectures you will hereafter know more of. It is not prudent to broach designs prematurely, and mine are not yet fully ripe for execution." It has been shown that the practice of medicine in the Colonies embraced every branch of the profession, including pharmacy. This arose from the necessity of the case, and the difficulty of division of labor in a restricted community. The plan pursued in Europe of a separation of practice into several departments was regarded as inexpedient, and had not been adopted. When Dr. Morgan returned from Europe, he determined to take a different course from that in operation, and was the first physician who restricted himself to simply prescribing for the sick. In the preface to his discourse he published his views with respect to the mode of practice which he thought should be pursued by the physician, enforcing them with arguments derived from the advantages which he believed would be secured by such procedure. Having been appointed professor in the college, there was another reason, having reference to this position, which must be admitted as valid. It is thus given: "As far as I can learn, everybody approves of my plan for instituting medical schools, and I have the honor of being appointed a public professor for teaching physic in the college here. Can any man, the least acquainted with the nature of that arduous task, once imagine it possible for me to acquit myself in that station in an honorable or useful manner, and yet be engaged in one continued round of

practice in surgery and pharmacy as well as physic? To prepare for a course of lectures every year requires some leisure, and a mind undisturbed with too great variety of pursuits. So that my usefulness as a professor makes it absolutely necessary for me to follow that method of practice which alone appears to be calculated to answer that end." In reference to this, Dr. Carson, one of his biographers, says: "Although the opinions of Dr. Morgan were not at the time adopted, nor was his example immediately followed, still, in connection with the history of the profession they are important, from the fact that he was the first practitioner in the city of Philadelphia who placed himself upon the highest ground by separating himself from the handicraft which requires distinct skill, and so long a training, as to constitute in itself an occupation. He insisted upon the distinction being made between medicine proper and pharmacy, which ultimately became a recognized necessity, affording relief to the physician, while by improving pharmacy, he was provided with greater resources for the application of his skill. The course pursued by Dr. Morgan may be said to have given the original impulse to the cultivation of the profession of pharmacy and sanctioned its independent existence." The biographer above quoted informs us that the College of Philadelphia was founded in 1749, sixteen years before a medical school was engrafted upon it. This institution was intended to meet the demands of the population for education of a more extended nature than was afforded by the private schools in existence; as liberal pursuits engaged the attention of a greater number of individuals in the Province, and as preparations for the professions, as well as a diffusion of knowledge in arts and letters, became necessary, the importance of employing all the facilities at command was made apparent. "Franklin drew up the plan of an academy to be erected in the city of Philadelphia, suited to the state of an infant country; but in this, as in all his plans, he confined not his views to the present time only. He looked forward to the period when an institution on an enlarged plan would become necessary. With this view he considered his academy as a foundation for posterity to erect a seminary of learning more extensive and suitable for future circumstances." On the return of Dr. Morgan to Philadelphia from Europe he proposed to establish a medical school in connection with the College of Philadelphia. In this laudable enterprise he was indorsed by a letter from Thomas Penn, dated London, February 15, 1765, and his plan was also approved by Dr. Fothergill, Dr. Hunter and Dr. Watson, of the British Metropolis, as well as by Dr. Cullen, of Edinburgh; "men distinguished for their superior knowledge in literature, and particularly eminent in everything which relates to medical science." All the gentlemen who were called upon to give aid and counsel to this enterprise were among the most respectable in Philadelphia. Five prominent physicians were members of the Board of Trustees at the time, viz: Thomas and Phineas Bond, Thomas Cadwalader, William Shippen, Sr., and John Redman. To such an organization was the proposal of Dr. Morgan submitted. The impression which his earnestness and the arguments in his applica-

cation made upon the Board of Trustees, sustained by the letters from abroad, which were submitted, prevailed with them to accede to his propositions and to approve the scheme, and, as the records express it, "entertaining a high sense of Dr. Morgan's ability and the high honors paid to him by different learned bodies and societies in Europe, they unanimously elected him Professor of the Theory and Practice of Physic." The first medical professorship in America was thus created. The date of the event is May 3, 1765. At the public commencement of the college, which took place on the 30th and 31st of May following, Dr. Morgan delivered his famous inaugural address, entitled "A Discourse upon the Institution of Medical Schools in America." It had been prepared in Paris. This discourse constituted a part of the commencement exercises on both days of their continuance. In noticing this performance, the *Pennsylvania Gazette* thus comments upon it: "We would not wish to anticipate the judgment of the public, and shall only say that the perspicuity with which it was written and spoke drew the close attention of the audience, particularly of the gentlemen of the Faculty of Physic." In this address will be found an exposition of the nature and scope of medical science; a sketch of the departments of which it is composed, with the reasons for their special cultivation; an advocacy of classical, literary, and general scientific attainments on the part of the student of medicine, and, what is pertinent to the purpose, the demonstration that to be effectively taught "a coalition is required of able men, who would undertake to give complete and regular courses of lectures on the different branches of medicine." In connection with his statements, the author insists especially upon the advantages presented by the city of Philadelphia, to which even then students resorted, attracted as well by the reputation of its practitioners, as by the facilities for clinical instruction afforded them in the hospital. In this literary and scientific performance, a prognostication was uttered which has been fully realized, viz.: "Perhaps this Medical Institution, the first of its kind in America, though small in its beginning, may receive a constant increase of strength, and annually exert new vigor. It may collect a number of young persons of more than ordinary abilities, and so improve their knowledge as to spread its reputation to distant parts. By sending these abroad duly qualified, or by exciting an emulation amongst men of parts and literature, it may give birth to other useful institutions of a similar nature, or occasional rise, by its example, to numerous societies of different kinds, calculated to spread the light of knowledge through the whole American continent wherever inhabited." It is worthy of note, that at the time this was uttered the population of the city of Philadelphia was about twenty-five thousand, and of the colonies in the aggregate less than three millions. In September following, the appointment of Dr. Morgan, Dr. Shippen was, on application to the board, unanimously elected the Professor of Anatomy and Surgery. "In October, 1775, Dr. Morgan was appointed by Congress Director-General to the military hospitals, and Physician-in-Chief to the American army, and immediately joined General Washington, in Cambridge. He found the hospitals and

army without medicines and appliances, and reorganized the General Hospital, requiring proofs by examination of the qualifications of the assistants that were to be intrusted with the sick and wounded." Previous to this many unlettered and incompetent medical officers had found their way into the army, and the resulting condition of things was said by Washington to be "a disgrace to the profession, the army and to society." In consequence of unjust complaints Dr. Morgan was dismissed by Congress, without reason, on January 9, 1777; but a committee of that body afterwards investigated his conduct, and honorably acquitted him. Washington, in a letter to Dr. Morgan, dated January 9, 1779, says: "No fault, I believe, was or ever could be found with the economy of the hospitals during your directorship." In 1773, Dr. Morgan visited Jamaica, W. I., at his own expense, to solicit donations for the advancement of general literature in the College of Philadelphia. Dr. Morgan died at the age of fifty-four years. It is stated that he had retired very much from active life, actuated by chagrin at his treatment by Congress, in removing him from the post of Director-General, upon charges from which he was ultimately exonerated. That Dr. Morgan had lost his interest in the duties of his professorship, would appear from a communication from the professors to the trustees of the University, in December, 1788, in these terms: "That the Faculty are of opinion that the Medical School suffers for want of a course of lectures being delivered annually on the 'Theory and Practice of Physic.'" Dr. Benjamin Rush, who was the successor of Dr. Morgan in the Medical College (Oct. 24, 1789), says: "His memory was extensive and accurate; he was intimately acquainted with the Latin and Greek classics; had read much in medicine, and in all his pursuits he was persevering and indefatigable. I never knew a person who had been attended by him that did not speak of his sympathy and tenderness with gratitude and respect." His paintings and engravings which he had collected in Europe, with a choice library of books and original manuscripts, were either destroyed by the British at Bordentown, N. J., where he had removed them for safety, or consumed by fire at Danbury, Conn., in the destruction of that place by the troops under Governor Tryon. He took an active part in founding the American Philosophical Society, in 1769, and published papers in its Transactions. He was for many years a Physician to the Pennsylvania Hospital. His writings include "A Discourse upon the Introduction of Medical Schools in Philadelphia," 1765; "Dissertations on the Reciprocal Advantages of a Perpetual Union between Great Britain and her American Colonies," 1766; "A Recommendation of Inoculation According to Baron Dimsdale's Method," 1776, and "A Vindication of his Public Character in the Station of Director-General of Military Hospitals," 1777.

MORRIS, Seth Mabry, of Galveston, Texas, was born in Austin, that State, in 1867, and is a son of Dr. W. A. Morris, a well-known physician of the South. He received his preliminary education in the schools of his native city, and on completion of the University of Texas, matriculated amongst the very first pupils. He took the five years' course, devoting special attention to chemistry under Professors

Mallett and Everhart, and physics under Dr. Macfarlane. In both of these branches he won distinction, and during his last senior year he was chosen by Professor Everhart as laboratory assistant. Graduating at the university in 1888, with the degree of B. S., he at once began the study of medicine in his father's office, and in the fall of that year entered the College of Physicians and Surgeons in New York. Here he took the required three years' course, giving special attention to chemistry under the instruction of Professor Chandler, and graduated, M. D., from that school in 1891. In addition to the degree of Doctor of Medicine conferred upon him, he was awarded a "special examination diploma," and a cash prize, being one of the ten to whom special honors were awarded, in a graduating class of over one hundred and fifty. Dr. Morris has recently been elected to the chair of chemistry in the medical department of the University of Texas.

MORTON, Samuel George, of Philadelphia, Pa., was born in that city in January, 1799, and died there May 18, 1851. He was educated in the strictest school of the Quaker sect, and was destined, originally, for commercial pursuits. Revolving at the details of mercantile life, shut out from the bar and the pulpit by his birth and education as a Quaker, he became a student of medicine under Dr. Joseph Parrish, though assisted in his studies by others, among whom was prominent Dr. Richard Harlan, an accomplished teacher of natural history of that period. In January, 1820, he attained his majority, and received his degree of Doctor of Medicine in March of the same year. Later in the season he sailed for Europe, and in the spring of 1823 he received his degree at the University of Edinburgh. During his stay on the other side of the Atlantic he visited France and Italy. In 1824 he returned, and began the practice of medicine in Philadelphia, and at the same time became a prominent member of the Academy of Natural Sciences. In 1839 he was appointed Professor of Anatomy in the Pennsylvania College of Philadelphia, which position he held until 1843. His last few years were devoted to ethnological research and collateral science. His death occurred in the midst of his active investigations and at a period but little beyond the meridian of life, but not until he had attained a world-wide fame as a philosopher. Such is the brief record which tells the story of the life of one whose genius has left its impress on the age, and whose teachings are destined still farther to modify and control public opinion on some of the most important questions of the day. To fill out this sketch, to show wherein lies the true greatness of Morton's life, is a task that has been admirably executed by his biographer, Dr. Sanford B. Hunt, as follows: His early career manifested only a broad, general taste for natural science; the specific branch of research in which he was to become great was not indicated until a later period. Thus, his Edinburgh thesis was upon the subject of pain. On his return from Europe he presented to the Academy of Natural Sciences a collection of the greenstone rocks of Scotland; in 1827 he published an "Analysis of Tabular Spar from Bucks County;" in the succeeding year, some "Geological Observations." His attention, thus directed to geology, was naturally turned to its paleon-

tological features, and a long and important series of papers was published by him in *Silliman's Journal*, or in the *Journal of the Academy*, on the fossils of the cretaceous formations of the United States. In 1834 these were gathered into a volume, with the title, "Synopsis of the Organic Remains of the Cretaceous Group of the United States." This book, in itself, might well form the subject of a warm eulogy of its author, but it was only a stepping-stone to higher labors. By a natural progression, comparative anatomy also occupied his attention. In 1831 a paper on some "Parasitic Worms;" in 1841, a description of "An Albino Raccoon," and in 1844, a memoir, "On a Supposed New Species of Hippopotamus," were published, and still exist as evidences of the breadth of his studies. Nor was his attention drawn away from his profession by these studies. As author, or editor, he made some valuable additions to American medical literature in rapid succession. In 1834 he published a laborious work, entitled "Illustrations of Pulmonary Consumption: its Anatomical Characters, Causes, Symptoms and Treatment;" in 1835, an American edition, with notes, of "Mackintosh's Principles of Pathology and Practice of Physic;" and in 1839, a text-book of human anatomy, under the designation of "An Illustrated System of Human Anatomy, Special, General, and Microscopic." Many men have built up, and deserved, an enduring medical reputation, on claims to consideration no more ample than these. The anatomical work, especially, is remarkable for the clearness and beauty of its descriptions. But the true fame of the scholar in natural science is not attained in the mere addition of isolated facts to our general store of knowledge. This is worthy and useful. The pursuit of details may exhibit great perseverance and acumen, but a fact is a dead thing until associated with its surroundings. To group together, to interpret, to generalize, this is the province of the mind having within it the true philosophical element. Thus far in our record of Morton's work, we have seen only the observer, patient, careful, painstaking, and meritorious, but not as yet the parent of any great original idea. To use the broadest term, it was in his ethnological studies that Morton secured his highest and most permanent reputation. The publication of his "Crania Americana," in 1839, and of the "Crania Egyptiaca," in 1844, were the result of studies dating back to 1830, and pursued during that long interval with enthusiasm and industry. The one embodied a description of 155 skulls of Toltec Indians, and of 161 skulls of the various barbarous tribes of American Indians, including their facial angle, their contour, their relative capacity of different portions of the cranium, and, finally and most important, their internal capacity in cubic inches, ascertained by accurate measurement. Its principal conclusions were, in his own language: That the American race differs essentially from all others, not excepting the Mongolian; nor do the feeble analogies of language, and the more obvious ones in civil and religious institutions and the arts, denote any thing beyond casual or colonial communications with the Asiatic nations; and even those analogies may perhaps be accounted for, as Humboldt has suggested, in the mere coincidence arising from

similar wants and impulses in nations inhabiting similar latitudes. That the American nations, excepting the polar tribes, are of one race and one species, but of two great families, which resemble each other in physical, but differ in intellectual character. That the cranial remains discovered in the mounds from Peru to Wisconsin, belong to the same race, and probably to the Toltec family. "Crania Egyptiaca" was a work of similar character, embracing similar observations of a large number of ancient and modern Egyptian skulls, from which similar and equally important conclusions were reached. In the course of these two works, moreover, and in various less pretentious publications, the cranial characteristics of many skulls of different races were examined, including, finally, a sufficiently full measurement of all the leading families, to lead to the grave conclusion, that the events of history and of national conquests have, from the creation of the world, rested as much upon the relative superiority or inferiority of the cranial capacity of nations, as upon those other causes of climate, education, or warlike character, which have heretofore been supposed to govern and control the progress of human events. It is interesting to recognize the curious fact, that it was in a nominally exhausted science, that of descriptive anatomy, that Morton obtained these results. At that time, when Morton had fairly enlisted as an anatomist, and fixed upon that department of science as his future field of labor, it became a question in what province of anatomy he should apply himself. The attention of students had been for a long time turned away from descriptive anatomy. In comparative anatomy, the labors of Cuvier had developed a grand and comprehensive division of the animated creation, so farsighted and philosophical that it only remained for his followers to fill up the details; the great plan was already complete. But even here was an inviting task. The fauna of the New World still needed description and study. The geographical distribution of animals, as well as their geological history, waited for the discoverer of their wonderful relations to the world's progress, relations destined to remain unnoticed, until, at the magic touch of Agassiz, they sprang into a theory, bold, far-reaching, and, in the truest sense of the word, sublime: a theory, like many others, derived from the study of God's works, startingly at variance with merely human ideas of God's will. No less deeply hid beneath the myriad superficial forms of comparative anatomy was the then undeveloped theory of design in the vertebrate creation, of one original pattern, upon which, and its modifications, are built up all those otherwise incomprehensible variations in the vertebrates. True, the genius of Oken had already sent its electric light into this chaos; but with his peculiarly transcendental mind, he had not conferred upon his theory that clearness and precision which would gain it favor with the exact and practical minds who governed public opinion on this subject. Thus it happened that, at the time of which we are writing, the new developments of anatomical research, since known as "transcendental," or "philosophical anatomy," and illustrated and made clear by the accurate mind of Owen, were not in a favorable position for attracting the notice or enthusiasm of

the student. Like the very subject it investigated, its relations to actual, practical science were as dim and indistinct as those of the complex and stalactitic head of the fish, to the typical vertebra of which it is but a modification. So by Providence, or accident, it was not in the wide region of comparative anatomy that Morton was destined to shine as a discoverer. The field was wide, its paths inviting, but the subject of our notice trod them only in the footsteps of others who had gone before. At that time, more than at any other in the history of medicine, the revelations of the microscope conferred upon general anatomy a deep and absorbing interest. Art had perfected the necessary instrument. The human eye—profoundest problem of creative wisdom—had magnified its powers a thousand fold. As the difficulties of distance and magnitude had been overcome by the telescope, so now had the opposite conditions of proximity and minuteness yielded to the art of the cunning optician. Here beckoned at once the charm of novelty and the forms of beauty, the faultless symmetry and unapproachable perfection which are hidden by nature from the unassisted eye. Here, too, was utility developed, in the added powers to control disease given to us by a deeper knowledge of the tissues it inhabits. And greater attraction than these to the philosophical mind, here was the cell, the problem of embryology, the *integer vitae*. In it lay undiscovered mystery, in it God's deepest design for the preservation and perpetuation of life; beyond it all, the solemn question, "What is life itself?" Here emulation prompted. Others were eagerly engaged, and honors were rapidly accumulating upon them. But with Morton, though the head was interested, though he earnestly kept pace with the progress of others, and in the honest discharge of his mission as a physician, suffered no knowledge to escape him, he but profited by the labors of others—his heart was not there. Only descriptive anatomy was left. We may not tell why it, rather than the other provinces, was chosen. Accident, or whim, often guide the most earnest minds, "by ways which they know not," to results equally unexpected. Looking at the probabilities of acquiring distinction as a philosopher, originator, discoverer in descriptive anatomy, the chances were indeed meager. Works on the subject abounded, but for a long series of years no one of their authors had laid claim to originality. The most that any hoped for was a convenient classification and the high merit of credible and lucid description. Meckel and others, it is true, had, by comparison of many bodies, made known all those variations from the archetype which are liable to occur, and by numerical analysis had taught the surgeon in what proportion of cases he might find this artery varying from its normal distribution, or that one deficient. Others still, as Suichka has since done, might trace a nerve deeper to its origin in the cerebral mass, or track its windings by the microscope to a more distant distribution than that before assigned. All this was useful and honorable, but it was not the work of a comprehensive mind, fitted to grasp the more intricate relations of one department of science to another. And yet this seemed then, as it now does, all that the descriptive anatomist might hope for. His was an exhausted science—not a point remained unoccu-

pied. From head to foot, from the epidermis to the innermost medullary canal, patient and careful observers had traversed every tissue. Every prominence upon a bone, every curve upon an artery, each sinuous winding of a nerve, and every swelling of a muscle, had been described and named. The medieval worthies who, at the revival of learning, had renewed and enlarged the teachings of Hippocrates, Avicenna, Aristotle, Galen and Celsus, those later workers who, after the Harveian discovery, had again reconstructed and completed the labors of Vesalius and his followers, were the only true discoverers in descriptive anatomy. Vieussens, Fallopius, Eustachius, Monro, Malpighi, Steno, Havers and many others, had perpetuated their names in connection with parts by them first described, until no room seemed left for the modern student. The chivalry and romance of anatomy had no longer a being. In the day of many of those just named, the study was prosecuted only by the truly brave. All that strong materialistic veneration for the dead human body, which is even now so strong in the multitude, then amounted to such an overwhelming public opinion that an actual bodily danger surrounded the student; and it may be readily supposed that he too was not entirely free from the prejudices of his age. Under these circumstances of danger, and, if not of superstition, of that heroic triumph over it which is equally exciting, the older anatomists were enthusiasts. In the awed silence of some lonely tower, beneath the antique overhanging lamp, alone with the dread majesty of death, in their dissections those grave old men saw wonders such as the modern dissector can not see. The scalpel, in their hands, was like the prow of a ship cleaving its way to unknown countries, and the discovery of a new organ came to the sense of the anatomist—

"Welcome as the cry
That told the Indian Isles were nigh
To the world-seeking Genoese;
When the land-wind from fens of balm,
And orange groves, and woods of palm,
Blew o'er the Haytian seas!"

How changed all this in the nineteenth century! The solemn awe with which the early dissectors prosecuted, in dangerous secrecy, their dread researches into the undiscovered mysteries of dead humanity, has given place to the light song of the boy-student, in the cheerful, well-arranged dissecting room, around which pass the merry jest and rapid repartee, the gay, exuberant vitality of youth, in unnoticed proximity to dull, disfigured death! And yet it was in this exhausted science—these ways of learning worn by the feet of all that countless multitude who, from century to century, had sought an entrance to the medical profession—that Morton struck out a new avenue to fame, and gained the priceless name of philosopher. From the time when, in 1830, he failed to procure a sufficient number of skulls to illustrate the cranial forms of the five great races, in an introductory lecture to a class in anatomy, on to the close of his life, he set himself to supply this remarkable deficiency, and to study the forms of the human skull. Gradually his collection grew in size such as he had not himself anticipated. In every section of the country, and finally in all countries, he found willing and enthusiastic helpers. The Pyra-

mids of Egypt, and the lone burial-ground of the Indian, on that far western coast—

"Where rolls the Oregon, and hears no sound,
Save his own dashing"—

the old Phœnician tombs of Malta, and the temples of the Incas of Peru, alike gave up their dead to his unwearied search. Time went on. The office of Morton became a "place of skulls." At the time of his death, his collection of human skulls amounted to nearly a thousand specimens, while of mammals, birds, reptiles, and fishes, he had some seven hundred more. With patient toil, with large expense, this gathering of crania was continued for many years, until its result far exceeded that of any other in the world. The visitor to the Academy of Natural Sciences at Philadelphia, as he paces its long and crowded galleries, will behold the windowed shelves containing these vestiges of humanity. From out the clear glass glares the stony gaze of the Egyptian mummy, the withered, blackened, parchment cheeks of old kings of Peru and priests of the sun worshippers; lips which breathed music, or uttered prayers three thousand years ago, cling shrivelled to the shrunken gums and glistening teeth. And there are the patched-up heads, the skulls broken and comminuted to fragments, of brave old knights of the Crusades, and Saracenic opponents. The glittering lance, the flying pennon, the rattling shield, are long since mouldered, rusted, gone to nothingness; the lusty mouth which shouted the war-cry of "Mary, Mother of God," or "Allah-il-Allah," can speak no more of its old history, can tell no tale of the human passions which beat and throbbed in the bony case of that silent skull; but out of it speaks a common humanity, a strong lesson of the permanence of races, the enduring character of national ambitions, and the solemn fact that man, as we see him now in the crowded street, is, after all, but the man of centuries ago. The gradual gathering together of these crania developed in the mind of Morton a taste or passion for the study of ethnology—the science of races—and the noblest study which can, by any possibility, occupy the human intellect. In it lie the deepest problems of God's will to man, out of it shall yet be solved the most intricate questions of man's destiny. It was a new study. In the eighteenth century, Camper, the original propounder of the theory of the facial angle, had announced the heretical idea of diversity of races. Late in the same century, Blumenbach, of Göttingen, took up the subject, and by the decennial publication of his *Decades Craniorum*, placed himself at the head of ethnologists. His works were made familiar to the English reader by the lectures of William Lawrence, at the Royal College of Surgeons, in 1819. Before this, however, Mr. Pritchard, the able author of the "Natural History of Man," took the field as an ethnologist in the larger sense of the word, and has ever since been hailed by the clergy, and by biblical scholars, as the champion of their belief. When Morton returned from his sojourn in Edinburgh, in 1824, Gall and Spurzheim, and their colleagues, had widely promulgated what was then considered the science of phrenology. Great attention was at that time devoted to cranial forms, and though Morton pursued the subject as an ethnologist, he never committed himself to the doctrine of phrenology as such. In our days, when phrenology ranks

with mesmerism, and other pseudo-sciences—when it simply constitutes a disreputable means of livelihood for a few beggarly itinerant lecturers—we are apt to forget that Gall and Spurzheim were not the vagabond teachers of the present day; that they were men of reputation, honesty, learning, and varied accomplishment; that their dictum was of itself weighty in the scientific world; and that, therefore, we need feel no surprise, if, on searching the records, we find sound anatomists and able physiologists committed to the doctrines of phrenology. A calm, unprejudiced investigation will show us, even now, that they are based on principles of undisputed correctness; that only in their application—in the absurd mapping out of the cerebrum into territories for the passions and intellect, which, like the States of our own national government, have each a sovereign power, and are each constantly embittered and at war with each other on some question of sectional prejudice—is it really at fault. The division of the head into general regions of intellect and of animal life, is one which forces itself upon the physiologist; that which assigns a thimble-full of brain to one imaginary organ, and a cubic inch to another; that which destroys the unity of the mind, and makes it up of a hundred warring contraries—which packs organ with organ in the cranium, like so many eggs in a basket, one of which may be addled while the others are sound—is at once unwarranted by anatomy, and disastrous in its reaction upon our ideas of human responsibility. To return. It can not be doubted that the active discussion of the phrenological idea had an important influence in directing Morton's mind to the study of craniology. That he never adopted it, is in itself a strong contradiction of the theory. Even at that early period of his studies, he had familiarized himself with the different forms of craniological development, to an extent far beyond the attainment of many who thought themselves deeply versed. But, fortunately for him, fortunately for science, his investigations were not confined to the crania of a single race. Grouping together hundreds of skulls, belonging to a single nation, he recognized that, aside from the comparatively trivial individual differences, to which the investigations of phrenology were confined, there existed broad national differences; that, for instance, the skull of the Toltec Indian was an individuality, and could never be mistaken for that of the German, or other of the dominant white races. For awhile his mind was interested in these forms. He noted the cranium of the Indian, with its low, receding forehead, its short antero-posterior diameter, its great breadth between the ears, its flattened occiput, prominent vortex, high cheek-bones, and prominent and ponderous jaws, and compared with it that glorious Grecian form, immortalized in the Apollo Belvidere, but daily seen upon our streets. And so on through other races, he traced a permanent, unchangeable type of form, which dated back to the earliest historic periods. So accurate did he become in assigning nationality to any individual skull, that, in one instance, when a skull, unlike any in his collection, reached him from an unknown source, he unhesitatingly labelled it "Phœnician," and placed it on the shelf. More than a year afterward, he learned that it had

been found in an old Phœnician tomb, at Malta. Among other permanent differences which he noticed in skulls, was a difference of size, in comparing nationalities. His mind grasped the great idea which this involved, that not only variety in form, but actual difference in cranial capacity, in the size of the brain itself, was one of the conditions of national greatness. First devising a careful and accurate means of measurement, he subjected all the crania in his collection to the test of capacity, and reached the following results: The Teutonic family, made up of Germans, English, and Anglo-Americans, had the highest capacity, viz., 92 cubic inches; and that the lowest is assigned to the Hottentots and Australians, viz., 75 inches. Ranging between these two, we have the Celtic, with its 87 inches; the Malays, 85; the Chinese, 82; the African Negro, 83; the barbarous American Indian, 84, and the Toltecan Indian, 77. This, then, is the doctrine. Each of the pure, unmixed races has a cranial capacity and form, which is one of its most marked and permanent conditions. In a word, there is a permanent inequality in the size of the brain of different races of men, and also a variety of shape and contour of the brain-case, which is almost equally marked and descriptive. Having thus traced the gradual development of this doctrine of a different cranial capacity, we should pause for a moment and study the bearings of the theory, those tendencies and relations to political economy which distinguish it from all other discoveries in purely natural science, and which have their only counterpart in the wide-spread influence which geology has had upon religious belief. It is a marked feature in the grouping and generalizations of modern science that this sphere of influence is not confined to science alone, but involves those great questions of religion or politics which come nearer to the passions of men than any mere discovery, however useful. In this way a fearful responsibility is incurred by the teacher in natural science. The memorable onslaught made upon religion by the French encyclopedists is a familiar instance of the close connection between science and religion, and of the manner in which one may be brought to war upon the other. The still more recent teachings of geology, going to prove the great antiquity of the globe, and the gradual development of one organism into another, without a distinct creative fiat for each race of animals—the historical theories evolved from the deciphering of the hieroglyphics of the Pyramids, and supposed to show a continuous nationality in Egypt back to a period preceding the Noachian deluge—have in turn arrayed the religious against the scientific world. Morton's doctrines, like these, involved great moral issues; and let them once be widely circulated among the common people, let them be made the topics of newspaper discussion, and an embroilment would result whose termination no man can foresee. We do not intend to discuss, continues Dr. Hunt, that effort which has been made, since his death, to array Morton on the side of a diversity of origin of human races. We have many reasons for wishing to avoid this. During his life-time he never declared for or against the unity of the races. The doctrine of the diversity of races is not a necessary deduction from his theory. But, more

than this, we distrust our own capacity to handle this subject without doing harm. The doctrine mentioned is one involving the most solemn interests. Denying the unity of the human race, it makes a myth of the Adamic curse and fall, and does away with the redemption through Christ, by making it at once unnecessary and insufficient. Able, earnest and honest minds are at work upon this problem. To them we leave it, and have only thus alluded to it because the fact of a varying cranial capacity in different races has been strongly urged as one of the arguments for a diverse origin. For us, the political and social tendencies of Morton's theory have breadth and magnitude enough. Looking first at the broad fact, so amply established by Morton, that different races have a different cranial capacity, the mind seeks naturally for those influences which such a difference might be supposed to produce upon the political and social conditions of different races. Is it accident, or is it a great providential design, looking toward the ultimate perfection of humanity? Shall all our cherished notions of liberty, equality, fraternity, be crushed beneath the one inexorable fact of unequal brain, coupled with unequal mental power? The fact may as well exist in scientific theory, as in the actual workings of human relations. In looking back upon the records of that Providence which dictates the pages of human history, we find one nation always in servitude, another always free. One particular family gradually overspreads the temperate zone; before it perish all other kindred tribes and tongues. The fact, inevitable as death, is there, however disagreeable to the kindly, generous doctrine of social equality. Let us not argue that the doctrine of human equality, the right of each member of the human race to equal privileges, is, in itself, as just as it is generous, or as truthful as it is kindly. The problem of government is not to be solved by asserting the dignity of human nature, *per se*, for all history and all analogy contradict it. In history, we find that, so far as the welfare of nations is concerned, there is no such thing as equality; that the strong hand, guided by the intelligent brain, has ever conquered; and through so many apparent variations, so many momentary defeats resulting in permanent victories, has this held true, that, however false the assertion "Might makes right" may be, so far as ends merely human are concerned, nevertheless, the Divine Will attains its purposes through Might as the means, and makes the feeble Right the temporary victim. Human crimes, as well as human virtues, work out the fates of the Almighty; and all things, great and small, willing or unwilling, do serve him. We need not travel from our own continent to find the history of a series of races which will illustrate with sufficient fullness the influence of a single anatomical fact upon national success. "Human history," says Dr. Robert Knox, "can not be a mere chapter of accidents. The fate of nations can not be always regulated by chance; its literature, science, art, wealth, religion, language, laws, and morals, can not surely be the result of mere accidental circumstances." The monumental history, as well as the traditions of the aborigines of our country, indicates that the Toltecan or Peruvian was once the dominant race of this continent. As described by Cortez and his

followers, they were a gentle people, of fixed habits, given to assembling in large communities, and the building of great cities. The arts of civilization existed among them to a great extent. A monarchical government, a priestly hierarchy, and a provident agriculture indicated a condition far above barbarism. Their average cranial capacity, as ascertained by Morton, from the measurement of two hundred and thirteen skulls, was seventy-seven cubic inches. Its conformation presented a low receding forehead, the longitudinal and parietal diameter nearly equal, a flattened occiput, high cheek bones, and heavy and projecting jaws. This race once held possession from the great lakes to the Isthmus of Darien. It was they who constructed the forts and mounds which dot our western prairies. But long before the peopling of North America by the whites, they had disappeared from the whole country north of the Rio Grand; and their place was occupied by a race superior to them in cranial development, but inferior in the arts. The barbarous tribes had some seven cubic inches of brain the advantage over the Toltecan. The cranial conformation was similar, with the exception of a fuller occiput, and smaller intellectual lobe. These anatomical characters found an analogy in their minds. Crafty, subtle, vindictive, nomadic, despising manual labor, and incapable of civilization, they were still permitted, in the providence of God, to drive before them the mild Toltecan, and give to rapine and blood the land which once waved with corn. It was the manifest destiny of the Toltecan race to perish from the earth. Their civilization, their knowledge of fortification and defense, were no match for the larger brain of the red man. The men of largest brain, of strongest will, fiercest animal passions, and smallest share of human sympathies, passed from their northeastern origin, and swept all obstacles from their path. It was the work of annihilation, and nothing was left of the Toltecan but his forts and mounds. The second act in this great drama opens with the most important and immense migration of the human race on record. There came to the shores of New England and Virginia some feeble bands of men, who, whether rightfully or not, were soon engaged in bloody wars with the numerous tribes around them. Looking at the probabilities as they then existed, the chances were a thousand to one that a broil once commenced between the white and the red man, the former would soon be driven from the shores of the continent, or find a grave beneath its forests. They had to contend with a race numerous, powerful, vindictive, armed with efficient weapons, and the bravery to use them. Why is it, then, that we have seen the Teuton gradually enlarging his borders, and the red man as steadily perishing before him? The work is like that which the Indian had previously inflicted on the Toltecan. It was not conquest or subjection, but annihilation. Rank by rank, and tribe by tribe, the red man faded from his possessions. Like some Sarsar wind of death, the races of the Teuton have passed from the portals of the East, until now the golden shores of the Pacific acknowledge their dominion. It mattered little what means were chosen to accomplish this result. The peaceful policy of William Penn and the stern, unyielding integrity of the Puritans were as fatal to the Indian as the

fierce slaughter of the Spaniards in the halls of Montezuma. And the high necessities of civilization were but a secondary element in this contest. On the whole line of advance, from the Bay of Massachusetts to the Gulf of Mexico, the progress of the white race was preceded and pioneered by a class of adventurers who fled from the life of towns and assimilated themselves to barbarism. It was not for civilization that the Daniel Boones of our country fought and struggled. They contended with the Indian for his hunting-grounds, and not for sites of cities. It was the physiological antipathy of race for race, not sufficiently proximate, and too proud and stubborn to blend. And here we may pause to notice another marked difference in the conquering races. The Teuton, with an average cranial capacity of ninety-two inches—or if we take the pure English standard of the Puritans, of ninety-six inches, making a capacity of twelve cubic inches above that of the red man—fought less and conquered more than did the Spaniards and French at the South, with an average of eighty-four and eighty-seven cubic inches, thus nearly assimilating them to the barbarous, but not reducing them to the Toltecan measurement. As a natural consequence, we find that the Teuton has never widely amalgamated with the Indian. The animal passions were too feeble, and the innate pride of birth and connection too high, for such an intermingling. But the converse held true with the Spaniard and Frenchman. The Iberian and Celt belong to the swarthy families of the Caucasian race, and are as distinctly separable from the Anglo-Saxon as from the negro. Possessing as a race five cubic inches less of brain than the Teuton, they more nearly approximate the aborigines than the men of the North. They have everywhere first fought and conquered, and then amalgamated with the Indian. The consequence is a feeble and hybrid race, defining hybridity as a loss of permanence of national type. The physical degeneration which has resulted from this blending is a very noteworthy feature in anatomical science. The races now inhabiting Mexico are a breed so disgracefully mixed and intermingled that the types of the heroic Indian, as well as the dignified Spaniard, have alike disappeared. The average size of the head in Mexico is so small that it is with the greatest difficulty that an American of average cranial size can find a native hat sufficiently large. Still another race comes in to mingle in the confusion of American population. We are indebted to our English forefathers for the presence among us of more than three millions of a low type of human organization—the negro. Prognathous jaws, narrow, elongated forms, receding foreheads, large posterior development, and an internal capacity of only eighty-three inches, characterize the cranium of the African Negro. The cranial capacity is nine inches less than that of the Teuton, but still exceeding the Toltecan by six inches, and only one less than the barbarous Indian. The history of the negro, not only on the American but the African continent, illustrates the influence of the anatomical on the national conditions. Although he has never, in his native state, attained to any degree of culture, he is endowed with a wonderful imitative faculty, which enables him to adapt himself to the customs of civilized life. But we find that he more read-

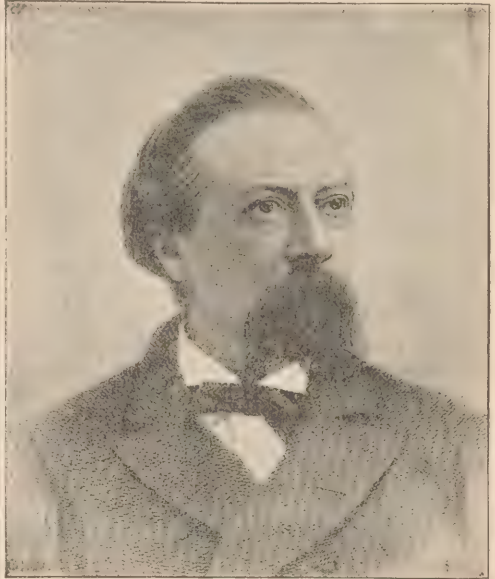

ily amalgamates with the Indian than with the white. The red man, though he sometimes makes a slave of his black fellow, is still more generally disposed to admit him to a footing of equality. In his relations with the whites he for two centuries remained in servitude, without an effort on his part to escape from bondage. The casual flight of a few solitary individuals, does not invalidate the fact that he was enchained by a people which could not thus enslave the Indian. The story of "Uncle Tom's Cabin" contains a most truthful moral on this point, however unconsciously on the part of the author. "George," the almost white slave, strikes for freedom with a bold hand, preferring death to slavery. So too, did "Cassy," and every other light mulatto in the book. But we find that Mrs. Stowe has always portrayed the pure black as a willing bondsman, and "Uncle Tom," himself, as a model of submission to the lash, and to bitterest wrong and outrage. This was not mere Christian non-resistance. The meekest martyr, from St. Stephen to John Rogers, would have resisted such wrong, by force of arms. It is an inborn characteristic of the black race. While we may not sanction the idea that the mere fact of inferiority, or diversity of race, can justify the holding of a fellow man—for a fellow-man he is—in involuntary servitude, it is nevertheless evident, that the anatomical facts of difference should have some influence in modifying our sentiments, and render us slow in imposing the responsibility of self-support upon a race whose ability to maintain themselves, in competition with the white man, is at least as much a problem as is that of the co-existence of the Anglo-Saxon and the Indian. It is impossible for eighty-three cubic inches of cerebral matter, fed by negro blood, to compete with ninety-two of educated, Teutonic brain. It is not the province of the anatomist to decide what should be done; but it is safe to assume, that any being, however degraded, if he possess reason and conscience, should also possess the liberty to use them for his own welfare. The limit of authority over a degraded race should not extend beyond an exercise of paternal care and superior wisdom, in guiding, protecting, and elevating it, in such a manner of life as is best fitted to its capacities. The amalgamation of the two races produces the mulatto, who manifests a certain degree of hybridity. He is a superior negro, but a very inferior white man. As we go on approximating to the white, we have increasing aptitude to learn, and greater intelligence; but this is accompanied by a corresponding degradation of the white. The mulatto is an unnatural and a sinful existence. Feeble in constitution, unable to perform severe labor, he manifests a tendency to scrofulous diseases and early death. Though the pure negro is naturally long lived, we find the mulatto rarely attaining the verge of old age. It is a notorious fact that, were it not for constant importations from the South, the race of negroes would soon disappear from the Northern States, from amalgamation, and consequent short life. If amalgamation is thus fatal to the existence of the negro, what better would be his condition if left to his own resources? It is but just that we should look the anatomical argument fairly in the face. The condition of the negro has ever been that of servitude—a consequence of his lack of brains.

It can not be pretended that this should form a justification of American slavery; but the anatomist will still shrink from hastily disturbing the present order of things. An immediate setting free of the bondsmen of the South, would place three and a half millions of an inferior race in competition with one far superior to it in anatomical perfection. Who can doubt where misery would fall? The experiment has already been tried twice on this continent. The Toltec and the Indian have in turn faded, and passed away from the broad lands they once claimed as their own. Without a claim to the soil, without a vestige of national organization, and in competition with a vastly superior race, that annihilation which has so surely dogged the retreating footsteps of the Indian, would find but a feeble resistance from the humble, crouching African. One circumstance may, in this contingency, operate in favor of the negro. Had the Indian been capable of subjection to slavery he would still be found among us. The negro would soon, in freedom, adapt himself somewhat to his new condition; and, although a large class might, like the wretched inhabitants of the British West Indies, prefer abject poverty to labor, yet the influence of a colder climate, and the necessity of providing for a winter, might gradually engraft industrious habits. Even the ever-working bee, when transported to Jamaica, laid up his store of honey for a single season only. Ever after that he forgot his provident Northern notions, and led a roisterous and dissipated life among the sweets of the sugar-houses, unmindful of the morrow. [The reader will understand that this memoir was written immediately before our Civil War and the emancipation of the negro by President Lincoln's proclamation, and that while his ultimate destiny in competition with the dominant race of this country remains an unsolved problem, yet his history and condition since that period by no means justify a contradiction of the ethnological conclusions then published.—*Editor.*] It is now a received opinion with ethnologists that the large-headed Teuton is the dominant race of all the earth. Wherever climate will permit his existence, his passion for discovery leads him. The negro, the Hindostanee, the Malay, the aborigines of America, have all fallen before him; and now he knocks at the door of the Japanese Mongol, and demands admission there. One by one the lesser tribes have owned his sway. The lively Celt of Ireland has yielded his long-fought battle with the English Teuton; the high-spirited Hungarian and the wily Italian feel the yoke of the Austrian Teuton; and throughout the world the race of the great brain is enlarging, by war or by diplomacy, its conquests. Who can tell where or when this immitigable advance shall cease? And what shall be the fate of feeble nations beneath its sway? There is no cause for anxiety, for an all-wise Governor controls it. Out of all this seeming wrong cometh good. If the Teuton rob a feeble race of its possessions, we find that with him go all the arts of civilization,—the power of steam, the blessings of education, the privileges of freedom, and an open Bible. The forests fall, and the ring of the artisan's hammer is heard in cities; and peace smiles upon broad fields of wheat, white for the harvest. Here, in the broad foundation and the full elaboration of such a theory, we find Morton's

true glory. In the most unpromising of all the sciences assigned to the physician, he has struck out a discovery, from which, as from some wondrous spring, has welled forth a fountain of public opinion, which, starting from the quiet valleys of scientific research, has grown into a torrent as it reaches the vast teeming plain of active human thought. Not in the domain of medicine do its consequences stop, but sweeping resistlessly on, it forms one of the chiefest of those currents of belief which agitate the restless sea of social and political discussion. What though it buries beneath its tide of evidence our preconceived ideas of human liberty, equality, fraternity? Not out of the hopeless selfishness, the inborn depravity, the jealousies, the secret crimes of human hearts, can we contrive a scheme of Providence. The heaviest burden borne by the truly ambitious medical mind, the great deficiency in the relations of the medical profession toward society, is that it stands at one side of the current of human life, and exerts no direct and palpable influence upon the creeds of men. Those natures which would seek in medicine an opportunity to mingle in the grander competitions of life, and long for fame, in the broad, satisfactory sense of the term, are doomed to disappointment. Physicians live at one side of the world; they are a separate people, and their mission links them, not to human greatness, but to human weaknesses and sorrows. But the physician, if, like Morton, he is content to be, rather than to be seen to be, can make his mark upon the world's progress through those avenues wherein natural science is now operating upon creeds of belief and systems of ethics. Like Morton, we may not stand in the hot vanguard of opinion, but, placed calmly in the rear, seeking only for truth without regard to creeds, we may push on the column, and watch the battlements of error, the dogmas of theorists, the nicely-built strongholds of policy, tottering and falling before an impulse which had its origin in the quiet study of the unpretending man of science.

MOTT, Alexander Brown, of New York City, son of the late Dr. Valentine Mott, was born in that city, March 31, 1826, and died in Yonkers, N. Y., August 12, 1889. His preliminary education was received from a private tutor, Wm. Darling (afterward Prof. W. Darling, M. D., of the University Medical College of New York), and he subsequently entered Columbia College Grammar School. In 1836 he accompanied his family to Europe, where he received a thorough classical education, returning to his native city after an absence of five years. A love for a military life about this time led him to place himself under military instruction at West Point, but in deference to the religious peace principles of his father he abandoned the idea. In 1842 he again visited Europe, and after passing a year in Germany and France, he accepted a position of trust in the naval agency, Marseilles. In 1844 he became private secretary of Commodore Morris, United States Navy, commanding the Mediterranean Squadron. He subsequently visited Spain, took part in the revolution there in command of a battery, and was present at the siege and surrender of Barcelona. He afterwards worked his way to Marseilles, and became connected with a commercial firm in that city, visiting Italy, Austria, Piedmont, Greece and Turkey,

in their interest, during 1845. He passed most of the years 1846 and 1847 at Havre, where his first studies in medicine were prosecuted, under the direction of a practicing friend. Returning to New York, he entered his father's office as a student, and attended lectures at the University Medical College. He was also a graduate of the University of Pennsylvania, New York Medical College and Castleton Medical College. He commenced practice in 1850. He tied the common carotid fifteen times, internal carotid twice, subclavian four times, innominate once, common iliac twice, internal iliac twice, and external iliac five times; femoral eighteen times; performed the operation of resection of the femur three times; also two amputations at hip-

Alex. B. Mott

joint; exsection of ulna twice; removal of entire lower jaw for phosphor-necrosis twice, and performed lithotomy twenty-one times. He acted for many years as prosecutor to his father, Prof. Valentine Mott, at the University medical clinic, and performed many of the operations in the surgical clinics. In 1850 he was appointed Surgeon to the New York Dispensary; in 1853 Visiting Surgeon of St. Vincent's Hospital, which he had assisted in founding in 1849; he was Attending Surgeon to the Jewish Hospital in 1855, a position he held till 1863, and also Surgeon to the Charity Hospital, which he held for fourteen years. In 1859 he was appointed Attending Surgeon at Bellevue Hospital, and later, Consulting Surgeon to the Bureau of Medical and Surgical Relief to the Out-door Poor, and was at one time Professor of Surgical Anatomy in the Bellevue Hospital Medical College, of which he was one of the founders, and filled the chair of Clinical and Operative Surgery in

that institution from 1872 till his death. At the outbreak of the War of the Rebellion, April 18, 1861, he was requested to accompany the first regiments of militia and ordered to proceed to Washington, on two hours' notice. He organized the medical corps of the regiments under his charge; was subsequently appointed medical director pro tem. in New York, and inspected all the recruits for thirty-eight regiments of New York Volunteers, over 70,000 men passing under his supervision. He subsequently, under orders, visited and inspected all the New York regiments around Washington and Fortress Monroe, and continued this arduous work till he was relieved on account of sickness contracted in the performance of his duty, when, on returning to New York, he resumed the office of inspector, besides being associated with the United States Mustering and Disbursing Office of that city. He caused a post hospital to be prepared for the sick troops passing through the city, but this proving inadequate, in 1862 he founded, in connection with several patriotic ladies of New York, the United States Army General Hospital, corner Fifty-first street and Lexington avenue, which he was placed in charge of by the Surgeon-General. In November, 1862, he was made Surgeon United States Volunteers, and thenceforth gave much of his time to the hospital above mentioned. He was appointed as one of the medical examining board for admission to the Medical Corps of the Army for Surgeons of Volunteers, and served for one year in that capacity. From time to time during the war he was ordered on special duty with the army, and in the winter of 1864-65 was placed on duty as inspector of the Department of Virginia, with headquarters with the Army of the James, then under command of Maj.-Gen. Ord. He served with him until the close of the war, and after the memorable campaign of April, 1865, was present at the conference between Gens. Ord and Longstreet, on the morning of the 9th of that month, and in the room, by special request, at the interview between Gens. Grant and Lee, in the afternoon of that day, when the articles of agreement of surrender were signed at Appomattox C. H., Va. After this he was ordered on duty in Richmond, Va., and shortly after, upon hearing of his father's severe illness, obtained a short leave of absence, and reached New York three days before his death, which took place on the 26th of April, 1865. His father had been taken ill on the Saturday previous, complaining of a chill and intense pain in his left leg, which was much swollen and very sensitive to the touch. His son, immediately on his arrival Sunday night, examined the limb and found that the circulation was more feeble than in the other, and suspected a beginning of gangrene from obstruction in the iliac artery. He called a consultation of several of the most eminent physicians and surgeons of the city for the next day, and expressed his opinion to them, which was fully verified on the following day by the appearance of vesication on the foot. He was mustered out of the United States service on August 1, 1865, with the rank of Brevet-Colonel United States Volunteers. Several reports of interesting cases treated by him have been published. He was a permanent member of the American Medical Association; honorary member of the Hudson County Pathological Society; fellow

of the American Geographical Society; member of the New York Academy of Sciences; of the New York Society for the Relief of Widows and Orphans of Medical Men; of the New York Medico-Legal Society, and of the New York Physicians' Mutual Aid Association. In April, 1851, he married the youngest daughter of Thaddeus Phelps. He left one son, Valentine Mott, who graduated from Bellevue Hospital Medical College in 1878, and who is now a prominent member of the profession in New York City.

MOTT, Valentine, of New York City, was born in Glen Cove, L. I., August 20, 1785, and died April 26, 1865. From a recent sketch in "Appleton's Cyclopædia of American Biography," we derive the following details concerning the life and achievements of this noted surgeon: He was descended from an English Quaker who settled on Long Island about 1660, and was a son of Henry Mott, a physician who practiced his profession for many years in New York City. The subject of this sketch received a classical education, and at the age of nineteen began the study of medicine under the preceptorship of his kinsman, Dr. Valentine Seaman, with whom he remained for three years, in the meantime attending the medical lectures at Columbia College, which conferred upon him the degree of M. D., in 1806. He then went to London and became a pupil of Astley Cooper; studied practical anatomy by means of dissection; visited the hospitals and attended the lectures of the chief surgeons of the British Metropolis; afterwards spending more than a year at Edinburgh under the instruction of eminent teachers of the University of that city. He returned to New York City in 1809, and rapidly attained a reputation in surgery. In the winter of 1810 he delivered a private course of lectures on this branch of his profession, and shortly afterward he was made Professor of Surgery in Columbia College. In 1813, the medical faculty withdrew from that institution and was merged in the College of Physicians and Surgeons, and in 1826 the trustees gave offense to Dr. Mott and his associates, who formed a new school under the auspices of Rutgers College, and subsequently connected themselves with the college at Geneva, N. Y., but were compelled to close their institution in 1830, on account of a decision regarding the legal right to confer degrees. Dr. Mott then returned to the College of Physicians and Surgeons as Professor of Operative Surgery and Surgical and Pathological Anatomy. In 1835 he resigned, in order to rest from exhausting labors, and repair his health by travel. He was already recognized in Europe as one of the first surgeons of the age. After visiting London, and a tour on the Continent, he returned to the United States at the end of sixteen months. Finding his health not fully restored, he returned to Europe, and made annual excursions from Paris into various countries during the next five years, when he finally returned to New York with health completely invigorated. While abroad he spent much time in the hospitals of Paris, and became much interested in orthopedic surgery. When visiting Constantinople he removed a tumor from the head of the Sultan, Abdul Medjid, and was invested for this service with the Order of the Medjidieh. Dr. Mott was the principal founder of the New York

University Medical College, and became Professor of Surgery and Relative Anatomy, as well as President of the Faculty, on its establishment in 1841. In 1850; his lectures were interrupted by a third trip to Europe. From 1852 until his death he was Emeritus Professor, and lectured occasionally to the classes every year. He drew his subject matter and illustrations largely from his own personal experience, and devoted but little attention to theories. He was for fifteen years Senior Consulting Surgeon to Bellevue Hospital, and for different periods served in the same capacity for St. Luke's, the Hebrew, St. Vincent's, and Women's Hospitals. Dr. Mott early gained a world-wide reputation for boldness and originality as an operative surgeon. Through life it was his constant practice, before every novel or important operation, first to perform it upon the cadaver. When but thirty-three years of age, he was the first to place a ligature around the innominate artery for aneurism of the right subclavian artery. The neighboring arteries became involved and the patient died from secondary hemorrhage, due to ulceration, on the twenty-third day. Dr. Van Graefe, of Berlin, repeated the operation three years later, with the same result, and it was not until 1864 that Dr. Andrew W. Smyth performed it, and insured the recovery of the patient by tying also the common carotid and the vertebral arteries. In 1821, Dr. Mott excised the right side of the lower jaw for osteosarcoma, having first ligated the primitive carotid in order to prevent hemorrhage, and afterwards he thrice removed the bone at the temporo-maxillary articulation. He performed a successful amputation at the hip joint in 1824. In 1827 he ligated the common iliac artery for a large aneurism of the external iliac artery, placing the ligature within half an inch of the aorta. The artery had been secured once before for the arrest of hemorrhage with a fatal result, but never for the cure of aneurism. Another of his original operations was cutting out two inches of the deep jugular vein, which was imbedded in a tumor. He was also the first surgeon to tie both ends of that vein, and the first to close with fine ligatures longitudinal or transverse wounds in large veins, even when slices had been cut out. He tied the common carotid artery forty-six times. In 1828 he removed the right clavicle, on which a large sarcomatous tumor had formed that had contracted adhesions with important structures on every side. He termed it his "Waterloo operation," not, however, because it surpassed, as he declared, in tediousness, difficulty and danger anything he had ever witnessed or performed, but because, as it appears, it fell on the 18th of June, the anniversary of the battle of Waterloo. We find, however, that this was not the first operation for the removal of the entire clavicle. It is stated by Dr. Johnson, in the *New Orleans Medical Journal* (January, 1850), and in an address by Dr. D. W. Yandall, on "Pioneer Surgery in Kentucky," that this had been accomplished for the first time in the history of surgery by Dr. Charles McCreary, a young practitioner living in a village composed of a few scattering houses situated in a sparsely settled country, where opportunities for cultivating surgical science were necessarily rare, and the means for acquiring anatomical knowledge correspondingly

difficult. The date of this operation was 1813, fifteen years before the case of Mott. The place Hartford, Ohio county, Ky.; the patient a lad named Irvin. The disease for which the operation was performed was said to be scrofulous. Recovery was slow but complete. The use of the arm remained unimpaired, and the patient lived in good health to be forty-nine years old. It is greatly to be regretted that more is not known of McCreary's personal and professional character. He is said to have been a serious, thoughtful man, given to study, devoted to his calling, and fatally fond of drink, to which he fell a victim when but thirty-seven years of age. Mott's operation is said to have required nearly four hours for its execution; he tied the jugular vein in two places and not less than forty arteries, but after all it proved to be not a complete extirpation, for the autopsy, made many years later, showed three-quarters of an inch of the bone at the acromial end still in its place, yet the case passed quickly into the annals of surgery and added much to the already great renown of the operator. "To this day," says Yandall, "it is referred to by surgical writers as 'Mott's Celebrated Case,' and the description of his procedure is often given in his own words." Although these two cases both recovered it was thirty years before any other surgeon had sufficient confidence in his dexterity, strength and knowledge of surgical anatomy to attempt a similar operation. In 1830 Dr. Mott effected a cure for hydrorachitis or cleft spine, removing a tumor at the lower part of the back, and later performed the same operation at the neck. From an early period in his practice he was remarkably successful in rhinoplastic operations, and in many instances restored the form of cheeks and lips that had been badly mutilated through the excessive use of mercury. Immobility of the jaw, caused by the same practice, engaged his attention soon after he began his professional work in New York City, and he finally devised an instrument on the screw and lever principle for prying open the jaw after preliminary operation with the scalpel, which he put into use in 1822. He was the first to remove the lower jaw for necrosis. He was one of the foremost lithotomists of his day, operating by the lateral method with the bistoury. He removed one stone that weighed more than seventeen ounces, and operated 165 times, altogether averaging the loss of only one patient in every twenty-seven cases. His amputations numbered nearly a thousand. It is said that Dr. Mott possessed all the qualifications for a great operator. His acute vision, steadiness of nerve, and physical vigor were extraordinary. He could cut with one hand almost as well as with the other, and developed a dexterity in the use of the knife that has never been surpassed. He cultivated and refreshed his knowledge of surgical and pathological anatomy by constant dissection and post-mortem examinations, and collected a large museum of morbid specimens at a period when the law obstructed these practical methods of study, which are now allowed and protected. Although the most intrepid operator of his age, performing, as said by Sir Astley Cooper, "more of the great operations than any man living, or that ever did live," yet he was a friend and advocate of conservative surgery,

and never performed an operation without weighing the question of its necessity with much deliberation. "His success in capital operations was due not simply to his surgical knowledge and skill, but in a large measure to his care in the after-treatment of the patient, and to a knowledge of therapeutics that brilliant operators rarely possess. In addition to his surgical practice, Dr. Mott's services as a physician were often sought. He invented many valuable surgical and obstetrical instruments, and till the end of his life was eager to adopt in practice the inventions and improvements of others in surgery or medicine. The introduction of anesthetics was facilitated by his early and frequent use of them. His health and vigor lasted until the end of his life, and in his old age he was still able to perform difficult surgical operations. In 1864 he went with other physicians to Annapolis to investigate and report on the condition of prisoners of war released from Confederate jails." Dr. Mott received the honorary degree of M. D. from the University of Edinburgh, and in 1851 that of LL.D. from the regents of the New York State University. The medical societies of several States of the Union, the Imperial Academy of Medicine of Paris, the Paris Clinical Society and the Medical and Chirurgical Societies of London and Brussels each made him a Fellow, as well as Kings and Queens College of Physicians of Ireland, which has elected only twenty new members within 200 years. He was for a long period president of the New York Academy of Medicine, and at the time of his death was president of the New York Inebriate Asylum. Shortly after Dr. Mott's death, his museum of anatomical specimens was destroyed in the fire which consumed the medical college on Fourteenth street, and many of his most valuable surgical plates and preparations were consumed. His widow succeeded in gathering some mementos of his laborious life, and placed them in the building at 64 Madison avenue, now known as the Mott Memorial, which was incorporated in 1866, and was afterward under the special care of his son, the late Professor Alexander B. Mott. It contains a library of nearly 4,000 volumes, exclusively on medical and surgical topics, and is free to all medical students and physicians, on application. Dr. Mott created a trust in his will by virtue of which one gold, one silver, and one copper medal are bestowed upon the three graduates of the New York University Medical College, for the best dried anatomical specimens. After his return from abroad, in 1841, Dr. Mott published "Travels in Europe and the East." His published papers on surgical subjects number only twenty-five, though some of them are of great length, and illustrated with numerous engravings. It is said that literary composition was distasteful to him. In 1818, with Dr. John Watts and Alexander H. Stevens, the other professional attendants at the New York Hospital, he established the *New York Medical and Surgical Register*, which was intended to chronicle the more important cases, on the model of the *Dublin Hospital Reports*, but the publication was continued for only one year. He supervised the translation, by Dr. Peter S. Townsend, of Alfred L. M. Velpeau's "Surgical Anatomy," adding a preface and copious notes and illustrations, from his published cases and reports, filling

several hundred pages. The curvilinear incision in resections of the bones and operations on the jaws, to which Professor Valpeau attached much importance, was mainly originated by Dr. Mott, though not credited to him in the French treatise. In 1862 he prepared, at the request of the United States Sanitary Commission, a paper on the use of anesthetics for the benefit of the army surgeons, and subsequently a pamphlet on the means of suppressing hemorrhage in gunshot wounds, which was intended as a guide for the use of soldiers on the battle-field. Several of his professional papers were published in the "Transactions" of the New York Academy of Medicine, and one was presented to the Royal Medical and Chirurgical Society of London, treating of a rare congenital tumor of the skin, called pachydermatocoele, first described by him. He published a "Sketch of the Life of Dr. Wright Post." His inaugural address as president of the New York Academy of Medicine was printed; also, an address entitled, "Reminiscences of Medical Teaching and Teachers in New York," 1850; "Address before the Trustees of the New York Inebriate Asylum at Binghamton;" "Anniversary Discourse before the Graduates of the University of New York," 1860; and a "Eulogy on John W. Francis, M. D.," 1861.

MUNDE, Paul Fortunatus, of New York, was born in Dresden, Saxony, September 7, 1846, his father being descended from Swedish emigrants who came to Germany with Gustavus Adolphus, his mother belonging to a Saxon baronial family. Immigrating to America with his parents, in 1849, he was educated in this country, graduating from the medical department of Harvard University in March, 1866. While a medical student, he was, in 1864, an acting medical cadet in the United States army. Going to Europe in the year of his graduation, he entered the Bavarian service as a volunteer assistant surgeon, serving through the war, and being decorated at its close with the cross of civil merit. In 1867-70 he was clinical assistant to Professor Scanzoni, and house physician to the Lying-in Hospital at Wurzburg, Bavaria; from 1863 to 1870 he was tutor to the School for Midwives in the same city. At the outset of the Franco-Prussian war he tendered his professional services to the Bavarian government for the period of the conflict, and being accepted, was attached as battalion surgeon to the Second Corps of the Bavarian army, accompanying that corps on its march to Sedan, and thence to Paris, before which city he lay in camp for five and a half months. In 1871, at the close of the war, he took his discharge, receiving the German service medal for service in the field, and also that for non-combatants. After retiring from the army he pursued his professional studies in Vienna for nearly a year, receiving the degree of Master of Obstetrics from that university in December, 1871. Thence he went to Berlin, Heidelberg, Paris, London and Edinburgh, spending several weeks at each of these universities. Returning to America in October, 1872, he established himself in New York, making a specialty of gynecology and obstetrics. In 1873 he married Eleanor Claire, daughter of E. B. M. Huges, Esq., of New Haven, Conn. He is a fellow of the American Gynecological Society; New York Obstetrical Society, of which he was secretary, 1873-76;

New York Academy of Medicine, and corresponding fellow of the Edinburgh, Leipsic and Philadelphia Obstetrical Societies; also member of the New York County Medical Society. He was assistant surgeon to the Woman's Hospital, New York, and has been since 1881 Gynecologist to the Mount Sinai Hospital; since 1880 Professor of Gynecology at Dartmouth, and since 1882 he has held the same chair in the New York Polyclinic. For eighteen years he was editor of the *American Journal of Obstetrics*, to which he has contributed a number of important papers—among the most noteworthy of these are "The Treatment of Cancer of the Uterus with the Sharp-edged Scoop or Curette;" "The Cranioclast as Improved and Used by the Vienna School;" "The Radical Operation for Prolapsus Uteri, as Practiced by Professor Carl Braun, of Vienna;" "A Case of Presumptive True Lateral Hermaphroditism;" "Retention of the Dead Ovum;" "Reposition of Retro-displacement of the Gravid Uterus by Posture and Atmospheric Pressure;" "Chronic Vaginitis and Endometritis;" "The Flap Splitting Operation for Lacerated Perineum," 1889; "The Conservative Treatment of Salpingitis," 1892, besides numerous reviews of books and foreign articles. He is also one of the collaborators to Johnson's Universal Cyclopedia, having written the article "Obstetrics" for that work. He published "Obstetric Palpation" in 1880, and "Minor Surgical Gynecology" in the same year, which was revised and enlarged in 1885. He has invented numerous and valuable instruments now in general use with gynecian surgeons.

MURDOCH, J. B., of Pittsburgh, Pa., was born in Glasgow, Scotland, in the year 1830, and came with his father, who was a missionary of the Presbyterian church to Canada in 1833. He left Canada for the United States at the time of the "Patriot War" and has since resided at Ballston, Catskill and Oswego, N. Y., and at Pittsburgh, Pa., which latter place is his present residence. He took his degree as a physician from the College of Physicians and Surgeons, New York City, in the spring of 1854. During the year 1855 he was surgeon of the steamship North Star, which vessel belonged to the Vanderbilt line of ocean steamers, and sailed between New York City and Havre, France. From 1856 until 1872 he practiced medicine at Oswego, N. Y., where he was a member of the Oswego County Medical Society, and its president in 1865; also a member of the New York State Medical Society. In 1861 he was made surgeon of the Twenty-fourth Regiment New York State Volunteers, which served for two years in the War of the Rebellion. He was made surgeon-in-chief of his Brigade, which consisted of the Fourteenth, Twenty-second, Twenty-fourth and Thirtieth Regiments of New York Volunteers, and served as surgeon of the Brigade at the battles of Bull Run, Falmouth, Rappahannock Station, Sulphur Springs, Groveton, South Mountain, Antietam, Gainesville, Manassas Plains, Fredericksburg and Chancellorville. Returning to Oswego at the expiration of his term of service, he was made surgeon of the Board of Enrollment of the Twenty-second District of New York, which position he held until the close of the war. During his residence at Pittsburgh, Dr. Murdoch has been a member of the Allegheny Medical Society and its president in 1885, and a member of the Pennsylvania State Medical

Society, of which he was president in 1888. He was company surgeon of the Pennsylvania Railroad, at Pittsburgh, from 1876 to 1880. He has been company surgeon of the Pittsburgh, Cincinnati, Chicago and St. Louis Railway since 1876, and still retains the position. He is attending surgeon at the Western Pennsylvania Hospital at Pittsburgh, which position he has held since 1872. He was one of the charter members of the National Association of Railroad Surgeons, and was made its president at St. Louis in 1889. He is at present clinical professor of surgery at the Western Pennsylvania Medical College, Pittsburgh, and is also dean of the college. Dr. Murdoch has been a frequent contributor to the medical journals of the country. Reports of his surgical clinics of the Western Pennsylvania Medical College have been made from year to year, and are published in the Journal of the American Medical Association. His articles on the "Torsion of Arteries," for the arrest of hemorrhage, have been widely circulated, and it may be truly said that he has done more to popularize this method than any other American surgeon.

MURDOCK, E. P., of Chicago, Ill., was born

E. P. Murdock

in Dearborn county, Ind., December 15, 1845, being the fourth son of E. P. Murdock, Sr., and Rachel Taylor, his father being of Scotch descent, the great grandfather having been reared in Ayrshire, Scotland, but immigrated to America to take part in the War of the Revolution. His maternal ancestors, "the Taylors," came to America from England, after the downfall of Oliver Cromwell, and settled in Virginia. The doctor was raised on a farm in Missouri and pursued his studies at home until his fifteenth year, when he attended one term at the Quincy Academy, which school he left to join his associates in the interstate war-

fare at the opening of hostilities. He acted as guide to Union soldiers in their search for guerrillas in North Missouri, and served in the State Militia during the first years of the war; he then joined the Forty-seventh Illinois Volunteer Infantry, in which regiment he served until 1866. During the summer of 1865, while stationed at Selma, Ala., he was detailed as hospital steward in the Hospital for Freedmen and Refugees, and was placed in charge of the Small-pox Hospital during the latter part of the summer. In returning from the army he attended literary college and graduated in 1868, after which he taught school and gave attention to natural history, being a student and friend of the elder Agassiz. He was superintendent of the city schools at Canton, Mo., and later at Streator, Ill.; and at public conventions of educators was a lecturer upon natural history; graduated at Rush Medical College and was made the curator of the museum immediately after graduation, which position he held until he resigned to accept the lectureship of the surgical diseases of women in the College of Physicians and Surgeons of Chicago. He has made a special study of prenatal deformities and has published numerous articles on teratology, showing the fallacy of maternal impressions being the cause of deformities in their offspring. He is an active and successful practitioner, a skillful surgeon, and a popular teacher, being now Professor of Oral and Clinical Surgery in a dental college, and Professor of Physiology and Hygiene of the Voice in Song and Speech in the American Conservatory of Music. He has been an active worker in the societies of organized labor, and a leader in the work of having them systematize their societies to the plan of mutual protection and sick and insurance benefits. He is a member of a number of medical societies—the State Microscopical Society, the Cornell Alumni Association, Surgeon for the Grand Lodge of Switchmen, the Amalgamated Carpenters and Joiners, and Surgeon-in-Chief of the Railway Brotherhood Hospital.

MURPHY, John B., of Chicago, Ill., was born December 21, 1857, at Appleton, Wis. He was educated at the public school, and graduated from the High School, June 26, 1876. Practicing Surgeon Dr. J. R. Reilly, of Appleton, was his preceptor. He graduated from Rush Medical College in 1879. He was Intern in Cook County Hospital, from February 1, 1879, to October 1, 1880; he then practiced medicine in Chicago until September, 1882. From that date he studied at the universities and hospitals in Vienna, Munich, Berlin, and Heidelberg, until April, 1884. Since that time he has practiced surgery in Chicago; is Professor of Clinical Surgery in the College of Physicians and Surgeons, Chicago; Professor of Surgery in the Post-Graduate Medical School of Chicago; Attending Surgeon to Cook County Hospital for the past ten years; Attending Surgeon in Alerian Brothers' Hospital; President of Medical Staff of Cook County Hospital; Vice-president of the National Association of Railway Surgeons; and member of the Entertainment Committee for Visiting Physicians to the Columbian Exposition. His principal professional writings have been: "Gunshot Wounds of Abdomen;" "Actinomycosis Hominis," he being the first man to recognize the disease in this country; "Early Operation in Perityphilitis;" "Echino-

John B. Murphy.

coccus of Liver;" "Original Experimental and Clinical Research in Surgery of Gall-Bladder, Liver, and Intestinal Tract," illustrating utility and application of his "Anastomosis Button" in abdominal surgery. The "Anastomosis Button," invented by him, is very ingenious. It relieves intestinal surgery of many of its dangers, and simplifies its technique very materially.

MUSSEY, Reuben D., of Boston, Mass., was born in Pelham, N. H., June 23, 1780, and died in the former city, June 21, 1866. He was graduated at Dartmouth in 1803; studied medicine and attended the University of Pennsylvania, from which he received the degree of Doctor of Medicine, in 1809. It is said that while a student at the latter institution he subjected himself to an experiment that demonstrated the incorrectness of the theory that the human skin has no power of absorption. Immediately after graduation he established himself at Salem, Mass., where he continued the practice of his profession until 1814, when he became Professor of Materia Medica and Therapeutics in Dartmouth, holding that position until 1820. He was also Professor of Obstetrics from 1814 till 1838, and was made Professor of Anatomy and Surgery in 1822, holding this chair for sixteen years. From 1831 till 1835 he lectured on anatomy and surgery in Bowdoin. He was Professor of Surgery in the Ohio Medical College from 1838 till 1852, and held the same chair in Miami Medical College from 1852 till 1860, when he removed to Boston. In 1830 he proved (what Sir Astley Cooper had said was impossible) that intra-capsular fractures could be united, and was the first person to tie both carotid arteries. In 1837 he removed the entire scapula and clavicle of a patient who was suffering from osteo-sarcoma, the first operation of the kind on record. Dr. Mussey was president of the New Hampshire Medical Society, and was an early advocate of the temperance cause.

Harvard gave him the degree of A. M. in 1806, and Dartmouth that of LL.D. in 1854. In addition to addresses, he was the author of "Health: its Friends and its Foes," 1862. His son, the late William H. Mussey, was a distinguished surgeon in the National Army during the Rebellion, and was afterwards Professor of Clinical and Operative Surgery in Miami Medical College from 1865 until his death, which occurred in 1882.

MUTTER, Thomas Dent, of Philadelphia, Pa., was born in Richmond, Va., March 9, 1811, and died in Charleston, S. C., March 16, 1859. His academic education was received at Hampden Sidney College, and his medical education at the University of Pennsylvania, from which he received the degree of M. D. in 1831. He then went abroad, attended the schools and hospitals of Paris, and on his return established himself in Philadelphia. From 1841 till 1856 he was Professor of Surgery in Jefferson Medical College. He wrote an account of the Salt Sulphur Springs of Virginia, an essay on "Club Foot," and contributed various papers to medical periodicals, and in 1846 published an edition of Robert Liston's "Lecture on the Operations of Surgery," with additions to the same.

NASH, Herbert M., of Norfolk, Va., was born there May 31, 1831. His ancestry were English, and settled in his native State before the War of the Revolution. He was graduated in medicine at the University of Virginia, in 1852, and established himself in practice the following year in his native town. During the War of the Rebellion he was in the medical service of the State of Virginia and of the Confederate Army, and attached to the Ninth Virginia Infantry, Armstead's brigade; the Sixty-first Virginia Infantry, Mahone's brigade; the artillery service, as Surgeon of Poague's Battery, and later as Chief of the Medical Department of the Artillery, Third Army Corps, to the close of the war, serving with the Army of Northern Virginia in all its active movements from 1862 to the surrender at Appomattox Court House. He was president of the Board of Health of the city of Norfolk, in 1875, and resigned in 1876 in order to accept the position of Medical Officer of the Quarantine District, comprising Norfolk and Portsmouth, a position he has held for several years. He is a member and ex-president of the Norfolk City Medical Society, and is an active member of the Virginia State Medical Society; member of the State Medical Examining Board of Virginia; member of the American Medical Association, and the Southern Surgical and Gynecological Association.

NEBINGER, Andrew, of Philadelphia, Pa., was born in that city December 12, 1819, and died there April 12, 1886. After receiving an academical education, he was apprenticed to the drug trade, and in 1839 established himself in business on his own account. This business he continued during the ensuing eight years, then relinquishing it for the purpose of studying medicine. He attended lectures in the medical department of the University of Pennsylvania, obtaining therefrom his degree of M. D. in April, 1850. Establishing himself in Philadelphia, he rapidly acquired a very large general practice, which continued to increase until within the past few years, when his various official duties compelled him to curtail its extent. He was a member of the

State, County and Northern Medical Societies, having held the positions of vice-president of the State, and president, vice-president and treasurer of the County Societies, and of the Obstetrical Society. He was also a member of the American Medical Association, a Fellow of the College of Physicians, and a life member of the Academy of Natural Sciences. For three years he was a member of the Board of Managers of the Wills Ophthalmic Hospital, being elected by the city councils, and serving during the latter half of his term as president of the board. In 1868 he was appointed member of the Board of Education of Philadelphia, and had been reappointed to that position every three years until his death. He was Medical Director of St. Mary's Hospital. During the war he was an active member of the Cooper Shop Volunteer Refreshment Saloon, which institution he served as surgeon-in-charge during the entire continuance of the war. He also assisted in the organization and was one of the incorporators of the Cooper Shop Soldiers' Home, the first institution of the kind established in the country, serving as its vice-president. In addition to his duties as member of the Board of Education, he also had the management of several charitable institutions. To one of these, St. Agnes Hospital, he left a large bequest. He was an extensive contributor to the literature of his profession, his writings having appeared in the leading medical journals. Of his most important papers may be mentioned: "Variola: its Nature and Treatment," in which was advocated a compensating nutritive treatment; "Diphtheria," and "Puerperal Convulsions." He was also the author of many addresses to societies and biographical sketches of deceased physicians.

NEBINGER, George W., of Philadelphia, Pa., was born in that city, July 23, 1824, and died there March 8, 1868. He had been a prominent democratic politician prior to the War, and a Presidential elector in 1856. He first studied pharmacy and then medicine, after which he entered the University of Pennsylvania, from which institution he received the degree of M. D. in 1862. He soon after acquired an extensive practice, and served during the Civil War as a volunteer surgeon, and after the battle of Antietam had charge of all the hospitals about Hagerstown. It is said that when it was feared that Lee would advance after the battle of Antietam, Dr. Nebinger was the only volunteer surgeon that remained at his post. He was Comptroller of Public Schools in Philadelphia for many years, and was for nine years one of the directors of Girard College, in that city. He was a brother of Drs. Andrew and Robert Nebinger, and was for a time associated with them in the management of the Cooper Shop Hospital. The three brothers were unmarried, and were men of fine personal appearance.

NEFTEL, William Basil, of New York City, was born in Riga, Russia, September 22, 1830. Having received a thorough classical and mathematical education in St. Petersburg, he entered the Medical College of the University of St. Petersburg, and after five years of study of medicine under the celebrated Carl Ernst von Baer, Gruber Pirogoff, and other professors, graduated in 1852 with honors. He was appointed physician to the Military Hospital of St. Peters-

burgh, and was for two years assistant to Prof. Pirogoff. During the Crimean War he received the appointment of Surgeon to the Imperial Guards, and in 1857 was sent by the government as member of an expedition to Central Asia. For his services he was awarded the rank of Aulic Councillor (Hofrath), and was sent at the expense of the government to the universities and hospitals of Germany, France and England. In 1868 he settled permanently in New York, devoting his attention to nervous diseases, electro-therapeutics and electro-surgery. Prominent among his researches are those on the "Electrolytic Treatment of Tumors," which included both malignant and non-malignant, and also fibrous tumors of the uterus, published in *Virchow's Archives* between 1868 and 1881, and therefore long before Apostoli. He also published researches on "Atremia" (a nervous affection first described by him), on "American Nervousness," on "Locomotor Ataxia and Its Most Successful Treatment by New Methods." He was the first to describe the periodical form of psychical affections, notably periodical melancholia, and pointed out their etiological and prognostic importance. He has published researches on "Epilepsy," on "Nervous Diseases of Women," and on the "Rational and Efficient Treatment of Chronic Neuroses and Psychosis," also, monographs on "Galvano-Therapeutics," on the "Galvanic Reaction of the Optic and Auditory Nervous Apparatus in the Healthy and Diseased Conditions," and on various other subjects.

NEILL, John, of Philadelphia, Pa., was born in that city, July 9, 1819, and died there February 11, 1880. He was the son of a noted physician of Philadelphia. The subject of this sketch was graduated in arts at the University of Pennsylvania, in 1837, and in medicine at the same institution in 1840. He began the practice of medicine in his native city, but spent a short time in the West Indies in 1841. The following year he was appointed Assistant Demonstrator of Anatomy in the University of Pennsylvania, where, in 1845, he became Demonstrator. In 1847, he was elected Surgeon of Wills' Hospital, and lectured on Anatomy at the Medical Institute of Philadelphia. In 1849, he was appointed Physician to the Southeastern Cholera Hospital, where his method of treatment formed the basis of a report that was published by the College of Physicians and Surgeons. He was elected Professor of Surgery in the Pennsylvania College, at Gettysburg in 1854, Surgeon to the Philadelphia Hospitals in 1855, Surgeon-in-Charge of Military Hospital in 1861, and organized the first eight general hospitals in that city. In 1862, he was commissioned Surgeon of United States Volunteers, and in 1863 appointed Medical Director of the forces from Pennsylvania. The same year he was brevetted Lieutenant-Colonel for meritorious services. Dr. Neill established the hospital at Dickinson College, after the bombardment of Carlisle, also the hospitals at Hagerstown, and was afterward appointed Post-Surgeon at Philadelphia. In 1874, he became Professor of Clinical Surgery in the University of Pennsylvania, but resigned that position in 1877. In addition to many articles in medical journals, he wrote "Neill on the Veins," in 1852, and in connection with the late Professor Francis Gurney Smith, "Neill and Smith's Compend of Medicine," 1848, a work of great value to

medical students while attending courses of lectures.

NELSON, Daniel T., of Chicago, Ill., was born in Milford, Mass., September 16, 1839. Having received his preparatory education at Amherst College, he entered the Harvard Medical School, and received the degree of M. D. from that institution in 1865. While a student at Harvard he served at the Mason United States General Hospital, Boston, successively as nurse, medical cadet and house surgeon, and after his graduation was an Acting Assistant Surgeon United States Army, serving in that capacity during the last few months of the Rebellion. In November, 1865, he established himself in Chicago, where he still remains engaged in general practice, but devoting special attention to gynecology. He has invented some important instruments employed in gynecian surgery, which have been generally adopted. His improved tri-valve speculum has been extensively used by the profession. In 1866 he was appointed lecturer, and in 1867 Professor of Physiology and Histology in the Chicago Medical College, which position he held until 1880. In 1881 he became adjunct Professor of Gynecology in the Rush Medical College. He is also attending physician at Mercy Hospital. He has contributed important articles to medical periodicals, relating chiefly to his special line of practice. Dr. Nelson is now recognized as one of the leading members of the medical profession in the Northwest.

NEW, George W., of Indianapolis, Ind., was born in Madison, that State, February 27, 1819, and died in the former city, April 10, 1891. His ancestry were among the early settlers of Delaware. His grandfather, Jethro New, served under Gen. Washington in the War of Independence, and was one of the guard over the unfortunate André, whose execution he witnessed. His father was the Rev. John B. New, of the Christian Church, one of the most noted pioneer preachers of the State of Indiana. The subject of this sketch received an academic education, the intervals of study having been spent in labor on a farm, or in the shop of a neighboring cabinetmaker. From 1836 to 1838 he became interested in the study of forestry and botany, and in 1837 began the study of medicine under the preceptorship of Dr. W. C. Thompson, of Indianapolis; he then entered the Medical College of Ohio, from which institution he was graduated in 1840. He selected Greensburg, a flourishing town in his native State, as the field of his earliest professional labors, and was associated in practice with Dr. Abram Carter, a distinguished physician and a former student of Dr. B. W. Dudley, of Lexington, Ky. In 1841 Dr. New was married to Miss Adelia, daughter of Dr. Carter. Dr. New was, at the time he located at Greensburg, the only graduate of medicine in that vicinity, and speedily attained a practice which extended to adjacent counties, having performed all the surgical operations for a wide area of territory. In 1860 he removed to Indianapolis, and in April, 1861, entered the National Army as Surgeon of the Seventh Indiana Volunteers, receiving the first commission as surgeon issued by Governor Morton. After three months service in West Virginia, where he dressed the first amputated leg of the war and attended the first wounded Federal colonel, the regiment was reorganized,

and Dr. New continued as its surgeon. He followed the fortunes of this regiment until the fall of 1864, and it is said that no case of surgery under his charge proved fatal, though he had the supervision of an operating table on the occasion of every battle. During this time he was surgeon-in-chief both of a brigade and of a corps. In the latter part of 1864 he was commissioned by Governor Morton Military Agent of Indiana, and assigned to the Department of the Gulf, with headquarters at New Orleans. At the close of the war he was commissioned by the Secretary of the Treasury examiner of drugs for the port of New Orleans. In 1867 he returned to Indianapolis, after an absence of six and a half years, where he remained, engaged in active general practice, until within a few years of his death. He was a member of the Marion County Medical Society, the Indiana State Medical Society, and of the American Medical Association.

NEWELL, Timothy, of Providence, R. I., was born in Sturbridge, Mass., March 29, 1820. After receiving his preparatory, academical and collegiate education, he entered the Vermont Medical College and received the degree of M. D. from that institution in 1850. After practicing his profession three years at Cranston, R. I., he established himself at Providence, that State, where he has since remained engaged in the successful pursuit of his profession. During the Civil War he was for a period of nine months Surgeon to the First Rhode Island Cavalry, being for a short time a voluntary prisoner in the enemy's lines for the purpose of caring for the wounded of the Army of the Potomac. He is a member of the American Health Association, Providence Medical Association, and of the Rhode Island Medical Society; and has been Treasurer of his State Medical Society. In 1874 he drew attention of the members of the latter organization to the need of a rational system of school hygiene, and presented, as chairman of a committee appointed on the subject, a report, a portion of which was extensively copied throughout the country. His publications have been limited to contributions to popular journals, and have in the main been discussions of sanitary subjects; the most important of these is a paper upon "The Changes Demanded by Physiology in Our School System," published in *New York Sanitarian*, 1877.

NEWELL, William L., of Millville, N. J., was born in Bridgeton, that State, March 27, 1834. He received his preparatory education at Mount Holly Academy, and subsequently attended Princeton College for two years. After studying medicine he entered the Jefferson Medical College and obtained the degree of M. D. from that institution in 1859, and soon after established himself in the city of his present residence. In 1862 he entered the United States service as surgeon of the Twenty-fourth New Jersey Infantry. With this regiment he continued for nine months, when he became brigade surgeon (and surgeon-in-chief of Kimball's brigade). Subsequently he served as surgeon-in-chief of General French's division, Second Corps, Army of the Potomac. On returning to private practice, he located at Salem, in his native State, for one year, when he returned to Millville where he has since remained. Dr. Newell is a member of the Cumberland County District Medical Society and the American Medical Association. He has

been president of the former and delegate to the latter, and has taken an active interest in the deliberations of these organizations.

NEWMAN, Henry Parker, of Chicago, Ill., was born at Washington, N. H., December 2, 1853. He is of New England parentage, his father being one of eight brothers reared among the granite hills of New Hampshire, and his mother a descendant of the old and respected Fairbanks and Everett families, so prominent in anti-slavery days. His parents, James and Abby (Everett) Newman, moved to Hillsborough, N. H., when he was but a few months old, and the rudiments of his education were acquired at the public schools of that place.

H. P. Newman

He attended the Literary Institute at New London, and afterwards continued his preparation for college under a private tutor. He commenced reading medicine under Dr. Geo. Cook, of Concord, N. H., prior to 1875, when he entered the medical department of Dartmouth College, and took one course of lectures. After a year engaged in teaching, he removed to Detroit Mich., and continued the study of his profession at the Detroit Medical College. While a senior student he held the position of house physician at St. Luke's Hospital, Detroit. He graduated in 1878, and spent the following years in post-graduate study in the leading universities of Germany. He was fortunate in receiving instruction from some of the most celebrated scientists and clinicians of the day, and enjoyed special privileges in the private laboratory of Professor Cohnheim of Leipsic, through the courtesy of that eminent pathologist and teacher. While abroad, Dr. Newman visited the more noted hospitals and universities of Germany, Austria, France and Great Britain. He returned to this country in 1880 and located in Chicago. He married in

1883 Fanny Louise, the only daughter of one of Chicago's ablest lawyers, Lothrop S. Hodges. Of their four children two are living, Helen Everett and Willard Hodges. Dr. Newman is a member of the Chicago and Illinois State Medical Societies, the Illinois State Microscopical Society, and the American Medical Association. He is secretary of the Chicago Gynecological Society, corresponding Fellow of the Detroit Gynecological Society, and has contributed quite largely to the medical literature of the day. In 1890 he revisited Europe as a delegate to the fourth International Medical Congress at Berlin. Dr. Newman was one of the founders of the Post-Graduate Medical School, its first president, and is Professor of Diseases of Women. He has been president of the Laboratory of Experimental Research since its organization as an auxiliary of the former institution. He has also been actively associated with the College of Physicians and Surgeons of Chicago since its establishment, in 1882, and holds the chair of Professor of Obstetrics and Clinical Gynecology, and Lecturer on Gynecology. Dr. Newman is Surgeon in the department of Diseases of Women in the Post-Graduate Hospital, St. Elizabeth Hospital, Chicago Public, and West Side Free Dispensaries.

NEWMAN, Robert, of New York City, was born in Germany, where he received the usual liberal education for which that country has been so long renowned. When quite young, and hardly out of his boyhood, Dr. Newman participated in the War for Liberty, fighting at the barricades, and later on as adjutant of the Battalion Homburg, in the Palatinate. After several battles in Bavaria and Baden, the cause of the Liberalists was lost, and the Doctor then accompanied Gen. Ligel's column into Switzerland, but diplomatic pressure was brought to bear, and the refugees, with the Doctor amongst them, emigrated to America. Arriving in New York, the Doctor once more devoted his attention to the study of medicine, and became a pupil of Dr. Joseph Kammerer, whose specialty was gynecology, being on the staff of the German Dispensary. After studying at the New York Medical College, at the Long Island College Hospital, and at the Bellevue Hospital Medical College, he was graduated at the Long Island College Hospital in 1863, and later at Bellevue Hospital Medical College in 1869. During the Civil War in 1863 he went to the front as State's Volunteer Surgeon. In the same year he was appointed Physician to the Northern Dispensary, and from that period he has been a resident of New York City. In 1864 he was appointed by Prof. Hutchison, Prosecutor and Chief of the Surgical Clinic in the Long Island College Hospital; also Physician to the Northeastern Dispensary, and a Sanitary Inspector in the Council of Hygiene and Public Health. In the same year he became a member of the New York County Medical Society, and was elected a member of the New York Pathological Society. During the next year, 1865, he was appointed District Physician to the New York Lying-in Asylum, and joined the Medico-Historical Society, whose object it was to classify the members of the medical profession and print a list of the regulars in the *Medical Register*. When the Metropolitan Board of Health was organized in 1866 he was appointed a Sanitary Inspector. His zeal in

his duty in this capacity was too great, and while inspecting an old house in Nassau street with too much minuteness, he fell through a trap door, and was injured to such a degree that he was laid up for six months, and then went to Europe to restore his health. During the same year he operated successfully in ovariectomy, and was the first who removed the tumor with a galvano-cautery battery, introducing antiseptic precautions, drainage, and washing out the abdominal cavity. In 1867 Dr. Newman was one of the founders of the Medico-Legal Society, and its first vice-president. The New York State Medical Society appointed him a committee to investigate the result of consanguineous marriages. For two years he corresponded largely with medical men all over the world in order to complete

Robert Newman.

his investigations, and made an elaborate report to the society at the meeting in 1869. Soon after, he was one of the founders of the Forensic Society, which had only a short life. In 1870 he was appointed Chief Medical Examiner by the Republic Life Insurance Company, and the Gynecological Society of Boston elected him a corresponding member. He was also a member of the Neurological and Electrological Society, and in 1872 became a permanent member of the American Medical Association, and in the next year, 1873, was elected a permanent member of the New York State Medical Society. After having delivered some lectures he was elected, in 1874, a honorary member of the Ulster County Medical Society. During the same year he also was honored by elections as Vice-President of the Alumni Association of Bellevue Hospital Medical College, and President of the Northwestern Medical and Surgical Society, of which he was one of the founders. In 1875 Dr. Newman received the appointment as Surgeon of the Northwestern Dispensary, which position he has held for fourteen years, and during that period he has performed many operations. For

several years, beginning in 1879, he was Corresponding Secretary of the Alumni Association of Bellevue Hospital Medical College. Since the organization of the Alumni Association of Long Island College Hospital in 1880, Dr. Newman has been in the Board of Managers and successively its Vice-President, and lastly President. While Dr. Newman has a preference for surgery, he has made electrolysis his special study, in which branch he is the acknowledged authority; and his improved method of treating strictures by electrolysis, which he has practiced successfully now for twenty-three years, is well known and accredited. All the electrodes for this operation have been devised by him and are distinguished by his name. In 1886 he also devised the galvano-cautery sound for the treatment of hypertrophied prostate. In medical literature the Doctor is not unknown. Articles from his pen are again and again appearing, and some of his papers read before medical societies in this country have attracted so much attention that they have been translated and published in the leading European medical journals. He has contributed to medical literature forty-five articles; and when in Berlin in 1890, at the International Medical Congress, he read a paper in German upon "Electrolysis." Besides the societies previously mentioned, Dr. Newman is now a member of the following societies: The Physicians' Mutual Aid Society; Society for Relief of Widows and Orphans of Medical Men; the New York County Medical Association; the New York State Medical Association; the Society of Medical Jurisprudence; the New York German Medical Society; Fellow of the American Electro-Therapeutic Association; honorary member of the Berlin Cremation Society, and honorary member of the Danbury (Conn.) Medical Society. He is also in active service as Consulting Surgeon to Hackensack Hospital; Consulting Surgeon to Bayonne Hospital; Consulting Physician to Home for Aged and Infirm at Yonkers, and Consulting Surgeon to German Dispensary, West Side, New York.

NEWMAN, William Henry, of Pueblo, Col., was born February 24, 1829, in Spencer county, Ky., his parents being natives of that State. Receiving an academic education at St. Joseph's College, Bardstown, Ky., he subsequently entered the Jefferson Medical College, Philadelphia, and graduated in March, 1855. Locating in Bardstown, Ky., he there practiced until 1863; then at Louisville until 1872, when, seeking relief from asthma, he removed to Denver, Col. He practiced there, and in Leadville, for ten years, when he removed to Pueblo. While residing in Bardstown he was Physician to St. Joseph's College and the Nazareth Female Academy. Entering the United States Army in 1862, he served as Surgeon of the Third and Tenth Divisions, Army of the Cumberland, and in charge of hospitals at Bardstown, Ky., until the close of 1863. In 1864 he was elected Professor of Obstetrics in the University of Louisville, but immediately resigned. In the fall of 1865 he delivered a series of nine lectures on the "Surgical Diseases of Women," which is believed to be the first course ever given upon this subject. In 1870, in performing ovariectomy, he demonstrated, probably for the first time, the efficiency of carbolic acid as a local anæsthetic. For three sessions, 1869-70, he gave clinical

lectures on the diseases of women at the Louisville City Hospital. He is a member of the Obstetrical Society (of which he was president in 1869-70) and College of Physicians and Surgeons of Louisville; corresponding member of the Gynecological Society of Boston, Mass., and was vice-president of the Colorado Territorial Society. Among his contributions to the literature of his profession are papers on, "Amputation of the Cervix Uteri;" "On Chronic Inflammation of Cervix Uteri;" "Rupture of Cervix Uteri Occurring at Time of Parturition;" "Inversion of Uterus;" "On Ovariectomy without Anesthesia;" and "Colorado as a Health Resort."

NICHOLS, Arthur H., of Boston, Mass., was born, in that city, September 9, 1840. He received his medical education at the medical department of Harvard University, and obtained the degree of M. D. from that institution in 1866, and immediately afterward established himself in practice in his native city. He has devoted especial attention to domestic and public hygiene. He is a member of the American Social Science Association; of the Boston Society for Medical Observation; the American Statistical Society, and the Norfolk District Medical Society, and was secretary of the latter organization for many years. He is also an active member of several other medical societies and scientific bodies. His contributions to medical literature have been numerous and important, among which may be mentioned, "Charbon in Massachusetts," "The Effects on Health of the Use of Sewing Machines," "The Adulteration of Milk," and the "Contamination of Drinking-Water by Impure Ice," all of which have been published in the reports of the Massachusetts State Board of Health.

NICHOLS, Henry L., of Sacramento, Cal., was born in Augusta, Me., September 11, 1823. He received his medical education from Bowdoin College, and was graduated at that institution in 1845. He first established himself in the general practice of his profession in his native city, where he remained for about eight years. In 1853 he removed to California, and located in Sacramento, where he has since remained. Dr. Nichols has been a member of the Sacramento County Society for Medical Improvement, and of the Medical Society of the State of California. Dr. Nichols is a man of affairs, and has been honored with many positions of honor and trust since a resident of the Golden State. He was Mayor of Sacramento City from 1858 to 1859; Secretary of State from 1867 till 1871; and was a member of the State Capital Commission. He was also Director of the State Prison, and has served as Trustee of the State Library.

NIVISON, Nelson, of Burdett, N. Y., of Scotch-English ancestry, was born in Ulysses, N. Y., May 27, 1816. Having received an academical education he obtained his professional training at the College of Physicians and Surgeons of the Western District of New York, at the Geneva Medical College, and at the University of New York. He received the degree of M. D. from the Geneva institution in 1856, and his *ad eundem* degree from the University of New York in 1859. Dr. Nivison began his professional career at Mecklenberg, in his native State, in 1839. He practiced in that village during the ensuing ten years, and for the next twelve years at Hector, in the same

State, and since 1861 has been established in the town of his present residence. He is a member and one of the founders of the Schuylers County Medical Society, and has served as president of the same. He is also a member of the New York Medical Society and of the American Medical Association. From 1863 till 1872 he was Professor of Physiology, Pathology and Microscopic Anatomy in the Geneva Medical College, and has since been Professor of Physiology, Pathology and Hygiene in the medical school of the Syracuse University. He has occasionally contributed reports and essays to professional periodicals, one of his more important papers being "On Certain Antagonistic Effects of Opium and Quinine," published in the *American Journal of Medical Science*, and extensively noticed in other leading medical publications.

NORTH, Elisha, of New London, Conn., was born in Goshen, that State, January 8, 1771, and died in the former city December 29, 1843. Being the son and grandson of physicians, he was early influenced to follow that profession. For this purpose he studied in Hartford, under Lemuel Hopkins, and subsequently in Philadelphia, under Benjamin Rush. After being admitted to practice, he settled in his native town and engaged in the pursuit of his profession until 1812, when he removed to New London, and in both places obtained a wide reputation for his skill and judgment. Dr. North was always foremost in adopting improvements in medicine, and was among the earliest to practice vaccination in the United States. He was the first to introduce vaccine matter in New York, sending to Dr. Edward Miller, of that city, a person who had been vaccinated expressly for the purpose of supplying the physicians with genuine virus. Dr. North devoted special attention to diseases of the eye, and established the first Eye Infirmary in this country, at New London, in 1817. "When the new and obscure disease known as 'spotted fever' raged in New England from 1806 till 1810, Dr. North treated it with marked success, and his publication on the subject received general approbation." He published "A Treatise on a Malignant Epidemic Commonly Called Spotted Fever," 1811; "Outlines of the Science of Life," 1829, and numerous essays, one of the latest being upon the subject of phrenology.

NOYES, Henry D., of New York, was born in that city in 1832, and was educated at the New York University, from which he graduated A. B. in 1851, and A. M. in 1854. He studied medicine at the College of Physicians and Surgeons, New York, in 1855, and also at the New York Hospital from 1855 to 1858, and settled in New York City, making a specialty of diseases of the eye and ear. He is a member of the New York Academy of Medicine; County Medical Society; Pathological and Ophthalmological Societies; Medical Library Journal Association; State Medical Society, and of the American Medical Association. His contributions to medical literature have appeared in the *American Journal of Medical Sciences*, in the *New York Medical Record*, in the *New York Medical Journal*, in the Transactions of the American Ophthalmological Society, and in those of the Medical Society of the State of New York; and in the Ophthalmic Hospital Reports, London. He has also recently published a "Text-Book on Diseases of the Eye,"

1892. He has been Professor of Ophthalmology and Otology in Bellevue Hospital College many years, as well as Executive Surgeon of the New York Eye and Ear Infirmary. Dr. Noyes was the first to establish the use of cocaine in this country as a local anesthetic in ophthalmic surgery.

NUTT, George D., of Williamsport, Pa., was born in Pemberton, N. J., April 17, 1845. He was educated at Hightstown Classical and Scientific Institution, and studied medicine at the University of Pennsylvania, from which he received the degree of M. D. in 1869. He immediately afterward settled in the town of his present residence, where he has been engaged in general practice, but has in the meantime given special attention to diseases of the eye and ear. His medical education and training have been supplemented by attendance at the Philadelphia Polyclinic, in 1882. He has been an active member, secretary, and president of the Lyscoming County Medical Society; he is also a member of the West Branch Medical Association; Pennsylvania State Medical Society, and of the American Medical Association. Dr. Nutt is Attending Surgeon to the Williamsport Hospital, and is recognized as one of the leading medical men of that section of Pennsylvania.

O'HANLON, Philip Frank, of New York City, was born there September 13, 1862, in the family house in East Eighteenth street. His father, also a physician, and a distinguished soldier of the Irish Brigade during the war between the North and South, was an Irishman, born in Limerick county, where the name of O'Hanlon has been associated with medicine for many years, father and son yielding the knowledge down the line of new generations. Philip is the family name. The subject of this sketch was trained in the public schools of the city in which he was born, and also in the Jesuit College, at Montreal, Canada, and St. Francis Xavier, in that city. After graduating at the medical department of the University of the City of New York, Dr. O'Hanlon secured a position on the hospital staff of Gouverneur Hospital, and at the expiration of service at that institution he was appointed Attending Physician to the Out-door Poor of Bellevue Hospital. During his service as House Surgeon at Gouverneur Hospital, he introduced a method of overcoming oedema of the lungs by placing patient on his chest, inclining head downwards. It was a success in two cases of oedema complicating pneumonia, the fluid in the lungs coming out in a considerable flow, a condition in which the patients were literally being drowned. The heart action in both cases being strengthened, the recovery resulted. In the same year he introduced, per rectum, a rubber tubing three and a half feet long into the intestines, overcoming, by the introduction of water, a fecal impaction of the bowel, which resulted in the saving of the life of the patient after his case was pronounced hopeless by several good practitioners who had sent the case to the hospital. Both of these cases were published in the *Medical Record*, 1887 and 1889, respectively.

O'HARA, Michael, of Philadelphia, Pa., was born in that city January 2, 1833. He is the eighth of thirteen children; his oldest brother, the Right Rev. William O'Hara, is the first bishop of Scranton, Pa. His parents were Thomas O'Hara and Louisa Miller of Lima-

waddy, County Derry, Ireland. He received his preliminary education in the public schools of Philadelphia, and graduated from the Central High School of that city in 1848. His medical preceptor was Dr. William V. Keating, at one time Professor of Obstetrics in the Jefferson Medical College of Philadelphia. He is a graduate of the Medical Department of the University of Pennsylvania, April, 1852. The degree of Master of Arts was conferred on him by the faculty of the Central High School of Philadelphia in 1853. He first practiced in Philadelphia, and subsequently served as Assistant Surgeon of the United States Navy, from 1854 to 1859, when he returned to private practice in Philadelphia. On September 12, 1862, he was appointed Assistant Surgeon to the One-Hundred-and-Fiftieth Regiment Pennsylvania Volunteers (second Buck-

delphia County Medical Society, the first International Medical Congress of America (in which he served as delegate), held at Philadelphia, July 4, 1876. He was also a delegate, and contributed a paper on "Extra-uterine Gestation," to the Ninth International Congress at Washington, D. C., 1887. Since March, 1873, he has been active in the Catholic Total Abstinence Union of America, and served as chairman of the committee, which erected the Centennial fountain and statuary in Philadelphia Park, and presented to that city and dedicated July 4, 1876, in honor of religious and civil liberty. He also served as chairman of the committee to endow the Father Mathew Memorial Chair in the American Catholic University at Washington, D. C. He is a member of the American Association for the Advancement of Science. He has written for various magazines, and for the societies of which he is a member. His contributions are mainly contained in the reports of County Medical, Pathological and Obstetrical Societies. He was one of five brothers who served during the late war, and is at present corresponding secretary of Survivors of the One-Hundred-and-Fiftieth Pennsylvania Volunteers. He is the father of ten children, the oldest of them being Dr. Michael O'Hara, Jr., who is Assistant Gynecologist to St. Agnes Hospital, Philadelphia.

OHMANN-DUMESNIL, Amant Henry, of St. Louis, Mo., was born at Dubuque, Iowa, September 30, 1857. He is of French extraction, his parents being born in France. When quite young he was sent to school, but illness interfered with a regular attendance until January, 1868, when he began in the primary class of the College of the Christian Brothers, of St. Louis, receiving the degree of A. B. in 1874. He then entered the Missouri School of Mines and Metallurgy (Missouri State University), from which he obtained the degree of M. E. (Mining Engineer), in 1877, receiving the degree of M. A. the same year. He then matriculated in the St. Louis Medical College (Washington University), and had the degree of M. D. conferred on him in 1880. He then immediately entered upon the practice of his profession. He always had a leaning for dermatology, but devoted himself to general practice for seven years, after which he gradually abandoned it and now limits himself entirely to his chosen specialty. In 1891 he married Mrs. Lillie P. Beecher, who was a resident of St. Louis. From the time he began to study medicine, Dr. Ohmann-Dumesnil was a constant attendant upon the meetings of medical societies. In 1881 he was elected recording secretary of the St. Louis Medical Society, which position he occupied for three successive years. In 1883 he was elected secretary of the Missouri State Medical Association. In 1887 and 1888 he acted as treasurer of the Mississippi Valley Medical Association. In 1887 he was first vice-president of the Section on Dermatology of the ninth International Medical Congress, and is at present president-elect of the Section on Dermatology of the Pan-American Medical Congress. He is a member of the International Congress of Dermatology. He was one of the charter members and incorporators of the Association of Military Surgeons of the National Guard of the United States, being at that time the medical officer of Battery A. N. G. Mo. He has also been, for years, an active

Michael O'Hara

tails), and on November 13, 1862, he was promoted Surgeon. Since his resignation from the army in 1863, he has been engaged in general practice in his native city. He was president of the Board of Examining Surgeons of the Pension Bureau at Philadelphia in 1888 and 1889. He was Visiting Physician to St. Mary's Hospital, Philadelphia, from 1878 to 1892, and to St. Agnes Hospital, of the same city, since its opening in 1884. He is now serving his seventeenth year as Physician to House of the Good Shepherd, Philadelphia. He is Medical Examiner for the Catholic Knights of America, and one of the Physicians to Hibernian Society of Philadelphia. He is a member of the following societies, viz: Philadelphia County Medical (of which he was vice-president and librarian); the Pathological; Obstetrical; the Pennsylvania State Medical, and the American Medical Association. He, with Drs. L. Turnbull and J. G. Stetler, constituted a committee, who originated and organized, for the Phila-

member of the American Medical Association, being a member of the executive committee of the Section on Dermatology, having been largely instrumental in its organization. Dr. Ohmann-Dumesnil began to teach at an early date. He first occupied the chair of Dermatology in the St. Louis College for Medical Practitioners, in 1881. A year later he was called to the chair of Dermatology and Lyphography in the St. Louis College of Physicians and Surgeons, in which position he has continued to the present day, being now one of the oldest members of the faculty. Original investigations have always occupied a large portion of his time; and, as a result of former investigations, he has originated a number of therapeutical methods of established worth, and has invented a number of instruments for the use of dermatologists. Dr. Ohmann-Dum-

A. H. Ohmann-Dumesnil

esnil has been a noted clinician and frequent contributor to medical literature since 1877. At that time he was a regular contributor to the *St. Louis Medical and Surgical Journal*, becoming associate editor in 1880. For several years past he has been its editor and continues to occupy that position. In addition to this he assumed the editorial management of the *Medical Review* (weekly) in January, 1892, and still continues in that position. Aside from the editorial work connected with the above journals, Dr. Ohmann-Dumesnil has been a prolific writer. He has always confined his contributions to dermatology and syphilology, and his articles have been published in foreign and American medical journals, both general and special. Among his most noteworthy publications may be mentioned a series of clinical lectures published in the *International Clinics*, during 1891, 1892 and 1893, and articles on the following subjects: "A Case of Indigent Leprosy," "Lupus Erythematosus of the

Hand," "Kraurosis Vulvae," "Parasitic Disseminated Perifolliculitis," "Neurotic Hypertrichosis," "Alopecia Areata." Many of these were conditions which were undescribed before he called attention to them, such as "Intra-Urethral Chancroid," 1891. All of his contributions have been marked by originality of research and rarity of diseases described. Dr. Ohmann-Dumesnil has also contributed some books to medical literature, the principal of which are: "A Hand-Book of Dermatology," 1890; "A Critical Translation, with Notes and Additions, of Buret's Syphilis in Ancient and Prehistoric Times," 1891; "Syphilis in the Middle Ages," and "Syphilis in Modern Times," 1892. He is comparatively a young man yet, and has a brilliant future before him. He is an indefatigable worker in his profession and is entirely devoted to dermatology.

O'NEAL, John W. C., of Gettysburg, Pa., was born near Alexandria, Va., April 21, 1821, and is of Irish and English descent. His classical and literary education was obtained at Pennsylvania College and the primary schools connected with that institution. His medical studies were pursued under the preceptorship of Dr. John Swope, of Taneytown, Md., and the teaching of the Medical Department of the University of Maryland, from which he obtained the degree of M. D., in 1844. He first settled in Hanover, Pa., where he remained five years, when he removed to Baltimore, in 1849, in which city he practiced his profession twelve years, and finally established himself at Gettysburg, in 1863. He is a member of Adams County Medical Society, of the Pennsylvania State Medical Society, and of the American Medical Association. He has contributed to the literature of the profession a pamphlet, "On the Cholera of 1852, as it Appeared in Baltimore;" "Medical and Surgical Experience upon the Battle Fields of Antietam and Gettysburg," and numerous other papers and reports. He has been a member of the Board of Public Charities, Commonwealth of Pennsylvania, since 1883. He was President of the Pennsylvania and Maryland Association of Physicians and Surgeons in 1887. He attended as Medical and Surgical Adviser of the House of Industry of Adams county, Pa., from 1863 till 1871, inclusive, and resigned in favor of his son, Dr. Walter H. O'Neal, who has since filled that position.

OPIE, Thomas, of Baltimore, Md., was born at Martinsburg, W. Va., February 14, 1840. After receiving a preparatory education at Staunton, Va., he attended two sessions at the University of Virginia; studied medicine and entered the medical department of the University of Pennsylvania, receiving the degree of M. D. from the latter institution in 1861. Soon after he was graduated he entered the Army of the Confederate States as Surgeon of the Twenty-fifth Virginia Regiment, and was subsequently placed in charge of a division hospital at Staunton, Va. On leaving the army in 1865, he located at Baltimore, where he entered on the private practice of his profession. In 1867 he married the daughter of Col. M. G. Harmon, of Staunton, Va. Dr. Opie has held the position of Dean of the College of Physicians and Surgeons, Baltimore, since its organization in 1872, and has filled the chair of Obstetrics in the same institution, and that of Obstetrician to the Maryland Lying-in Hospital. He is a member of

the American Medical Association, Southern Surgical and Gynecological Association, Medical and Chirurgical Society of Maryland, Baltimore Medical and Surgical Society, Gynecological and Obstetrical Society of Baltimore, and the Clinical Society of Baltimore.

ORME, Henry S., of Los Angeles, Cal., was born at Milledgeville, Ga., March 25, 1837. He is of English descent, and was educated at Oglethorpe University, from which he received the degrees of A. B. and A. M. in 1858. He attended medical lectures at the University of Virginia in 1859-60, and at the University of New York in 1860-61, receiving the degree of M. D. from the latter institution. From 1861 till 1865 he served as Assistant Surgeon and Surgeon in the Confederate States Army. From September, 1865, till December, 1867, he was engaged in the general practice of his profession at Atlanta, Ga., and from July, 1868, to the present date he has been established at Los Angeles. He is a member of the American Medical Association, American Public Health Association, Medico-Legal Society of New York, ex-president and member of the Los Angeles County Medical Society, member of the California State Medical Society, ex-president of the California State Board of Health, member of the Southern California Medical Society, and is Professor of Hygiene in the Medical College-University of Southern California. He has been Physician to the Los Angeles Small-pox Hospital, and has been for many years Physician and Surgeon to the Los Angeles County Hospital. He has read papers before the California State Medical Society on the topography and climatic advantages of Los Angeles as a health resort.

ORTON, John G., of Binghamton, N. Y., was born at Seneca Falls, that State, December 5, 1827. His ancestors emigrated from England, in 1636, and settled in Windsor, Conn. His professional education was received at the University of New York, and he was graduated M. D. from the medical department of that institution, in 1853, settling in the spring of 1854 at Binghamton, where he has since remained engaged in the general practice of his profession. In 1856, he was married to Helen M., daughter of Dr. Amni Doubleday, of Binghamton. He is a member of the American Public Health Association; permanent member of the New York State Medical Society; American Medical Association; International Medical Congress, and founder and ex-President of the New York State Medical Association. He has also held the position of Consulting Surgeon to the New York State Inebriate Asylum, and the Binghamton City Hospital. Among his contributions to medical literature special mention may be made of, "A Case of Successful Operation for Ovarian Dropsy;" "Amylene as an Anæsthetic," and "Contributions to Clinical Pathology," which have been published in the Transactions of the medical societies in New York. Dr. Orton has for many years held the position of Manager of the New York State Inebriate Asylum; Manager and President of the Orphan Asylum at Binghamton; Trustee of the New York State Blind Asylum; Trustee of the Binghamton Savings Bank; member of the Board of Education of that city, and United States Examining Surgeon for Pensions. He has also been the confidential adviser and medical examiner for a majority

of the life insurance companies represented in Broome county, N. Y.

OTIS, Fessenden Nott, of New York, was born in Ballston Spa, Saratoga county, N. Y., March 6, 1825. He was educated at the Canandaigua and Fairfield Academies, and received his literary degrees from Union College, Schenectady, N. Y. He studied medicine in the New York Medical College, and at the College of Physicians and Surgeons, New York; graduated M. D. at the former in 1852; he also received the honorary M. D. from the latter in 1864. In 1859 he married Frances H., daughter of Apollos Cooke, of Catskill, N. Y. He was first at Blackwell's Island Hospital; in 1853 he became Surgeon of the United States Mail Steamship Company, a position he held till 1860; he has since resided in New York. He is President of the Medical Board of the Strangers' Hospital, New York; fellow of the New York Academy of Medicine; member of the New York County Medical Society; of the New York Pathological Society; of the New York Dermatological Society; of the New York Medical and Surgical Society; American Association of Genito-Urinary Surgery, and British Medical Association. He was appointed Lecturer on Genito-Urinary Organs in the College of Physicians and Surgeons, New York, in 1862; Clinical Professor in same institution, in 1871; was President of the Board of Surgeons of New York Police Department, 1870 and 1872; Superintending Surgeon Pacific Mail Steamship Company, 1869 to 1873; President of the Medical Board of Strangers' Hospital, New York, 1871 and 1873; Honorary Advising Physician of Artists' Fund Society; Visiting Surgeon of Charity Hospital since 1873; Consulting Surgeon of St. Elizabeth's Hospital since 1876; Consulting Surgeon of New York Colored Orphan Asylum, Manhattan Eye and Ear, and New York Skin and Cancer Hospitals; Clinical Professor (emeritus) of Venereal Diseases at the College of Physicians and Surgeons, New York; Surgeon to the Genito-Urinary Department of the Strangers' Hospital. His contributions to medical science consist, among other papers, of a pamphlet on "The Physiology of Syphilitic Infection," 1872; "Monographs on Urethral Strictures and Various Diseases of the Male Genital Organs," 1877, and "Genito-Urinary Diseases and Syphilis," 1883—Students' Edition, 1886. In 1871 Dr. Otis invented the urethrometer and the dilating urethrotome, which he perfected in 1872 and 1875, respectively. He is the inventor also of the dilating catheter and prostatic guide; the cold water coil; the ready aspirator, which he introduced in 1875, and a simplified evacuator for removing stone from the bladder, after lithotomy; introduced in 1883 and perfected in 1888.

OTIS, George A., of Washington, D. C., was born in Boston, November 12, 1830, and died in the former city, February 23, 1881. Graduating, with degrees of A. M. and A. B., from Princeton, he entered the medical department of the University of Pennsylvania, receiving his degree of M. D. from that institution in 1850. He subsequently prosecuted his professional studies in London and Paris, eventually returning to this country and establishing himself at Springfield, Mass., in 1854. In September, 1861, he entered the army as Surgeon of the Twenty-seventh Massachusetts Volunteers, and rendered efficient field service dur-

ing the entire war. In February, 1866 he was appointed Assistant Surgeon in the United States Army. In September, 1866, he was made surgeon and brevet lieutenant-colonel in the regular service. He was a member of the leading medical societies of America, and corresponding member of various similar organizations in Europe. He has written freely for prominent medical journals, but the bulk of his literary work has been in the shape of the reports which he has issued under orders from the Army Medical Department, viz.: "The Surgical Report of Circular 6, S. G. O., on the Nature and Extent of the Materials Available for a History of the War;" on "Amputation at the Hip-joint;" on "Excisions of the Head of the Femur;" on "A Plan for Transporting Wounded Soldiers by Railway;" on "The Transport of Sick and Wounded by Pack Animals;" "Report of Surgical Cases Treated in the Army of the United States from 1867 to 1871;" also "A Check-list of the Anatomical Section of the Army Medical Museum at Washington," and two volumes, constituting Vol. 2 of Part I, and Vol. 2 of Part II, of "The Medical and Surgical History of the War of the Rebellion." The compilation of this last-named work placed Surgeon Otis among the most prominent of contributors to surgical history.

OTTO, John Conrad, of Philadelphia, Pa., was born near Woodbridge, N. J., March 15, 1774, and died June 26, 1844. He was of German descent, and his ancestry for several generations were prominent in the medical profession. "His grandfather came to this country in 1752, and settled in Philadelphia, where he engaged in the practice of medicine, and during the winter of 1778, he had charge of the Hospital of the Continental Army at Valley Forge. His father, Dr. Bodo Otto, was warmly attached to the patriot cause; he sat in the senate of New Jersey, and served during the war as an officer in the Revolutionary Army." The subject of this sketch was graduated at Princeton in 1792, and in medicine at the University of Pennsylvania in 1796. In 1798 he was elected one of the physicians of the Philadelphia Dispensary, and in 1813, on the death of Dr. Rush, he was chosen to succeed the latter as one of the physicians and clinical teachers of the Pennsylvania Hospital, which he held twenty-one years, and in connection with which he became extensively known throughout the United States. He was physician to the Orphan Asylum and the Magdalen Asylum of his adopted city for many years. During the cholera epidemic of 1833, he was one of the twelve physicians that were chosen by the public authorities of Philadelphia to adopt sanitary measures, and establish and conduct hospitals in the city, and at the organization of the Sanitary Board he was made its president. He was a Fellow of the College of Physicians in which he held the office of Censor, and from 1840 until his death that of vice-president, and he was also for many years a member of the American Philosophical Society. He was the author of numerous papers, including "An Account of an Hemorrhagic Disposition in Certain Families," 1803; and another paper on the same subject, in 1805, which were published in the *New York Medical Repository*, and *Coxe's Medical Museum*, respectively. It is said that these papers were the first to appear on this subject.

OUCHTERLONY, John A., of Louisville, Ky., was born in Sweden, June 24, 1838. His father, an officer in the Swedish army, was of Scotch lineage, and his mother was a lady of French descent. He was educated in Sweden, studied medicine in the University of New York, and received his medical degree from that institution in 1861. He served as medical officer in the National Army during the Rebellion. He settled first in New York, but subsequently removed to the city of his present residence, where he has been engaged in the practice of his profession for many years. He has contributed numerous papers to medical periodicals of great value, among which may be mentioned "Angina Pectoris," "Graves' Disease," "Cystic Degeneration of Kidneys," "Molluscum Fibrorum," "Cholelithiasis" and numerous clinical records. Dr. Ouchterlony is Professor of the Principles and Practice of Medicine and Clinical Medicine in the University of Louisville; Consulting Physician to St. Mary and Elizabeth Hospital and the Louisville City Hospital. He has been president of the Louisville Medico-Chirurgical Society and secretary of the Louisville Obstetrical Society. He is an active member of the Louisville Clinical Society; of the Kentucky State Medical Society; of the American Medical Association, and honorary member of the Michigan State Medical Society, as well as numerous other medical, scientific and social organizations.

OWEN, Abraham M., of Evansville, Ind., was born at Madisonville, Ky., March 19, 1849. His preliminary education was acquired at Notre Dame School, Indiana; he was also a student at the University of Virginia. He read medicine under the preceptorship of his father, who was a physician, and entered Bellevue Hospital Medical College, New York, and received his medical degree from that institution in 1869. Dr. Owen then established himself at Evansville, where he has since remained engaged in a successful practice of his profession. In 1871 he established the Free Dispensary in that city. In 1874 he was made Professor of Diseases of the Eye and Ear in the Medical College of Evansville, and has since been appointed Professor of General and Operative Surgery in the same institution. He is a member of the Evansville Medical Society, and the Vanderburg County Medical Society, and has been president of the former and vice-president of the latter. He is also an active member of the Indiana State Medical Society, the American Medical Association, and of the first Pan-American Medical Congress, held in Washington, D. C., September, 1893, and served as treasurer of that distinguished assembly. Dr. Owen is also a member of numerous other medical and scientific organizations.

OWEN, Griffith, of Philadelphia, Pa., was born in Wales about 1647, and died in 1717. He was liberally educated and became a physician and surgeon. When William Penn received his charter for the Province of Pennsylvania, Owen, then a Quaker, took an active part in promoting the emigration of his Welsh co-religionists, and being desirous of retaining their language, laws and customs in the New World, he, with others, induced Penn to set apart 40,000 acres as a Welsh tract, in which the Welsh alone should have the right of purchase, and within the limits of which the language of ancient Britain should prevail. On

securing this, Owen emigrated with his family, arriving in Pennsylvania in September, 1684, and settled on this tract which was called Merion. He acquired an extensive practice both there and in Philadelphia, to which place he subsequently removed, and performed the first surgical operation, it is thought, in Pennsylvania, namely, the amputation of a young man's arm injured by the premature firing of a cannon on the occasion of Penn's second visit to the Province. Thomas Story narrates that this operation was performed in Philadelphia (Dec. 1, 1699), and in a skillful manner, but as the arm was cut off, some spirits in a basin happened to take fire and being spilt on the surgeon's apron, set his clothes on fire, and there being a great crowd of spectators, some of them were in the way and in danger of being burned, as was the surgeon himself upon his hands and face, but running into the street the fire was quenched, and so quick was he that the patient lost not very much blood, though left in that open bleeding condition. Dr. Owen, whose merit and ability raised him to several offices of trust, continued his vocation as physician, "in which he was very knowing and eminent," as we are informed by Proud in his *History of Pennsylvania*. In fact, he appears to have been the chief medical practitioner of Philadelphia, and was highly respected for his professional talents, integrity and energy. Thus we find that he became coroner in 1685, and the next year was chosen to the assembly, in which body he served many years. In 1690 he was made a provincial councilman for a term of three years, and in 1700 was again chosen to this body, of which he remained a member until his death. Among the other offices that he held were those of an alderman under the charter of 1691; a justice of the peace; a judge of the court of common pleas, and one of Penn's commissioners of property. In the church affairs of the Society of Friends he bore a useful part, not only as a layman, but as a minister, and in the performance of religious work traveled frequently into other colonies and to England and Wales. In 1689, with others, he drew up a paper "to incite the quarterly meetings to keep up a godly discipline and a tender inspection over the youth." He attended the historical meeting of Quaker ministers at Burlington, N. J., in 1692, where George Keith declared: "There is not more damnable heresies and doctrine of devils amongst any protestant professions than among the Quakers," and was at the head of the committee of three that was appointed "to admonish Keith." Owen was one of those who prepared the testimony of the "Public Friends" against Keith, and he was the first to sign the noted Quaker document, "Our Ancient Testimony Renewed Concerning Our Lord and Savior Jesus Christ, the Holy Scriptures, and the Resurrection," of which paper it is said he was the author. "He was frequently employed to write epistles from the meeting in Philadelphia to the meetings in other places. Dr. Owen was one of the "Dear Friends" to whom William Penn, in 1712, addressed a letter from England, in which he said: "Now, know that though I have not actually sold my government (Pennsylvania) to our truly good queen, yet her able lord treasurer and I have agreed it." The sale was not consummated, however, owing to Penn's illness. Dr. Griffith Owen left no record of a

medical sort, but was a man of diversified talent, and held an unquestioned and somewhat curious pre-eminence in connection with the most important affairs of his time. He accomplished many things, which nowadays would scarcely be regarded as within the legitimate career of the broadest-minded physician. He died at about the age of seventy years, and was succeeded by his son, who practiced medicine for some time after his father's death.

OWEN, Pascal H., of Montgomery, Ala., was born in Lowndes county, that State, October 3, 1839. He is the son of Col. Lewis Owen, for many years president of the Montgomery and Eufaula Railroad Company. He was educated at New Haven, Conn., and at Union College, Schenectady, N. Y. His medical education and training were received at the University of New York, from which institution he was graduated M. D. in 1859, on which occasion he delivered the valedictory address. He soon after established himself at Montgomery, and has ever since been actively engaged in the practice of general medicine and surgery in that vicinity. During the Rebellion he assisted in organizing the General Military Hospital at Montgomery, and became surgeon-in-charge after the resignation of Surgeon Gindrat, in 1862. In 1869 he was elected a member of the American Medical Association; he is also an active member of the Alabama State Medical Association, and of the Montgomery Medical and Surgical Society. He is the author of "Reports of Mott's Surgical Clinique," "Essay on Cannabis Indica," and a "Monograph on Diphtheria." In 1876 he was elected Judge of the Court of Appeals, and in the same year State Senator. In the latter position he was instrumental in getting an act passed in the Legislature of Alabama to regulate the practice of medicine in that State, which protects regular practitioners and severely punishes "quackery."

OWEN, William T., of Louisville, Ky., was born in Claiborne county, Miss., November 3, 1829. He was educated in the University of Louisville, receiving therefrom the degree of A. B. in 1844, and that of M. D. in 1849. In the latter year he established himself in Louisville, where he has since remained engaged in the general practice of his profession. In 1854 he married Sarah E., daughter of Major Moses T. Hoagland, of Gen. Andrew Jackson's staff, Hunter's Bottom, Ky. He is a member of numerous medical organizations in his city and State, as well as of the American Medical Association. He has published important papers on professional subjects, among which may be mentioned: "Critical Epitome of the Differentiæ of Pyæmia and Leucocythæmia," 1866; "Rheumatism, a Review of Fuller," 1868; "Case of Extra-Uterine Pregnancy," 1870; "The Cause of Cholera," 1876; and a criticism of "A Note of Warning," by Dr. Ely McClellan, United States Army, 1877. From 1868 to 1870, inclusive, he was Professor of Theory and Practice of Medicine in the Kentucky School of Medicine.

OWENS, John E., of Chicago, Ill., was born in Cecil county, Md., October 14, 1838. His preparatory education was received at the schools of his native county, and in the city of Baltimore. In 1858 he began the study of medicine, under the preceptorship of Drs. J. and T. D. Dunott, Elkton, Md., remaining with them about two years. In 1860 he en-

tered the Jefferson Medical College, and was graduated from that institution in 1862, after which he received the appointment as "Interne" of Blockley Hospital for the period of one year. During the spring of 1863 he removed to Chicago, and served as surgeon in a military hospital in that city until 1864. He then established himself in general practice, devoting his time mainly to surgery. He has served as Surgeon to the Illinois Central Railroad, and as Visiting Surgeon to St. Luke's Hospital, Chicago, for many years. He has also lectured at the Rush Medical College on diseases of the urinary organs, and since 1872 on general surgery in that institution. He has contributed important articles to medical literature, and is an active member of numerous medical societies, including the American Medical Association.

OWINGS, Thomas B., of Ellicott City, Md., was born in Howard county, that State, September 23, 1830. His father was Dr. J. H. Owings, for forty years a leading practitioner of Maryland, and his grandfather, Capt. Thomas Boyle, of the privateer sloop "Vigilant," that blockaded the English Channel during the War of 1812. The subject of this sketch, having received a liberal preparatory education, entered the University of Maryland and was graduated in medicine from that institution in 1852. In the same year he established himself in Ellicott City, where he has since remained, engaged in a successful general practice of medicine and surgery, and has served for many years as physician to various local educational institutions. He has been an active member of the Medical and Chirurgical Faculty of Maryland and of numerous other medical organizations.

PACKARD, John Hooker, of Philadelphia, Pa., was born in that city, August 15, 1832. His family, of English descent, were among the original settlers of Massachusetts. He was educated at the University of Pennsylvania, going through the academical department, the department of arts, and the medical school, where he took the degrees of M. A. and M. D. in 1853. His medical studies were pursued under the preceptorship of Prof. Joseph Leidy. Soon after graduation he began private teaching in anatomy, surgery and obstetrics, and for over fifteen years was engaged in demonstrations and examinations on these subjects. During the War of the Rebellion he was an acting assistant surgeon, serving as Attending Surgeon at the Christian Street and Satterlee United States Army General Hospitals, in Philadelphia, and as Consultant at the Haddington Hospital, as well as at the Hospital at Beverly, N. J. He was one of the Surgeons to the Hospital of the Protestant Episcopal Church in Philadelphia, from 1863 to 1884. In the latter year he was elected on the staff of the Pennsylvania Hospital, a position which he still holds. Dr. Packard became a Fellow of the College of Physicians and Surgeons of Philadelphia in 1858; was its secretary for the fifteen years, 1862-1877, and its vice-president from 1885 to 1888. He was also the first Mütter lecturer in that institution from 1864 to 1866. He is a member of the American Medical Association, State Medical Society of Pennsylvania, and County Medical Society of Philadelphia; was one of the founders of the Pathological and Obstetrical Societies of Philadelphia, and twice presi-

dent of each. He was one of the original members of the American Surgical Association, and for two years its treasurer. His literary work, besides contributions to various medical journals, is as follows: A translation of "Malgaigne's Treatise on Fractures," 1859; "Hand-book of Minor Surgery," 1863; "Lectures on Inflammation," 1865; "Hand-book of Operative Surgery," 1870; important articles on "Poisoned Wounds" and on "Fractures," in

John H. Packard

Ashhurst's Cyclopaedia of Surgery, 1883, and one on "Fractures and Dislocations," in *Keating's Cyclopaedia of the Diseases of Children*, 1889. He also published three editions of the Philadelphia Medical Directory in 1868, 1871 and 1873. For many years engaged in a general practice, Dr. Packard has of late given his attention almost wholly to surgery. Among his other operations have been two successful hip-joint amputations, a successful ligation of the common iliac artery, etc. In 1872 he published the first notice of the primary anesthesia from ether, discovered by him, and since that time extensively used for brief operations.

PAINE, J. Y. F., of Galveston, Texas, was born in West Feliciana Parish, La., August 16, 1840, and is of Scotch-English descent. He received an academic education at Centenary College, Louisiana, and graduated in medicine at the University of Louisiana in 1861, during the service of the immortal Warren Stone, the great physician and surgeon of the South, then in the zenith of his renown. On the breaking out of the war between the States, Dr. Paine entered as a private soldier in the Fourth Louisiana Regiment of Volunteers, but was appointed assistant surgeon of the Twenty-second Louisiana Regiment in December, 1861. After the fall of New Orleans he served in the hospitals at Corinth and Holly Springs, Miss.; was examined May, 1862, at Columbus, Miss., by the Army Board

of Medical Examiners (Yandell, Pim and Heustis), and was commissioned surgeon with rank and pay of Major of Cavalry; assigned as surgeon of the Twenty-first Alabama Regiment, which was sent to Fort Morgan at the mouth of Mobile bay. By seniority of commission, he took rank as chief surgeon of the forces constituting the defense of Mobile bay. At the fall of these forts, in 1864, Dr. Paine was assigned as chief surgeon of General Hospital Nidelet, at Mobile, where he served till the surrender of that city, in 1865. Dr. Paine was then ordered to Gainesville, Ala., and took rank as surgeon in charge of the General Hospital at that post, and remained there till the final surrender of all the Confederate forces, in June, 1865. Upon the declaration of peace Dr. Paine settled in Mobile and engaged in general practice; removed to Texas in 1874; was elected to the chair of Obstetrics and Diseases of Women and Children in the Texas Medical College and Hospital at Galveston in 1875; after competitive examination, was made dean of the faculty in 1879; was elected chairman of the Section on Gynecology in the Texas State Medical Association, in 1885, and chairman of the Section on Practice, in 1886; was chosen secretary to the Section on Gynecology in the American Medical Association, 1885; elected president of the Galveston County Medical Society in the same year; was one of the vice-presidents of the Section on Public and International Hygiene of the Ninth International Medical Congress; and elected to the chair of *Materia Medica, Therapeutics and Hygiene* in the medical department of Tulane University—his *alma mater*—in 1885, which position he filled one term, to the entire satisfaction of the faculty and trustees, and with distinguished credit to himself and to Texas. Resigning this honorable position, for private reasons satisfactory to himself, he resumed practice in Galveston, where he has a large clientele of the wealthier classes, and lives in elegance and comfort, in a beautiful home on Broadway—the boulevard of Galveston—the fruits of his individual labors and industry. On resigning the chair in the university, at the close of the session, after repeated solicitations to reconsider his determination, he was made the recipient of a testimonial from the faculty, in the shape of a set of resolutions, expressive of the high appreciation of his services (which were characterized as eminently satisfactory and valuable); entertained by his colleagues, individually and collectively; and of deep and sincere regret at the necessity which induced him to sever relations so pleasant to them. These resolutions bore testimony to Dr. Paine's professional attainments and ability, no less than to those agreeable social qualities for which he is distinguished; and altogether, expressed a sincere regard for him as a teacher, a physician and a man—whom to know, is to respect; couched in a language as courteous as complimentary. Dr. Paine is an honorary member of the Southern Surgical and Gynecological Association; an honorary member of the Louisiana State Pharmaceutical Association, and was president of the Texas State Medical Association in 1888-9. He filled the chair of Obstetrics and Diseases of Women and Children in the Texas Medical College from 1876 till 1890, and upon the organization of the medical department of the University of Texas in 1891, was chosen by the Re-

gents for the corresponding position, and filled that chair the first session, 1891-2, having been also elected dean, the position which he now fills. He has contributed but little to current medical literature, being kept busy by his large practice, the demands of which were such as to prevent his even being present in the hall when his election as president of the Texas State Medical Association was announced amidst cheers and applause. His best papers are to be found in the Transactions of the Texas State Medical Association—notably his address as chairman of the Section on Practice—and in the *New Orleans Medical and Surgical Journal*. Dr. Daniels writes that, "Dr. Paine is characterized by a distinguished courtesy of manner, and has an easy and forcible manner of speaking which is impressive. These, conjoined to a splendid physique, mark him as a man well fitted to lead, and especially adapted to the position he fills."

PALLEN, Montrosé A., of New York City, was born January 2, 1836, in Vicksburg, Miss., and died in the former city October 1, 1892. His father, a Virginian, was Professor of Obstetrics in the St. Louis Medical College for twenty-seven years. Dr. Pallen received his medical education at the St. Louis University, from which he graduated in 1856. He spent two years in the medical schools and hospitals of London, Paris and Berlin, and then settled in St. Louis, where he remained till 1874, when he was called to the chair of Gynecology in the medical department of the University of the City of New York. During the War of the Rebellion, Dr. Pallen was medical director of Gen. Henry A. Wise's Legion in 1861, of Gen. William J. Hardee's Army Corps in 1862, and later on the Department of Mississippi until February, 1863. Subsequently he was sent to Canada by the Confederate government to report on the condition of the Confederate prisoners on Johnson's Island. He returned to Richmond in 1864, went to Paris, and obtained surgical and medical supplies for the Confederate armies. He was sent to Montreal again, but was captured on his way back to the South, and held on parole in New York until the end of the war. He was Professor of Gynecology in the Humboldt Medical College in 1866-67; Adjunct Professor of Obstetrics in the St. Louis Medical College, 1867-68; Professor of Gynecology in the St. Louis College of Physicians and Surgeons, 1869-70; Professor of Anatomy in the Missouri Medical College, 1871-72, and Professor in the medical department of the University of the City of New York from 1874 to 1882. In 1883 he assisted in forming the Post-Graduate Medical College. He also served as Surgeon to the Charity Hospital. He was a member of the New York Journal and Library Association; of the New York County Medical Society; of the New York Obstetrical Society; the New York Neurological Society; of the American Medical Association, and of numerous other medical organizations. In 1858 and in 1867 he was author of prize essays on "The Ophthalmoscope" and "Uterine Abnormities," read before the American Medical Association. He also contributed numerous valuable papers to medical journals, relating to the practice of ophthalmology, neurology, gynecology and obstetrics.

PALMER, Alonzo B., of Ann Arbor, Mich., was born in Richfield, Otsego county, N. Y.,

October 6, 1815, and died December 23, 1887. His father, born in Stonington, Conn., came of Puritan stock. He was educated in the schools and academies of Otsego, Herkimer, and Oswego counties, N. Y., and graduated in medicine at the College of Physicians and Surgeons of the western district of New York, in 1839. After passing the winters of 1847 and 1848 in New York City, and that of 1849 and 1850 in Philadelphia, in attendance on medical schools and hospitals, he took up his residence at Tecumseh, Mich., but removed to Chicago soon after. During 1852 he served as city physician during a severe cholera season among emigrants from the northern ports of Europe, and in the same year received the appointment of Professor of Anatomy in the College of Medicine and Surgery in the University of Michigan; in 1854 he was transferred to the chair of Materia Medica, Therapeutics, and Diseases of Women and Children; and in 1860 was transferred again, this time to the chair of Pathology and Practice of Medicine, holding the latter professorship until his death. In 1855, he was the recipient of the degree of A. M. from the University of Nashville, Tenn. Visiting Europe in 1859, he spent most of his time in the medical schools and hospitals of London, Dublin, Edinburgh, and Paris, returning to this country on the opening of the War of the Rebellion, in which he became subsequently engaged. In September, 1861, he resumed his duties as Professor in the University of Michigan. In 1864 he was appointed Professor of Pathology and Practice of Medicine in Berkshire Medical College, Mass., and in 1869 to the same chair in the Medical School of Bowdoin College, Me. The latter position he held for many years, the lectures being delivered during the vacation of the University of Michigan. Although occupied with a large general practice in Tecumseh and Chicago, he had, since his removal from Chicago, devoted himself principally to teaching medicine and the practical duties of the physician; and while his clinical, hospital, and consulting practices were still large, yet his most absorbing work was teaching, most of his time being occupied with his duties of instruction. His students, in the different medical schools in which he was engaged, number more than ten thousand. During the whole period in which he held the professor's chair, he had been a decided antagonist to the habitual use of alcoholic liquors and other narcotics, whether tobacco or opium, and even taught the inutility and often ill effects of tea and coffee when used as stimulants. Dr. Palmer was a member of the American Medical Association, and for many years took an active part at its meetings. He was elected its vice-president in 1860, and held that office during its suspension and until its meeting in Chicago. He had also, at different times, been chairman of various standing committees of the association. In 1859 he was elected honorary member of the New York State Medical Society; was president of the Michigan State Medical Society in 1872 and 1873, and was elected honorary member of the State Medical Society of Maine in 1875. Among his varied contributions to medical literature may be mentioned, "A Full Report of the Chicago Cholera Epidemic of 1852," referred to above, considered in connection with the sanitary condition of the city at that time. As chair-

man of committees of the American Medical Association, he made various reports, viz: On "The Plan of Organization of State and County Medical Societies;" on "Medical Literature," and on "Medical Education." He contributed numerous papers to medical journals, besides publishing a brochure on "Sulphate of Quinine," and another on "Asiatic Cholera;" four lectures on "Homeopathy," criticising adversely the dogmas of that school. He published several clinical lectures on "Paralysis" and on "Pneumonia," reference being made in the latter to the experience of several years' practice in the use of free antipyretic and antiphlogistic doses of quinine. In addition to the above, he was, with others, editor, from 1852 to 1859, of the *Peninsular Journal of Medicine*. In the beginning of the War of the Rebellion, in the spring of 1861, he was appointed surgeon of the Second Michigan Regiment of Infantry; was ranking surgeon in Gen. Richardson's Brigade at the first battle of Bull Run, and dressed the first wound inflicted by the enemy at Blackburn's Ford, on the 18th of the following July. The position of army surgeon, however, he resigned in September, 1861, to perform the duties of the professorship previously mentioned. He nevertheless visited the army as volunteer surgeon, during the vacations of the college, on various occasions during the war.

PALMER, Gideon S., of Washington, D. C., was born in Gardiner, Me., June 14, 1813, and died in the former city December 8, 1892. When a young man he taught the Lyceum at Gardiner, and fitted himself for college. He graduated from Bowdoin College, Maine, in the class of 1838, and afterward studied medicine in Philadelphia. He served his native city as councilman, alderman, representative in the State Legislature, where he was associated with Secretary Blaine. At the beginning of the late war he enlisted as a volunteer surgeon, serving as brigade surgeon on Gen. O. O. Howard's staff in the Army of the Potomac. He was in charge of Lincoln Hospital, of a hospital at Annapolis, and retired with the rank of brevet lieutenant-colonel. In 1869, at the request of Gen. Howard, Dr. Palmer took the chair of physiology and hygiene in the medical department of Howard University. He was for many years dean of the university faculty and surgeon in charge of the Freedman's Hospital.

PALMER, Henry, of Janesville, Wis., was born in New Hartford, N. Y., July 30, 1827, is a son of Ephraim and Abigail (Brown) Palmer, and a descendant from English Puritan and Scotch ancestors. His early education was received at Whitestown and Cazenovia Seminaries, and he subsequently entered on a course of teaching in New York and Massachusetts. In 1849 he made a cruise to the Arctic regions, and on his return entered the office of Professors March and Armsby, of Albany, N. Y., and graduated at the Albany Medical College in 1854. He was the resident surgeon of the Marshall Infirmary, Troy, N. Y., until he removed to his present place of residence in 1857. For thirty-five years the Doctor has been in general practice, which has been largely surgical, and between five and six years of this time was devoted to military surgery in the late war as surgeon of Volunteers and medical inspector, and in the Turko-Russian war in Europe. He has occupied

many positions of honor and trust; has held the office of mayor of the city of Janesville two terms; was Surgeon-General of Wisconsin for ten years, and has held various positions in local, State and national, medical and surgical societies, and is examining surgeon for pensions. The Doctor was appointed Professor of Operative and Clinical Surgery and Pathology in the College of Physicians and Surgeons, Chicago, Ill., when it was organized in 1882,

Henry Palmer

and continues to hold that position; he is surgeon for several railroads and to several hospitals. Dr. Palmer's original investigations and literary contributions have been largely in the direction of brain and abdominal surgery, and with results that have been satisfactory, as his last thirty-one cases of ovariectomy and hysterectomy have resulted in recovery.

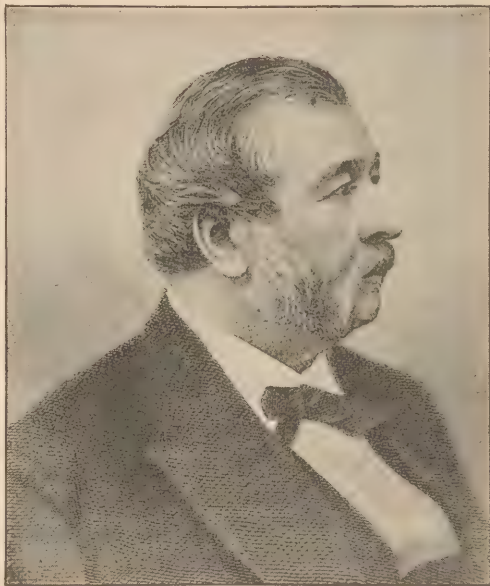

PALMER, James Croxall, of Washington, D. C., late Surgeon-General United States Navy, was born in Baltimore, Md., June 29, 1811, and died in the former city April 24, 1883. He was a descendant of an English family, Crochelle, A. D. 1056, and Croxall in 1640, all of Warwickshire. Richard Croxall I. of Birmingham, having married Joanna Carroll, cousin to Charles Carroll, Esq., who was chancellor to Lord Baltimore (the lord proprietor himself having married Alice Croxall), immigrated in the seventeenth century and established himself near the site of Baltimore town. Edward Palmer, also descended from a good English family, married Catharine Croxall in Baltimore. The subject of this sketch graduating A. B. from Dickinson College, in 1829, entered upon the study of law, in the office of

Upton S. Heath, Esq., of Baltimore; but relinquished this profession in order to enter the navy. Being too old to enter as midshipman, he studied medicine, and on March 26, 1834, was commissioned assistant surgeon, having just graduated M. D. from the University of Maryland. On the 29th following, he was ordered to the frigate "Brandywine," and sailed in her for the Pacific station, where (January 9, 1835) he voluntarily exchanged to the sloop "Vincennes," bound on a cruise through nearly all the South Sea islands, to China and other ports, and so around the world, home. After a short period of shore service, he applied for orders to sea. On July 17, 1838, he was ordered to the store-ship "Relief" of the exploring expedition under Lieut. Charles Wilkes. After very interesting service in that vessel, which made a perilous escape from shipwreck at Noir Island, in attempting the Brecknock passage into Magellan's straits, he was transferred to the sloop "Peacock." The adventurous cruise of that vessel is recorded in the general history of the exploring expedition; but Dr. Palmer has embodied one episode in a poem, the last edition of which is called the "Antarctic Mariner's Song," and describes the adventures of the "Flying-Fish" and the "Peacock," on a cruise as far south as the ice-barrier would permit. In a search for land, and penetrating too far into an ice-channel, the "Peacock" encountered an island of ice thirty-two miles in area, and higher than her mastheads. Her wreck was nearly complete; but, by the magnificent seamanship of her commander, Lieut. Hudson, she was taken safe to Sydney, New South Wales. After the wreck of the "Peacock" at the mouth of the Columbia river, July 19, 1841, he (Palmer) was, of necessity, established in command of a large shore-party at Astoria, and required to keep meteorological and tide-tables, and to perform duty with the scientific corps. On September 30, 1841, camp was broken at Astoria, and he was ordered to a purchased brig, called the "Oregon," in which he took passage to the bay of San Francisco, where, October 25, 1841, he was finally transferred to the flagship "Vincennes," in which he finished the exploring expedition, being detached in New York, June 17, 1842. After this long and perilous service, generally beyond the pale of civilization, and entirely out of the atmosphere of the profession, he had almost to begin anew; but the difficulties of examination were finally overcome, and he was commissioned as surgeon October 27, 1841. In that grade he served at the Washington Navy Yard, where he had charge of the numerous wounded by the frightful explosion on board the "Princeton," and gained some painful professional experience without losing any of his patients. October 31, 1844, he was ordered to the sloop "St. Mary's," in the squadron commanded by Commodore Stockton, and went to the coast of Mexico, where he was present at the annexation of Texas, and continued throughout the consequent war; at the bombardment of Vera Cruz, the surrender of San Juan de Ulloa, the taking of Tampico, and other operations on the coast. After another long period (three years and five months) aboard the "Valalia," in the Pacific, and some short services ashore, he was ordered, April 11, 1857, to the steam frigate "Niagara," on the first effort to lay the Atlantic cable. The sec-

tions aboard the "Niagara" and "Agamemnon" had their strands of armor-wires laid in different ways, one to the *right* and the other to the *left*. This, of course, rendered ordinary splicing impossible; for each must, of necessity, pull the other apart. The fate of the cable, when spliced in mid-ocean, depended upon overcoming this difficulty. Everybody was called upon for a plan; and the surgeon's was preferred by the commanding officer, Capt. Hudson, although interested in his own. The unfortunate break, 103 miles from the Irish coast, prevented an experiment. After a short cruise in the Mediterranean, he returned as fleet-surgeon, and was attached to the Naval Academy at Annapolis. The Civil War broke out, and the academy was transferred to Newport, R. I. He went, in sole medical charge of it, and, under great difficulties, accomplished hospital organization ashore and aboard the school-ships. But the war was going on, and he represented to the Bureau of Medicine and Surgery that he ought to be elsewhere. Accordingly, August 11, 1863, he was ordered to report as fleet-surgeon to the Western gulf blockading squadron, commanded by Admiral Farragut, and was attached to the flag-ship "Hartford" at the battle of Mobile, August 5, 1864, in which, out of six members of the medical staff, two were killed outright. After passing the forts and fleet and anchoring in the bay, he took the Admiral's steam barge (the "Loyall"), and went around the fleet, to aid the surgeons who had no assistants; and, upon returning to the "Hartford," he was hailed by Admiral Farragut and directed to go aboard the enemy's ram, the "Tennessee," just captured, and attend to Admiral Buchanan, who had had his leg broken in the action. It had been decided to amputate that leg, but he suspended the operation and reported the result of his visit to Admiral Farragut. Then followed numerous surgical performances by the medical officers of the ship, and some who had been signalled to come aboard. Among the cases that fell to his own share was an excision of the right clavicle, which was accomplished without accident, and successful in its issue, though the patient died about three weeks afterwards of acute pneumonia. On the morning after the battle the Federal and Confederate wounded—the latter being assigned to his exclusive charge—were taken to Pensacola and lodged in temporary hospital barracks. Of Admiral Buchanan personally, being his blood relation, he took exclusive charge, and in due time had the satisfaction of sending him north, with his leg restored and no limp in his gait. He took advantage of these hospital associations to accomplish between the Confederate Secretary Mallory and Admiral Farragut, whose consent had been previously obtained, a final agreement exempting all medical officers and attendants from detention as prisoners of war. Soon after the "Hartford" returned north, with Admiral Farragut's now renowned flag; but the fleet surgeon remained at Pensacola, to account for the men and material of so large a fleet. But unfortunately he stayed too long for his good, and was finally taken home in a dying condition, from accumulated malarious poisoning. He did, however, wind up the affairs of his department and was detached, with gratifying acknowledgments, from the bureau of medicine and surgery, September 21,

1865. He was afterwards in charge of the Naval Hospital at Brooklyn, N. Y., for about four years; but he continued in such precarious health for many months, that his death was reported imminent; though he finally, but slowly, recovered. On March 3, 1871, he was commissioned as a medical director; and on June 10, 1872, as Surgeon-General. From that office he was retired on June 29, 1873, and was put on the retired list according to law. During his period of active service he passed in actual sea-cruises seventeen years; on shore-stations seventeen years and four months; and was unemployed four years and eleven months. After his retirement, he was for four years a visitor to the Government Hospital for the Insane, near Washington. He published a volume of 240 pages, on a philological subject, and made some important professional contributions through the Bureau of Medicine and Surgery.

PANCOAST, Joseph, of Philadelphia, Pa., was born in Burlington county, N. J., in 1805,

Joseph Pancoast

and died in the former city March 7, 1882. Adopting the profession of medicine and surgery, he studied at the medical department of the University of Pennsylvania, and graduated therefrom in 1828. He at once commenced practice, and made surgery his specialty. He began teaching practical anatomy and surgery in 1831, and during the same year he translated from the Latin a "Treatise on the Structure, Functions and Diseases of the Human Sympathetic Nerve," by J. Frederick Lobstein, to which he added notes. In 1834 he was elected one of the Physicians of the Philadelphia Hospital, Blockley; shortly afterwards Physician-in-chief to the Children's Hospital, in the same institution, and from 1838 to 1845 he was one of the visiting surgeons to the same hos-

pital. In 1838 he was elected Professor of Surgery in the Jefferson Medical College. In 1844 he published his "Treatise on Operative Surgery," which he revised and enlarged in 1852, when it had passed to a third edition. During the first nine years of its existence upwards of four thousand copies were sold. He also, in 1844, remodeled the able work—originally written by Dr. Casper Wistar, to which the late Prof. William E. Horner had made valuable additions—entitled "A System of Anatomy for the Use of Students." On March 27, 1854, he was elected one of the Surgeons of the Pennsylvania Hospital, and resigned that position on February 29, 1864. In 1847 he was elected Professor of Anatomy in Jefferson Medical College, from which he resigned in 1874, and was succeeded by his son, Dr. William H. Pancoast. He thus filled for a period of thirty-six years, successively, two of the most important chairs in that celebrated school. Among the many new operations devised by him is the following one for soft and mixed cataracts: A very fine needle, turned near the point into a sort of hook, was introduced three-sixteenths of an inch behind the cornea; it was passed through the front part of the vitreous humor, between the margin of the dilated iris and the lens, and did not even touch the corpus ciliare—the most sensitive part of the interior of the ball. The advantage of this needle is that the soft parts of the lens can be well and deeply cut, and any hardened nucleus withdrawn by the needle, along the line of its entrance, by a sort of horizontal displacement, and the piece left in the outer border of the vitreous humor; surprisingly little irritation usually follows this operation. He devised, in 1841, the plough and groove, or plastic suture, in which four raw surfaces, the beveled edges of the flaps, and the margins of the groove cut by the side of the nose to receive the flaps, come together. He continued the use of this suture, and was quite certain to have union to follow in all his rhinoplastic operations. In removing cystic tumors, he advised not to cut them out, but to open the integuments down to the sac, and then cut on a director the cellular connections that hold the sac down. For the occlusion of the nasal duct, in the ordinary cases of epiphora, he introduced from the front, by a puncture of the lachrymal sac, a hollow ivory tube from which the earthy matter had been removed, and left it to slowly dissolve. Mr. Bowman, of London, endorsed the plan, and very frequently used it. He demonstrated that in bad cases of internal strabismus the tendon of the internal oblique muscle is often girdled by rigid connective tissue. The eye then will hardly come right till the tendon is drawn out with the blunt hook and cut. He has shown that, after the eyebrow had been destroyed, a good-looking substitute could be made by raising a flap of the scalp with the soft, drooping hairs of the temple, and giving it a long pedicle, to run in a bed cut for it up to the brow. He performed four times, with success, a lumbar operation for large abscesses, lying in the connective tissue between the colon and cecum and the front of the quadratus muscle. It is caused sometimes by a blow, but more frequently from inflammation of the colon and cecum; operations in these cases are peremptorily required. The posterior muscles of the velum palati are sometimes robbed of their

mucous membrane, and from the cicatrices following these throat ulcers, the muscles become rigid and hold the velum drawn up and so fixed as to impair the voice. By cutting these muscles behind the velum and loosening any attachment it may have made to the pharynx, a voice that was unintelligible, can often be restored. This operation was also often successfully performed by Dr. Pancoast. In 1829 he published, in the *American Journal of the Medical Sciences*, an operation for empyema, by raising a semi-circular flap of the integuments over the ribs, and puncturing the pleura near the base of the flap, putting a short catheter down to the inner end of the puncture, secured with a strong string; and forming thus a fistulous opening, to which the movable flap served as a valve, when the catheter was removed. He was the originator of the operation for the relief of extrophy of the bladder, by the turning down of cutaneous flaps from the abdomen and groin, over the hollow raw surface of the open bladder. This operation was first done by him in January, 1868, and has since been repeatedly practiced in Europe, as well as in this country, with more or less success. Amputations at the hip-joint or even high up on the thigh, were formerly very fatal operations from the excessive loss of blood. Far more patients died than recovered from these operations, especially that of the hip. Dr. Pancoast devised a plan to prevent this, by using the abdominal tourniquet with a large roller compress over the lower end of the aorta, so as to shut off all the arterial blood from the lower limbs. He found, by trial, that the patients could respire freely with this pressure, under ether, so as to give all necessary time for the operation, and carefully closing the divided vessels. The venous blood, before the aortic pressure was made, was swept back into the circulation by raising and rubbing the limbs. In June, 1860, he performed this operation at the Pennsylvania Hospital, on a large, muscular man, for a cancer of the thigh. The patient did not lose more than two or three ounces of blood, and made a very rapid recovery. In 1864, at the Jefferson Medical College, he made a similar operation on a fleshy woman, for a large bony tumor of the femur, extending the whole length of the shaft. The operation was here rapid and almost bloodless—she made a speedy recovery, and has since borne several children. This plan of operation is now followed in all such cases in this country, and in very many instances in Europe. In fact, it must become the fixed rule. There are cases of tic douloureux, involving all the branches of the second and third divisions, of the fifth pair of nerves—producing for months and years horrible suffering; and for which there is no relief but the division of the trunks of these nerves, as they come out of their foramina, at the base of the skull. He devised a plan for that operation which he successfully practiced in four cases. The first case was done in 1862, before the class of the Pennsylvania Hospital. Three others were done in the presence of the class of the Jefferson Medical College. He edited at sundry times, "Manec on the Great Sympathetic Nerve," and the "Cerebro-Spinal System in Man," by the same author; and subsequently, "Quain's Anatomical Plates." He was a voluminous contributor to the *American Journal of the Medical Sciences*; the *American*

Medical Intelligencer, and the *Medical Examiner*; besides publishing various monographs, both pathological and surgical, and at the time, many new operations in the then novel department of plastic surgery. He also published sundry essays and introductory lectures to his class; the one of 1856 is entitled, "Professional Glimpses Abroad." He was a member of the American Philosophical Society, of the College of Pharmacy, and other scientific institutions; of the Philadelphia County Medical Society, and the Medical Society of Pennsylvania.

PANCOAST, William H., of Philadelphia, Pa., was born in that city October 16, 1835. He is a son of the late Dr. Joseph Pancoast, Emeritus Professor of Anatomy in the Jefferson Medical College. He completed his collegiate education at Haverford College, Pa., graduating B. A. at the age of eighteen, in the spring of 1853. He subsequently, upon furnishing original papers, received the degree of M. A. from the same institution. He pursued his medical studies at the Jefferson Medical College, and graduated M. D. in 1856. The two and a half years following were spent in Europe, visiting the great hospitals of London, Edinburgh, Paris, Vienna and Berlin, in the continued pursuit of his profession, as well as in the study of such special courses as were afforded in those centres of medicine. While in Paris he was a special student with, and often an assistant of, the distinguished French surgeon Civiale (the founder of a surgical service in the Hospital of Necker; surgeon to the Emperor Louis Napoleon; to Leopold, King of the Belgians, and officer of the Legion of Honor), who wished him to settle in Paris as his assistant, and offered to take charge of his future—an offer respectfully declined. He returned to this country and settled in his native city, where he commenced a general practice, but devoting himself chiefly to the surgical branch of his profession, also to private teaching, and especially anatomy. Dr. Pancoast is now recognized as one of the most prominent of medical men in Philadelphia. He is seldom mistaken in diagnosis, is conservative in treatment, and has acquired a high reputation as a bold, rapid and skillful operative surgeon. Among the incidents of his career was his conception to obtain the bodies of the Siamese twins for the purpose of the scientific examination of the band uniting them—a conception subsequently put in execution. For this purpose, after their death, in the spring of 1874, he visited North Carolina with his colleagues, and procured the bodies, upon which he subsequently made a post-mortem examination, under the auspices of the College of Physicians of Philadelphia, and proved that the band could not have been safely cut except in their childhood. He is a member of the Academy of Natural Sciences of Philadelphia; fellow of the College of Physicians of Philadelphia; member of the Philadelphia County Medical Society, of which he was elected president in 1869; permanent member of the Pennsylvania State Medical Society, of which he was elected vice-president in 1870; permanent member of the American Medical Association; member of all the various Philadelphia Medical Societies, and was a member of the International Medical Congress held in Philadelphia in 1876. His contributions to medical literature consist of papers to the different medical journals; clinical lectures on

surgery, published in the *Medical and Surgical Reporter* and *Philadelphia Medical Times*. He also published a report on the surgical anatomy of the band which united the Siamese twins, and which settled the question that had previously interested scientific surgeons all over the world, in the Transactions of the College of Physicians and Surgeons. He was elected Visiting Surgeon to the Charity Hospital, Philadelphia, in 1859—a position he held for ten years, and during which he established a large surgical clinic. On resigning that position he was elected Consulting Surgeon and placed on the board of trustees. During the War of the Rebellion he was appointed Surgeon-in-Chief and Second Officer in charge of the Sixth and Master Streets Military Hospital, Philadelphia; and for volunteering surgical services in the field upon three occasions during the war, was elected a member of the Loyal Legion. In 1862 he was appointed Demonstrator of Anatomy of the Jefferson Medical College, and held that position for twelve years; was also appointed by the faculty of the college Lecturer on Surgical Anatomy in the summer school. In 1866 he was elected one of the Visiting Surgeons to the Philadelphia Hospital. During the absence of Prof. Joseph Pancoast in Europe, in 1867 and 1868, he was appointed Adjunct Professor of Anatomy in Jefferson College, and in that season lecturing as professor of anatomy and as demonstrator of anatomy, teaching operative surgery, holding surgical clinics at the Philadelphia Hospital twice a week for the first half of the session, and at the Jefferson College twice a week for the last half. In 1873 and 1874 he served a second time as Adjunct Professor of Anatomy in the Jefferson Medical College, aiding his father; and in the spring of the last-named year, on the resignation of his father, was elected, by the trustees of the college, Professor of General Descriptive and Surgical Anatomy of that institution. In 1886 he became Professor of General Descriptive and Surgical Anatomy and Clinical Surgery in the Medico-Chirurgical College of Philadelphia, a position he now holds.

PANTZER, Hugo Otto, of Indianapolis, Ind., was born at Sheboygan, Wis., June 9, 1858, and is the eldest child of German parents. He attended the German Lutheran school two years, and afterward the public schools of his native city. At the age of fifteen years, before completing the course at high school, he started out in life, relying upon his own unaided efforts. He worked as draughtsman, and later as machine hand on a Mississippi river sounding boat, in the service of the United States Government Survey Office at Rock Island, Ill. With his savings he attended the Bryant & Stratton Business College at Davenport, Ia., from which he graduated with honors in 1874. Enticing mercantile positions were rejected that he might resume his literary education. He attended three courses at the German-English Academy of Milwaukee, Wis., then did work as book-keeper, and for his physical development devoted his evenings to the practice of gymnastics. In January, 1875, he was accepted as a pupil in the Gymnastic Teachers' Seminary of the North American Turnerbund (German system), at Milwaukee, and one year later he graduated there. He taught gymnastics during five years, and by this employment found the leisure and means with which to pur-

sue his general and medical education. He was engaged by the Turnvereins at Sheboygan and Plymouth, Wis., and at Indianapolis, and was tutor in the family of a mining superintendent in Southwestern Utah. Meanwhile he had had various honorary appointments within the gift of the North American Turnerbund, and he was a frequent contributor to its official organ and other German publications. The loss of his savings in 1878 thwarted his plans of attending at Cornell University, and induced him to take up the study of medicine without first acquiring a full humanitarian education. He read medicine at Sheboygan, under Drs. Carl Muth and Alonzo Clarke, and, later, at Indianapolis, became the student of Drs. Wm. B. Fletcher and E. F. Hodges, and attended lectures at the Indiana Medical College, from which he graduated in the spring of 1881. His essay on "Puerperal Eclampsia,"

H. O. Pantzer

the prize thesis for the senior year, attained meritorious distinction, and at the competitive examination for City Dispensary and City Hospital positions in 1881, he obtained the highest average, and selected and held the Dispensary appointment for one year. He then practiced general medicine at Indianapolis until the spring of 1892. During this time he made three trips to Europe, spending altogether three and a half years in study at different German university cities, and at Vienna, Paris and London, and in travel in Hungary, Italy and Switzerland. His effort abroad was directed toward perfecting his general knowledge in medicine and surgery. He spent eight months on pathology at Strassburg, under von Recklinghausen; was co-assistant during two courses at the Surgical Clinical Institute of Prof. von Nussbaum, at

Munich; attended the bacteriological course at Koch's Institute, at Berlin; was practicing at the obstetrical wards of the Allgemeine Krankenhaus, at Vienna, besides taking many other courses on medical and surgical specialties with such renowned medical teachers, as Schroeder, Winckel, Carl Braun, Hofmeier, Ziemssen, Nothnagel, Leyden, Gerhardt, Billroth, Albert, Maydl, Helferich, Thomsen, Oppenheim, Goltz, Pettenkofer, Kaposi, Rothmund, Gruenfeld, Ultzmann, Schnitzler, Seifert, Bumm and others. The last visit was devoted to surgery and gynecology, and a part was spent at Bonn, where he was assistant at the Surgical University Clinic under Prof. Witzel. He has enjoyed, at all times a rare degree of success in practice. In 1891, while he was preparing to change from general to special practice, he engaged the services of Dr. Haebelin, lately assistant to the chair of Obstetrics and Gynecology at the Zurich University, who remained with him until in May, 1892, at which time he limited his practice to surgery and diseases of women. He has constructed and equipped, at Indianapolis, an elaborate private sanitarium for his special practice. He is a member of various medical societies, amongst them the American Medical Association and the International Medical Congress; he is president of the Indianapolis Surgical Society; a member of the Judicial Council of the Marion County (Indianapolis) Medical Society, and Gynecologist to the City Dispensary and the City Hospital. He has prepared papers on various subjects read before county, State and interstate medical societies, which were published in the transactions of the relative societies, and in various journals. Amongst these papers are: "Morbus Basedowii;" "The Treatment of Ruptured Ovarian Cysts;" "The Influence of Grip on Surgical Practice;" "Rare Cases of Malarial Intoxication;" "The Technique of Abdominal Surgery;" "Treatment of Herpes Zoster;" "Cancer Following Cholecystotomy for Stones," and "Emphysema of the Abdominal Cavities After Laparotomy." He has done the first successful case of laminectomy performed in Indiana, restoring to perfect health a man who, after an injury to his spine, four and one-half years previously, had become paralyzed and helpless. This case and another of its kind was published in the *New York Medical Journal* of August 26, 1893, and was reproduced in extract in many other home and foreign journals. Dr. Pantzer was married on June 23, 1891, to Miss Emmy Schmidt, a native of Hagen, Westfalia, Germany, the daughter of a physician, and herself a pupil of the Frankfort Conservatory of Music. He has one child, a son, named Kurt Friedrich. The Doctor is a thirty-second degree Scottish Rite Mason, and is a Republican in politics, though not a partisan.

PARK, Roswell, of Buffalo, N. Y., was born in Pomfret, Conn., in 1852, his father being Rev. Roswell Park, D. D., who was first an officer in the United States Army, and later Professor in the University of Pennsylvania, and then the founder of Racine College, Racine, Wis. His ancestors on both sides were prominent in the War of the Revolution. He received the degrees of B. A. and M. A. in course from Racine College, and then became a student in the Chicago Medical College, his

home being at that time in Chicago. Here he graduated in medicine in 1876, taking the first prize among his class. He served as interne in the Mercy and Cook County Hospitals, then became Demonstrator of Anatomy in the Woman's Medical College. In 1879 he became Demonstrator and Adjunct Professor of Anatomy in his alma mater. This position he held for three years, then resigned it in order to study abroad. His foreign studies were pursued for a number of months, when he was given the position of Lecturer on Surgery in Rush Medical College. He was also made Surgeon to the Michael Reese Hospital. Before leaving for Europe he also gave up the position of Assistant Surgeon to the Illinois State Eye and

"Mütter Lectures on Surgical Pathology." It is in this field, especially, that he has done much and original work, and he is one of the few surgeons who does, or superintends, his own bacteriological work, having equipped for this purpose a private but complete bacteriological laboratory. He was for some years associate editor of the *Annals of Surgery*. He also edited for some time the *Weekly Medical Review*, of Chicago; and after removing to Buffalo, the *Medical Press of Western New York*.

PARKER, Benjamin, of Bradford, Mass., was born at the old Parker homestead, in that town, in 1759. He died in his ancestral home in Bradford, what is now Groveland, in 1845, at the venerable age of eighty-six years. He was the grandson of Abraham Parker and Elizabeth Bradstreet, and son of Bradstreet Parker and Rebecca Balch. He was a student of the Dummer Academy while the celebrated Master Moody was the principal. He was graduated from Harvard College in 1782, and received his medical degree from Dartmouth Medical School. He practiced in Virginia, mostly in Cumberland county, where he acquired considerable property and a very honorable professional and trust position. He married for his first wife a Mrs. Brown, a widow of a prominent Virginia family. She died shortly after the birth of her daughter, Maria, who married Governor Draymond, of Rhode Island. Later in life, he sold his plantation in Virginia and returned to Bradford and married for his second wife Miss Hannah Moulton, by whom he had three sons, William Thornton, Eldred Simpkins and Charles Francis. Dr. Benjamin Parker was a man of great professional ability, of deep religious character, sterling honor and of dignified and commanding presence. He was prominently mentioned at one time as a candidate for President of the United States.

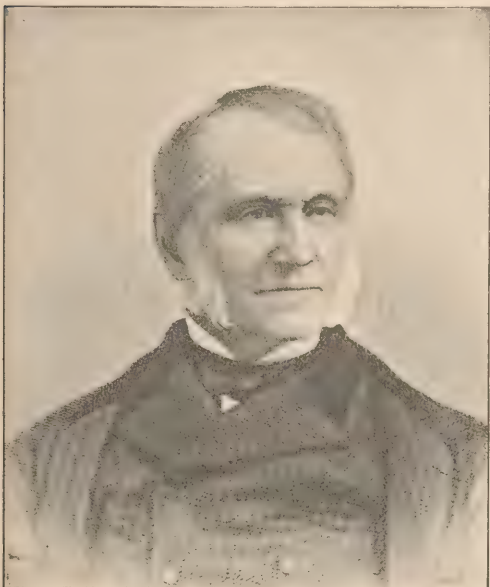

PARKER, Willard, of New York City, was born in Hillsboro, N. H., September 2, 1800, and died in the former city April 25, 1884. He descended on both sides from English Puritan stock. The family on the father's side emigrated to Massachusetts in 1640, and settled at Chelmsford, Middlesex county, as farmers. Several members of different branches of the family were active patriots in the War of the Revolution. Col. Moses Parker, a great uncle, who had been distinguished in the French war, was at Bunker's Hill, where he was wounded and taken prisoner, dying in Boston, July 4, 1775. On the maternal side, his grandfather, Capt. Peter Clark, was with Stark at Bennington, and also at the surrender of Burgoyne. Although born in New Hampshire, his father returned to Massachusetts when the subject of this sketch was five years old, and settled on the old homestead, which was owned by the Doctor at the time of his death. Being the oldest, much of his time was spent in working on the farm until he was nineteen, when he took charge of a district school, resolving by such means to prepare for college. He graduated at Harvard in 1826. In his freshman year an incident occurred which attracted his attention to surgery. His chum happened to have strangulated hernia, and was at first attended by the surgeon of the town, but without relief. In the morning, Dr. John C. Warren, the Professor of Surgery in the college, was sent for, and the facility with which he diagnosed the case and reduced the

Roswell Park.

Ear Infirmary. In 1883 he was made Professor of Surgery in the University of Buffalo, and Surgeon to its General Hospital, which position he has since held, declining most flattering calls to other institutions. He is a member of the German Congress of Surgeons, of the American Surgical Association, the American Association of Genito-Urinary Surgeons, the American Orthopedic Association, the New York Academy of Medicine, the New York State Medical Society, and of numerous other medical and scientific societies. In 1892 he was made the recipient of the honorary degree of M. D. from Rush College. His practice is limited exclusively to surgery, and he enjoys a large consultation practice, drawn from extensive territory. He is Surgeon to the Fourth Brigade National Guard, State of New York, and a member of the Military Service Institute. Dr. Park has been a rather prolific writer, as the *Index Medicus* will show. Besides numerous addresses, journal articles, and editorials, and a monograph on Brain Surgery, he has contributed important articles to most of the Cyclopedias and Systems of the day. In 1892 he published a volume of

hernia so forcibly impressed young Parker that he resolved to devote his life to the study and practice of medicine and surgery. In the spring of 1827 he received the appointment of House Physician in the United States Marine Hospital at Chelsea, remaining there about two years, and having the best of opportunities for the study of practical anatomy under the late distinguished surgeon, S. D. Townsend, of Boston. In the winter of 1828-29 he became the private pupil of Dr. John C. Warren, whose lectures he had attended for two years, and whom he had aided in the anatomical department. The office of House Surgeon had just been created in the Massachusetts General Hospital, and the situation was proffered to Mr. Parker, who gladly accepted it, serving nearly a year, attending lectures in the meantime, and gradu-

Willard Parker

ating in medicine in February, 1830. In the summer of 1829 the medical school at Woodstock, Vt., wanted a Lecturer on Anatomy, and was referred to Dr. Parker, who delivered an anatomical course there the following year, after graduation. In June, 1830, he was appointed to the chair of Anatomy in the Berkshire Medical College at Pittsfield, Mass., then a leading country school, continuing also to lecture in the Vermont school. In 1832 a vacancy occurred in the surgical chair at Pittsfield, which was also filled by Dr. Parker, he lecturing twice daily. In 1836 he accepted the chair of Surgery in the Cincinnati Medical College, and afterwards spent some time in the English and French hospitals. On his return to America he expected to make Cincinnati his home, but on account of ill-health, caused by the climate, and the advice of his medical friends, he removed from the West, and in 1839 was appointed to the chair of Surgery in the College of Physicians and Surgeons in the city of New York, which he held for thirty

years, subsequently accepting the chair of Clinical Surgery, which he resigned a few months before his death. During the next ten years after his removal to New York he established a large and lucrative practice, and took the highest rank in his profession. His remarkable success was based on great knowledge and skill and his mode of treatment, which inspired the absolute faith of his patients. In the spring of 1840, appreciating the want of practical demonstration in teaching surgery, and not being connected with a hospital, he visited, with the students, two of the city dispensaries. Soon afterwards interesting cases were selected and taken from the dispensaries to the college, then in Crosby street, where the anatomical theater offered superior advantages for making diagnoses and performing operations before the whole class. This was the commencement, in this country, of what are called college clinics. In 1845 the present Bellevue Hospital, then the City Almshouse, was reorganized under a board of governors, and Dr. Parker and Dr. James R. Wood were appointed Visiting Surgeons. For many years after this no changes were made in his professional relations except an appointment of Visiting Surgeon to the New York Hospital in 1856. On the death of Dr. Valentine Mott, in 1865, who was then president of the New York State Inebriate Asylum, at Binghamton, Dr. Parker was appointed his successor, a position which he accepted upon concluding that it offered a field for work in which he had taken a deep interest. The success which has attended the institution in overcoming much opposition attests the wisdom of the appointment. The position held by Dr. Parker, and many others in this country and in Europe, is that alcohol is essentially a poison, that it can not be considered as a food, and should only be used in exceptional cases and under the advice of a physician, and in the preparation of medicines. He received the degree of LL.D. from the College of New Jersey, at Princeton, in 1870. Dr. Parker was Consulting Surgeon to the New York Hospital, Bellevue Hospital, St. Luke's Hospital, Roosevelt Hospital, Mt. Sinai Hospital, and Emeritus Professor of Surgery in the College of Physicians and Surgeons, having resigned the active duties of professor in 1870. He was an honorary member of many of the State Medical Societies. He made many important discoveries in practical surgery. Dr. Parker was the first to point out a condition which is known as "Concussion of the Nerves," as distinguished from concussion of the nerve centers, and which had been previously mistaken for one of inflammation. The operation of cystotomy for the relief of chronic cystitis, and also that for the cure of abscess of the appendix vermiformis, are among his contributions to the art of surgery. His operation, introduced several years ago, for laceration of the perineum occurring during parturition, in which the sphincter of the rectum is divided near its coccygeal attachments, and the edges of the septum divided, so as to give increased uniting surface, the strain upon the sutures being taken off by relief incisions, must be regarded as an important advance in the science of surgery. As a teacher, Dr. Parker enjoyed the highest reputation. With a fine personal presence, and a courteous and affable manner which won the personal regard of his

pupils, he also riveted their attention by his direct and lucid manner in unfolding the principles of his art, and by the unexcelled and simple and common-sense character of his operations and general treatment. With an erect carriage and elastic step, and an eye and features kindling with animation, he was one of the best examples of the preservation of a splendid physical and mental organization by the observance of those laws of health he so long and so ably advocated. All the important and rare operations which only fall under the hands of great surgeons have been performed by him with more than average success. Few American surgeons have filled so acceptably so large a number of responsible offices. He was not a book-maker; his extensive practice prevented his giving much time to writing, and even the reports of his cases have been made by other members of the profession. A volume compiled from these, and from his private memoranda, could not fail to be welcomed as one of the most important contributions to the physicians' and surgeons' library. The following are a few of the cases which have been reported in medical journals during the last thirty years of his life: "Cases of Extensive Encephaloid Degeneration of Kidneys in Children;" "Case of Polypus of the Larynx;" "Some Rare Forms of Dislocation;" "Trephining the Cranium and Ligature of the Carotid in Epilepsy, and Cure;" "Case of Fracture of Processus Dentatus;" "Cases of Cancer of Omentum, Stomach and Rectum;" "On the Radical Treatment of Hydrocele by the Local Application of Lunar Caustic to the Internal Surface of the Tunica Vaginalis;" "On the High Operation for Stone;" "Case of Strangulated Femoral Hernia Containing Ovary and Fallopian Tubes;" "Practical Remarks on Concession of the Nerves;" "Ligature of Subclavian Artery for Axillary and Subclavian Aneurism;" "Operation for Abscess of the Appendix Vermiformis;" "Laceration of the Perineum and Sphincter Ani During Parturition, Cured by Division of the Coccygeal Attachment of the Sphincter and Subsequent Closure of the Perineum by Sutures;" "Excision of Umbilicus for Malignant Disease;" "Ligature of the Subclavian Inside the Scalenus, together with Common Carotid and Vertebral Arteries, for Subclavian Aneurism—Hemorrhage from Distal End of Subclavian—Death after Forty-two Days." Dr. Parker continued to practice until within two years of his death. He was a member of many foreign and domestic professional bodies, active in benevolent and religious organizations, and the friend of education. The Willard Parker Hospital for Contagious Diseases was erected and named in his honor.

PARKER, William Thornton, of South Boston, Mass., was born at the old Parker homestead in Bradford (what is now Groveland), January 8, 1818. He was graduated from Dartmouth College, and received his degree of M. D. from the Harvard Medical School. Soon after graduating in medicine he settled in South Boston, and speedily acquired a very excellent practice among the leading families of that section. He married, in 1845, Clementina Morse, a daughter of Elijah Morse, a prominent lawyer of Boston, and granddaughter of Hon. Asa Rand, M. D., and of Dr. William Jackson, of London, England. He took an early interest in the Church of the Advent, Boston. As an

anatomical artist he is said to have been simply unrivalled. His Anatomical Atlas is a work of great beauty and value. He was an accomplished musician, playing the flute with rare skill. He was an able writer, and described with great clearness and with interest his travels in foreign lands. His professional writings were very clearly and accurately presented, and some of them have been published. His professional record of cases show an able and competent observer and a successful practitioner. He was a truly great physician, a loving husband and father, and devout, fearless, and consistent Christian. Receiving what was practically a mortal wound on his head, while in the discharge of his professional duties, his strong system gave way under the heroic treatment then in vogue, and he died from consumption, in March, 1855, at Jamaica Plain, Mass. He left a widow and one son, and a host of sincere friends to mourn his untimely loss.

PARKER, William Thornton, of Groveland, Mass., was born in South Boston, December 24, 1849. He was the son of the preceding Dr. William Thornton Parker, of Boston, and a grandson of Dr. Benjamin Parker, of Bradford, Mass. He attended school at Vinson's Academy, at St. Paul's School, Concord, and at the Highland Military Academy. He began the study of medicine under the tutorship of Dr. Dixie Crosby, of Hanover, and attended his first course of lectures at Dartmouth Medical College. He afterwards went to Europe, studying for some years in Edinburgh, London, Paris and Vienna, and graduated at the University of Munich, with honors, in 1873. He was the private student of Von Gietl, of Munich, the dean of the Medical Faculty. He was surgeon, after graduation, in the service of the Hamburg Line, and returning to this country in 1874, was offered the first assistantcy of the Flatbush Lunatic Asylum. He returned to Europe and took a post-graduate course of medicine in the hospitals of Leipsig, Paris and London. He married, in 1875, Elizabeth Richards Stebbins, daughter of Hon. John B. Stebbins, of Springfield, Mass. He served as acting assistant surgeon in the United States Army in the Department of Missouri, and was appointed by Secretary Manning for service at Hampton Roads, Virginia, during the cholera epidemic of 1885. He was vice-president of the Section of Anatomy of the International Medical Congress at Washington, and was medical examiner at Newport, R. I. He founded, in this country, the Medical Guild of St. Luke, and the Misericordia (the Medical Society of Mercy). He was the originator of the bill to provide a National Sanitarium for Consumptives. He was appointed acting Professor of Medical Jurisprudence in the College of Physicians and Surgeons, Chicago. He is a member of the Massachusetts Medical Society, the American Medical Association, the Academy of Hygiene, France; Recorder of the Association of Acting Assistant Surgeons United States Army, and member of other medical societies. Among his contributions to medical literature are the "Burton (murder) Case;" "Boroglyceride in Surgery," and many articles on hygiene. He has invented several instruments and appliances for use in his profession. He now resides in the old home of his ancestors.

PARKES, Charles T., of Chicago, Ill., was

born in Troy, N. Y., in 1847, and died at his home, March 28, 1891. He served during the war in an Illinois volunteer regiment, and was mustered out as captain in 1865. Entering upon the study of medicine he at once assumed a foremost position in his classes, and from 1868 until 1875 was Demonstrator of Anatomy in Rush Medical College. He was then advanced to the chair of Anatomy, which professorship he held until his appointment to the Chair of Surgery, in the same institution, made vacant by the death of Prof. Moses Gunn. His advancement in his profession was phenomenal, and the sudden termination to his brilliant career brought grief to the hearts of all who knew him; and was a signal loss to his college, to his city, and the country. His death resulted from pneumonia, produced by an attack of the "grip," his illness lasting about two weeks.

PARRISH, Joseph, of Burlington, N. J., son of Dr. Joseph Parrish, of Philadelphia, was born in that city, November 11, 1818, and died January 15, 1891. His classical and literary education was under private tutors, and at a private academy in Burlington, N. J., and his medical studies were pursued at the University of Pennsylvania, whence he graduated M. D. in 1844. He located himself in practice first in Burlington, and remained there till 1855. He then removed to Philadelphia and took the chair of Obstetrics in the Philadelphia Medical College. Failure of health, however, after some time caused him to visit Europe; and having while in Rome noticed the imperfect management of the Insane Hospital of that city, he obtained an interview with Cardinal Antonelli, and addressed the pope on the subject. By this intervention the abuse was corrected and the thanks of the pope tendered to him through ex-President Fillmore. In 1857, on his return, he was called to reorganize and place on a permanent basis the Pennsylvania Training School for Feeble-Minded Children, and under his administration large grants were obtained from the legislatures of Pennsylvania, New Jersey, Delaware, and the city of Philadelphia, and the present structure now occupied by that institution erected. During the war he entered the service of the sanitary commission, and acting as Hospital Inspector under a roving commission from the President, visited the hospitals and camps from Washington, along the Atlantic coast, to New Berne, N. C., Fredericksburg, and Petersburg, and westward to the fields of Nashville, Look-out Mountain and Chickamauga, with orders for supplies and hospital stores. He also had charge of the sanitary posts of White House and City Point, and subsequently visited the governors of loyal States, and aided in the organization of auxiliary associations for the continued supply of hospital stores. After the war he established and conducted for seven years the Pennsylvania Sanitarium for the Treatment of Alcoholic and Opium Inebriety; was the originator of the American Association for the Cure of Inebriates in 1870, and of which he was president for four years. In 1872 he was sent for by a committee of the British Parliament, to give evidence in London as to the work of inebriate asylums in America, and the effect of laws of this country, known as prohibitory and local option laws and license laws. A verbatim report of his testimony was laid before the House of

Commons, and published in the British "Blue Book." His recommendations were adopted by the committee. Subsequently his testimony was questioned by Dr. John Charles Bucknell, of London, but an open letter in reply, which was distributed among the profession of Great Britain by the British Medical Association, and by its delegate to the Congress des Sciences Medicales, at Geneva, was universally acknowledged to be a fair and complete refutation of Dr. Bucknell's statements. The letter has since been republished in England by the friends of inebriate asylums there for circulation among Members of Parliament and the medical profession. The result of his labors was the establishment of the Dalrymple Home for Inebriates in England on the general American plan. He finally settled in Burlington in 1875 and opened a private sanitarium for invalids. He was a member of the College of Physicians of Philadelphia; formerly of the Philadelphia County and Delaware County Medical Societies, president of the latter for three years; of the State Medical Society of Pennsylvania, of which he had been first vice-president; was associate member of the Obstetrical Society of Philadelphia; permanent member of the Medical and Surgical Faculty of the State of Maryland; of the Medical Association of Baltimore; of the American Medical Association; of the American Association for the Cure of Inebriates; the District Medical Society of the County of Burlington, N. J., of which which he was historian; of the New Jersey Academy of Medicine, and honorary member of the New Jersey State Medical Society, and delegate to the International Medical Congress in Philadelphia, 1876. In 1885 he was elected president of the New Jersey Medical Society. His contributions to medical literature consist of various editorial and other communications on general medical subjects, contained in his Reports, for six years; Reports on "Idiocy and Feeble-mindedness," for seven years; Report to the Medical Society of Pennsylvania; "Intemperance as a Disease;" an essay on "Alcoholic Diathesis;" "Philosophy of Intemperance;" "The Classification and Treatment of Inebriates;" "Opium Intoxication;" "Report on the Criminal and Dependent Population of Pennsylvania," addressed to the Legislature; "The Pathology of Inebriety," and "Insanity and Law." In 1848 he established and edited the *New Jersey Medical and Surgical Reporter*, which is still continued, but under other auspices, and with slight modification, in Philadelphia. He also edited *The Sanitary Commission Bulletin*, and was editor of the Transactions of the Associations for the Cure of Inebriates, and was its secretary for foreign correspondence, and was one of the editors of a quarterly, published at Hartford, Conn., entitled the *Quarterly Journal of Inebriety*.

PARRY, Charles, of Indianapolis, Ind., was born near Philadelphia, Pa., February 15, 1814, and died in the former city August 11, 1861. His parents were Quakers. His literary education was received mainly at Wilmington, Del., in a school under the charge of Samuel Smith, a famous mathematician, whose instruction found a mind that was well developed and strengthened under its rigid discipline. With young Parry, the pursuit of this part of his education was doubtless an important factor in cultivating his perceptive and

reasoning powers, teaching him accuracy and clearness of thought—serving in after years in making him a clear-headed, sagacious practitioner, much superior to the majority of physicians. It is said that no net-work of fallacies and sophistries could entangle him, but through them all he marched deliberately and steadily onward to rest upon solid truth and fixed facts. His classical education was defective, and knowledge of Greek and Latin he had none. This he greatly regretted, and had there not been this defect he would not only have enjoyed a wider range of medical literature than he did, but he himself would have been a frequent contributor to medical journals, and the treasures of his experience, the fruit of his ripened judgment and large understanding would have been valuable indeed. Twice only (each time in the *American Journal of Medical Science*) did he break his life-long

Chas. Parry

silence by speaking to the profession through the press; but those two articles—one on account of an operation on a limb crooked and useless from a badly-treated fracture, the operation similar to that performed by Barton for ankylosed knee, and the other on congestive fever—though published many years ago, gave him a name ever known by all intelligent members of the profession throughout the country. He began the study of medicine with Dr. Stokes, of New Jersey. Afterward he went to Philadelphia, entered the office of the late J. K. Mitchell, subsequently the eminent Professor of Theory and Practice of Medicine in Jefferson Medical College. He then attended the medical department of the University of Pennsylvania, and was graduated from that institution in 1835, the subject

of his thesis being "Hemoptysis." Immediately after receiving his medical degree he went to Camden, N. J., and there had his first experience of the trials of a young physician. In a year or two he removed to the West, by the advice of his uncle, the late Hon. O. H. Smith, then a member of the United States Senate from Indiana, and settled in Connorsville, that State, where he remained about two years, and then removed to Indianapolis and there resided until his death, a period of nearly twenty-three years. Not at once, however, at the State Capital did he meet his professional success; not at once find a place in the golden field for his sickle; other reapers monopolized the labor and the reward. He was poor, often having to borrow money to pay the postage on letters from his friends in the East; but he patiently waited until time and opportunity should vindicate his right to occupy a foremost place among the practitioners of medicine and surgery. These came, and a few years found him doing as large a business as any physician of his city, possibly larger. During some seasons, when severe epidemics of malarial fever occurred, it was not unusual for him to ride sixty or seventy-five miles a day, and the night brought him no rest. Sometimes even a week would elapse without removing his clothes, but he would sleep in a chair, in his buggy, sometimes even on horseback. No man, unless possessed of an iron constitution such as he had, could endure so great fatigue and exposure. Physically he was a remarkable man. His bodily presence was impressive; a manly, erect figure; about six feet in height, his weight over two hundred pounds; he would have been taken in any assembly as a man of mark. It is rare to find such a combination of professional ability as existed in Dr. Parry's case. He was a superior physician and an excellent surgeon and obstetrician. His obstetrical business for some time averaged over eighty cases a year, and every year he had a greater or less number of capital operations. As a surgeon he was not a brilliant, dashing operator, but cool and collected, his eye intent upon his work, his hand steady and firm. He *always knew where his knife was*, and never attempted what he could not readily perform, and never operated merely for the sake of operating. His abilities as an operative surgeon were indeed excellent. But his greatest merit was as a practitioner of medicine. It may be inferred that he was highly esteemed in this regard, from a remark made by one of the most intelligent and successful practitioners, at a meeting of physicians held to take action in reference to his death: "Had we been taken dangerously sick, and were we thinking whom we would prefer to attend us, the great majority would decide for Dr. Parry." This commendation was most worthily bestowed. Dr. Parry was not rash in forming his opinion, nor in jumping at conclusions. He studied disease not so much in books as at the bedside, and he thoroughly investigated a case, even if that investigation required an hour or more for its completion. He was cautious, seeking all the light he could, carefully reasoning, and his natural sagacity, logical understanding, and strong practical sense, directed him almost invariably to a correct diagnosis. Seldom, indeed, could a man be found making fewer mistakes. "Dr. Parry did not hesitate to use freely, in what he believed proper cases,

the lancet, mercury, and the blister, and his patients got well oftener sooner, and better than they would have done under the treatment of those who in effect renounce art, and rely only on nature." In three important respects Dr. Parry's life must be pronounced a decided success. First, in the attainment of wealth; second, in the attainment of reputation; and third and highest, in the relief of much suffering. While it is pleasant to speak of his abilities and the success which crowned their exercise, yet, says his biographer, the moral aspects of his character must not be omitted, and on those especially it is grateful to dwell. He was honest, honest not merely in business transactions, but honest in all his intercourse with his professional brethren, and honest, too, in the sick-room and at the bedside; honest in matters of life and death. A deceiver in any respect he never could be. To his friends he was generous and kind-hearted. Many physicians know that their start in professional life while young was, in a great measure, due to the kind words and deeds of Dr. Parry. His time and invaluable counsel were ever at the service of the young practitioner in difficult cases, without hope of pecuniary reward. He kindly concealed errors from the erring party unless by plain statement of them he could prevent further mistakes. He was kind to his patients and profoundly sympathetic, though usually repressing decided manifestations, and yet he often wept with all a woman's tenderness with the father and mother over their dying child. He was of a spirit too noble to be consumed by the fires of jealousy. "If families left him—a rare event in the case of any worthy ones; his friends adhered to him with great tenacity—he cherished no unkind feeling towards their new medical adviser, attributed to him no dishonesty of conduct, cultivated no spirit of retaliation, but without a whisper of complaint, graciously and gracefully yielded. He would listen patiently to the opinions of the young physician, and if they could be well established, no false pride, no prejudice kept him from at once abandoning his own and accepting them. He was not blind either to the truth of the judgments or to the abilities of others. Indeed, he was one of the most catholic of men." His character was fixed, not fickle. Few men presented a more manly front or stood more firmly by their conviction than he did. He changed not from year to year. "He was no April day, alternate sunshine and clouds, the light of love and the darkness of hate, but his friendship was abiding, weakened by no lapse of time, varying not from month to month or year to year, no mean jealousy or plotting hate disturbing the equanimity of his temper or the kindness of his conduct. He was ever the same, speaking of you or to you. Resentful he might have been at times when greatly wronged, but it was rarely manifested, and there were wrongs that he did not resent. He meekly forebore when others might have been provoked, lest he might say or do anything which would cause unkind feelings or pain." It is believed by those who knew him well that had Dr. Charles Parry acquired a more liberal literary education, had he been more ambitious of fame and been given a larger sphere, an arena suitable for such strength and culture, he might have placed himself among the fore-

most men, not only of the country, but of the age.

PARVIN, Theophilus, of Philadelphia, Pa., was born January 9, 1829, at Buenos Ayres, where his father, the Rev. Theophilus Parvin, of New Jersey, a graduate of Princeton Theological Seminary, was at that time residing with his family. His mother, Mary (Rodney) Parvin, of Wilmington, Del., died a few days after his birth, and he was shortly thereafter brought to this country by his father. The subject of this sketch is therefore not only an American, but is said to be of American heritage of several generations. "Dr. Parvin's early education was derived principally from Lafayette College, and in 1847 he took academical honors at the University of Indiana. Thence he returned to New Jersey, and spent three years in teaching at the High School

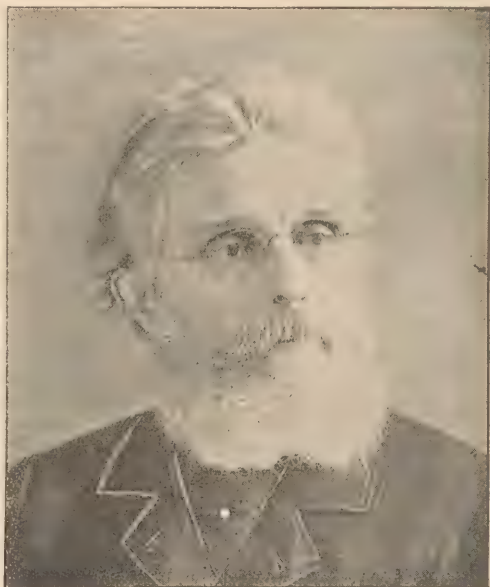

Theophilus Parvin.

and in the Female Seminary of Lawrenceville, in his adopted State." Referring to the former, a recent biographer in the *New York Journal of Gynecology and Obstetrics*, says: "I do not know if this stepping-stone to Princeton College had then the fashionable reputation it now possesses, but it has certainly maintained its habit of attracting to its teaching corps many young men who later in life in the great schools of academical and professional science have fulfilled the early promise of the high-school teacher." In 1852 he received his medical degree, after the usual course of study, from the University of Pennsylvania, and became Resident Physician to the Wills Hospital in Philadelphia. In about a year, however, he resigned this post and returned to Indiana. It is believed that this early preference for the West was not altogether a professional one, for he married there within the year, Miss Rachel, daughter of Amos Butler, Esq., of Hanover, Ind. His marked abilities soon brought him in recognition among his Indiana brethren for nine years;

later we find him President of the State Medical Society. In 1864 he accepted the chair of *Materia Medica* and Therapeutics in the Medical College of Ohio, and in a few years he resigned this for the newly created professorship of the Medical and Surgical Diseases of Women. For the next fourteen years he held consecutive professorships in the University of Louisville, the College of Physicians and Surgeons of Indianapolis, and in the Medical College of Indiana after it had become consolidated with the preceding school. In 1882 he returned to the University of Louisville, but one year later was elected to and accepted the chair of Obstetrics and Diseases of Women and Children in the Jefferson Medical College of Philadelphia, where he has since remained. He is obstetrician to the Philadelphia Hospital; consulting obstetrician to Preston Retreat, Women's Hospital, and Northern Dispensary, and is an honorable fellow of Edinburgh Obstetric Society, and a member of numerous other medical and scientific organizations. "Although Professor Parvin early identified himself with gynecology, his reputation as an obstetrician, whether by circumstances or by inclination, has attained such overshadowing proportions that the profession at large have come to consider him a specialist *par excellence* in obstetrics rather than in the former branch of medicine. He ranks to-day, undoubtedly, among the very greatest obstetrical authorities in America, and these are necessarily few. As a lecturer he appears to have been eminently successful. Since a man's success, generally speaking, is dependent more upon what he says and the way in which he says it than upon what he writes, especially in his own generation, Dr. Parvin's right to popular estimation is not only well but doubly earned. His personal admirers, though many, are most numerous among those whose fortune has led them to reap the fruit of the truths sown in his lectures." He has written much on obstetrics, but the cream of all his writings and the work which at once placed him in the front rank of his profession is his "Science and Art of Obstetrics." This book first appeared in 1886; its worth was at once recognized and it has already passed through two editions. Not long ago he translated and placed upon the American market the work of Winckel, of Munich, entitled, "Diseases of Women." Among the many honors he has received from his professional brethren the most conspicuous have been the presidency of the American Medical Association, of the Philadelphia Obstetrical Society, and of the American Academy of Medicine. He was also one of the founders of the American Gynecological Society. "It may safely be said that no one of equal eminence has more devoted and admiring friends, both among those of his own generation and high standing in the profession, as well as among those of a younger generation—"the mute inglorious Miltons"—whose turn is yet to come. The personal traits of Dr. Parvin are striking and in some respects, unfortunately, rare. He is cordial, helpful and sympathetic to his younger brethren, to whom these things mean much upon the threshold of their lives, but his finest trait, and the rarest, is a broad-minded capacity which enables him to appreciate the good work of his peers, and to acknowledge it open-heartedly." Dr. Parvin has received the degree of LL. D.,

which was conferred upon him by Hanover College in consideration of his superior professional attainments.

PATTEE, Asa Flanders, of Boston, Mass., was born in Warner, N. H., March 5, 1835. He was the sixth son of Asa Pattee, an intelligent and well-to-do farmer. He belongs to one of the old families of New England, and among his predecessors on the Pattee side were several noted physicians. Peter Pattee, the head of the family, came from England, and settled in Virginia in 1658. He was the son of Sir William Pattee (or "Petty," as it was then called), physician to Oliver Cromwell, and King Charles II. Although brought up on a farm, Asa F. Pattee showed from his childhood a taste for anatomical and chemical pursuits, and performed dissections on sheep and other lower animals, when a youth, long be-

A. F. Pattee

fore he began the study of medicine. His education was derived from the public school in Warner, up to the age of sixteen, when he received private instruction in Latin, mathematics and medicine. In the autumn of 1854 he entered Dartmouth Medical School, and the following year became private pupil of the late Prof. E. R. Peaslee. In 1857 he received the degree of Doctor of Medicine from Dartmouth College. His limited means the following year compelled him to teach, and he remained in Warner till 1859, when he began the practice of medicine in Amesbury, Mass., remaining there seven years. His spare time was devoted to the study of botany and *materia medica*. In the autumn of 1864 he entered the army as Acting Assistant Surgeon. He returned to Amesbury in 1865, but remained only until the following year, when he came to Boston for a permanent residence, and soon acquired a lucrative practice. In 1859 and 1860 he was in charge of an epidemic of small-pox

in Amesbury, and met with remarkable success, only three persons dying out of the one hundred and fifty treated; these being a woman of eighty, a child of three years, and a consumptive. In 1885 he made a most remarkable cure of senile gangrene in the foot of a man of seventy; the toes of the left foot had sloughed away, the line of demarcation being just below the tarso-metatarsal articulation. Nature did the whole work of amputation. The patient is still living. In 1887 he invented a catheter attachment for irrigating the bladder. In 1867 he lectured on Chemistry and Materia Medica at the New England Female Medical College, Boston. In 1883 he was elected Professor of Materia Medica and Therapeutics, and lecturer on Nervous Diseases, at the College of Physicians and Surgeons, Boston, which chair he occupied four years. He is a member of the Massachusetts Medical Society, the American Medical Association, and was one of the founders, and for several years president, of the Boston Therapeutical Society. He is an honorable member of the Botanical Society of Italy, and in 1887 he received the honorary degree of M. A. from Dartmouth College. His contributions to medical literature have been more or less constant throughout his professional career. In 1859 he wrote, "Therapeutic Properties of Veratrum Viride," with cases illustrating its use in pneumonia; then followed, "Atropia in Incontinence of Urine," "Atropia in Wounds and Inflammation of the Eye," "Asclepius Cornuti," physiological experiments to show its action on the kidneys and heart; "Phytolacca Decandra," its use in the prevention of milk abscess, chronic induration of the mammae, and scrofula; "Chemical Laboratory of Plants," how and where acids, alkaloids, sugars, glucosides, starches, and oils are formed; the cause of the beautiful colored tints of autumn leaves; "Cactus Grandiflora" (Night Blooming Cereus), its habitat and therapeutic uses in disease of the heart, with cases; "Therapeutics of Metorrhagia and Menorrhagia, and Hemorrhage from Fibroid Tumor," "Picrotoxine," in nervous exhaustion, obstinate headache, and paralysis of the lower extremities; a large double "Hydro-Hematocoele" of the "Scrotum," containing 147 ounces; "Recovery under Operation and Antiseptic Treatment," "Resorcine" as an anti-fermentative and anti-putractive agent in diseases of the stomach and bowels; also as a general antiseptic (read before the American Medical Association, at New Orleans, April 28, 1885; "The Percuteur," in obscure nervous diseases, with cases (read at same time and place); and "Treatment of Chronic Tubercular Consumption." His articles in all comprising over two hundred. He also has a book to appear shortly, entitled, "The Physiology of Nervousness."

PATTERSON, Duncan Nathaniel, of Mangum, Richmond county, N. C., was born at the "Old Beaver Pond," in the county of Moore, that State, and is of pure Scotch descent; both father and mother could converse in and read the Gaelic language. His mother came to America from the Isle of Skye, Scotland, in the year 1802, at the age of twelve years. His early education was obtained from the common schools in the community in which he was raised. His academic education and training was gained at the Jackson Springs Academy,

in Moore county, N. C., a celebrated watering place, under the superintendence of Rev. Hugh McLaurens, a minister of the Presbyterian Church, and at a high school at Carthage, Moore county, N. C., under the management of Rev. A. D. McNeil, also a minister and teacher of much celebrity. Dr. Patterson commenced the study of medicine at Carthage, N. C., in the office and under the preceptorship of Dr. John Shaw, but completed his course at Mangum, N. C., in the office of Dr. Wiley

D. M. Patterson

Smith, with whom he formed a partnership after his graduation, which lasted one year. On the death of his preceptor and partner he remained in this field of labor, and ever since he has devoted his whole time and talent to the study and practice of his chosen calling. It is not often found that a life work be done in one locality, as in this instance. His practice, a general one, has almost imperceptibly drifted into the specialties of gynecology and diseases of the nervous system. Dr. Patterson was graduated from Jefferson Medical College, of Philadelphia, in the day when Dunglison, Meigs and Pancoast were celebrities. He is a member of the Pee Dee Medical Association, of which he has been president as well as one of its founders; is a member of the Medical Society of North Carolina, of which he has been vice-president and its delegate to the American Medical Association, and since 1881 a permanent member of the body. As a general practitioner his work was medicine and surgery, but from an early inclination and study that way, it is now confined to diseases of the female sexual organs and pelvic cavity, together with diseases of the nervous system. His writing has been confined to diseases of females.

PEASLEE, Edmund Randolph, of New York City, was born in Rockingham county, N. H., January 22, 1814, and died January 12, 1878.

He was educated at the New Hampton Institution and Atkinson Academy, N. H.; entered Dartmouth College in September, 1832; graduated in 1836, and served as tutor in his alma mater for two years; studied medicine in the Medical Department of Yale, and there received the degree of M. D. in 1840, having received that of A. M. from Dartmouth the year previously. After his medical graduation he visited Europe for the purpose of still further pursuing his medical studies in the hospitals of London and Paris, and while absent was elected Professor of Anatomy and Physiology in Dartmouth College, as successor to Dr. Oliver Wendell Holmes. In 1841 he assumed the duties of that professorship, and continued them till 1871, when he resigned, and was elected Professor of Gynecology in that College. He settled in Hanover, N. H., on his return from Europe, in August, 1841, and resided there till 1858, when he established himself in New York City, more especially as a gynecologist. He performed the first successful ovariectomy in New England, by the large abdominal section, in September, 1850; all of his first six cases, previous to 1857, being successful. He also first made use of injections into the peritoneal cavity after ovariectomy, in 1855. He was a member of the New York County and Pathological Societies; of the Medical Journal Association; of the New York Academy of Medicine; the Medical and Surgical Society; Obstetric Society; Physicians' Mutual Aid Society; the Society for the Relief of Widows and Orphans of Medical Men; New York State Medical Society; of the American Gynecological Society; and the American Medical Association. He was also president of the New Hampshire State Medical Society; was president of the Pathological Society of New York, in 1858; of the New York County Society, in 1867; of the Obstetric Society in 1875; of the Academy of Medicine, 1871 to 1873; of the Medical Journal Association in 1875; and was ex-president of the American Gynecological Society. He was also a member of the New York Academy of Natural Sciences; of the American Geographical Society; of the New York Historical Society, and other scientific associations; honorary member of the Obstetric Societies of Louisville and Philadelphia; corresponding Fellow of the Obstetric Society of Berlin; and honorary Fellow of the London Obstetric Society. He received the degree of LL. D. from Dartmouth College in 1859. In 1843 he was appointed Professor of Anatomy and Surgery in the Medical School of Maine, a position he held for seventeen years; in 1851, Professor of Anatomy and Physiology in the New York Medical College, and in 1853 was transferred to the chair of Physiology and General Pathology, and still later to that of Obstetrics and Diseases of Women. He resigned this connection in 1860. From 1872 to 1874 he was Lecturer upon the Diseases of Women in the Albany Medical College; and from 1874 until his death he has been Professor of Gynecology in Bellevue Hospital Medical College. From 1858 to 1865 he was physician to the Demilt Dispensary, in the department of Diseases of Women; and he had been a surgeon to the Woman's Hospital since its reorganization in 1872. During the War of the Rebellion he was one of the surgeons of the New England Hospital in New York City,

and was similarly connected with the New York State Hospital, on Howard street. His contributions to medical literature are as follows: "Human Histology," in 1858, the first systematic work on this subject in the English language; "Uterine Displacements," 1860; "Ovarian Tumors and Their Treatment, Except by Ovariectomy," and "Ovariectomy," papers read before the New York Academy of Medicine, 1864; "Statistics of One Hundred and Fifty Cases of Ovariectomy," "Retroflexion of the Unimpregnated Uterus," 1865; "Ovariectomy, When and How to Perform It, and Its Treatment," 1867; "History of Ovariectomy, and Sketch of Dr. E. McDowell's Life," read before the Medical Journal Association, "Intra-Uterine Medication," "Intra-Peritoneal Injections," 1870; "Inflammations and Congestions of the Non-Gravid Uterus;" "Ovarian Tumors and Ovariectomy," in 1872, the only complete monograph on these subjects which had been published in any language; "Incision and Dissection of the Cervix Uteri," 1876. He also was one of the editors of the *American Medical Monthly* during his connection with the New York Medical College, in which appeared a number of his lectures and reports.

PENNELL, William W., of Fredericktown, Ohio, was born in Benton, Holmes county, that State, February 2, 1853, the third son of Hugh and Martha A. Pennell, being of English de-

W. W. Pennell

scend. His parents having but limited means, he was given as good an education as could be procured in the public schools, and which he supplemented by home studies aided by competent persons, thereby gaining a fair knowledge of literature, science and language. He was a teacher for two years, and studied medi-

cine under the preceptorship of Dr. Isaac H. Hague, of Nashville, in his native State. He was graduated in 1875 from the medical department of the University of Wooster, and entered the practice at once with his preceptor. Dr. Pennell married Melvina M. Williams in 1875. An *ad eundem* degree of M. D. was conferred upon him in 1882, by Adelbert College Western Reserve University. He pursued a post-graduate course in Philadelphia the winter of 1883. He located in Fredericktown in 1884, in the meantime keeping up instructive reading outside of medicine as outlined by the Chautauqua Course of Study. He is a member of the Ohio State Medical Society, American Medical Association, American Medical Temperance Association and Pan-American Medical Congress. He has contributed several articles to current medical literature, and in 1890 read before the State Society a paper on the then recent "Influenza Epidemic." In June, 1892, before the section of medicine of the American Medical Association at Detroit, Mich., he read a paper entitled "The Genesis of Croupous Pneumonia," which was subsequently published in the *Medical News*, of Philadelphia. Dr. Pennell is also the author of a small volume, "Poetical Compositions," on which he has received many friendly criticisms. He enjoys a large share of patronage and for several years has been a member of the Board of Education, of which he is president.

PENROSE, Richard Alexander F., of Philadelphia, Pa., was born in Carlisle, that State, March 24, 1827. He is the second son of Hon. Charles B. Penrose. His early education was received at Dickinson College, where he graduated with the degree of A. B., in July, 1846, his medical studies being pursued in the Medical Department of the University of Pennsylvania, from which institution he graduated with honor in 1849. He began the practice of medicine in Philadelphia in 1853, and rose rapidly to eminence. He was one of several members of the profession through whose instrumentality the wards of the Philadelphia Hospital, which had previously been closed to the profession, were opened to medical instruction in 1854. He was soon after elected consulting physician of that institution, and in a short while commenced a series of lectures on the diseases of women and children. These he made thoroughly subserve their purpose by the introduction of illustrative cases selected from the wards of the hospital, thus strengthening the effect of his teachings by the presentation of examples whose principles he was elucidating. As a private teacher of medicine he was very successful, his lectures on obstetrics especially attracting very large classes by their conciseness and practical character. In 1856 he took prominent part in the successful endeavor to found the Children's Hospital of Philadelphia. He was also one of the founders of the Gynecian Hospital, and of the American Gynecological Society. In 1863 the trustees of the University of Pennsylvania elected him to the Professorship of Obstetrics and Diseases of Women and Children, a position made vacant by the resignation of Prof. Hugh L. Hodge. He filled the chair for many years, and as a teacher in this department of medicine he retained his popularity as long as he was connected with that institution. In consideration of his eminent professional attainments, the degree of LL. D. was conferred

upon him by Dickinson College, in 1875. Dr. Penrose is now Emeritus Professor of Obstetrics and the Diseases of Women and Children in his *alma mater*. He has contributed to various medical journals important articles relating to his special line of practice.

PEPPER, William, Sen., of Philadelphia, Pa., was born in that city January 21, 1810, and died there October 15, 1864. After his collegiate studies at Princeton, where he was graduated with the first honors of his class in 1828, he entered the office of Dr. Thomas T. Hewson, who, in his capacity of private preceptor, was excelled by none of his contemporaries. Dr. Pepper graduated at the University of Pennsylvania in 1832, the subject of his thesis being "Apoplexy." After receiving his medical education, he spent two years in Europe, more especially engaged in studying diseases in the great hospitals of Paris. "Upon his return to Philadelphia, he ardently devoted himself to the practice of his profession, and rose rapidly in reputation until for several years before his death he was recognized as the chief consultant in his community." He was physician to the Philadelphia Dispensary, and to Wills Hospital for several years. In 1841 he was chosen physician to the Pennsylvania Hospital and held this position for seventeen years, during which time he took an active share in clinical teaching. In 1860 he was elected Professor of the Theory and Practice of Medicine in the University of Pennsylvania, but was forced by ill health to resign in 1864. Prof. Carson writes that the strong feature of Dr. Pepper's medical character was the possession of analytical acumen, and decided ideas of diagnosis. This he carried into his office of a teacher. "As a didactic lecturer he was clear, concise and complete. Thirty years of active practice had made him familiar with disease in its varied forms, and had led him to reject as useless that which was merely speculative in medicine, while it enabled him to speak with authority of all that was valuable in our science. Thoroughly familiar with medical literature, he had also studied disease in the great book of nature, at the bedside in private practice, and in the wards of hospitals. Thus, to him, nearly every disease treated of presented itself in the form of individual cases which had come under his notice, or been under his immediate care. From this great treasury of knowledge he continually drew in illustration of the subject-matter of his lecture. Catching at the typical features of the disease, its pathological history and phenomena, its diagnosis, general and differential, were given with such clearness and force, that the student saw before him, as at the bedside, all that was distinctive and important in the case; while the principles of treatment and its results followed with almost mathematical accuracy and precision. Dr. Pepper made no effort at oratorical display. The main object of his teaching was apparent—to give a thoroughly practical course, one which, as far as possible, would prepare his pupils for the intelligent treatment of disease. His enunciation was distinct, and his delivery rather a rapid than a slow one. No one could visit his lecture-room without noticing the marked attention of the class, nor be associated with the students without perceiving with what affectionate respect they regarded their preceptor. It is a remarkable

fact, and in keeping with what has already been noticed, that during the four years of his professorship, a period the most exciting and important in our national history, notwithstanding the cares of a very large practice and the infirmities of declining health, he was never absent from a lecture, and never failed to meet his class punctually at the time appointed for its delivery." The career of Dr. Pepper was short in connection with the university, but was so marked as to give promise of eminence and usefulness. Some papers were contributed by him to the periodical journals; they were, on account of his engrossing practice, few in number, but marked by excellent reflection and the spirit of inquiry, his long experience in the Pennsylvania Hospital having placed ample material at his command. Dr. Pepper was a member of various learned societies and a Fellow of the College of Physicians.

PEPPER, William, of Philadelphia, Pa., was born in that city August 21, 1843. He is a son of the late Dr. William Pepper, and was educated at the University of Pennsylvania, graduating from the academy department in 1862, and from the medical department in 1864. He has been connected with various hospitals, and was chiefly instrumental in the establishment of the University Hospital, securing a gift for the site from the city of Philadelphia, and served as chairman of the finance and building committee, and is a member of the board of managers of that institution. From April, 1864, to 1865, he was Visiting Physician of the Philadelphia Infirmary; from April, 1865, to October, 1866, Resident Physician of the Pennsylvania Hospital; from 1866 to 1870, Curator and Pathologist of that institution; from 1867 to the present time, Visiting Physician to the Philadelphia Hospital; from 1867 to 1871, Pathologist to the last-mentioned institution; from 1868 to 1870, Lecturer on Morbid Anatomy in the University of Pennsylvania; from 1870 to the present time, Visiting Physician to the Children's Hospital; in 1870, Lecturer on Clinical Medicine in the University of Pennsylvania; from 1876 till 1887, he was professor of the latter branch, and was then elected to the chair of Theory and Practice of Medicine and Clinical Medicine to succeed Prof. Alfred Stille, a position he now holds. In 1881 he was unanimously elected provost of the university, and at the same time the dignity and powers of the office were materially increased. During no period in the history of this institution has its interest been more rapidly advanced than since his assumption of this office. He founded the *Philadelphia Medical Times*, and was its editor in 1870-71; in 1875 and 1876 Medical Director of the Centennial International exhibition. For his services, in connection with the latter position, he received from the King of Sweden the decoration of knight commander of the order of St. Olaf. He is a member of the College of Physicians; of the Society of the Lincoln Institution; of the American Philosophical Society; of the Pathological Society of Philadelphia, of which he was vice-president in 1870, and president from 1873 to 1876; of the Academy of Natural Sciences of Philadelphia, in which he has been director of the biological section; of the Obstetrical Society of Philadelphia; of the American Neurological Association; of the American Medical Association;

of the Pennsylvania State Medical Society; of the Philadelphia County Medical Society; a delegate to the Centennial International Medical Congress, and an honorary member of the New Jersey Medical Society; a member of the American Climatological Association, and was its president in 1886. He was also president of the First Pan-American Medical Congress, which convened in Washington in September, 1893. Upon that occasion, which is regarded as one of the most important events in the history of medicine that has ever occurred in the Western Hemisphere, he delivered a very eloquent address, which has been widely published and read with great interest. His contributions to medical literature comprise "Lectures on Morbid Anatomy," delivered in the Pennsylvania Hospital, and in the University of Pennsylvania; "Lectures on Clinical Medicine," in the Philadelphia Hospital, and the University of Pennsylvania; a "Catalogue of the Museum of the Pennsylvania Hospital; a Pennsylvania hospital report on "The Fluorescence of Tissues," prepared in conjunction with Dr. E. Rhoads; "Phosphorous Poisoning," "Variola," 1869; "Meigs and Pepper on Diseases of Children," 1870; "Tracheotomy in Chronic Laryngitis," "Abdominal Tumors," "Trephining in Cerebral Diseases," "Progressive Muscular Sclerosis," 1871; "Local Treatment of Tuberculous Cavities," "Operative Treatment of Pleural Effusions," 1874; "Annual Address in Medicine," before the Pennsylvania State Medical Society, "Sanitary Relations of Hospitals," read before the American Public Health Association, "Progressive Pernicious Anemia," 1875; "Cheyne-Stokes Respiration in Tubercular Meningitis," 1876, and numerous other articles and lectures in the *American Journal of Medical Sciences*, *Philadelphia Medical Times* and *Medical and Surgical Reporter*, as also in the Transactions of the various societies mentioned above. His most important literary work, however, has been the editing of the "System of Medicine by American Authors," 1886. This work consists of five large volumes, and has met with immediate success, being recognized as the chief American authority on medical questions. He is a member of the executive committee of the Alumni Society of the University of Pennsylvania; also a member of the board of directors of the Pennsylvania Museum of Industrial Art.

PERKINS, George William, of Ogden, Utah Territory, was born in Essex county, Mass., January 6, 1860, of native New England parentage. He fitted for college at Phillips Academy, Exeter, N. H., graduating in 1879; entered Harvard College in the fall of the same year, and completed the four years' course in three years, obtaining the degree of A. B. in June, 1882; was appointed Assistant in Biology in Harvard University soon afterward, and held that position for two years, pursuing at the same time the study of medicine in the Medical School of Harvard University, where he completed the medical course in 1885, having obtained, in December, 1884, an eighteen months' appointment as House Officer in the Boston City Hospital, where he served as House Surgeon in 1885 and 1886, deferring on this account the taking of his degree of M. D. till the latter year. He was admitted a Fellow of the Massachusetts Medical Society in 1886, and the same year received the appointment of Division Surgeon for the Mountain Division of the Union Pacific Railway

Company, with headquarters at Ogden, Utah, where he has charge of the Union Pacific Railway Company Hospital, to which all serious cases from about sixteen hundred miles of the Union Pacific Railway system are sent for treatment. In 1888 he was appointed Surgeon for the Southern Pacific Company.

PERRY, Joseph M., of Lakeland, Polk county, Fla., was born near Liberty Hill, Kershaw county, S. C., April 7, 1837, of Irish and Scotch extraction, being born and reared in one of the wealthiest slave-owning districts of the South, he had, in common with other young men of his day, sons of wealthy slave-owners, the advantage of good educational facilities in the way of select schools in which he obtained the greater portion of his literary education. He commenced the study of Medicine in 1856, in office with his brother-in-law, Dr. Henry J. Lee, of Darlington, S. C., and entered the Medical College of the State of South Carolina in the year 1858, graduating on the 15th of March, 1860. The Civil War breaking out shortly after, his devotion to principle, and fondness of adventure, led him to join the Confederate Army, entering service as a scout, serving throughout that terrible struggle to its close, in different capacities, losing both property and health, contracted bronchitis with Hemoptysis early in his military life, from which he suffered for ten years. At the close of the war he sought a more genial climate in an effort to recover his health and made Florida the home of his adoption, recovering entirely from the hemorrhages in the salubrious climate of Florida. Dr. Perry has been in active practice of his profession up to the present time, participating in every epidemic of yellow fever since his coming to the State. Has been a member of the Florida State Medical Society from its inception, has been honored with the vice-presidency of that body; one of the surgeons of South Florida Railroad from its completion, and is now at the age of fifty-six, actively engaged in his profession. He has held several positions of trust in civil life in the home of his adoption. Dr. Perry was married in Winnsborough, S. C., March 31, 1864, to Miss Emma L., daughter of Col. Felix Long, and a grand-daughter of Col. William McCreight of Revolutionary fame, when America achieved her independence.

PETERSON, Frederick, of New York City, was born in Faribault, Minn., March 1, 1859; and is of Swedish and Russian descent. His preliminary education was obtained from public high schools and private tutors. He was graduated from the Medical Department of the University of Buffalo, in 1879. His graduation thesis was on "The Physiology of the Posterior Lobes of the Brain," which received honorable mention. He studied for several years in Vienna, Strasburg, Leipzig, Stockholm, Paris, and London, making a special study of general pathology, and of nervous and mental diseases, under Von Kecklinghausen, Weichselbaum, Chiari, Obersteiner, Benedikt, and Meynert. He practiced general medicine in Buffalo, N. Y., several years; he then entered the Hudson River State Hospital for the Insane, at Poughkeepsie, N. Y., for three years, as First Assistant Physician; and established himself as a specialist in nervous and mental diseases in New York City, in January, 1888. He visited Europe three times, from 1881 to 1892, during which he devoted six years to for-

eign study. He was Professor of General Pathology and Director of the Laboratory in the University of Buffalo, from 1882 to 1884, and was Pathologist to the State Insane Asylum and Erie County Insane Asylum, at Buffalo. His present positions are, Pathologist to the New York City Insane Asylum, Professor of Nervous Diseases in the University of Vermont, Chief of Clinic Nervous Department, College of Physicians and Surgeons, New York, Attending Physician to the New York Hospital for Nervous Diseases, and to the St. Xavier's Sanitarium for Inebriate Women. Dr. Peterson is one of the editors of the *New York Medical Journal*, the *American Medical and Surgical Journal*, and the *Journal of Nervous and Mental Disease*. The following are his contributions to medical literature, which have been published in the *Buffalo Medical and Surgical Journal*, *Philadelphia Medical News*, *New York Medical Record*, *American Journal of Insanity*, *Medical Analectic-Electrical World*, *Medico-Legal Journal*, *Journal of Mental and Nervous Diseases*, *American Journal of Psychology*, *New York Medical Journal*, *Alienist and Neurologist*, and other leading periodicals and "Transactions" of medical societies, "The Physiology of the Posterior Lobes of the Cerebrum," graduation thesis; "A Large Renal Calculus in a Case of Acute Insanity," "Traumatic Aneurism of the Femoral Artery," 1879; "Sarcoma of the Wrist," "Compound Comminuted Fracture of the Skull," "Various Articles Translated from the French and Danish," "A Remarkable Fracture Case," "A Case of Puerperal Septicemia," 1880; "Cremation," 1881; "Medical Letters from Strassburg and Vienna," 1882; "The Aliptic Art," "Reports of Interesting Autopsies at the State and County Insane Asylums and General Hospital, Buffalo," "Contagium Animatum," 1883; "Reports of Two Hundred and Fifteen Autopsies," 1884; "Pneumonokoniosis," 1885; "Hydrobromate of Hyoscine, its Use in Thirty-six Cases of Insanity," 1885; "On the Adoption of Some General System of Districting the New York State Asylums," 1886; "The Bielefeld Epileptic Colony," "Remarks on Some European Asylums" (visited in 1886, 1887); "Morbus Basedowii" (Prize Essay Dutchess County Medical Society,) 1887; "Some of the Principles of Craniometry," "A Case of Arsenical Paralysis," "Critical Digests on Insanity and Nervous Diseases," "Experiments with Electrical Death-Currents," "Capital Punishment by Electricity," 1888; "A Contribution to the Study of Muscular Tremor," "Extracts from the Autobiography of a Paranoiac," "Cranial Measurements in Twenty Cases of Infantile Cerebral Hemiplegia" (with E. D. Fisher); "Electric Cataphoresis as a Therapeutic Measure," "Cephalocele" (Wood's Reference Handbook); "Electrothanasia," "Notes on Exalgine," "A Case of Paraplegia from Gunshot Wound of Skull," "Neuroses from Electric Injuries," "The Proposed New Lunacy Law for New York State," "The Colonization of Epileptics," "Paranoia in two Sisters," "Electricity as a Death Penalty," 1889; "Ichthyosis Linearis Neuropathica," "The Cerebral Palsies of Early Life, Based on a Study of One Hundred and Forty Cases" (with Dr. B. Sachs); "A Clinical Study of Forty-seven Cases of Paralysis Agitans," "Homonymous Hemipic Hallucinations," "A Second Note on Homonymous Hemipic

Hallucinations," "Note on the Disturbance of the Sense of Taste after Amputation of the Tongue," "Chapter on Insanity and one on Paralysis Agitans in Starr's 'Familiar Forms of Nervous Disease,'" published by W. Wood & Co., N. Y.; "A Plea for the Epileptic," "A Case of Locomotor Ataxia Associated with Nuclear Cranial Nerve Palsies and with Muscular Atrophies," "A New Method of Accurate Dosage in the Cataphoretic Use of Electricity," 1890; "Further Studies in the Therapeutics of Anodal Diffusion," "The Introduction of Drugs into the Human Body by Electricity," "Notes on Some Southern Health Resorts," 1891; "Observations on the Riviera," "Athenian Hospitals," "The Insane in Egypt," "An Ancient Spa," "Outline of a Plan for an Epileptic Colony," "Progress in the Cure and Colonization of Epileptics," "The Treatment of Epilepsy," "Wintering in Egypt," "A New Portable Faradic Battery of Small Size and Great Power," "Gyrosplasm of the Head of Infants," "Electricity in the Diagnosis of Nervous Diseases," "Three Cases of Acute Mania from Inhaling Carbon Bisulphide," "Some Practical Points in the Localization of Spinal Cord Disorders," "Physiological Experiments with Magnetism at the Edison Laboratory" (with A. E. Kennelly), 1892; "Hydrotherapy in Mental and Nervous Diseases," "The New Phrenology," "The Treatment of the Insane Outside of Asylums," "The Treatment of Alcoholic Inebriety," "A Study of the Temperature in Twenty-five Cases of General Paresis of the Insane," 1893.

PHELPS, A. M., of New York City, was born at Alburch, Vt., January 27, 1851. He is a descendant of the Phelps family of Tewksbury, England, who emigrated to this country in 1630, landing in Connecticut. He was educated in the University of Michigan, where he graduated in medicine March 27, 1873, after which he spent three years in the German Universities, studying surgery. He practiced in Chateaugay, Franklin county, N. Y., from 1873 to 1877, when he moved to New York and took the chair of Orthopedic Surgery in the University of the City of New York, and in the Post-Graduate School and Hospital he was given the same chair. He held the chair of Orthopedic Surgery at the University of Vermont from 1885 to 1888, when, upon the resignation of J. Williston Wright, he was elected to the chair of Surgery which he holds at the present time (1893). He is at present Visiting Surgeon to the City Hospital; Attending Surgeon to the Orthopedic ward of the Post-Graduate Hospital; Consulting Surgeon to the Mary Fletcher Hospital; member of the State Medical Society; Academy of Medicine; New York County Medical Society; American Orthopedic Association; ex-vice-president of the New York State Medical Society; delegate from the University of Vermont to the Tenth International Congress, Berlin, Germany. Dr. Phelps originated an improved operation for talipes varo equinus and for hare-lip, and devised a hip splint, a club-foot machine, artery forceps, and aspirator and other surgical instruments and appliances which bear his name.

PHYSICK, Philip Syng, of Philadelphia, Pa., was born in that city July 7, 1768, and died there December 15, 1837. From an extended memoir written by the late Dr. John Bell, and life sketches by Dr. Jacob Randolph and Dr. Joseph Carson, of Philadelphia, the

editor is indebted for the details concerning the personal history and professional achievements of this remarkable man, who is known as the father of American surgery. Referring to his ancestry, Dr. Bell writes as follows: His father, Edmund Physick, was an Englishman, possessed of considerable strength of mind and noted for his integrity. He held office in the Colonial government, as Keeper of the Great Seal, and after the Revolution he became agent of the Penn family, and was intrusted with the charge of its estates. His wife, Miss Syng, the mother of the subject of this sketch, was the daughter of a silversmith, and was also noted for her intellectual vigor, correct judgment and decision. It was by such an inheritance that young Physick, so soon as his calling in life was chosen or indicated for him, evinced that steadiness of aim and intentness of purpose which, within the limits of reasonable ambition, seldom fail to insure success. Wanting them, the richest gifts of genius are of little avail, even if they do not mislead their possessor into erratic courses and by-paths in which the energies are weakened and fail to produce the desired effect at the critical moment of struggle for the prize. Some of the chosen few may, indeed, like Byron, awake some morning and find themselves famous. Some, from an unusual and unexpected concatenation of circumstances, such as family influence, popular whim and a lucky chance, may have fame thrust upon them; but it is only the fame of the hour, which serves them in no better stead for obtaining future confidence or abiding reputation than did the effort of the "Single Speech Hamilton" in the House of Commons. It was his first and his last, and as such was more noticed, perhaps more noticeable. But no single speech or single act ever made a man a great orator or a great leader, either at the council board or in the field. Once on the topmost round, a man becomes suddenly more conspicuous than before; but to have attained that eminence was the work of time and of patient and laborious effort, of which, during its progress, the world does not always take the trouble to inform itself. The father of young Physick was not prevented by his painstaking habits of business, and the accumulation of riches consequent on their exercise, from a watchful regard for the proper education of his son, or a liberal bestowment of money for the purpose. This would seem, indeed, to be the first duty and one of the chief pleasures of a parent solicitous for the welfare of his child; but it is not always so regarded, and we every now and then find that a liberal and even lavish expenditure in matters of household and personal adornment is not deemed to be at all incompatible with the closest economy, if not positive niggardness, in making a pecuniary return, we can not say requital, to the teacher. Edmund Physick thought and acted differently; and believing the ordinary charges for tuition to be too low, he gave double the customary remuneration to the teacher of his son Philip, who was placed under the care of Robert Proud, the historian, principal of the Friends' Academy in Fourth street, near Chestnut. As Mr. Physick resided in the country, seven miles from Philadelphia, on the banks of the Schuylkill, his son was introduced, as a boarder, into the family of Mr. John Todd,

father-in-law of the lady who, as widow Todd, became the wife of James Madison, at the time a member of Congress, and afterwards President of the United States. Philip was allowed by his teacher to visit his parents every Saturday, and to remain with them until the following Monday morning; and in availing himself of this permission, he never failed to return in time to be present at the opening of the school, although sometimes his walk back to town was in very inclement weather. Thus early the boy evinced a punctuality which soon became a confirmed habit, forming, in after-life, one of the distinguishing traits of the man. It is but natural for us to infer that the scholar went through his lessons in the same methodical manner in which he performed his weekly visits to his parents and returned to his school. From the academy Philip was transferred to the classical department of the University of Pennsylvania, in which he continued his studies until he had reached his eighteenth year, when, in 1785, he took the degree of Bachelor of Arts. Of his school boy and college days, nothing has come down to us; no record or incident, illustrative either of precocity or genius in the recitation-room, or of scrapes or escapades, and follies or vices, which are so often the concomitants of genius, as to lead to the vulgar error that they are necessarily incorporated with it. After a month's rest from study, the young bachelor of arts was received into the office of Dr. Adam Kuhn, then Professor of *Materia Medica* and Botany in the Philadelphia College of Medicine, a post to which he was first appointed in the year 1768, that in which Physick was born. The period of his medical pupillage under Dr. Kuhn extended to three years and six months. If there have been men who had an early and almost instinctive fondness for the profession of medicine, Philip Syng Physick was not of the number. He yielded, on this occasion, to the wishes of his father, and for this act of filial obedience he received, in after-life, an ample reward in fame and wealth. An initiatory scene in the Medical College in Fifth street, opposite Independent Square, to which he was a witness, and which consisted in the preparing of a skeleton, was not adapted to make him either a follower of Esculapius or an imitator of Machaon. But his entreaties for an abandonment of his professional destination were urged in vain. They who knew and watched with admiration the calm, unwavering look, and steady hand of the great surgeon in the height of his fame, would hardly credit the fact of his almost fainting, and of his being obliged to quit the amphitheater of the hospital, when, at the instance of Dr. Kuhn, he had been taken by his father to witness, for the first time, the amputation of a limb. In proof of his diligence as a student one trait will suffice. Having been recommended by his preceptor to study carefully "Cullen's First Lines of the Practice of Physic," he complied so fully with the advice as to commit the entire work to memory. It must be considered a fortunate circumstance in the student-life of young Physick, that he did not conceive himself to have been born a surgeon, and was not bent on an exclusive devotion to surgery; for in such a case he would probably, as so many always do, have neglected to acquire a knowledge of the principles of medicine and a habit of looking

over the entire domain of the science, so to see and appreciate the reciprocal connection of its several branches and the support which they gave to each other. He was, happily, prevented from becoming a merely mechanical and jobbing surgeon, dexterous in the use of instruments, but ignorant of the conservative and recuperative powers of nature, and the assistance derived from medicine, by which the use of instruments and the mutilation of the patient are avoided. In the office of Dr. Kuhn, the young student went through a course of reading which must have had a good effect in liberalizing and enlarging his therapeutical methods and appliances beyond the mere empiricism which too often accompanies "pure surgery." We may grant that in many of the volumes read there was much useless lore; but is it certain that all the pretensions to positive knowledge, by the demonstrative methods of chemistry, microscopy, and statistics of the present day, will be sustained by the observations and experience of those who may be in quest of the truth a century later. It is not probable that the students of that period, while receiving some of these recorded phenomena, after having subjected them to fresh scrutiny, as valuable aids to medical science and proofs of progress, will still look back to the penultimate century, and to many centuries beyond it, for accurate physiognomical and life-like descriptions of morbid changes and sanitary recuperation, and of the effects of medicines and alimentary regimen, even although no chemical analysis had exhibited the constituent elements of the articles used in therapeutics and hygiene, or taught which were the essentials, and which the secondary or unimportant ones? Young Physick did not confine himself to reading under the guidance of his preceptor, Dr. Kuhn; he also attended the lectures of the latter on *materia medica* and botany, and of his associates in the College of Philadelphia; for it was not until the year 1789 that a union was brought about between this institution and the University of Pennsylvania, which had been chartered by the revolutionary legislature in 1778. The medical department of the Philadelphia College, the first organization of the kind in the then provinces, was founded, in 1765, by Dr. John Morgan and Dr. William Shippen. Its Faculty consisted, at the time of which we are now writing, of Dr. Shippen, Professor of Anatomy, Surgery, and Midwifery; Dr. Kuhn, of *Materia Medica* and Botany; and Dr. Rush, of Chemistry, and of Clinical Medicine in the Hospital. Dr. Morgan had withdrawn himself from the school, on the occasion of his entering the army in 1775, in which he acted for a while as Surgeon-General. He died in 1789. Although young Physick was undoubtedly an attentive listener to the prelections of the professors in the Philadelphia College, and turned his opportunities of medical instruction to the best account, yet he wisely declined to ask for the degree of Doctor of Medicine, and thus early, it might have been said prematurely, to assume the heavy responsibilities incident to the practice of his profession, until he had given himself a wider range for observation and more time for maturing his judgment. The father, fortunately coinciding with these views, gratified the longing desire of his son to visit Europe, and even went still farther by determining to accompany him

across the Atlantic. They arrived in London in January, 1789, and Mr. Physick, without loss of time, placed Philip under the care of John Hunter, so that he became at once a member of the family, and could be benefited by the continued teaching of this great surgeon and physiologist. How the young American, now in his twenty-first year, comported himself, and how he turned to account the great opportunities for instruction offered in the dissecting-room and the museum at the house of Mr. Hunter, and in the wards of St. George's Hospital, of which the latter was surgeon, may be inferred from his previous habits, and might readily be gathered from his whole life, even if there had not been contemporary evidence on this point. The first intimation of the course of study which his preceptor wished him to pursue, was made in the Hunterian fashion—sententious, bordering on the abrupt, but quite explicit. It was given in a reply to a question from the father, what books it would be necessary for him to procure for his son! "Then, sir, follow me: I will show you the books your son has to study;" and leading the way from his own study to the dissecting-room, he pointed to several bodies, adding: "There are the books which your son will learn under my direction; the others are fit for very little." The pupil received the advice in the earnest spirit in which it was given, and at once engaged in a course of dissections, in which he displayed so much neatness as to win the favorable notice and approval of Mr. Hunter, whose confidence in him was farther manifested by making him an assistant in his experiments, the useful deductions from which must necessarily depend on their being performed accurately, as well as recorded in good faith. The pupil became gradually the trusted friend of his teacher, who gave a practical evidence of regard, on the occasion of a vacancy in the post of House-surgeon to St. George's Hospital. Among the many applicants to fill the vacancy, young Physick was the successful one, owing to the recommendation and exertions of Mr. Hunter in his favor. His term of service was for one year, which began on the first of January, 1790. We can easily conceive that the newly elected house-surgeon would, in this new field of labor, be continually alive to the importance of the duties devolving on him, as well as intent on acquiring a knowledge on practical surgery, the principles of which he was in the habit of hearing so ably expounded by his master. The hospital was the school in which he prepared himself for the active exercise of his profession, at a future day, in his native city. There he became familiar with the operations of the first class, and with minor surgery, including the apparatus and contrivances best adapted to the relief and cure of fractures and deformities. In fine, he learned to prepare himself for prompt action in sudden and unforeseen emergencies, and to adapt the treatment to the circumstances of each particular case. Of his self-possession and readiness of resources, he gave early proof before the assembled class at the hospital, by his prompt reduction of a dislocation at the shoulder-joint downwards, without the aid of an assistant or of apparatus of any kind. By temperament, and early education under good parental example, young Physick was prevented from catching the impulsive ways and

often rude manners of his great preceptor; for, with all his genius, industry, and habits of labor, John Hunter wanted self-control and amenity, as well as intellectual cultivation. The usual conditions on which he took pupils were the payment of five hundred guineas—about \$2,645—and their being bound to him for five years. In the case of Physick, this rule must have been waived, as he only remained under Mr. Hunter's care two years and four months, or from January, 1789, to May, 1791, of which time one year was spent in St. George's Hospital as house-surgeon. In the first part of this period he attended regularly the lectures delivered by Mr. John Clarke and Dr. William Osborne on midwifery. It is very probable that the previous medical studies of the young Philadelphian were taken into account, as well as his intention to visit Edinburgh and spend some time there, after he should have left London. His age, he being in his twenty-first year when he was placed under the care of Mr. Hunter, was no bar to prolonged residence with his preceptor, whatever may be thought on the subject in these times of railroad speed in study as in everything else. Jenner, it is said, had attained this age when he became a pupil of Mr. Hunter. But we are not left to measure young Physick's professional knowledge and attainments by the standard of chronology or the actual length of time in which he had been studying medicine. Practical and unmistakable evidence on this point was given in the laudatory testimonials from the governing authorities of St. George's Hospital of his medical qualifications and correct deportment. They even went so far as to declare that the institution was indebted to him for the zeal and ability which he manifested in the discharge of his duties for the relief of the inmates of the hospital. In farther proof was the offer made to him by Mr. Hunter. This eminent man, conscious of his own great powers, and tasking them to the uttermost in his anatomical and physiological researches, could scarcely keep terms with mediocrity, either in his pupils or in his compeers in the profession. He was perhaps too ready in conferring his friendship on very young men if he perceived anything in their character which pleased him; but he was equally ready to throw them off again on finding them to fall short of what he had anticipated. He had every opportunity of becoming acquainted with his American pupil; first as a student continually under his eye, and next at St. George's Hospital, of which he himself was one of the attending surgeons. The scrutiny must have been as thorough as it was satisfactory, since it led Mr. Hunter to invite Physick to take up his residence with him, and to take a share in his professional business. Inducements of a prospective nature, looking to the permanent establishment of Physick in London, as a candidate for professional honors and emoluments, were also held out. In the event of his accepting the temporary offer, he would most probably have replaced Mr. Hunter in the practice of surgery, so as to allow of the latter devoting more time to his cherished studies in his anatomical cabinet and museum. Nor would he have foregone all assistance, even here, from his young partner, of whose neatness in dissection and whose dexterity in making preparations, as well as in performing

physiological experiments, he had already made satisfactory trials. In his "Treatise on the Blood," Hunter says: "Many of these experiments were made by Dr. Physick, now at Philadelphia, when he acted as House-Surgeon to St. George's Hospital, whose accuracy I could depend upon." There can be no question of the entire success of Physick and the eminence which he would have reached had he remained in London. The road was open, and he possessed all the needful qualifications for traveling it with signal honor to himself, and for the benefit of a large number of his fellow-men. The annals of English surgery would then have exhibited his name in equal prominence with those of Astley Cooper, Abernethy, Carlisle, Home, and their younger contemporaries, Charles Bell, Brodie, Lawrence, Travers, Samuel and Bransby Cooper and Guthrie, not to speak of John Bell in Edinburgh, Hey in Leeds, and Carmichael and Macartney in Dublin. Happily for American surgery and for the interests of humanity, Physick declined the offers of Mr. Hunter, and looked to his native city as the theater on which to try his fortunes and exhibit his professional skill and attainments. We are told that he may have been influenced in his course by the fact that the air of London did not agree with him, in its probably subjecting him to repeated attacks of catarrh, to which he was prone through all his life. While in St. George's Hospital he had a severe attack of illness, for which no name has been given. It was so serious, however, that Mr. Hunter was on the point of writing to his father to tell him of the necessity of his son's returning home. In parting from his preceptor and friend, who had given such convincing proofs of the strength of his regard, Physick must have felt deep emotion. He cherished in all after-life the memory of John Hunter, for whom he felt greater admiration, we may truly add, more profound veneration, than for any other man. In the year 1791, Physick received his license from the Royal College of Surgeons in London, and in May of the same year, he repaired to Edinburgh with a view of procuring the degree of Doctor of Medicine. In the Scotch capital he turned to account the opportunities offered for instruction with the same zeal and assiduity that he had displayed in London; he attended regularly the medical lectures in the university, and visited with equal regularity the Royal Infirmary, then, as now, the chief clinical school in Edinburgh. Having complied with the requisitions of the university, which could not have been so stringent on the score of time of study as it now is, he took in May, 1792, his degree of M. D. after having written and defended a thesis "*De Apoplexia*." Dr. Randolph, in his "Memoir on the Life and Character of Dr. Physick," speaks of the original manuscript copy of this inaugural essay in English, then in his possession, as evincing the great care with which it had been prepared. There are two interesting facts, writes Dr. Carson, in connection with his graduation as Doctor of Medicine, which may be noticed; the one, that it occurred at the time of the coalition between the two Faculties in Philadelphia, and the permanent establishment of the University of Pennsylvania, of which he was destined to become so conspicuous an ornament; the other, that he was placed upon an *ad eundem* standing with

the University of Edinburgh, and permitted to graduate with attendance upon one course. We are told "that the professors of the University of Edinburgh were very careful upon whom they conferred its honors, and have never deviated from the resolution they had taken that none should be promoted to the honorable degree of Doctor of Medicine without having studied medicine *at least three years at this or some other university*; at the same time producing certificates of having attended regularly the public lectures prescribed by the statute and submitted to be examined in the most solemn manner by the Faculty." We are not aware of an instance of a similar nature having previously occurred at Edinburgh in the case of an American student. Even at Edinburgh, where there were no facilities, and, at the best, but scant means for the study of practical anatomy, he did not forget, during his short stay there after graduation, John Hunter's "books;" as we learn from his note-book, an extract from which is given by Dr. Randolph, in the following words: "June, 1792. Prepared for the house-surgeon at the Royal Infirmary, Edinburgh, *intussusceptio*, in which the ileum had passed into the colon, and at last dragged down six inches of the colon. Most probably there was a stricture formed about the termination of the ileum, near the valve, as there were strictures in other parts of the intestines. At present, a stricture of the ileum at this part certainly exists, but whether that did not arise from the binding of the inverted colon, and the inflammation consequent thereon, I am not sure. I was not present at the dissection of the body, and the person who took out the parts tore them very much." Dr. Physick returned home in September, 1792, in the twenty-fifth year of his age, and the eighth of his medical studies, an age and a period the bare idea of passing through which would alarm our students of the present day. Too many of their number think themselves quite prepared by the time they are twenty-one years old and had studied medicine after a fashion during three years, some of them barely eighteen months of this period, to rush out into the world and to take on themselves the weighty cares and responsibilities of professional life. If his biography be intended, as all biographies ought to be, for the instruction of the living, it will not be amiss for us to pause for a while before we follow Dr. Physick in his subsequent career to eminence and fame, and to inquire into the foundation on which he and his friends could reasonably rest their hopes of his future success. His was not the adventurous mind to catch at fame in her onward and sometimes capricious flight, nor the bold and self-confident one to compel fortune to do his bidding, in spite of all opposition. No equipage of his rolled over the streets of Philadelphia to serve as an advertisement of the arrival of a young and promising surgeon, who, by implication, it must be supposed, had traversed the streets of London in a similar style in the carriages of its celebrities. There was no combination of overkind but not over-scrupulous friends, who, trumpet-tongued, might proclaim his brilliant talents, and the wonderful operations performed by him in the hospital at London; none who, in a confidential whisper sent into the ear of every person whom they met, would tell of this patriotic man declining all the offers and prospective

honors and emoluments with which he had been tempted to remain in London, and of his preferring to devote his skill and his labors to the benefit of his countrymen at home. He never could have been brought, by any stress of circumstances, either to countenance or in any way to give his aid to these devices; nor could he, in Cossack fashion, make daily sallies on the unsuspecting halt, and maimed, and blind, by following them into cellars and garrets and out of the way places, in order to beguile them into a consent to an operation, under iterated assurances that he would cure their infirmity and restore them to usefulness and to the world. He never boasted of his performing brilliant operations, with a view of getting his name up as a surgeon of great dexterity, who could take off a limb or cut out a tumor in the twinkling of an eye. Dr. Physick must have felt conscious of resources within himself, superior to all those ephemeral clappings. He had passed through a long period of probationary study, in which, first under Dr. Kuhn, he had made himself familiar with the medical classics—the opinions and the practice of the great teachers of former times; and afterwards, under John Hunter, and in St. George's Hospital, he had become a thorough anatomist and a practical surgeon, intimate with the several organs and tissues of the body, and the changes which they underwent in inflammation, as well as with the most appropriate means of relieving all external injuries and lesions, both by mechanical aids and the use of the knife. He had learned, also, the necessity of restraining and removing inflammation, when occurring either from traumatic lesion, or consecutive on an operation, and which, if neglected, might prove fatal. In listening to the lectures and private locutions of his great teacher, he became imbued with the doctrines of sympathy, which taught that external local injury affects often severely the internal organs, and that, inversely, the condition of these, particularly of the digestive system, will greatly modify, for good or for evil, the condition of the external parts and their lesions, whether these be wounds or ulcers. He had acted, in practice, on a knowledge of this sympathetic connection, for years before the appearance of the work of Mr. Abernethy on the "Constitutional Treatment of Local Diseases." Thus prepared by reading, by study, and by habits of observation, and mental and manual experience, and adopting principles in medicine only so far as they might serve for the condensed expression of positive facts, constitutionally calm and unimaginative, and trusting to no plausible conjecture or even large generalizations, Dr. Physick could wait patiently for coming opportunities for the exercise of his talents and the display of his available skill. It is for others to create the occasion; happy the man himself if he is on the spot at the opportune moment, and has the ability to turn it to account—a conjunction of circumstances this which is absolutely necessary, although often overlooked in our speculation on the different fortunes of two persons, who seemed, at the outset of life, to be equally capable of running the same career to eminence. The subject of this biography was not one who could invite others to his aid, and inspire them with much warmth of regard. He had not the ready smiles, the honeyed speech, the ready bow, and

demonstrative manners, which would imply an eagerness to anticipate another's wish, covering all the while the hope to obtain the vote and influence of this other. His calm and dignified expression of countenance, occasionally overcast, even at that early day, with a shade of melancholly, his erect port, and measured gait, were not calculated to invite confidence, however well-adapted they might be to retain it. A natural consciousness of his own great resources did not, however, prevent Dr. Physick from entertaining some anxiety, when he found time gliding on without his being able to see a list of patients; nor was he entirely consoled by the kindness of his friend, Mr. Prestman, whose well-stored library was opened to him during his leisure hours. The first step to professional business was an agreement which Dr. Physick, at his own instance, made with this gentleman and some others, to attend their respective families for the sum of twenty dollars a year. Dr. Charles Caldwell represents the beginning of Dr. Physick's professional life to have been of a still more discouraging character, and he repeats the language which the latter held on this subject: "I walked the pavements of Philadelphia, after my return from Europe, for nearly three years, without making as much by my practice as put soles on my shoes, and such were my discouragements and dissatisfaction that I would have sold the fee-simple of my profession for a thousand pounds, and never again have felt a pulse in the capacity of a physician." That Dr. Physick should have held this desponding language need not excite surprise. How many, who subsequently rose to eminence in the different professions, have expressed themselves in similar terms. Obstacles and discouragements belong to the history of genius, as we learn from the lives of nearly all who have won for themselves a name in the annals of fame; and it would seem, indeed, such are the contradictions in human nature, as if difficulties, in their being a spur to action, were an indispensable condition for success. Undue stress has been laid on the alleged advancement of Dr. Physick's professional standing and income from the indirect effects of his services in the yellow fever of 1793. Reputation won by public services of any kind is seldom convertible into bullion, still less into the current coin by which a man procures his bread; and although it has been said that an epidemic disease is the harvest of the physician, experience tells a different story. So far from garnering an abundant harvest, they are rather gleaners of scattered and fallen grain, themselves exposed the while to pestilence, and subjected to the privation of sleep and meals, and all social pleasures. Not a few of them fall victims to the disease from which they are trying, at every cost, to protect or relieve their fellow-citizens. The survivors, it is true, get a vote of thanks, sometimes a piece of plate, sometimes a piece of poetry, for which they are expected to be profoundly grateful, and to feel that they have been richly rewarded for all their arduous labors. Literal folks and utilitarians, who have no feeling of the sentimental, may be inclined to take a different view of the case, and irreverently repeat Falstaff's question, "What is honor?" Dr. Physick must have been among the small number of the professors who, as we learn from Dr.

Rush, continued at their posts during the trying months of September and October, 1793. Some were carried off by the pestilence, others carried themselves away to the country and neighboring towns, under the feeling of general alarm which infected nearly all whom the fever spared. There are on record two proofs of Dr. Physick's remaining in the city, and of his doing his share of duty among the forlorn hope, viz: his being himself attacked with the fever, and his making, in conjunction with Dr. Cathrall, dissections of some of those who had died of the disease. The result of these examinations confirmed the opinions antecedently expressed by Dr. Lining, of South Carolina, and by Dr. John Mitchell, of Virginia, that the force of the fever was spent on the stomach. Dr. Physick's constitution received a shock from the attack of the fever, from which, it was always his own belief, he never completely recovered. It is evident that, in the following year, 1794, the subject of this memoir had reached a recognized position among the more prominent members of the profession. Dr. Rush, in his "Account of the Bilious Yellow Fever of 1794," makes frequent reference to Dr. Physick; at one time as telling Dr. Rush of his having a patient with yellow fever under his care as early as the 6th of June, at another, of the inefficacy of bark; and, again, of the good effects of the antiphlogistic treatment, in this disease. At these times, his name is associated with those of Griffiths, Woodhouse, and Dewees. In this year, Dr. Physick was elected one of the surgeons to the Pennsylvania Hospital, and, also, a prescribing physician in the Philadelphia Dispensary. His long connection with the first of these institutions was to him a means of usefulness and distinction; to it, increase of reputation, as an asylum in which all that could be done by the art of surgery was accomplished. We shall have occasion to speak hereafter, in a more particular manner, of the value of his services in the hospital. During the short period in which he held the post of physician to the dispensary, he discharged his duties to it with what may henceforth be called his characteristic punctuality and conscientiousness. We are told by Dr. Randolph that the professional engagements of Dr. Physick, as shown by his papers, increased very considerably during the year 1795; and that about this period, the prospect of establishing himself in business was exceedingly flattering. We learn, from the same authority, that in this year he began to keep a journal of the most remarkable and interesting cases which occurred in his practice, more especially such as were of a surgical character. This journal was continued up to the year 1810; but if we except the probable gleanings from it by Dr. Dorsey, introduced into the "Elements of Surgery" of the latter, the profession has derived no benefit from this precious record, which keeps company with his lectures in some old trunk or forgotten closet. The yellow fever of 1797 tried severely the physicians of Philadelphia. Dr. Physick suffered, in this year, from a second attack, during which he was bled to the amount of one hundred and seventy-six ounces. Dr. Rush states, in his history of the fever of 1797, that he attended two other persons at this time who had been affected by the epidemic of 1793, and two others who had suffered in a similar manner in 1794. Among

the eleven hundred deaths from yellow fever in 1797, were those of nine physicians. Seven others in addition to Dr. Physick, viz., Drs. Reynolds, Caldwell, Church, Benjamin Duffield, Hayworth, Boys and Strong, survived an attack of the disease. It has been well said by a historian of the fever of this year, "If a generous contempt of danger and of death merits the gratitude of mankind, that tribute is undoubtedly due to the physicians of Philadelphia. The most laborious, hazardous and disagreeable task was, in almost every instance, to be performed gratuitously." Among those physicians who fell victims to the disease was Dr. Annan, one of the early medical attendants at the Bush Hill Hospital in 1793, in connection with Physick, Leib and Cathrall. Another, Dr. Pleasants, had retired to the country; but, feeling himself called on to confront danger, he returned to the city and gave his life as an evidence of the sincerity of his benevolence. The case of Dr. Thompson was of a still more startling and melancholy nature. "He had been married in the evening; had gone to bed, and within two hours felt the symptoms of the disorder approaching. The family were alarmed. The bridegroom was removed, and died on the third or fourth day, leaving his unfortunate wife 'at once a widow and a bride.'" It is said that there were only twenty-three or twenty-four physicians in the city who attended patients during this season of pestilence; we can well imagine the excessive strain of mind and body to which they would be subjected, even if their ranks had remained entire, instead of being thinned by the death of eight of their number, and farther weakened for a season by the sickness of nine others. The name of Dr. Physick will ever be associated with the history of the scourging epidemic yellow fever of 1798, and his gratuitous and invaluable services as Resident Physician in the City or Bush Hill Hospital are duly recorded in the annals of Philadelphia. He had for associate on the occasion Dr. Samuel Cooper, who himself fell a victim to the disease. Some surprise will probably be felt at Dr. Physick's being able, conscientiously, to detach himself from the families and individuals in the city who must have regarded him as their medical counselor. On this point we can not offer any explanation, unless it be in the fact of the flight of so many families from the city. Certain it is that he was now looked upon as a man of mark, and was in high repute among his professional brethren—evidenced both by his being made president of the Academy of Medicine and by the frequent reference to his observations on the yellow fever of this year, in Dr. Rush's brief history of the disease. The opinion unequivocally advanced by Dr. Deveze in 1794, that yellow fever is not contagious, was, with slight reservation, now advanced by the Academy of Medicine in a communication signed by the president, Dr. Philip Syng Physick, dated August 8, to the Board of Health. We meet in this document with the following declaration: "Many respectable modern authorities assert that yellow fever is *not contagious* in the West Indies, and repeated observations satisfy us that it is rarely so during the *warm weather* in the United States. None of the cases we have yet seen have propagated it, and we conceive it to be an error as absurd in its nature as it

has been fatal in its operation upon the city of Philadelphia, that the contagion of a disease should adhere to the timber of a ship during a sea voyage, and should spread from the timber of the ship without contact, through an extensive neighborhood, and cease to communicate itself afterwards by long and close connection of the sick with their families and attendants." The City Hospital was opened on the 9th of August for the reception of the sick, and closed on the 1st of November. Few of the nurses of the hospital were attacked with the disease. It was often customary for them to sleep on the same bed with the sick. One or two instances occurred of wives nursing their husbands, and mothers their children; and while thus engaged they would often lie on the same bed with them; but in no instance did these persons have the fever. It will, perhaps, be alleged that some of the scenes and incidents, and the names of individuals which we have introduced in relation to the epidemic visitation of the yellow fever in Philadelphia in the year 1798, and in the preceding years of 1793, 1794 and 1797, do not belong to the personal history of Dr. Physick. But without some historical references to the eventful times and the agitated and distressed community in which he performed so useful, and, in some sense, so conspicuous a part, we can not do full justice to the man as a philanthropic citizen and a courageous physician. After learning, in this way, who were his local contemporaries, and what were the circumstances in a social and professional point of view in which he was placed, we shall be able, to some extent, to appreciate the trials to which he was exposed, the dangers he incurred, and the difficulties he overcame, while discharging the high trusts confided to him, as a member of a chosen band who had inwardly vowed to battle with dread pestilence, and to restore health and hope to their fever and fear-stricken friends and fellow-citizens. The simple announcement of the fact that Dr. Physick had volunteered his services as Medical Superintendent of the City Hospital, and that the offer had been accepted, would create a favorable opinion of his humanity and benevolence; but they would fail to convey any idea, approaching to the reality, of the scenes of suffering—the torments of the sick, and the agonies of the dying—of which he was hourly a deeply interested, but at the same time, of necessity a self-possessed witness—calm himself amid the groans, the cries, and contortions around him. More trying still, were the anxious inquiries of mothers, wives, and sisters after their sick relatives in the hospital, often at a time, too, when he must have felt that they were doomed to inevitable death. And then the grief, sometimes displaying itself in tears and sobs, sometimes in the low moans, and again in the piercing cries of the bereaved and hope-abandoned parents, who had lost their only son, or a sister her beloved brother, her only protector on earth! Such scenes as these called for more than a soldier's fortitude, while his part in them promised far less, in the way of subsequent honors and distinction, than a soldier's reward. Dr. Physick was placed in nearly a similar situation to that of the commander of an outpost of a beleaguered city, from which he was continually hearing of the sickness and the death of neighbors, friends and acquaintances, many of whom he must have esteemed for their virtues and venerated

for their piety. He would be told, at the same time, of the protective measures taken by the authorities, and of the daily toils and exposure of the lives of the medical brotherhood, with all of whose names and merits he was familiarly acquainted. With what intense anxiety he must have inquired, from day to day, whether Rush, the more than "hero of a hundred fights," was still spared to lead on, as he had done in former years, the forlorn hope, and to teach the affrighted people, even in the very extremity of suffering, how to draw courage from despair. And there was his worthy compeer, the drab-coated Griffiths, who, ever at his post, showed now, as in former years of pestilence, how great civil courage and active service could be combined with Quaker mildness and simplicity of manner. Of Wistar, of whom afterwards he became the colleague in the University of Pennsylvania, Physick must also have received daily news relating to his professional efforts in the common cause. All thoughts and feelings of jealous rivalry in the path of surgery were, at this time, dormant in the minds of both. The ears of the Resident Physician at the City Hospital were becoming familiar with the names of Caldwell and Coxe, who had now appeared in the field of danger and took part in the battle against pestilence and death. The former was to speak, nearly forty years afterwards, his funeral eulogium on the banks of the Ohio, in a city at that time barely known and in a State but then recently received into the Union. The latter was destined to be, in two several chairs, his collegiate associate in medical teaching. Dr. Church was another of the medical garrison in the more than besieged city. He was among our earliest lecturers on midwifery, and cards may still be seen with the name of Dr. James associated with his own for a course of lectures on this branch. While ample provision was made for the sick who could be taken to the City Hospital, those similarly afflicted among the poor in the city itself were not uncared for. The north part of the city, and the Northern Liberties, were placed under the medical charge of Dr. Francis Barnes Sayre, Dr. James Mease and Dr. Kinlaid; Southwark, and the south part of the city, were attended by Dr. John Church and Dr. Benjamin Duffield, while the center was under the care of Dr. Samuel Duffield. It will be seen from this record and the references which we have previously made that, great and conspicuous as were the merits of Dr. Physick, in taking his station at the City Hospital, he did not stand alone in devotion to the public welfare, under the trying circumstances of this memorable year. There was no need of any foil to set off the benevolent traits of these good men, although we are pained to say that it was created by the opposite course of other members of the profession. So at least we learn from a very significant passage in an able and a feeling address of the Board of Health, signed by its president, William Jones, to the citizens of Philadelphia, invoking their aid in the emergency. The words to which we refer are these: "View the list of your physicians, and mark how few are at their posts." In the absence of statistics which might indicate the entire number of practicing physicians in Philadelphia in the year 1798, before the breaking out of the epidemic, we are unable to say how far the grave accusation, implied in

the words just quoted, is deserved. On comparing, however, the number on duty in the city during this year with that of a similar class in 1797, we find the proportion to be more than three in the first to one in the last. The mortality in the medical ranks does not seem to have been as great in 1798 as it was in 1797, although the actual and proportionate mortality among the citizens generally was much greater in the former than in the latter of these two years. Dr. Physick, in addition to his direct services in the cause of humanity, by his applying all the resources of medical science for the relief of the sick in the hospital, contributed indirectly but efficiently to the same end by his pathological investigations. He continued, on this occasion, *post-mortem* examinations similar to those which he had made in 1793, and with the result of ascertaining, still more clearly than before, the gastric character of yellow fever and the origin of the black vomit, which he and Dr. Cathrall showed to be given out from the inflamed vessels of the stomach and intestines. In the absence of any account, by himself or others, of his mode of practice in yellow fever, we are left to infer that, regarding, as he would do, the disease to be gastritis, he must necessarily have avoided the use of stimulants and of irritants—a conclusion the more probable, as we are told by Dr. Randolph “that, in one instance, he ascribed the death of a patient laboring under this malady to a relapse produced by swallowing a small quantity of chicken-water.” On the termination of his voluntary duties at the Bush Hill or City Hospital, he received a very flattering and at the same time substantial testimonial of the estimation in which his services were held, in the shape of several pieces of plate, valued at more than a thousand dollars. In the year 1800, Dr. Physick, then thirty-two years of age, married Miss Emlen, “a highly gifted and talented lady, and daughter of one of the most distinguished ministers of the Society of Friends.” Of this union, four children were the fruit. The year 1800 was a memorable one in the life of Dr. Physick in another respect; for it was in that year that he commenced a regular private course of lecturing on Surgery at the Pennsylvania Hospital, to a number of students who were attending the Medical Department of the University of Pennsylvania, and gave the promise of that reputation and authority he possessed in after years, and which warranted the appellation applied to him, “Father of American Surgery.” In 1805 he was given the independent chair of Surgery in the University of Pennsylvania, which he held for thirteen years. This was the first separate Professorship of Surgery established in America. In the University of Edinburgh the institution of the Chair of Surgery did not occur until a quarter of a century later (1831). Dr. Physick was from the time of his election in the possession of the widest field for the exercise of his talents, “and was listened to by the large classes in the University, through the members of which he could disseminate the principles of surgery imbibed from his celebrated preceptor, John Hunter—strengthened and enforced by his own meditation and personal experience obtained in hospital and private practice.” Referring to his first lectures on surgery, Dr. Bell writes: “He was encouraged to take this important

step by Dr. Rush, who, in giving his advice, was probably influenced by mixed motives. The latter may have felt the necessity of a more extended course of instruction in surgery than was compatible with the restricted plan in the university, in which this branch was taught in conjunction with anatomy and midwifery, by Dr. Shippen; and at the same time he may not have been loth to bring forward a rival to Dr. Wistar, who was then somewhat prominent as a surgeon, and who was also the adjunct of Dr. Shippen. Between Wistar and Rush a misunderstanding, some would choose to call it a quarrel, had existed since 1793, owing to some circumstances with the precise nature of which we are unacquainted. Whatever may have been the motive, the effect of the measure was in every way beneficial. Dr. Physick began to prepare himself for his new duties with his usual method and perseverance; and he was cheered at the outset by the approbation of those to whom his lectures were addressed. The introductory was committed to memory before it was delivered. At the close of the lecture, Dr. Rush, who was present by invitation, approached the lecturer, and, after shaking hands, observed with some emphasis: “Doctor, that will do; you need not be apprehensive as to the result of your lecturing. I am sure you will succeed.” Words of prophecy; for seldom was man more successful in the accomplishment of all that he could have proposed to himself, or that could have been expected from him by others, than was Dr. Physick as a teacher of surgery. Not only did he attract attentive classes to his lectures for some years following this time, but he succeeded in opening the eyes of the trustees of the university to the necessity of erecting an independent chair from which surgery should be taught, and also, as an almost inevitable consequence, of appointing him to fill it. This measure as stated was taken in the year 1805. It was one not less of policy, in reference to the interests of the institution, than of gratification and gain to himself. During the period in which he filled the chair of surgery, that in which the school, be it said, had the largest classes and the highest reputation, it was the good fortune of Dr. Physick to diffuse what must ever be regarded as sound and clear views of the principles and practice of surgery, and to make his opinions the received canons over a greater extent of territory than had ever previously received the lessons of any other teacher of this branch. In listening to him, the students felt that they were addressed by one who spoke with an authority, not merely derived from office, but from profound and thorough knowledge of his subject, and an entire conviction of the accuracy of what he was saying. With him there was no superfluity of phrase; no attempt to embellish the truth. What might seem to be wanting in copiousness, was made up in precision of diction. That which he knew, from carefully ascertained experience, had been his guiding star, ought, he believed, to fix in like manner the attention of his hearers. When, as has happened within our own observation, continues his biographer, Dr. Bell, on a gloomy winter morning he held forth to his class with his lecture in one hand and a candle in the other, the attentive and almost venerating students might believe, for the moment, and especially when looking at

his clearly defined, as if chiseled, features, and pale face, that he was a messenger from beyond the grave who had come to announce to them truths of deep import, which it behooved them to know well and to practice faithfully. His lectures were carefully prepared and written out. Of his meaning there could be no misconception on the part of his auditors, for the very sufficient reason, "that he never undertook to instruct others upon subjects which he did not clearly understand himself." What a wonderful curtailment of writing and lecturing, and of preaching, too, would result if this rule were adopted by the crowd of us who are authorized, or claim, if not authorized, the privilege of teaching by the exercise of the tongue or of the pen. Dr. Physick was opposed to extemporaneous lecturing, alleging that no man had a right to place so much confidence in his memory as would be implied by this practice, when treating of scientific subjects. There is some misconception in the meaning here attached to extemporaneous, which implies, properly, the utterance of sentiments and opinions without prior preparation, and of course without the speaker having previously marshaled them in his memory. Dr. Physick himself could not be said to have delivered the introductory to his first course of private lectures extemporaneously, when he spoke it *memoriter*. In debating the question of the relative merits of an extemporaneous and a written discourse, we ought to bear in mind the different ideas attached to the former, according as it is understood to apply to the thoughts or to the language. Few men can trust themselves to extemporize their thoughts; many, if the subject-matter be duly weighed and arranged, may adventure with a probability of success on extemporaneous speech. Some in whom the *copia verborum* is allied to poverty of thought, are heard as extemporaneous speakers; but such persons can not, without a long and tedious training, by which they learn to elaborate something from their small stock of thoughts, be listened to with the hope of receiving from them knowledge or instruction. In this case, the greater the fluency of speech, the smaller will be the flow of thought, as the very facility in the former indisposes from taking the time, and exercising the patience necessary to insure the latter. But without prior elaboration and suitable arrangements of his ideas, a man, having what is called a ready pen, incurs as much danger from being superficial in a written as he would in an extemporaneous discourse. The pen is no more trustworthy than the tongue, if it be allowed to give expression to the first vague notions and crude thoughts just as they occur to the mind at the moment. But as more time is taken up in the act of writing than of speaking, a better opportunity is offered in the former than in the latter case for a lecturer to arrange his subject in a methodical manner, so as, on the one hand, to avoid the pleonasm, redundancies, and repetitions to which he may be prone in oral discourses; and, on the other, of escaping the omission of some link in his chain of argument, or some pertinent fact in enforcement of a principle just enunciated. But entire success in either written or extemporaneous discourse must depend on a previously careful study of the subject, and meditation on all its bearings and great divisions, before an attempt is made to clothe it with

language either written or spoken. It is very evident, therefore, from the preceding remarks, that to be a good, that is, an instructive extemporaneous lecturer, requires a thorough training of the intellectual faculties, careful and prolonged study, and patient elaboration of the subject under its several divisions, to a greater extent than is demanded in writing a lecture, during which the mind has time to draw on the stores that had been treasured up in the memory, and to frame the requisite argument and introduce appropriate illustrations. It must be equally clear from these premises, that he who shall pretend to teach extemporaneously because he has not time to write his lecture or discourse, commits a grievous mistake, since fully as much time, and certainly, as we have just seen, more study is required in the first than in the second of these modes of delivering his thoughts. The lecturer will probably do himself and his subject, as well as his auditors, most justice by first writing out fully his lecture, and then making a record of the prominent points as notes, which will both remind him of the divisions of his subject, and prevent him from the wandering and diffuseness to which a person who has not thoroughly studied it is so prone in extemporaneous discourse; at the same time, he will be enabled to look at his audience, and engage their attention with more certainty than if his eyes were continually on his manuscript. These notes ought, in fact, to resemble the "contents" of a chapter, telling briefly what has been excogitated and fully written out; instead of being merely the dotting down of certain things as they may happen to occur to the mind at the moment, and which are meant to be merely suggestive of what is to be developed in the course of the lecture. Dr. Physick's impressiveness as a lecturer arose, as already intimated, from his entire mastery of the subject, which he was careful never to magnify beyond its due proportions; and hence he always kept it within his grasp. The same thoughts and inculcations might have been uttered in a more masculine, certainly in a more ornamental style, compatibly still with good taste; but it is not certain that the essence itself would have produced a stronger sensation or been longer remembered by its being blended with these pleasant adjuncts. It is very doubtful, also, whether the delivery of the lectures on surgery by another person, and he even a man of mark, or their perusal in print, would have produced as instructive an effect as when they were given by Dr. Physick himself. Was it owing to a belief of this kind that the great professor never allowed his MS. lectures to be published, or left any discretionary power to a literary or professional executor to perform this office? The period that elapsed between the date of his resignation of the chair of surgery and his death allowed full time for a revision of his lectures, and of their being sent out as a welcome offering to the profession in the United States. It is true that the principles and modes of practice that were inculcated in them had become familiar to the numerous alumni of the University of Pennsylvania, who were to be found in all parts of the country, and of whom some had become teachers in their turn to an equally numerous body in the several States in which new medical schools were founded by them. Dr. Physick had been appointed Surgeon Extraordi-

nary, and also one of the physicians of the Almshouse Infirmary, in 1801, the duties of the former of which offices he discharged, in connection with those at the Pennsylvania Hospital, down to the year 1816. During this period of his life he underwent a vast amount of daily labor, to do which he was obliged to be economical of his time and methodical in the division of it. His custom was, as he often told Dr. Randolph, to rise at four o'clock in the morning throughout the winter months; and as it was too early to expect the services of a domestic, he was obliged to make or arrange his own fire. "He would then sit down to his desk and prepare his lecture for the day, after which he would dress himself and then take his breakfast and leave his house between eight and nine o'clock, in order to attend to a most extensive and laborious practice. In addition to all this, he discharged his public duties as Surgeon to the Pennsylvania Hospital and the Almshouse Infirmary. This latter building was in Spruce, between Tenth and Eleventh streets, and, with its offices and out-houses, extended back to Pine street. On its site have been erected private houses. The present Almshouse, with its spacious Infirmary, known as Blockley, or the Philadelphia Hospital, and the Asylum for Insane Poor—the Pauper Palace, as it is not unaptly called—lies on the other or west side of the Schuylkill. He used often to remark, that in order to obtain entire success as a practitioner of medicine, it was necessary to work hard. It will be conceded that no portion of his success ever came to him gratuitously; on the contrary, he made laborious exertions to obtain it. He returned home about one o'clock, at which hour he dined. Between the hours of two and three p. m. he received patients in his office, and on this occasion gave cheerfully gratuitous advice to those who consulted him. When his health allowed, he went out again after three o'clock, and continued to make visits until sunset. He seldom left his house in the evening or in the night, owing to his great liability to catarrh. When the business of the day was over, he was obliged to take a recumbent posture from mere exhaustion. His common hour of retiring to bed was nine o'clock." A few words are due to a mention of the names of Dr. Physick's colleagues in the University of Pennsylvania. In the same year in which he was made Professor of Surgery, Dr. Rush was formally elected to the chair of the Theory and Practice of Medicine and of Clinical Medicine, although he had been discharging the duties pertaining to it for some years previously. In 1808 the death of Dr. Shippen left Dr. Wistar in full possession of the chair of Anatomy and Midwifery; but in two years from this time he detached himself from the latter of these branches, which was created into a separate chair, whose first incumbent was Dr. Thomas C. James. Dr. Benjamin Smith Barton continued to teach materia medica and botany, having held the chair from the time of the union of the University of Pennsylvania with the College of Philadelphia, in 1791. He had received a similar appointment in the Medical College of Philadelphia, in 1789, on his return from Europe. On the death of Dr. Rush, in 1813, Dr. Barton was elected to the chair of the Theory and Practice of Medicine, and was succeeded on the occasion by Dr. Chapman.

who had, a few years previously, been associated with Dr. James in giving a course of private lectures on midwifery, and who now became Professor of Materia Medica. In the first period of Dr. Physick's professorship, Dr. Woodhouse occupied the chair of Chemistry, which, on his death, in 1809, was filled by the appointment of Dr. John Redman Coxe. Dr. John Syng Dorsey, nephew of Dr. Physick, was made adjunct professor of surgery to his uncle, in 1807. In the year 1816 he received the appointment of Professor of Materia Medica as successor to Dr. Chapman, who, as stated above, had been transferred to the chair of the Theory and Practice after the demise of Dr. Barton. This event took place toward the close of the year 1815, shortly after the professor's return from Europe, where he had spent the previous summer. Further changes followed in quick succession. The death of Dr. Wistar in 1818, left a vacancy, which was filled by the election of Dr. Dorsey to the chair of Anatomy, who was succeeded by Dr. Coxe in that of Materia Medica, while Dr. Hare was installed in that of Chemistry. Dr. Dorsey died before the completion of his first course. What a glorious privilege was that enjoyed for nearly a decennial period by the students who attended the medical lectures in the University of Pennsylvania; to pass from the amphitheater of the great teacher of anatomy, Dr. Wistar, to that of Physick, the "Father of American Surgery," and thence to go and hear the prelections of Rush, the American Hippocrates, and the father of American medicine, the medical philosopher, the philosophical philanthropist, patient, learned, yet ever learning, diligent in collecting facts, and ready when the opportune moment came to expand facts into principles; whose purity of life, from boyhood to advanced age, was the practical commentary on his elevated ethics, and whose pen and tongue were enlisted in the advocacy of every theme that could give value to the independence of his country, by improving the health, cultivating the minds, and preserving the morals of its people. During the quarter of a century that followed the election of Dr. Physick to the chair of Surgery, he was the recognized chief of the surgeons in Philadelphia, and there were but few, if any, to contest the leadership with him in any other city in the Union. This may be said without disparagement of the merits of men of deserved eminence both here and elsewhere. Among the first we can not overlook the names of Hewson, Parrish, and Hartshorne, his more immediate contemporaries during this period in Philadelphia; nor of Post and Mott, in New York, Warren in Boston, and Dudley in Lexington, not to speak of Gibson in Baltimore. Nor was his reputation confined to surgery; he ranked very high as a physician also, and his advice was continually invoked by his professional brethren in consultation, both at home and at a distance, and by large numbers of invalids from all parts of the United States, who came to Philadelphia expressly to place themselves under his care. If the keepers of hotels and boarding houses, and the manufacturers and venders of light and ornamental articles for furniture and personal adornment had placed to Dr. Physick's credit a moderate percentage of the sums which they received from strangers who came to consult him, and from members of their families and other

friends, it would, we think, have very probably amounted to an income equal to all his personal and domestic expenses. As Surgeon to the Hospital and Almshouse Infirmary, his name became familiar to, and prized by, the common people. As teacher of surgery in the University of Pennsylvania, his precepts and practice were carried by his venerating students to every part of the country, and their animated representations could scarcely fail to induce many who were their friends, neighbors or patients, to come and receive healing balm from the chief dispenser himself. At home, in his native city, in the circles among which were to be found the most affluent and the most intelligent, his successes, his punctuality, and his readiness of resource to meet any emergency, had become familiar as household words, and insured him continual applications for the relief of their various ailments, wounds or deformities, and, at the same time, large remunerative fees in return for his services. What more did this eminent man want to make him happy? He had acquired fame, honors, wealth, and he enjoyed the proud consciousness that, by the teachings and practice of his profession, he was a benefactor, not only to his native city, but to the nation at large. But, alas! these are not the sole, nor even the chief conditions for happiness, where health and the flow of spirits which health alone can give are absent; they can not compensate for the want of the intimacy of friends, or of the chosen companions who heartily and appreciatively enter into our feelings, participate in our triumphs, and bring home distinctly and pleasurably to our daily perceptions an intimate knowledge of the admiration and regard which the world feels for us. All is vague, indeterminate and unsatisfactory until the opinion comes with more than the force of an oracle from the mouth of a friend, as expressive of that friend's own convictions. Dr. Physick, throughout the greater part of his career, as far as regards social intercourse, its amenities and minor pleasures, and the charms of friendship, seems to have lived lonely and alone. In the declining years of his life, he must often have said to himself—if not in the very words, yet with the feelings of poor Kirke White—"I have lived an unloved and solitary thing." His health—never very good, and especially after his successive attacks of yellow fever in 1793 and 1797, to which he had been subjected—was shaken severely and durably from typhus fever in 1813, the same year in which Dr. Rush was carried off. He was also liable to frequent returns of catarrh, and to a still more painful, the poor sufferer himself would call it, excruciating malady, consisting in the formation of small calculi in the kidneys, and their slow passage through the ureters into the bladder. "I knew him intimately," writes Dr. Horner, "since the death of his nephew, Dr. Dorsey, in 1818, and may say that he never passed a day without some sensation of pain, feebleness and derangement in his system—sometimes a catarrh—at other times a headache—sometimes pains in his kidneys, with sabulous discharge—sometimes dyspepsia—at other times anasarca swelling of the legs, and always a small, feeble, wiry pulse, irregular, and indicative of ossification, or some other change about the left valves of the heart. To these were added frequent exacerbations of his

habitual disorders—catarrh and nephritis—amounting to threatening illness, and from which he recovered very slowly." Bodily infirmities and disorders thus frequently recurring must have indisposed, even if they did not actually preclude, Dr. Physick from intercourse with the world beyond the rigid requirements of professional duty, which were of themselves heavy and exacting. He does not seem to have availed himself of those other sources of consolation in books, through which we can hold "communion large and high with bards and sages old," and terminate or prolong, without offense, an intercourse with various minds, according as time allows or inclination prompts. He did not seek for sweet oblivion of the dull, hard, and often repulsive realities of every-day life by losing himself, for an hour in the evening, in the mazes of speculative philosophy, for which he had no fondness, and, as we should infer, no respect. He cared not, fancy free, to follow the poet in his songs of love and friendship, his descriptions of sylvan scenery, or, in more lofty strains, the trials and adventures of the hero of the epic muse. We speak not now of the still higher, purer sources of consolation, when faith, on the wings of imagination, points the way to the great future, opening out pictures of wonderful beauty and variety, in the contemplation of which the wearied soul finds consolation and refreshment. The subject of this memoir had no imagination, nor any delicate perception and love of the beauties of either nature or art: he cared not for philosophy nor for poetry, and he was not prone himself, nor very patiently allowed others to indulge in any prolonged reasoning on medical subjects. Dr. Physick had not the inclination, or he wanted the art to bring forward young men in the profession, and to give them encouragement in their early trials similar to that which he received at the hands of Dr. Rush. In this respect, there was a marked contrast between him and one of his colleagues in the university, Dr. Chapman, who rallied around him a body of young men, to whom—especially in the Philadelphia Medical Institute of which he was the founder—he furnished opportunities and incitements for exertion, by which they all acquired position, and became, in their turn, instruments for the diffusion of much professional knowledge and promoters of sound medical ethics, as lecturers, authors and journalists. The only attachment of this kind felt by Dr. Physick, which would seem really to have been characterized by warmth, was that for his nephew, Dr. John Syng Dorsey, whose talents and attainments and rapid rise justified his partiality, and whose comparatively early death must have left him bereaved of that companionship which alone could awaken his dormant sensibilities, and make him at all desirous of keeping up social relations with the world around him. His son-in-law, Dr. Randolph, a kind, good-hearted gentleman, and who, under his auspices, attained eminence in surgery, came too late, even if he had possessed the requisite qualities for acquiring influence, and imparting a healthier tone to his feelings. We must be understood, in these remarks, as speaking of Dr. Physick out of his domestic circle. Within it, as far as we can learn, he was a kind and even an indulgent parent. In his intercourse with his professional brethren,

Dr. Physick was punctiliously observant of all the recognized rules of medical ethics, when he met them in consultation, as well as when their practice and opinions, as revealed to him at the bedside, were made the subject of remark or criticism by the sick and their friends in his presence. Being himself a model of precision, punctuality and caution, he laid proper stress on these qualities being manifested by others in their intercourse with him; and if he was betrayed into impatience, it was at a neglect on this score, which might not only compromise the reputation of the professional adviser, but, a still more important consideration, prove detrimental to the patient. The very frequent calls on him to visit the sick made it indispensably necessary that he should economize his time, both in justice to them and to himself. Being habitually, we might say constitutionally, a man of few words, and having neither time nor inclination to touch on extraneous themes, or to set himself about conciliating either the patient or his friends by any arts of manner or speech, he proceeded at once to ascertain the previous history and the actual symptoms of the disease, with a view of forming a correct diagnosis and of deducing from it the appropriate treatment. Intent on discharging the first part of his duty by questions made with the least possible waste of words, he was equally desirous of acquitting himself of the obligations of a prescriber in a similarly laconic style; and hence he was not disposed to receive hints or suggestions from either the patient or his nurse and friends, as to the course to be pursued; and still less could he brook opposition to the advice which he finally laid down on the occasion. After careful inquiry into the nature of the disease of his patient, and its morbid antecedents, a physician is bound by the highest sense of duty paramount to all considerations of his own dignity, to decision in laying down the rules of treatment, and firmness in enforcing obedience to these dicta. Idiosyncrasy, constitutional peculiarities and predisposition, previous disease, and habitual infirmities have, it is to be supposed, all been inquired into, and their relative influence in modifying the character, intensity and progress of the existing disease studied by the physician before he prescribes the therapeutical and dietetic course to the patient. In this way he leaves no show of reason or logic for ignorance, impertinence, or misguided affection to obtrude its fears and its cautions, and sometimes its prognostics of a sinister termination of the case. If he desires to be useful and efficient, he must preserve his authority, and be regarded, for the nonce, as the oracle whose dicta are beyond appeal; for who, in the sick-room, shall compete with him? Who has brought to the judgment the faculties strengthened by exercise and experience, and a knowledge of the resources called for by the emergency, which he possesses? If he concede one point, he will be asked to yield another, and soon he will be supposed to have no fixed opinion at all, and, by and by, the patient and old cronies and gossips of either sex will erect themselves into a college, and enter on a course of empirical guesses and trials which, as the case has been reduced already to an affair of guessing and trying, may, they think, be as good as the uncertain opinions of the easy and flexible doctor. But while he maintained his professional and personal dignity,

Dr. Physick was rarely abrupt, never rude in manner or in speech, and could retain his self-possession under circumstances of considerable aggravation. We can not regard as deviations from this course his sometimes reminding patients that he had rights as well as they, and that among these was the privilege of withdrawing from attendance when he found that his directions were not obeyed, or so imperfectly followed as to make them of little avail. He would not accept responsibility when deprived of control, nor allow it to be said that he was the physician in a case in which others were the advisers, or nullified his carefully devised and connected plans of treatment. He never furnished an excuse, by vacillation or yielding to the caprices of his patient, for the corrupt and senseless course of the venal crew, who, in conflicting systems of medicine, if, indeed, an absence of all the rules of logic and common sense can entitle every absurd fancy to be called a system, allow the sick man to choose the one by which he shall be treated. There would be scarcely a broader contrast, and one marked by more cruelty and absurdity, were a commander of a steamer to tell his passengers that he leaves it to them to determine by vote whether, when the machinery has become deranged, the engines shall be repaired and continue to work in the old way, so as to send the vessel forward at the rate of ten or twelve miles an hour, or, in accordance with a new creed in mechanics, they shall raise motive power by blowing the bagpipes, the bassoon and the French horn, and by making sundry gyrations with their arms, and pirouettes in the style of the ballet, so as to simulate the rotation of the paddle-wheels. Calm as he was in appearance and manner, and sententious in speech, even to to such a degree as to cause him to be looked upon as cold and repelling, Dr. Physick could unbend himself to sympathy for patient suffering, and manifest considerate kindness for those who resigned themselves in all confidence to his professional guidance. Hitherto, all the offices and honors conferred on Dr. Physick were fairly won, and incontestably appropriate, and in unison with his favorite tastes and pursuits, of which the chair of Surgery in the University of Pennsylvania might be regarded as the illuminating center. Here he was the ministering high-priest, standing alone and above all, before the altar in the temple of Epidaurus. By what sinister influence then, says his biographer, was he persuaded to abandon his post, and to become one of the sacrificial priests—a sacred butcher, without even a soothsayer's privilege of declaring the auspices? When speaking, a little way back, of his associates in the medical department of the university, and of the changes in the occupancy of the chairs during the period in which he was Professor of Surgery, we did not extend the narrative further than the death of Dr. Dorsey, in 1818. Dr. Physick was appointed to succeed his nephew, the following year, 1819. Pliable, and yielding up his own better judgment to the schemes of others, for perhaps the first time in his life, when, more than at any former period he ought to have been firm, he "allowed himself to be transferred—for the act was not of his own choice—from the chair of Surgery to that of Anatomy, from the place where he was emphatically *at home*, to one in which he was *comparatively a*

stranger. In this step his pre-eminence did not accompany him. Though unequaled as a surgeon, he had more than equals as an anatomist. He had many superiors. He ought not, therefore, to have consented to this transaction. It did not belong to his character and standing, to submit to inferiority, and invite defeat, by engaging in an enterprise in which others could surpass him. The act was a descent from his 'high estate,' which dimmed and deadened his academic luster." The connection of Dr. Physick with the university for the next twelve years was one of commonplace routine, which his friends and the friends of the institution hardly cared to notice at the time, and would willingly have forgotten since. A sad commentary this on jobbing in collegiate chairs, which one sees, every now and then carried on in medical schools, with as little regard for the interests of science and learning as if it were a question of arranging the seats of the guests at a dinner-table. His resignation of the chair of Anatomy, in 1831, owing to increasing infirmities, if it excited any sensation at all, gave satisfaction to the medical community; as by this act he freed himself from trammels that he ought never to have allowed to be imposed on him. In regard to this, however, Dr. Joseph Carson, who attended his lectures, writes, that in any position Dr. Physick was capable of commanding respect; his dignified bearing and imposing presence, his sympathetic manner and painstaking execution of his duties deeply impressed his pupils and commanded the profoundest deferences, and his anatomical lectures were listened to with earnest attention. The University suffered from Dr. Physick's abandonment of the chair of Surgery; but it lost nothing by his leaving that of Anatomy. In the first, he had been succeeded by Dr. Gibson; in the second, by Dr. Horner; the latter of whom, after having been for many years his adjunct, was appointed his successor. The trustees, on account of his resignation, unanimously elected him "*Emeritus* Professor of Surgery and Anatomy." This honor was purely titular. He never gave a lecture after it was conferred upon him. Mention may be made here of some other offices of honor and membership of societies in which he was elected. In 1802 he was made a member of the Philosophical Society; but, like many others who were affiliated with it, he never contributed anything to its Transactions, and rarely, if ever, attended its meetings. He did not imitate his former fellow-student, Sir Edward Home, whose communications to the Royal Society of London were very numerous. We must add, however, at the same time, that Home's originality in many of the questions of anatomy and physiology, on which he wrote, and his honesty in procuring the means by which he obtained the materials for his papers, have been more than questioned. He borrowed largely from their contents, and even abstracted no inconsiderable portions of the manuscript papers of his distinguished brother-in-law, John Hunter, which, with the museum of the latter, had been deposited in the Hall of the College of Surgeons. He left in the minds of all a strong suspicion amounting almost to conviction, that much of what he had sent to the Royal Society, as his own, was derived from his former teacher and relative; and it was ascertained

that in order to conceal his literary piracy, he burnt the abstracted documents which would have furnished evidence to convict him. In 1821, Dr. Physick was elected Consulting Surgeon to the Institution for the Blind; and, in 1822, president of the Phrenological Society of Philadelphia, just then founded. This last appointment furnished an amusing instance among the many that are continually met with, of the readiness of people to pin their faith to a name; they being entirely ignorant of the thing itself. Many persons who thought themselves privileged to ridicule and condemn the doctrines of phrenology, without their having given them any thought in the way of observation and study, assumed a new and altered tone, when told that Dr. Physick was elected president of the Phrenological Society. It must be confessed that the founders of the latter had this result in view, when they invited him to take the office. It was enough for him that the new inquiries of Gall and Spurzheim had already thrown additional light on the anatomy and physiology of the brain, without his caring to inquire into the accuracy of the details of their physiognomical system. In 1824 he was elected president of the Philadelphia Medical Society, and he retained this office until his death. The election of Dr. Physick to the presidency of the Pennsylvania State Temperance Society, in 1834, was made with a knowledge of his own temperate habits, and of his inculcation of similar ones on those over whom, either as physician or friend, his advice would carry weight. The society was not insensible to the influence of his name, even though he had never formally enrolled himself among its members. His tenure of office, however, was short. He had no objection to give his name and the social influence which it would carry with it to so good a cause; but he did object to give his money also, especially in the large figures then common with some of the more ardent and generous of the board of managers of the society. In 1825 he was elected a member of the French Royal Academy of Medicine; he being, we are told, the first American who received this honor. The last distinction of the kind conferred on him was in his being made an honorary Fellow of the Royal Medical and Chirurgical Society of London. The last winter of his life was marked by a spontaneous exhibition of the admiration and esteem in which Dr. Physick was held by the medical students of the University of Pennsylvania, although they might be said to belong almost to a new generation, since his withdrawal from the duties of his chair. At a meeting of the class, held December 3, 1831, a committee was appointed to procure Dr. Physick's consent to sit for his portrait to the eminent artist, Mr. Inman. This request was complied with, and on the morning of February 22 the portrait was presented to the Medical Faculty, in the presence of many of the trustees, several strangers, and the medical class. A brief and pertinent address, in the name of the latter, was made by Mr. N. Berkeley, which was responded to by Dr. Horner, the Dean, on the part of the Medical Faculty. He was followed in some remarks appropriate to the occasion by Dr. Hare, whose sentiments, in looking at the portrait, "were the mingled offspring of admiration for talent, esteem for virtue, and gratitude for the most zealous, effectual and disinter-

ested services." The speaker declared that Dr. Physick, in the sphere of his practice, "had fairly enthroned himself upon the gratitude and esteem as well as the admiration of his patients." Increasing infirmities and weakness had for some years past caused longer and more frequent interruptions to his regular attendance on the sick, until at last his fellow-citizens had reached the painful conviction that they must forego entirely his services, and speak of him and pass his mansion as if they were never more to see him approach their bedsides while bringing to them hope and health. It had been, indeed, a matter of surprise that, with his feeble frame, he still continued in the practice of the profession, when he could not be supposed any longer to be influenced by the common incentives—love of fame and love of lucre, even were we to admit that he had been previously swayed by considerations of this nature. He was now one of the wealthiest men in Philadelphia. Some explanation may be found in the force of habit—perseverance in doing what we have been long accustomed to do, irrespective of pleasure or of profit—and the painful void left by cessation of the daily routine, in whatever it may have consisted. It is only in this way that we can find a solution of the seeming anomaly exhibited in all men actively engaged in any profession or calling: the physician and the lawyer, the merchant and mechanic, the weather-beaten mariner, and even the daily laborer, looking forward to a time when they shall take their ease and live on the accumulated earnings of former years; but yet when that time comes, and when the fortune is made or adequate income secured, a majority still continue in their several pursuits, as if on a nearer approach they feared, and not always without reason, that something sinister were concealed in the leisure and the absence of the corroding cares of business and labor, which, at a distance, they so much longed to enjoy. Of the actually retired few, we meet with two classes. Those of the one are at a loss how to employ their time, and are consequently unhappy. The members of the other, and unfortunately the smaller class, having mental cultivation and diversified tastes, find solace and occupations in reading, study, dilettanti agriculture and gardening, with the farther enjoyment of active participation in schemes of benevolence, and the conversation and company of friends who are ready to reciprocate the cheerfulness and amenities which they are themselves receiving from these men of leisure. Dr. Physick did not belong to this last or favored class. Retirement from professional life was to him almost entire isolation. He had never cared for society, and in return society took no pains to please him; and even if, at last, he had been so minded, he would not have known how to make it subservient to his enjoyments, or, on his part, to have contributed a share towards its requirements. Withdrawing himself from the exercise of his profession, he would of necessity have been thrown upon his own mental resources, and these were limited almost entirely to one field of the vast domains of literature and science. If he failed to find relaxation or pleasure from other sources during the period of his active business life, he could hardly be expected to reach them at a time of sickness, and in the weakness and infirmity of old age. As we

have already intimated, he had no fondness for contemplative philosophy, nor for the study of philosophy in action as represented in history; nor did it ever occur to him to betake himself to the regions of imagination, or go a step beyond the realities of life and the logic which dealt with matter alone. We have never heard of his partiality for any poet, nor of his yielding to what he would probably have regarded as a weakness in repeating a line of poetry. To the fine arts he was equally indifferent, and hence he never cared to go beyond the dry details of special anatomy, by enlarging on the anatomy of expression and its relations to painting, sculpture and poetry. In this limited intellectual range he resembled his famed contemporary, Dupuytren, to whom, on the score of moral attributes, he was so superior. His studies and observations were not of that comprehensive nature which included both material descriptions and details, and general literature and subjects of taste—as evinced by the two Petits, Antoine and Louis, and, in our own times, Percy and Roux, among the French; and by Cheselden, the brothers John and Charles Bell, Carlisle and Lawrence, among the British surgeons and anatomists. With the latter we may rank William Hunter and Baillie, who taught anatomy, and shone, the one in obstetrical, the other in general practice. Cheselden was not the less eminent and successful, both as anatomist and surgeon, for being the friend of Pope and an associate of the "great master spirits of the age"—men of genius and of taste. Scarpa, one of Italy's favored sons, was a good draughtsman, and an ardent lover of painting and the fine arts in general. Dr. Physick was possessed of a large fortune, and might have made his spacious mansion one of social meeting for his fellow-members of the profession. He would thus have relieved himself of painful introversion of thought, and imparted to them pleasure, not less than instruction, even though he may not have chosen to appear as the central figure of the group, but have left to others the task of colloquial entertainment. His own sententious remarks would always have procured him deferential attention. It was left for his colleague, Dr. Wistar, to begin, for the first time in Philadelphia, if not in this country, this kind of literary and professional reunion, which in Europe had been long known and prized under the title of *conversazione*, an indication at once of the Italian origin of the practice. To the celebrated Dr. Mead, in the early part of last century, must be awarded the credit of substituting such meetings among physicians, literati and wits, for others that were quite common before. These consisted in a certain number of medical men adjourning to a coffee-house, and talking over their cases and their cures; while discussing, at the same time, the qualities of the wines which they used freely to imbibe. His house in Great Ormond street, to which he added a gallery, was the resort of men of learning and taste, from all parts of the world; and so well was this understood that it would have been a reflection on a traveler of either of these classes not to have become known to and visited Dr. Mead. It was acknowledged by all who knew him that few princes have shown themselves equally generous and liberal in promoting science, and encouraging learned men. He threw open his gallery in the morn-

ing, for the benefit of students in painting and sculpture, and was even in the habit of lending the best of his pictures for artists to copy. No discovery was made in science, in which he did not take a lively interest; no great literary work was brought out to which his name, as patron or friend of the author, did not appear. He kept in his pay a number of artists and scholars, both for their benefit and his own gratification. His hospitality was unbounded, and consequently his housekeeping expenses were very great; for, not content with the reception of his own friends and acquaintances, he kept also a very handsome second table, to which persons of inferior quality were invited. And whence, it may be asked, did he procure the means for this large and liberal expenditure? Was he the possessor of a great patrimonial estate? Had he become rich by lucky stock speculations, to which, by the way, he was rather prone; or was he a court favorite, in the enjoyment of a large sinecure? From none of these sources did Richard Mead, M. D., derive his income. It was the reward of a long period of arduous professional labor; not hoarded up to gloat over in his old age, or to insure him the reputation of dying a very rich man; but it was liberally and tastefully spent in deeds of munificence and charity. Mead was at the head of his profession in London for nearly half a century, and was engaged, during most of this time, in a lucrative practice, the proceeds of which amounted, in one year, to a sum equivalent to thirty-five thousand dollars; and for several years to twenty-five and even to thirty thousand dollars. He was also the author of various works; and yet, amidst all his engagements, he could find time, and more surprising still, retain the disposition to receive his friends and others at his house in the manner just described. His crowded *conversazioni* were held at stated intervals, in his library, a spacious room about sixty feet long, which contained a collection of ten thousand volumes, an immense number of prints, drawings, coins, and medals, of the greatest variety and value. Under the same roof were contained in addition, statues, busts of Greek philosophers and Roman emperors, Etruscan vases, and the gallery of paintings. That these last belonged to a high style of art was evinced in the fact of their being sold after his death for seventeen thousand dollars; being more by two or three thousand dollars than he gave for them. It must be confessed, and to suit the notions of a certain class of moneyed men, in a deprecatory tone, too, that Mead did not leave behind him as large a fortune as he could easily have done, if his sole ambition had been to bequeath to each of his three children a quarter of a million of dollars in place of not quite this amount divided among them. Every century does not bring forth a Mead; and if the name and example of this illustrious man are introduced in the present instance, it is with no design of inviting comparison between him and our great American surgeon, and impliedly dimming the luster of the latter; but rather to show that the suggestions as to what he might have done were made in no exacting spirit, nor after an imaginary standard, but only with the view of vindicating the claims of our profession to a union of painstaking and laborious duties and studies, with an exercise and display of various learning and culti-

vated tastes. The only recreation which Dr. Physick allowed himself was in the latter period of his life, when he used to spend a portion of every summer on an estate in Cecil county, Md., which he had purchased from his brother. He had become greatly attached to this spot, on the occasion of visiting it for the purpose of recruiting his health, which had been sensibly weakened by a second attack of yellow fever, in 1797. We wish that it were in our power to give the details of a day's life during his temporary residence in the country, as it would have afforded some measure of his means of warding off ennui, and of the intellectual resources of the man himself. He was on these occasions generally accompanied by one or more of his children. Surgery was in a great measure abandoned by Dr. Physick, at least the performing of capital operations, many years before his death; although he continued, up to within a comparatively short period preceding this event, to practice medicine. One of the last displays of his surgical skill and dexterity, in the class of cases just specified, was in the autumn of 1831, when he performed the operation of lithotomy successfully upon Chief Justice Marshall, then in the seventy-fifth year of his age; an operation remarkable in view of the professional position of both the individuals concerned in it, as well as the advanced age of the patient. The oldest and the first of the legal profession in the United States had sought relief from the most painful of maladies at the hands of the oldest and first of American surgeons, whose effort to relieve him was blessed by Providence. An interesting account of the circumstances accompanying this event, both as regards the reluctance of the great surgeon to undertake the operation, and the calmness and resignation evinced by Judge Marshall, even in his indulging in a sound sleep just before it was performed, is given by Dr. Randolph in his "Memoir." This gentleman tells us of the last operation of Dr. Physick, performed only a few months before his death. It was for cataract. The date at which he performed this operation was on August 13, 1837. "I was present," says Dr. Randolph, "on the occasion, and watched him with the most intense anxiety. He was quite collected and firm, and his hand was steady; notwithstanding at the time he was laboring under great mental and physical suffering." From about this date his disease is represented, on the same authority, to have increased in violence and intensity. The effusion of serum in the cavity of the thorax was accompanied by extreme oppression and difficulty of respiration, to such a degree, indeed, that he was unable to lie down for whole nights in succession, but was supported in a standing posture on the floor, by assistants. Dr. Chapman, "his old and well-tried friend and associate," was now requested to visit him in conjunction with Dr. Randolph; but, although some ease was at times procured by their efforts for the suffering invalid, the disease continued to increase, and anasarca was added to hydrothorax. "To such an extent did the former prevail that before his death the integuments at length gave way, openings were formed, and these finally ulcerated and became gangrenous. As might have been anticipated, there was a general expression of sorrow for the loss and respect for the memory of this

distinguished man among various medical bodies in different parts of the Union. We need but refer, as matters of course, to the lengthened funeral cortege, including the students of medicine composing the Pennsylvania University and the Jefferson Medical College classes, and the trustees and professors of these two schools, as well as the members of the State Convention, then in session. In the same spirit were resolutions passed by the Faculty of the University. Similar resolutions were adopted by the Faculties of the Medical Institute of Louisville and of the Medical College of Georgia, the Medical Convention of Ohio and the physicians of St. Louis. "A comprehensive minute, commemorative of Philip Syng Physick, M. D., *Emeritus* Professor of Anatomy and Surgery in the University of Pennsylvania," was prepared, under the instructions of the Board of Trustees of the University, by Wm. Meredith, Esq., chairman of the committee appointed for the purpose. Its object was to tell of "the long connection of the deceased with the university, and to express the respect entertained for his able and faithful services as a teacher, for his eminence as a practitioner of medicine, and for the virtues which adorned his private character." In conformity with resolutions of the Faculty of the Louisville Medical Institute and of the class in attendance, a glowing discourse, commemorative of Philip Syng Physick, was delivered by Dr. Charles Caldwell, January 12, 1838. Dr. Horner read, at a meeting of the American Philosophical Society, May 4, 1838, a necrological notice of his deceased predecessor in the chair of anatomy. A laudatory and discriminating reference to the character and merits of Dr. Physick is contained in an introductory lecture delivered by Dr. Granville Sharp Pattison, Professor of Anatomy in the Jefferson Medical College, before his class, at the commencement of the session, 1838-9. Dr. Physick left testamentary directions for the disposal of his body after death, which excited much comment at the time, and call for notice in this place. He forbade, in the most positive terms, any dissection of his body. No person was to touch it but two females, who had been his domestics for the last twenty years. It was not to be taken from his bed for some time, but was to be well covered up, and the room kept warmed until putrefaction had commenced. It was then to be covered with flannel and placed on a mattress in a wooden coffin, painted outside. This coffin was to be inclosed in another or leaden one, closely soldered up. A public notice was to be given of the period of interment, but no invitations issued. The test of death, in beginning decomposition, was soon evident in a temperature so well fitted to bring it about; and the body was then inclosed in the manner he had enjoined, with the addition of another coffin covered with black cloth. A still further proof of the change which came over the mind of the teacher of *anatomy and surgery*, and of the weakened state of his intellectual faculties through disease, was exhibited in his directing that a careful watch should be kept over his grave for six weeks after his interment, to prevent his body, or, it ought rather to be said the body which once belonged to him but was his no longer, from being disturbed. If there was any validity or propriety in this prohibi-

tion in his own case, Dr. Physick acted under wrong influences, in fact, ran counter to the feelings of humanity in those memorable dissections of the dead from yellow fever which he made in 1793 and 1798, for the purpose of establishing the correct pathology of that disease. Will it be alleged that the examinations in these cases were, most probably, of the bodies of persons who, when living, were poor and friendless, and which were unclaimed by relatives or friends? But this does not alter the question, so far as the principle is concerned: it merely makes it one of convenience, to the exclusion of both the moral and scientific bearings of the subject. Dr. Physick, throughout his whole professional career, must have believed conscientiously that *post-mortem* examinations were not only justifiable, but highly useful and commendable; and that they contributed to the best interests of humanity by enlightening the physician on the seats of disease, and establishing the connection between symptoms and the suffering organs, so as to enable him, at the bedside, to infer from the former the condition and changes going on in the latter, and thus to shape his treatment with a better prospect of success. We speak positively of what must have been Dr. Physick's conscientious belief, knowing well that he would never have practiced or sanctioned the practice of examination of the dead unless he had entertained the most thorough conviction of its usefulness; for he was in an eminent degree an utilitarian, who yielded nothing to prejudice, sentiment, or fashion. His own uniform course in this matter through a long life will ever be regarded as an anticipatory caveat in the steps which he directed to be taken in the disposal of his body after death; if, indeed, it be thought necessary to bring the case into court at all, to be tried by the laws of custom, common sense and humanity, in the place of letting judgment go by default. The case, if one were to be made, would stand thus on the record: Dr. Physick, in all the vigor of his faculties, during a long term of years, as investigator of the internal changes caused by disease, *versus* Dr. Physick, on the borders of the grave, his mind weakened by numerous infirmities and sufferings, and refusing to allow of an examination of his body; thus depriving his professional brethren of an addition to their knowledge the like of which he had long been in the habit of receiving himself. Dr. Physick might have pleaded the example of Dr. William Hunter, who, although himself a teacher of anatomy, is said to have manifested great antipathy to the idea of his own body being subjected to the scalpel of the anatomist. But the American surgeon went in direct opposition to the course which his celebrated English preceptor enjoined on his survivors, in his own case. Mr. John Hunter used, in the strongest language, to express his condemnation of those who should neglect to examine his body and preserve his heart, from a disease of which he had suffered so much, and from which he died. Twining, who has contributed useful facts and observations on diseases of the East Indies, and who made himself, and lays stress on *post-mortem* examinations, displayed similar weakness to that on which we are now commenting. How different were the injunctions laid by Jeremy Bentham on his friend and disciple in philosophy and political economy, Dr. South-

wood Smith! The body of the great reformer was dissected in the anatomical theater in the presence of a public assemblage, and a discourse pronounced on the occasion by Dr. Smith. Quite recently the eminent Warren, of Boston, so well known in the annals of surgery, left similar directions, with the important addition that his skeleton was to be prepared and set up in the Anatomical Museum. Insight is, every now and then, obtained by this means into constitutional peculiarities and tendencies to disease in a patient which are transmitted to his offspring, but the force and injurious operation of which may be greatly modified, if not entirely restrained, by a knowledge thus acquired, pointing to preventive measures, or, if disease have actually supervened, to a more successful treatment. The convictions of medical men respecting the great utility of the practice must be very decided to induce them to make examinations which are necessarily tedious and irksome, and would be every way disagreeable without the consolatory and encouraging conviction of the benefits thereby conferred on medical science and of gain to the interests of humanity. After the preceding outlines of the professional life of Dr. Physick, let us sketch, says Bell, the appearance, manner and character of the man. That he was habitually grave, approaching to the melancholic in his deportment and speech, was evident in looking for a moment at his pale, statue-like face, which told of pain, of suffering and anxiety, but partially concealed by the enforced calmness of a strong will. What other expression could be expected in one whose health was always infirm, whose frame had been racked by violent attacks of different diseases, and who had his own "unwritten troubles of the brain." The occasional smile that lighted up his face came from no sunshine of the mind; it was the illumination of a wintry cloud by the moon's rays, cold and uncheering. But if his appearance did not attract by sympathy, it could not fail to do so by respect, not unmingled with curiosity to learn something about the possessor of those classic features—high forehead, aquiline nose, thin and compressed lips, a finely formed mouth, and hazel eyes with their searching, and, at times, penetrating gaze. The complexion was one of extreme paleness. The hands of our great surgeon were "small, delicate and flexible," and would have won the favorable notice of Byron, as a mark of aristocratic descent and breeding. The same praise has not been extended to his lower extremities, and certainly there was no elasticity in his gait, nor a quick or jaunty step which might indicate a well-arched foot. Be this as it may, there was a time in the life of Dr. Physick, to tell of which seems like narrating a myth in early Roman story, when these feet of his were trained to dance, and to the performance of that most difficult saltatory feat, called "cutting the pigeon wing." The fact, however, of Dr. Physick being, "once on a time," a dancer, was mentioned by himself in one of the many visits which he paid, in the latter period of his life, to a lady who was laid up by a fracture of the thigh. He was desirous of lightening the tedium of long confinement under which his patient must often have suffered, and knowing, at the same time, both her strong sense and her social turn, he told her one day—apropos, perhaps,

of the effects of age in producing gravity of deportment and disinclination to the amusements of the day—that he had not always been as she now saw him, but that he could once dance the pigeon wing. Suiting the action to the word, he actually rose, and taking hold of one of the bedposts, made a demonstration of his early agility—how successfully we never learned. The author of the "Memoir," who knew him long and intimately, and whom we have already so freely quoted, states that Dr. Physick's "manner and address were exceedingly dignified, yet polished and affable in the extreme, and when he was engaged in attendance upon a critical case, or in a surgical operation, there was a degree of tenderness, and at the same time a confidence in his manner, which could not fail to soothe the feelings and allay the fears of the most timid and sensitive." Perhaps formally polite would better express Dr. Physick's manner and address than the extreme of polish and affability ascribed to them by Dr. Randolph. His punctiliousness, added to his habitual reserve and real dignity of deportment, must have made it impossible for any man, however long the acquaintance, to indulge in familiarity, or, as it is called, to take a liberty with him; and the most inveterate babbler and bore could hardly withstand the unmistakable intimations in his countenance and manner, as well as in his silence, that the interview must end. Nobody knew better, or practiced more determinately, the Horatian maxim, *est modus in rebus*, on these occasions than Dr. Physick, when the visit to him was made for a specific object, and he received few others. Nor would he make an exception in favor of a garrulous or exacting patient, whose prolixity he would cut short by putting a few questions, and then declare that he had learned enough. The style of dress worn by Dr. Physick showed the methodical man, who, while he adhered to the same color and very much to the same fashion of his garments, was always attentive to neatness and general harmony of effect. A blue coat with metal buttons, white waistcoat, and light gray or drab-colored pantaloons, made up his favorite attire. It must have been in his dancing days when he was seen with breeches and flesh-colored silk stockings. The bow-knot in his cravat, though it might fall short of dandy requirements, evinced care in its adjustment. His hair was combed backwards, *à la Chinoise*, so as to expose completely his forehead, while serving at the same time to give it the appearance of greater proportionate development. He was among the last to abandon the use of powder, but held on to the queue as long as he lived. His personal habits were early formed and never underwent change. As Dr. Horner somewhat quaintly says: "He had passed his life in a certain diurnal movement and rotation, any deviation of which put him to inconvenience. He must have the bed that he was accustomed to; the same food dressed in the same way. His delicate health made him seek solitude as a refreshment; he was, therefore, no diner out; had no habits of conviviality; received no company in a familiar way, except now and then the call of a friend." But while thus keeping his own hours and fashion of repasts, he left his daughters free to receive visitors and to entertain them in the approved style of the gay and fashionable society in

which they mixed. His dietetic formulary was very simple, an observance of it amounting to abstemiousness. The attack of typhus fever, from which he suffered in the winter of 1813-14, left behind it a chronically weakened digestion, accompanied with "a train of the most unpleasant dyspeptic symptoms." His treatment of himself was strictly antiphlogistic, backed by very low diet. "The small amount of food of which he would sometimes permit himself to partake is almost inconceivable; and this for many days together." Dr. Randolph, who furnishes these particulars, gives it as his opinion, and probably he was correct, that Dr. Physick "injured himself, and in a measure produced the very enfeebled and prostrated condition of his system which attended him during the latter years of his life, by the excessively reducing system of treatment to which he had recourse." Dr. Randolph frequently expressed his regret at his using such meager diet; to which Dr. Physick replied, "That he regretted it very much himself, and that he wished he could indulge in more generous living, but that he had accustomed his stomach for so long a time to abstinence from rich food that it was impossible now to make any change." When laboring under a severe cold, he would confine himself to a warm room, and he had accustomed himself to a degree of heat at these times which was almost insupportable to others. He greatly enjoyed heat—in the winter he kept his bedroom at from 75° to 80° F. In continuing this practice he must have been oblivious to the theory of respiration and of the evolution of animal heat. Both in his professional and business relations with his patients, he was governed by a strict sense of justice. He gave to them all the time and attention which he believed their situation required, and he exacted from them in return a rigid adherence to his directions. Neglect of his wishes, or deception in this respect, he very properly stigmatized as a breach of faith on their part, which absolved him from the obligation of any further attendance on the case. Under the influence of the same principles, his pecuniary charges, in the form of fees, were always low—lower often than was recognized by general usage. In such cases, however, his concession to the patient was at the expense of his fellow-members in the profession who, if they kept to the usual tariff, subjected themselves to the unjust accusation of overcharging; and if they fell to Dr. Physick's usage, they could not obtain the income required by their wants from the fees to which in equity they were entitled. This other view of the subject is sometimes forgotten by physicians who have incomes independent of professional sources. The doctor frequently, we are told, gave up large fees "when there was no adequate reason for it." "In the case of Judge Marshall, who was both an opulent and a liberal man, he refused positively a fee, and a sort of commutation was finally made by his consenting to receive a superb piece of plate." We confess ourselves at a loss to see the rule of action in this case. Where the gratitude of a patient so far outruns discretion as to offer remuneration disproportionate to his means and income, it is in a measure the duty of the physician to restrain such exuberance of feeling, and to return or refuse to receive the excess thus offered beyond the customary fees. But

if the wealthy choose to indulge in a fit of liberality of this kind, as there is not the least danger of its becoming epidemic, we can see no good reason, derived either from professional duty or pride, for balking them in their intentions. Sir Astley Cooper, a contemporary of Dr. Physick, and who commenced practice in London about the same time that the latter began in Philadelphia, had no misgivings on this score, although his professional income in one year exceeded one hundred thousand dollars, or twenty thousand guineas, and for many years it was seventy-five thousand dollars, equal to fifteen thousand pounds sterling, and upwards. An old rich West Indian, on whom Sir Astley had performed the operation of lithotomy, with the most satisfactory results, asked what the fee was, and on receiving for answer, two hundred guineas—a little over one thousand dollars—rejoined: "Pooh, pooh! I shan't give you two hundred guineas! there, that is what I shall give you!" taking off his night-cap and throwing it at Sir Astley. "Thank you, sir," said Sir Astley, "anything from you is acceptable," and he put the cap into his pocket, anticipating, no doubt, the nature of the joke. Upon examination, the cap was found to contain a check for one thousand guineas! Examples of this nature doubtless occur in the professional life of physicians, although, taken collectively, the number is not great. The tendency is, for the most part, in another direction, viz., to begrudge or to curtail the just and regular charges made by the physician for services rendered, although at the time they were thankfully received and acknowledged. Often a physician is complimented by his being told, "Doctor, I have paid all my bills but yours;" the life saved, or the agonizing pains removed, being deemed a thing of less moment than a supply of groceries, or the purchase of fine broadcloth or rich silks. It would seem, therefore, to be a duty which a medical man owes to his profession to resist this fashion of disparaging its usefulness, and to keep up to the generally recognized tariff of charges in all cases in which there is ability on the part of the former invalid to comply with its requirements. After enforcing the claims of justice, there will still be a large field for the exercise of benevolence in gratuitous attendance and advice for the relief of the sick poor, and of those in reduced circumstances, in which few physicians are backward to engage, whatever may be the degree of their natural sensibilities, their own necessities, or even their cravings for wealth. It becomes a question of ethics, whether the money left in possession of the recovered sick man, in the shape of remitted or neglected fees, might not, if it had been received, be made to answer the purposes of undoubted and enlarged benevolence, by the physician's giving it in aid of well-known useful charities, or to help individuals whose distress comes immediately under his own observation. Some may answer, that the feelings that induce a physician to abandon his fees will prompt him to yield readily to the ordinary claims of benevolence; but this is far from being a general thing. It was not so with Dr. Physick. Money once received by him was held with considerable tenacity, and never spent with a liberal hand; but, on the contrary, it was always appropriated to some productive end, with a view to its yielding the best percentage. He would give his profes-

sional services, but he would not give his money; and his name was rarely seen among the contributors to the benevolent enterprises of the day, or to older charities of the utility and stable character of which he could entertain no doubts. Unlike Dr. Chapman, his friend and colleague in the University of Pennsylvania, who was liberal both in his offers of assistance and in actual assistance to the students whose funds ran low, Dr. Physick was not known to indulge in either offers or loans. "His professional labors," as we are told by Dr. Horner, "sometimes produced twenty thousand dollars a year, and his method in this respect finally yielded more than half a million of dollars." The fact must often have occurred to Dr. Physick that a no small proportion of this large fortune was derived from the receipts, and accumulated interest on their investment, from the chairs which he held in the university during a period of twenty-six years. Yielding to such reflections, it might, one would suppose, have seemed to him both natural and proper to leave some appreciative testimony of his grateful remembrance, of an institution which had been so largely instrumental in advancing both his fame and his fortune. Wistar and Horner, with less inducements of this nature, have made contributions and bequests to the Anatomical Museum, which will always associate their names with the university. In the case of the Pennsylvania Hospital, also, the early and long-continued theater for the exercise and improvement of his surgical knowledge and skill, it might have been expected, almost as a matter of filial duty and affection, that he would have made a bequest to that institution, not merely with a desire of having his name longer remembered and cherished, but of contributing in a substantial manner to its more extended usefulness, both as a school for clinical instruction and for furnishing additional accommodations, which were then much wanted, but have since been supplied, for the comfort of the sick in its wards. It is true that, in common with all the medical and surgical officers of the hospital, his services were rendered gratuitously. Dupuytren, unsocial and selfish, neither loving nor loved in that profession of which he was for a time the chief, still be thought himself of the means of adding to the already great facilities of medical instruction in Paris, and bequeathed \$40,000 to endow a chair of Pathological Anatomy. This sum, by the good management of Orfila, himself in after years a liberal bequeather for similar purposes, has been chiefly appropriated to the formation and continued support of a rich museum of morbid anatomy. Orfila, although he left children, did not think he was doing them injustice by making benefactions for the advancement of medical science. Dr. Physick appears to have been unsettled in his religious creed and connections. This has been partly attributed by Dr. Bell, his biographer, to a neglect of theological study before his mind became engrossed in his professional work, and he urges the importance of such studies in early life, when the intellect is most ready, and the feelings of devotion most fresh. "Impressions made in early life, when the mind is in a plastic state, are never effaced—they survive cares, sickness, sorrow, the shock of angry passions, a long career of folly, of vice, and even of crime itself. They were made by

a father's watchful care, a mother's tender prayer; they are revived and come up in the darkest hour, and, like the standard in the heavens which gave Constantine confidence and victory, snatch us from despair and restore us to hope and faith." Unhappily for Dr. Physick and for others who may be influenced by his example—who hesitate because he doubts, and are chilled because he is cold,—religious consolation is often denied a man in advanced life, especially if he has been accustomed to play the oracle, or to guide and dictate in other matters, or is ready with the arts of cunning fence to foil an opponent, rather than as an humble searcher of the truth, conscious of his own weakness and earnestly interceding for illumination of his path of inquiry, must find it exceedingly difficult to arrive at the desired conclusions on this subject. A more encouraging view of the state of Dr. Physick's frame of mind in reference to religion, at the close of his life, is, however, held out by his son-in-law, Dr. Randolph, who, after speaking of his extensive course of reading upon theology, which included many works of a conflicting and contradictory nature, and the gloomy and desponding views created at times in consequence, goes on to tell of his "uniform habit of perusing, every morning, a portion of the New Testament," and when, in consequence of his illness and increasing infirmities, he was incapable of so doing, his children were constantly employed in reading this and other works of devotion to him. During his last illness he derived great pleasure and satisfaction from the visits of his friend and pastor, Dr. Delancey, whose kind attentions towards him were unremitting. "I feel assured," is Dr. Randolph's concluding remark, "that the hopes and promises of the Christian religion were the greatest sources of consolation to him in the closing hours of his life, and smoothed his passage to the tomb." Hitherto the biographer has traced the subject of this memoir from the morning to the setting sun of his life, and recorded the distinctions and honors acquired in his professional and professorial career. It remains for us, in conclusion, to enumerate his contributions to surgery, that branch in which he more peculiarly excelled. These will be found to belong more to the practice than to the science; but, while the former always engaged his preference, the latter seemed, on different occasions, so distinctly to point the way that it is not easy, even if it were necessary, to separate them. Reference was made in a preceding page of this biography to the large and thorough foundation for the subsequent fame and usefulness of Dr. Physick in his long period of probationary medical study before he went to Europe, and the uncommon opportunities he enjoyed when there, under John Hunter and in St. George's Hospital, for obtaining an intimate acquaintance with anatomy and the details of surgical practice. When required to act for himself, he must have been prepared, by meditating on the principles laid down by his great teacher in his lectures on surgery, and more especially on sympathy, to find serious constitutional disturbance often caused by local injury, and hence to feel the necessity of exercising continued vigilance in protecting the noble organs from the shock which they would receive in the surgical act of removing a limb, excising a tumor, or taking up an artery

for aneurism. He would measure in his own mind their capability, and that of the organism generally, to bear up and react under the depressing influence of pain and loss of blood, and the extent of their endurance of subsequent irritative fever, following a capital operation. Of the stock of recuperative energy probably possessed by the patient, and the ability of the surgeon to check secondary inflammation, he would predicate the chances of the healing process being set up and gone through in a satisfactory manner, and the reasonable grounds for success from his operating. In his counting of probabilities, he would take into consideration the age, constitution, habits, and prior and actually concomitant diseases of his patient. With him it would not be a question merely of his ability to perform the operation without his patient dying a few hours afterwards, but, still more, whether an operation would not only remove the existing infirmity and suffering, but prolong life. So, also, on the other hand, he must have been aware that by the same laws of sympathy, as taught and explained by Hunter, an abatement or removal of a local and external irritation, or disease—a wound or an ulcer—would be greatly accelerated by measures addressed to the general system through the great internal organs, and especially the stomach as the chief of the digestive apparatus. He would know that in this way, by persevering in a constitutional treatment, both therapeutical and dietetic, aided by appropriate topical applications, he might save a member which, under the influence of merely empirical and mechanical surgery, would otherwise be doomed to amputation or excision. Whether or not the reader may choose to attach any value to the preceding sketch as really indicative of the pathological doctrines and opinions with which Dr. Physick began his career in surgery, it can not be doubted that he was thoroughly imbued with the conservative views of John Hunter, whose saying he must often have heard, viz.: "To perform an operation is to mutilate a patient he can not cure; it should, therefore, be considered as an acknowledgment of the imperfection of our art." Under this belief a true surgeon, as distinguished from a mere manipulator and dissector, a cutter and a bandager, will bring all the resources of medical science to his aid, with a fixed intention of saving vital structure and prolonging life, but with no desire to exhibit himself by feats of dexterity and dispatch, at the expense of his patient. He is not continually brandishing his instrument—knife, gorget, or bistoury—like a harlequin his wand; nor is he, like the latter personage, eager to play with it all kinds of fantastic tricks, under the name of brilliant, or dashing, or difficult operations. He, on the contrary, holds it back, concealed, until the very last extremity, nor will he then have recourse to it on the plea that other means have failed, if he can not promise himself decided benefit to the patient by its use. The first application of the philosophy of surgery, which was made by Dr. Physick, was in the treatment of ulcers in the Pennsylvania Hospital. Avoiding the empirical course which had been previously pursued, he resorted, in the treatment of inflamed and irritable ulcers, to one founded on principles. "He directed the patient to be confined to bed and

to be kept strictly at rest, and in cases where the ulcer was situated on the lower extremity, he caused the limb to be considerably elevated. Constitutional treatment was carried on at the same time, and soothing applications were made to the ulcer. When topical stimulants were resorted to, he always preferred their being used when the patient was confined to bed." Dr. Physick introduced numerous and valuable instruments, and applied novel methods of treatment now generally adopted. He made valuable modifications and improvements in the treatment of fractures, one of the most noticeable and best remembered because still used, is in that of the celebrated apparatus by Desault, for fractures of the thigh. By increasing the length of the splint, Dr. Physick procured a more complete counter extension to be made in the direction of the axis of the limb, and also insured more certainty of rest to the patient. The apparatus thus modified, and with the block attached to the lower extremity of the splint, as introduced by Dr. Hutchinson, for the purpose of making extension in the direction of the limb, was regarded by Dr. Physick as the most complete and successful method of treating fractures of the thigh ever invented. It is that which for a term of years has been used in the Pennsylvania Hospital with the best effects. He was equally successful in inventing a method of treating fractures of the humerus, at or near the condyles, so as to prevent deformity and restore the entire use of the limb. His plan of treating fracture of the lower end of the fibula, accompanied with dislocation of the foot outwards, was precisely similar to that recommended by Dupuytren. Dr. Randolph, from whom we freely borrow in this enumeration of Dr. Physick's improvements in surgery, and of his operations, is unable to say to which of the two great surgeons the priority of invention is due. In the treatment of dislocations, Dr. Physick carried into full effect the plan of venesection so as to produce fainting, "as originally suggested by Dr. Alexander Munro, of Edinburgh." We find that the writers in the *Dictionnaire de Médecine et de Chirurgie Pratiques* attributes this practice to the Italian, Flajani. By this means, "old and difficult dislocations have been reduced, and limbs restored to usefulness which otherwise would have been irrecoverably ruined." It is not to be forgotten, however, that there may be circumstances in the state of the patient: advanced age, shattered constitution or anemia, which would make the loss of blood illy borne, and in which such relaxants as tartar emetic or tobacco, and especially the first, may be substituted with advantage. Dr. Physick's first operation in lithotomy was performed in 1797. He was early led to suggest a valuable improvement in the gorget, as used by Mr. Cline, so as to facilitate division of the prostate gland and neck of the bladder, which since then has been almost universally employed in this country. A full description of Dr. Physick's gorget was published in "Coxe's Medical Museum," for the year 1804, by Mr. R. Bishop, surgeon instrument maker. It is also noticed in Dr. Dorsey's "Elements of Surgery." The modification consists in having the gorget so constructed that a perfectly keen edge may be given to that part of the blade which commences the incision, and which is connected to the beak of the instru-

ment. For this purpose the beak and blade are separable, and so arranged that the blade may be connected to the stem and firmly secured by a screw. Without this arrangement it is exceedingly difficult to impart a fine edge to that part of the blade which is contiguous to the beak, and inasmuch as the incision of the neck of the bladder is commenced at that point, the success of the operation must necessarily be much influenced by it. In performing his first operation of lithotomy, he accidentally divided the internal pudic artery with the gorget, and a profuse hemorrhage was the result. The forefinger of the left hand having previously compressed the trunk of the artery, the point of the tenaculum was passed under the vessel, and a ligature cast round it and firmly tied; but it was found that a considerable portion of the adjacent flesh was also included in the ligature. In order to obviate similar inconvenience in future, Dr. Physick subsequently contrived his forceps and needle for the purpose of carrying a ligature under the pudic artery. This useful instrument is equally applicable to other cases in which it is desirable to take up a deep-seated artery that can not be reached by the customary methods. Twice has it been used in the operation of tying the external iliac artery: in the first instance by Dr. Dorsey, and in the second by Dr. Randolph. Numerous modifications of the forceps and needle have since been made, which, in some instances, being close imitations, were regarded by Dr. Physick as tending, if not intended, to deprive him of the merit of originating the instrument, and hence occasionally elicited from him a very decided declaration of his rights in the matter. Dr. Randolph, a competent, even if he be regarded as a partial judge, declares his belief that "the original instrument, as designed by Dr. Physick, has never been excelled either in point of ingenuity or ability." A case of suppression of urine in the Pennsylvania Hospital, in 1794, of forty-eight hours' duration, in which Dr. Physick found it impossible to introduce a catheter of the smallest size into the bladder, led him to make a trial of a bougie appended to an elastic catheter, so that the former might act as a guide to the latter, through which, when once introduced by this means, the urine would readily flow. The experiment was quite successful. A full description of the bougie-pointed catheter is given in "Dorsey's Elements of Surgery." An account of the case was communicated by Dr. Physick to Dr. Miller, and was published by the latter in the *New York Medical Repository*, together with the method of preparing the instrument, and some experiments on the treatment of gum-elastic by spirits of turpentine and ether; also a description of the process of coating catheters with gum-elastic. Dr. Physick made the treatment of strictures of the urethra a subject of careful study, and was celebrated for the tact and dexterity which he exhibited in dilating them. In the year 1795 he invented an instrument for the purpose of cutting through a stricture which was intractable to the ordinary methods of treatment. This instrument consists in a lancet concealed in a canula, which is pressed down to the stricture, and then the lancet is pushed forward so as to effect its division. After the stricture is cut through, a catheter or bougie should be introduced and worn for some time, in order to produce the

requisite degree of permanent dilatation. This mode of treating obstinate strictures has been found so successful "as to entitle it to be considered one of the most important and useful operations in surgery." It may be had recourse to in cases of complete retention of urine, so as to obviate the necessity of puncturing the bladder. Dr. Randolph claims for Dr. Physick the credit of being "the first who pointed out to our surgeons the method of constructing the waxed linen bougie." He gave it the preference over either the metallic or gum-elastic bougies. In the year 1802, Dr. Physick gave fresh proof of the way in which practical surgery may be deduced from a careful study of pathological changes going on in the tissues. It was such as no empirical guessing could ever have hit on. We advert now to his proposal of passing a seton between the ends of an ununited fractured humerus, for the purpose of stimulating the parts to a deposition of callus, and thereby producing a consolidation of the broken bone. The case in which this practice was first tried was that of a seaman in the Pennsylvania Hospital, whose left arm had been fractured eighteen months previously while he was at sea. At the expiration of five months after the performance of the operation he was discharged from the hospital perfectly cured, his arm being as strong as it ever had been. An account of this case, written by Dr. Physick, appeared in the *Medical Repository of New York*, 1804, and it was republished entire in the *Medico-Chirurgical Transactions*, 1819. Chance afforded Dr. Physick an opportunity of seeing the man—at the time a patient of Dr. Randolph—on whom he had performed this operation twenty-eight years previously. This person declared that he had never suffered any inconvenience since the operation, and that his fractured arm was quite as strong as the other arm. On the death of his patient, Dr. Randolph obtained permission to make a *post-mortem* examination, and produced the humerus. "At the place of fracture he found the two ends of the bone to be perfectly consolidated by a considerable mass of osseous matter, in the center of which there is a hole, showing the place through which the seton passed." The superiority of the use of the seton, in cases of this nature, "over the method not unfrequently resorted to of cutting down to the ends of the bone and sawing them off, as recommended by Mr. White, of Manchester," is strongly affirmed by Dr. Randolph. A complete refutation of the misstatements unintentionally made by Mr. Lawrence, in his surgical lectures, respecting the use of the seton in ununited fractures, has been furnished by Dr. Hays, the editor, in the *American Journal of the Medical Sciences*, in the shape of a brief summary of numerous cases successfully treated by this means. A still greater boon to humanity than any previously conferred by Dr. Physick was his operation for the cure of artificial anus, which he performed in the month of January, 1809. Dr. Granville Sharp Pattison, Professor of Anatomy in the Jefferson Medical College, while paying an animated tribute to the memory of Dr. Physick, in his introductory lecture, November, 1838, uses very emphatic language respecting this operation. It is the more entitled to notice on account of the anything but friendly relations which had previously existed between the author of the lecture and

the medical faculty of the university. He had just adverted to the numerous improvements which Dr. Physick had introduced into surgery, and the difficulty of saying which of them was the most influential "in advancing and elevating our science." He then proceeds in the following strain: "The one I select is his improvement in the treatment of artificial anus, and I hesitate not to assert that there is not to be found, in the whole circle of the science, any single discovery which indicates higher power of philosophical induction than the one under consideration. It was no random, no chance discovery. It was not, and it could not have been made by accident. It was based on anatomical knowledge, and perfected by inductions derived from her handmaids, physiology and pathology." It is not necessary that we should describe this operation, the details of which are now so well known. Reference may be made, however, to a full account of it, given by Dr. Benjamin Hornor Coates, in the *North American Medical and Surgical Journal*, for October, 1826, which is otherwise valuable by the remarks of this gentleman on Dupuytren's method of operating in the disease. On this occasion Dr. Coates shows, in the most convincing manner, that Dr. Physick long preceded the French surgeon in operating for the cure of artificial anus, a point contested by Dupuytren and others, but fully admitted, many years later, by Roux, his successor, and, it may be added, long his rival. To all useful intents and purposes, our great surgeon must be regarded as the inventor of this operation; for, even though it could be shown that a similar one had been performed by others, the fact had remained, and would have continued to be generally unknown, without its suggesting repetition or imitation. That the conception of the operation, and the pathological process which would render it efficient, were original with Dr. Physick, and that he believed himself to be the first to perform it, can not be questioned by those who know his sincerity and truthfulness. Once fully engaged in the exercises of his profession, he read but little, and his reading was, we believe, never of a retrospective nature. His study was of the present realities before him, and of the best means of making them subservient to his immediate purposes, without inquiring into or caring for the opinions or practices of the past, and seeking in them hints and suggestions for his own guidance. If he had any retrospective lore, it was that gathered in his early studies, when serving his novitiate, and most probably even in its first period, or before he went to London to be placed under John Hunter. A more direct instance of his making what he believed to be an original suggestion, occurred in his proposing the use of animal ligature, in which he had been anticipated by one of the older surgeons. Dr. Randolph, when telling us that from the year 1816 (see "Eclectic Repertory," vol. vi), Dr. Physick employed, almost exclusively, animal ligatures, adds the expression of his regret that they are but seldom used by the surgeons of the present day. Dr. Physick, in a journal or note-book of the most remarkable and interesting cases which occurred in his surgical practice, records the case of a lady affected with blindness from cataract. The operation was by extraction of the opaque crystalline

lens, and resulted in the restoration of the patient to sight. This was his favorite operation for cataract, whenever the eye was in a suitable condition, and such was his care in selecting proper cases, and in preparing them when necessary by previous treatment, and his manual dexterity, that he was almost always successful. It is mentioned by Dr. Randolph, as "a singular coincidence," that as the first case recorded in his note-book was of one in which he performed extraction for cataract, so the last operation he ever performed, on August 13, 1837, was of the same kind, and attended with the like success. Dr. Physick gave an account, in Chapman's *Philadelphia Journal of the Medical and Physical Sciences*, 1820, of the method which he employed for the removal of enlarged tonsils, and hemorrhoidal tumors, by means of the double canula and a soft wire. In place of allowing the instrument to remain applied, as had been previously the custom, until the parts were separated and thrown off, a process requiring a week or ten days for its completion, it was his practice to remove the wire at the expiration of twenty-four hours, a period proved by experience to be long enough for strangulating the tumors, and destroying their vital connection with the structure to which they had been attached. A few years after this, he became convinced that excision was the preferable operation for the removal of enlarged tonsils; and to accomplish this end he contrived, very ingeniously, an instrument, which was adapted also to excision of the uvula. A full description of it will be found in the *American Journal of the Medical Sciences*, together with the very interesting case of a young lady afflicted with an obstinate cough, occasioned by an elongation of the uvula, who was entirely cured by Dr. Physick, by means of the excision of a portion of that organ. The success in this and some other analogous cases soon gave vogue to the operation for excising, or cutting, or, as some familiarly called it, clipping off the uvula. To have a teasing cough, and a uvula somewhat elongated, or believed to be so, was the signal for excision. The fashion prevailed very extensively among clergymen, so many of whom suffer from chronic laryngitis and bronchitis; and he who had undergone the operation himself seemed to feel it to be his duty to recommend a clerical brother who coughed to submit to the like process, so that, after a while, one could not help thinking of the traveled fox, in the fable, who returned to his comrades minus a tail, left very much against his will in a trap, but who proclaimed this curtailment to be the last and most approved fashion, and, as such, worthy of general imitation. One can not help regretting the vast amount of misapplied missionary labor on the part of many clergymen in their zealous and too often inopportune recommendations of not only popular modes of practice, but also of popular quackeries, which exert about as beneficial an effect on the bodies of those who freely resort to their use as Millerism, Mormonism and Spiritual Mediums do on the souls of the believers in their doctrines. After a time a more general knowledge of physical diagnosis of diseases of the chest, in which cough is a common symptom, led to a true appreciation of the value of uvular excision, and, of course, to a considerable restriction of the practice. Dr. Hays, in the second

volume of the *American Journal of the Medical Sciences*, published a description and plate of a forceps invented by Dr. Physick, and employed in certain cases to seize the tonsil and draw it out, so as to allow more conveniently of its extirpation. In cases of hemorrhoidal tumor, where the complaint was of long standing, and the lining membrane of the rectum much diseased, and where the tumors were internal, Dr. Physick preferred and continued to use the ligature for their removal. The drawing at once a wire tightly round the base of the tumor gives momentary pain; but it is less severe than might be expected. At the end of twenty-four hours, when the wire may be removed, "the tumor will be found shriveled and black, and in a few days will be separated and thrown off under the application of a soft poultice of bread and milk." Care must be taken, as enjoined by Dr. Physick, that nothing but the hemorrhoidal tumor itself be included within the ligature. An operation for varicose aneurism, performed by Dr. Physick, is described by him in Coxo's *Medical Museum*. In the same journal he details the history of a case of luxation of the thigh-bone forward, and the method which he employed for its reduction. The *Philadelphia Journal of Medical and Physical Sciences* contains the particulars of a case of carbuncle, with some remarks on the use of the common caustic vegetable alkali in the treatment of this disease, which he divides into three stages. It is in the second stage, in which "inflammation having ended in the death of the cellular texture in which it was situated, a process begins for making an opening through the skin, to allow the dead and acrid fluids to pass out." It is in this stage, marked by the appearance of pimples and small orifices, "that the application of the vegetable alkali upon the skin so perforated, and on that covering the middle of the tumor, in quantity sufficient to destroy it complete, proves highly beneficial." We shall next notice, in a summary manner, the contributions made by Dr. Physick to pathology and practical medicine. They are not numerous, but they are all of them of permanent value, either by removing previous obscurities or enlarging the domain of therapeutics. During the period in which the yellow fever appeared in Philadelphia, in 1793, he, in conjunction with Dr. Cathrall, published an account of several dissections of persons who had died of this disease. The results, as given in *Brown's Gazette*, though not absolutely original, were more definite and clear than had been previously described by Dr. Mitchell, in the yellow fever, as it prevailed in Virginia in 1737 and 1741, Dr. Mackittrick, in his inaugural thesis, at Edinburgh, 1766, Dr. Hume, in his account of the yellow fever of Jamaica, and of Dr. Lind, in his notice of the disease as it prevailed in Cadiz in 1764. The introductory paragraph of the newspaper account of the dissections made by Drs. Physick and Cathrall, to which their names are appended, contrasts strangely with the testamentary directions by the former for the disposal of his body after death. They say: "Being well assured of the great importance of dissections of morbid bodies in the investigations of the nature of diseases, we have thought it of consequence that some of those dead of the present prevailing malignant fever should be examined." After stating the gen-

eral soundness of the brain and the thoracic organs, they proceed to say, "That the stomach and beginning of the duodenum are the parts that appear most diseased. In two persons, who died of this disease in the fifth day, the villous membrane of the stomach, especially about its smaller end, we found highly inflamed, and this inflammation extended through the pylorus into the duodenum some way. The inflammation here was exactly similar to that induced on the stomach by acrid poisons, as by arsenic, which we once had an opportunity of seeing in a person destroyed by it." "A black liquor" was found in the stomach and intestines, which had been vomited and purged before death. "This black liquor appears to be clearly an altered secretion from the liver; for a fluid, in all respects of the same quality, was found in the gall-bladder. This liquor was so acrid that it induced considerable inflammation and swelling on the operators' hands, which remained some days." In subsequent observations the authors ascertained, with more precision, the real nature of the dark-colored fluid in the stomach and small intestines, which is identical with that ejected and known under the name of "black vomit"—altered blood given out from the vessels of the stomach. It is but just to add that dissections made by Dr. Deveze, in 1793, and published in the following year, reveal a state of the lining membrane of the stomach similar to that described above. This writer speaks also of the black blood mixed with the black bile in the gastric cavity. Dr. Physick confirmed and extended his experience gained in 1793, by additional dissections during his residence in the City Hospital, in 1798, a brief notice of which is made by Dr. Rush in his history of the yellow fever of that year. He mentions the matter which constitutes what is called the *black vomit* was found in the stomach of several patients who had not discharged it at any time by vomiting. He observed, also, the greatest marks of inflammation in the stomachs of several persons in whom there had been no vomiting during the whole course of the disease. It would be arrogating too much to claim for Dr. Physick and his associate in pathological investigations on the organic seat of yellow fever, the first knowledge of its gastric character, and the origin and nature of the black vomit; but certainly their observations had a dominant influence on the medical teachers and writers of Philadelphia, and contributed a full share in other directions in imparting something like fixedness of opinion on this part of the pathology of yellow fever. In the winter of 1798 a paper was read by Dr. Physick, before the Academy of Medicine, of Philadelphia, containing "Some Experiments and Observations on the Mode of Operation of Mercury on the Body," which was subsequently published in the *New York Repository*. Although falling short of the chemical requirements of the present day, these experiments exhibit evidences of a spirit of careful scrutiny and cautious induction which it would be well always to imitate in experimental investigations. In 1802 Dr. Physick communicated the particulars of a case of hydrophobia for the journal just mentioned. After giving a detailed account of the appearances exhibited on dissection, he suggests, as a means of relief in this disease, the propriety of tracheotomy in conjunction with other parts of the treatment. A

practical recommendation of great importance was made by Dr. Physick in Coxe's "Museum" for 1805. It consists in the use of blisters for the purpose of arresting the progress of mortification. He was led to this practice from a knowledge of the good effects of the remedy in arresting erysipelas, a mode of treatment which he had learned from Dr. Pfeiffer, of Philadelphia. In order to procure the best effects from the blister, it should be large enough to extend from the mortified to the adjacent sound parts. Dr. Physick, although he did not originate the suggestion, which should be credited to Dr. Alexander Munro, Jr., of Edinburgh, who gave it in his Inaugural Thesis, 1797, must have credit for being the first to carry into practice many years in advance of its reputed inventors in our own day. Our reference is to the introduction of fluid into the stomach by means of a gum-elastic catheter and a common pewter syringe, for the purpose of diluting poisonous substances which have been swallowed, and then of withdrawing them by the same apparatus, thus accomplishing what is now done by the stomach pump, or an instrument made expressly for this purpose. The circumstances, as detailed in the *Eclectic Repertory*, for October, 1812, were, that a mother, by mistake, gave an overdose of laudanum to two of her children, twins, aged three months, which produced convulsions and stupor: the pulse and respiration had almost ceased. As these children were unable to swallow, Dr. Physick injected one drachm of ipecacuanha, mixed with water, by the means already described. No effect resulting, he injected a quantity of warm water, and then withdrew it by means of a syringe. These operations were repeated again and again, until he had washed out the stomachs thoroughly and removed all their contents. "By the time these operations were completed, however," writes Dr. Randolph, "all signs of animation in each of the children were entirely lost. Discouraging as these circumstances were, the Doctor determined to persevere in his efforts to restore life, and accordingly he injected into their stomachs some spirits, mixed with water, and a little vinegar; and he also made use of external stimuli. In a few moments the pulse and respiration returned in each child, and in the course of a short time both were regularly performed." The results were that one of the children completely recovered, the other died. Dr. Physick, in a note to this paper, states that the idea of washing out the stomach in cases in which poison has been swallowed, occurred to him at least twelve years previously; and that his nephew, Dr. Dorsey, had performed the operation of washing out the stomach in such a case in the year 1809. Dr. Physick did not introduce new remedies, but he did more: he modified the preparation or the dose of familiar articles, with a rare nicety of adaptation in the particular circumstances of the case, thus giving a character of freshness and originality to his suggestions, which were often highly appreciated by his medical brethren in consultation. He had, it is true, the advantage which every man of eminence enjoys whose advice is invoked at an advanced period of the disease. He learns what has been done; what effects have followed certain remedies: he finds for example, that the patient has been bled and otherwise depleted, and that the period of ex-

citement is passing away, and he comes just at the opportune moment to counsel the use of stimulants and tonics, and a little increase of nutrimental substances; probably just at the time when the attending physician had himself proposed to advise these measures. The superficial observer sees in the means recommended a change of practice, where the experienced one sees only a continuation of treatment varying with the change in the stage of the disease. The administration of tonics and stimulants to-day is no evidence of error on the part of the physician, who, two days or even twenty-four hours before, had enforced venesection or leeching, and active purging. The crisis of a fever, followed as it often is by feeling of great languor and prostration, alarms the friends of the patient and prompts them to a request for additional medical counsel, at a time when, in fact, the danger is over. Hence a physician of experience, and who is imbued with sound ethics, when called into consultation, although he may get credit for the subsequent rally of the enfeebled powers of life, will have the good sense not to suggest any very decided course of treatment, but, waiting for time and nature, he will give his approval of the previous treatment. We have heard it said that, on one occasion, the friends of a patient who was under the care of an eminent French physician, becoming uneasy about him, for there are fits of panic on such occasions not explicable by the facts of the case, requested that Dr. Physick might be called into consultation. The request was, of course, complied with, and on his seeing the sick person, he felt that nothing additional to the actual treatment was necessary. But, that he might not seem to be indifferent to the case, he suggested the use of a few grains of magnesia, which were taken by the patient, who soon recovered, to the great joy of the friends and to the credit of the consulting physician, to whose timely visit and advice the salutary result was attributed. Dr. Physick abjured all theories and systems in the practice of medicine. He would neither advance any guiding principle on which could be based the treatment of a class of diseases, or of many cases having characters in common, nor listen with patience to an attempt on the part of a professional *confrere*, in consultation, to make such an exposition of the views by which the latter had been governed in the treatment of the case before them. If he recommended a remedy or a mode of practice, it was not to meet certain indications or to remove certain pathological conditions, but because he had found the remedy or the mode of practice useful in another case—giving often the name of the individual—which resembled this one. His practice was based on enlightened empiricism, a careful and minute observation of what had done good and what was injurious; but here he exercised those reasoning powers which, in what seemed to be theory or systematizing, he chose to place in abeyance; for he so modified and changed, as already observed, the mode or the time of giving the remedies, as to imply, in his mind, a certain hypothetical state of things which he proposed to himself to change by a new combination of means. He professed, however, to acknowledge no guide but experience, forgetting the remark of Hippocrates, echoed by Boerhaave and others, that experience is often fallacious—

Experientia fallax—and probably never having read the admirable treatise on the subject by Zimmerman. That experience, which is merely the knowledge of antecedent facts or events, must have had a beginning, and if so, might we not sometimes trust to trials suggested by a long previous study of the relations of successive antecedents, even though we may call it theory, with at least as much confidence as to unforeseen chances from which all experience must date? But, after all, what are called the results of experience are not deductions from a series of precisely identical facts or phenomena ranged in the memory like a string of beads. In the facts or phenomena there are differences which we throw out, and resemblances which we choose to retain, as representing a continuous chain of occurrences, so that the reasoning powers are actively at work, and the most doggedly practical, and the greatest sticklers for experience, are obliged, in despite of themselves, to combine and arrange things in their own minds, different from the actual realities before them, and to draw inferences which they may call the results of experience, but which in truth are the product of a theory, however simple and elementary it may be. The chief difference between your men who cling to experience and profess to eschew theory, and those who avowedly and conscientiously employ theory to fix in their minds a series of complicated events and to guide them in future inquiries, amounts very nearly to this: that the former theorize only from their own observations, while the latter theorize both from their own and those of preceding times, thus bringing the wisdom of the great departed to enlighten their own judgments. Dr. Physick's inflexibility in adhering to his opinions when once formed, and which made him insist on obedience from his patients to his advice and prescriptions, did not, however, interfere with his careful reconnaissance of the ground before he took his stand, or with his groping, as it were, his way in the paths of doubt before he reached the desired conclusions. The objections made by the invalid to what he proposed giving were listened to attentively, and as far as they rested on idiosyncrasies, or on positive disability of function, were treated with deference. When he saw that the issue ought still to be made between his prescriptions and the disease, but was aware that it could not be met directly, he was content to accomplish his object in an indirect manner. An instructive example of his mode of prescribing in such circumstances is related by Dr. Randolph. The case was one of a lady laboring under dyspepsia of the most aggravated character, for which she was brought to Philadelphia. Such was the irritability of her stomach that it rejected every kind of nourishment, and in consequence her state of weakness and prostration was so great that she seemed to be dying of inanition. Dr. Physick, after proposing a variety of articles, inquired of her whether, since she was first attacked, she had ever tried milk. On her replying that she had often taken it, but her stomach always rejected it, he asked her if she did not think that her stomach would retain the half of a tumblerful of milk? She answered in the negative, as she did also when a wineglassful was proposed, and again when a tablespoonful was mentioned. "He then told her that he was under the im-

pression that she could retain in her stomach one teaspoonful of milk, and accordingly he prescribed the article for her, to be taken in that quantity at repeated intervals. The lady adopted his views, attended to his prescriptions, and was ultimately restored to perfect health." In another case, of a lady who insisted on her inability to take opium with a view of procuring sleep, as it never produced that effect, although repeated trials had been made by its administration of an evening, Dr. Physick advised the physician, with whom he was called in consultation, to give the medicine at other hours, and with its taste covered as much as possible by other substances. In this manner the association in the mind of the patient between the taking of the opiate and a belief in its inefficacy would be broken. It was accordingly administered at intervals through the day, combined with mucilage and nitric acid, as if to meet other indications, but really with a view of placing the patient under its hypnotic influence by the time that night was reached. The result corresponded with the anticipations formed, and the lady obtained sound and refreshing sleep, and ceased ever after to dispute the soothing effects of opium in her own case. Most commonly the opiate prescribed in the evening is taken at too late an hour, and hence its full hypnotic effects are not experienced until the approach of morning, or even of the hour for breakfast. If Dr. Physick can be supposed to have followed out systematically a plan, it was in the numerous cases of chronic disease, many of them coming from a distance, which depended on chronic inflammation, induced too often by excess in living and the operation of climatic causes. Patients thus affected were generally subjected to a reducing treatment, the prominent points of which consisted in bloodletting, general or local, or both, purging and low diet, which last, by the multitude, is always called starvation. His design seemed to be to treat an inflamed internal organ or viscus as he would an inflamed eye, or an inflamed joint, by removing and withholding as much as possible, all causes of excitement, and allowing it to rest or to make a near approach to this state. The authority imparted by his great reputation and experience, procured for him a deference to this course of treatment, and more patience and persistence in it than would have been yielded to other professional men; and hence more instances could be recorded of his success than would have fallen to their lot, supposing even that they had been influenced by the same pathological views. It must be acknowledged, however, that instances were every now and then adduced of his pushing these measures to an extreme, or rather of continuing them needlessly long. It is possible that undue stress, if not exaggeration, would be displayed in popular comments and glosses on these cases, owing to the treatment being so adverse to the prejudices of the many, who can never divest themselves of the vulgar notions that the sole treatment of a disease ought to consist in keeping up the strength by feeding and stimulating, as if digestion and assimilation could be carried on at this time as they are during health. This idea is just as rational as would be that of recommending a man to keep up the strength of an inflamed eye by the free admission of light, and by continuing to use the organ, or to give supple-

to an inflamed knee-joint by walking and waltzing. In a more advanced stage of disease, and the inflammatory element absent or failing to yield to a reducing treatment, Dr. Physick's views and prescriptions exhibited nothing remarkable or requiring distinct record. His practice was such as we have already described. If he did not himself generalize from exceptional cases, his advice in these was sometimes assumed to be his regular treatment of the disease, and his name was made the cover or pretext for pure empiricism. It is most probable that a remedy used by him in the last resort, after he had exhausted the *materia medica*, was had recourse to in an early period by those who were either ignorant of the list or too impatient to make the selections from it which were sanctioned by previously recorded experience. Among these exceptional modes of treatment, generalized by the multitude to a mischievous excess, was the decoction of soot and wood ashes, which Dr. Physick was said to have found beneficial in dyspepsia in his own case, and hard cider, used by him in obstinate cases of dyspepsia with heartburn. If we have spoken of Dr. Physick's practice as one of enlightened empiricism, we must be understood to use this word in its large philosophical sense, that in which it is recognized in the history of medicine. Far different is it from the popular empiricism or quackery, which does not set up a claim for a particular mode of treatment, or a particular remedy in a specified disease and stage of that disease, but impudently asserts the all-healing and curative power of one article or combination of articles in all diseases, however opposite they may be in their origin, organic seat and other essential characters. No physician was more decidedly opposed to this impudent and ignorant assumption of the miraculous powers implied in such pretensions than the eminent man whose professional character we are now portraying. On a memorable and ever regrettable occasion, when some of his colleagues in the university, and the president of the College of Physicians, so far forgot the proprieties of medical ethics and the conclusions of medical logic as to give certificates in favor of a quack medicine, Dr. Physick steadily declined to join in what, in the mildest terms, must be called an exhibition of foolish good nature to a begging empiric, at the expense of the health of the community. We can scarcely speak of Dr. Physick as an author, so few and brief have been the papers from his pen which have appeared in print; and it must be regarded as somewhat singular for one of his eminence, who had been a public teacher so long, and who was so largely engaged in the practice of medicine, that he has not written a single article on the treatment of a disease, separate from its surgical bearings and the surgical means used for its relief. His accumulated experience is, therefore, in a great measure, lost to the world; and in this loss follows a gradual decay, as year succeeds year, of his own great reputation, which requires something more than tradition and historical eulogy to keep it fresh in the mind of posterity. We have good reason for believing "that in the latter years of his life he regretted very much he had not published more for the benefit of his fellow-beings; but at this period his disinclination and habits had become so confirmed that it was impossible for him to change them."

Another example to enforce the old moral of the danger of procrastination. For the account of the improvement in surgery made by him the world is indebted to others. To the treatise on surgery by Dr. Dorsey, and to the memoirs left us by contemporaneous writers, must reference be made for an enumeration of the contributions to the especial department of this eminent pioneer teacher of the medical profession. A tolerably fair knowledge of the most important of Dr. Physick's improvements in surgery may be obtained by a perusal of Dr. Dorsey's "Elements," in which the reader is continually reminded of the oracle whose revelations are law to the author. A little more of the expansive liberality of feeling which allowed Dorsey to disseminate many of the views and modes of practice of Dr. Physick, would have led the latter in after years, and in the latter part of his life, to have brought out, in a collected form, his published papers, his lectures on surgery, and selections of cases recorded in his note-book. Not only, however, did he fail to do this, or to authorize some person to perform the task after his death, but he made "an ardent request," which, by the parties to whom it was addressed, would naturally enough be construed into a positive prohibition against the publication of his manuscripts.

PIFFARD, Henry G., of New York City, son of David and Ann Matilda Piffard, was born at Piffard, Livingston county, N. Y., September 10, 1842.

Henry G. Piffard.

His preliminary education was acquired at the Military School of Marlborough Church, at Sing Sing, N. Y., which he left in 1858, to enter the Department of Arts of the University of the City of New

York. He was graduated from this institution in 1862, with the degree of A. B. Three years later he received the degree of A. M. In 1861 he commenced the study of medicine in the office of Professor Willard Parker, M. D., matriculating at the same time at the College of Physicians and Surgeons, New York. In 1864 he received the degree of M. D., and later spent eighteen months as an *interne* at Bellevue and Charity Hospitals. In 1873 he was appointed Lecturer on Urinary Analysis at the Medical Department of the University of the City of New York, and two years later Professor of Dermatology at the same institution. This latter position he has held, with the exception of an interval of two years, up to the present time. He served about fifteen years as Surgeon to the Charity Hospital, and on resigning that position was appointed Consulting Surgeon. His principal writings are, "A Guide to Urinary Analysis," 1873; "An Elementary Treatise on Diseases on the Skin," 1876; "Materia Medica and Therapeutics of the Skin," and "A Practical Treatise on Diseases of the Skin," 1891.

PINKERTON, Samuel Hunter, of Salt Lake City, Utah, was born in New York City, May

Samuel H. Pinkerton

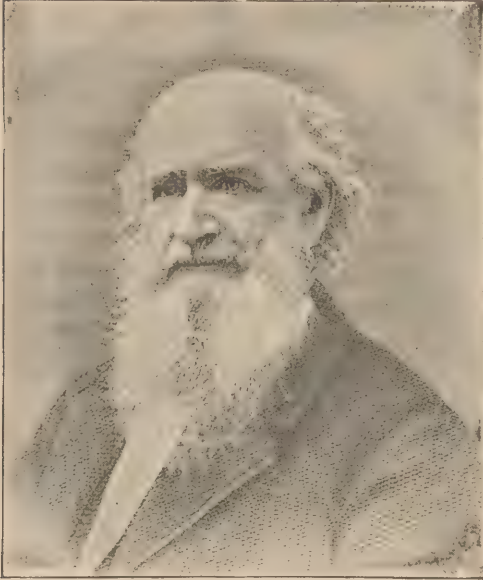

27, 1857. His early education was received in Brooklyn, N. Y. He entered upon the study of medicine, and received his degree of M. D. from the Bellevue Hospital Medical College in 1883. In October, of the same year, he entered Bellevue Hospital, where he served as *interne* for eighteen months on the Third Surgical Division. Was Prosector to the chair of Anatomy of Bellevue Hospital Medical College from 1883 to 1886; was appointed one of the Assistant Demonstrators of Anatomy in

the Bellevue Hospital Medical College, January 5, 1885. On October 15, 1886, he was advised to leave New York City on account of ill-health. He located in Salt Lake City, Utah, where he has taken up general surgery and gynecology. Was appointed Visiting Surgeon to the Holy Cross Hospital, of Salt Lake City, and Surgeon for the Rio Grande Western Railroad. Dr. Pinkerton is widely known in the West as a rapid and skillful operator. He is a member of Salt Lake County Medical Society and Salt Lake Academy of Medicine.

POOLEY, Thomas Rickett, of New York City, was born, October 1, 1843, in Chatteras, Cambridgeshire, England. He was educated at local schools and academies in the State of New York, and graduated from the Bellevue Hospital Medical College in March, 1864, subsequently attending medical lectures in London and Paris. He settled at first in the city of New York. His specialty is diseases of the eye and ear. He is a member of the Medical Society of the County of New York, which he has represented in the State Medical Society; the New York and the American Ophthalmological Societies; the International Ophthalmological Congress; the American and International Otolological Societies; the Medical Journal Association; the Yonkers Medical Society, of which he was president in 1876; and the Alumni Association of the Bellevue Hospital College, of which he was president in 1874 and 1875; and is a fellow of the New York Academy of Medicine. He is the author, among other writings, of papers on "Two Cases of Sympathetic Ophthalmia Distinguished by the Occurrence of Neuro-Retinitis," "A Case of Corectopia," "Keratitis Vesiculose, with Secondary Glaucoma," "Strabismus," "Hemioptia Depending upon a Gummy Tumor in the Left Posterior Lobe of the Brain," "Foreign Body in the Eye Diagnosed by Limitation of the Field of Vision," "Transactions of the American Ophthalmological Society," 1870; "Wound of the Sclera Treated by Suture, with Remarks," "Sympathetic Ophthalmia," "Injuries of the Eye from Gunpowder," 1871; "Foreign Bodies in the Eye, with Remarks," "Transactions of the New York Medical Society," 1875; "A Case of Epithelioma of the Lower Eyelid—Blepharoplasty by Sliding Flaps," "Hemorrhage from the Ear in Purpura," "Circumscribed Syphilitic Exudation of Chancroid," and "Syphilitic Iritis," 1876. He was a medical cadet in the United States Army from September 5, 1862, to May 18, 1864, and thenceforward assistant surgeon to the close of the war, being brevetted captain, June 1, 1865. In 1866 he was assistant sanitary inspector of the Metropolitan Board of Health, having charge of the cholera hospital, Battery Barracks, from July 24 to October 15; attending physician of the Northern Dispensary, from 1866 to 1869, inclusive; was clinical assistant in the New York Eye and Ear Infirmary; and has since been assistant surgeon of the New York Ophthalmic and Aural Institute; surgeon to the Charity Hospital; and consulting ophthalmic surgeon to St. John's Hospital at Yonkers, and clinical professor of ophthalmology in Starling Medical College, Columbus, O.

POST, Alfred Charles, of New York City, was born in New York, January 13, 1806, and died there February 7, 1886. "He was the son of Joel Post, a merchant of New York, whose place of business was on Hanover Square, and

who owned as his country seat the property known as Claremont, which is now included in Riverside Park, and embraces the site of Gen. Grant's tomb." Young Post was graduated at Columbia College in 1822, and after studying medicine with his uncle, Dr. Wright Post, a noted surgeon of New York, received his medical degree at the College of Physicians and Surgeons, New York, in 1827. Two years later, having meanwhile studied in Paris, Berlin, London, and Vienna, he established himself in New York, giving his attention mainly to surgery, and paying especial attention to the treatment of cicatricial contractions, deformities from burns, and other analogous injuries.

Alfred C Post

In 1831 he married Harriet, daughter of Cyrenus Beers, Esq., of New York, by whom he had eleven children. One of his sons, Dr. Geo. E. Post, became Professor of Surgery in the Syrian Protestant College at Beyrout. In 1835 he removed to Brooklyn, but, after passing two years in that city, resumed his residence in New York, where he remained until his death. As a surgeon generally, and within the lines of his specialties particularly, his practice, of large extent, had been very uniformly successful, and he was regarded as one of the leading surgeons of America. He was a member of the Berlin Königlich Medizinisch; Chirurgische Gesellschaft; Boston Gynecological Society; New York Pathological Society; New York County Medical Society, and Academy of Medicine; having been vice-president of the latter from 1861 till 1866, and president from 1867 till 1868, and of the American Medical Association, of which he was once chosen vice-president. As an author, his writings, dealing principally with surgical matters, were confined to contributions to professional periodicals, with the exception of a small volume on "Strabismus," published in 1840. Among his

more important papers may be cited the following: "Report on Stricture of the Urethra," *New York Medical Journal*; "Case of Blepharoplasty," in *New York Medical Gazette*; on "Club-foot," in *Medical Record*; on "Treatment of Stone in the Bladder," *New York Medical Times*; on "Cicatricial Contractions," in *Medical Record*; on "Contractions of Palmar Facia," in *Archives of Clinical Surgery*. From 1831 to 1835 he was Demonstrator of Anatomy to the New York College of Physicians and Surgeons, and from 1836 to 1852 was Attending Surgeon to the New York Hospital. Since 1852 he had been consulting surgeon to the latter institution. From 1851 to 1875 he was Professor of Surgery in the Medical Department of the University of New York; in 1875 he was made Emeritus Professor, and since 1873 serving also as president of the Medical Faculty until his death. He was also Consulting Surgeon to St. Luke's Hospital, Attending Surgeon to the Presbyterian Hospital, and president of the medical board of the Woman's Hospital. Dr. Post achieved his great fame in surgery, and his operations were noted for precision and dexterity. He was the first in the United States to operate for stammering, and in 1840 devised a new method of performing bilateral lithotomy. He also showed mechanical ingenuity in devising instruments and appliances, and in the latter part of his life labored much in plastic surgery, making important reports of operations in that line. In 1872 he received the degree of LL. D. from the University of the City of New York. Dr. Post was active in various religious and charitable organizations, and at the time of his death was president of the New York Medical Mission, and one of the directors of Union Theological Seminary.

POTTER, Frank Hamilton, of Buffalo, N. Y., was born in Cowlesville, that State, January 8, 1860, and died July 16, 1891, after an illness of ten days' duration. He was the only son of Dr. William Warren Potter. In 1882, when he was twenty-two years of age, he was graduated from the Buffalo Medical College. Prior to this time he had served as Resident Physician in the Rochester City Hospital for two years. In 1883, at the organization of the Niagara University, he was appointed Clinical Assistant to the Chair of Surgery, and subsequently held the position of Lecturer in Anatomy and Laryngology. He at one time was a member of the surgical staff of the Sisters of Charity and Emergency Hospitals. He first began the practice of general medicine, which he continued for a time, but afterward gave it up for the special field of laryngology, for which he had fitted himself in the schools of both this country and Europe. But recently he was appointed Clinical Professor of Laryngology of the University of Buffalo. He was also associate editor of the *Buffalo Medical and Surgical Journal* with his father. He was a member of numerous medical societies, among which were the Buffalo Medical and Surgical Association, Erie County Medical Society, Medical Society of the State of New York, Buffalo Pathological Society, and Obstetrical Society. He was also a member of the Saturday and Thursday clubs. During the year 1890 he was secretary of the Laryngological Society of the American Medical Association, and he was recently chosen by the Council of the American Laryngological Asso-

ciation for membership in that organization. In political life he had taken a small part, having served two terms as civil service commissioner. He was removed from that office by Mayor Becker, along with Mr. Loomis, but was reinstated when Mayor Bishop was elected. This office he resigned about a year ago, on account of other business duties. In 1887 he was married to Eva, daughter of Lars G. Sellstedt. To them two children were born, both of whom, with his wife, survive him.

POTTER, Samuel O. Lewis, of San Francisco, Cal., was born in England, September 18, 1846. He is the eldest son of the Rev. Samuel George Potter, vicar of Holliscroft, Sheffield, England, who is of English birth, but of Australian education. His mother is of Scotch-Irish family in the north of Ireland. One of his brothers is the Rev. Beresford Potter, rector of March, England; another is Superintending Surgeon to the P. and O. Steamship Company at Bombay; while another lived some years in California, and was drowned in the Missouri river about 1873. Two of his sisters are married in India to officers of high rank in the British army, one being Lieut.-Col. L. H. Young, commandant of Fort Saukra, in the Punjab, and the other Staff Surgeon Charles Hatchell, Indian Army Medical Department. The subject of this notice began the study of medicine at the age of fifteen years, under the direction of Dr. R. H. Courtenay, M.R.C.S., surgeon to the Baltinglass Union Hospital. After two years of study he came to the United States, at the age of seventeen, and entered the United States Army during the war, serving in the same brigade with the California Hundred. After the war closed he served several years as construction engineer on the Oregon and California railroad, and in the United States engineering department, where he acquired a reputation for conscientious work and literary pursuits, which is well set forth in a commendatory letter given him by Gen. A. A. Humphreys, then chief of engineers, United States Army. After thus working for some years to obtain the means necessary for a renewal of his studies, he resumed the study of medicine in England, under the preceptorship of Dr. George Kemp, surgeon to the Sheffield Union Hospital, passing the examination in general education required by the British Medical Council, and officially approved by the Royal College of Surgeons. He received his first medical degree in 1878 from the Medical College of Missouri, a homeopathic institution, but soon becoming convinced of the inutility and fallacy of the therapeutic doctrine of that system of medicine, he entered the Jefferson Medical College of Philadelphia, from which he was again graduated in 1882, with the first prize of that school in a class of 247 graduates. Dr. Potter then went before the Faculty of Bellevue Hospital Medical College, New York, for examination and endorsement of his diploma which he received. Shortly afterward he entered the medical department of the United States Army, serving as Post Surgeon at Fort Robinson, Nebraska, and as Acting Assistant Surgeon at Fort Russell, Wyoming, and at Fort Douglas, Utah; at the latter station leaving the army to settle at Salt Lake City, where he practiced successfully for over three years, and then established himself in San Francisco. In 1887 the Board of Trustees of the Cooper Medical College, formerly the Medical College of

the Pacific, on the unanimous recommendation of the faculty of that institution, elected him to fill the responsible chair of Theory and Practice of Medicine as successor of the distinguished Professor Henry Gibbons, deceased. This action was taken after a series of trial lectures delivered by Dr. Potter before the faculty and students, and an extended professional association between him and several of his colleagues. Referring to the subject of this sketch at the time he was selected to fill this position, the following clipping from the San Francisco *Alta Californian* may be quoted in this connection: "Dr. Potter is a man of forty years of age, who brings to the work before him a mind stored with the fruits of twenty-five years of study, a habit of industry in the literary fields of his profession, a thorough classical and technical education, and an extended and successful experience in military and civil practice. We are confident that he will prove eminently successful, both as a teacher and a practitioner of his specialty, the pure practice of medicine, and so believing, we welcome him heartily to San Francisco, where, surrounded as he will be by colleagues of the highest professional rank, his future success is already assured." The brilliant career of Dr. Potter since that time, as teacher, writer and physician, indicate that this estimate and prediction was well founded. In addition to the professorship, which he still holds in the Cooper Medical College, he was, while at Salt Lake City, a United States Examining Surgeon for Pensions, and has been examiner for the Equitable Mutual Life and Northwestern Life Insurance Company. In 1891, Dr. Potter was made a member of the Royal College of Physicians, London. He is also a member of numerous medical societies and scientific and social organizations. Among his contributions to medical literature may be mentioned the following: "Index of Comparative Therapeutics, 1880; "On Speech and its Defects," 1882 (prize essay); "Compend of Anatomy, 1883 (with lithographic plates, 5th ed.); "Handbook of Materia Medica, Pharmacy and Therapeutics," 1887. The last work is a large volume of eight hundred pages, including official and extemporaneous pharmacy, and presents the physiological action of drugs as well as the special therapeutics of diseases. This publication is altogether so practical and popular that a fourth edition, revised and enlarged, has been issued. In fact all of his works have gone through several editions and are in the hands of nearly every medical student in America, besides having a very large sale in England.

POTTER, Theodore, of Indianapolis, Ind., was born at Glendale, Hamilton county, O., November 29, 1861, his father being the Rev. L. D. Potter, D. D., president of the Glendale Female College. On his father's side he is of English stock, the first members of the family settling near Elizabethport, N. J., in the seventeenth century. His great grandfather was a colonel in the Revolution, and his grandfather, Jotham Potter, a major in the War of 1812. The latter was for many years a member of the New Jersey Legislature. Dr. Potter's mother came of one of the old Dutch families about New York, the Ketchams, though originally from France, they having fled, with the persecution of the Huguenots, to Holland. He was educated in the public schools of his native

town, in the High School, Lawrenceville, N. J., and graduated with honor, after a four years' course at Princeton University in 1882. At Princeton he was one of the editors of the college literary magazine; was the Dickinson prizeman for 1881, and one of the literary prizemen for 1882. He taught for a short time in the boys' classical school at Miami University, Oxford, O. In the fall of 1883 he began the study of medicine under Dr. R. D. Mussey, of Cincinnati, attending lectures at the Ohio Medical College. After four years of medical study he graduated at this college, being awarded the prizes for the best examinations in the practice of medicine and in obstetrics. In the spring of 1887 he was appointed Assistant Demonstrator of Bacteriology in the Medical College of Ohio; and about the same time entered upon practice in the office with Dr. J. T. Whittaker. Soon afterward he became Resident Physician at the Good Samaritan Hospital, where he remained till the spring of 1888. After leaving the hospital he spent about a year in clinical study in Germany, chiefly in the hospitals of Göttingen and Berlin, brief periods of recreation being occupied in travels through Belgium, Holland, Switzerland and Great Britain. In February, 1889, Dr. Potter settled in Indianapolis, which has since been his home. He was elected Demonstrator of Microscopy and Bacteriology in the Medical College of Indiana in the spring of 1889; the next year he became lecturer upon the same subjects; in 1891 Professor of Bacteriology, and in the summer of 1893 Professor of Pathology and Bacteriology, which position he now holds. He is Consulting Pathologist to the Indianapolis City Hospital, and Attending Physician for Chest Diseases at the City Dispensary. He is one of the editors of the *Indiana Medical Journal*, and an active contributor to current medical literature. He is a member of the Local and State Medical Societies; the Indianapolis Literary Club; the Portfolio Club, and the Indiana Academy of Science. In 1890 he was first vice-president of the Alumni Association of the Medical College of Ohio. Dr. Potter has taken a deep interest in the modern advances in bacteriology; has written many papers, and delivered a number of addresses upon the subject at medical meetings, and since 1890 has made the annual report upon bacteriological progress to the State Medical Society. He is engaged in general practice, with a special cultivation of the field of chest diseases.

POTTER, William Warren, of Buffalo, N. Y., was born in Strykersville, Wyoming county, N. Y., December 31, 1838. His father, Dr. Lindorf Potter, a native of the town of Sheldon, Wyoming county, N. Y., was a son of Dr. Benjamin Potter, formerly of Rhode Island, but who located in Western New York in the early years of the present century, and was one of the first physicians in the Holland purchase. The subject of this sketch received his preliminary education in private schools, at Arcade Seminary and at Genesee Seminary and College at Lima, in his native State. He came to Buffalo in 1854, receiving his medical education in the Medical Department of the University of Buffalo, and was graduated therefrom February 23, 1859. He then formed a copartnership with his uncle, Dr. Milton E. Potter, of Cowlesville, which continued until the breaking out of the Civil War. He passed the ex-

amination of the army medical examining board at Albany, April 25, 1861, and was soon commissioned as Assistant Surgeon of the Forty-ninth Regiment New York State Volunteers. He served with this regiment through its earlier career in the Army of the Potomac, and was left near Savage's Station, Va., with the wounded of Smith's division on the night of June 29, 1862, by order of Gen. Franklin, commanding the Sixth Army Corps. In a few days he was removed to Richmond and given quarters in Libby prison; he was released among the first exchanges under the cartel then arranging between the hostile powers. He was delivered to the hospital steamer "Louisiana" at Aiken's Landing, Va., July 18, 1862, and immediately rejoined his regiment at Harrison's Landing, Va. He was promoted to be surgeon of the Fifty-seventh Regiment New York State Volunteers on December 16, 1862, and served with this regiment during the Chancellorsville and Gettysburg campaigns. In August, 1863, he was assigned to the charge of the first division hospital, Second Army Corps; continued upon that duty until he was mustered out of service, and was brevetted lieutenant-colonel of United States Volunteers March 3, 1865. He practiced medicine in Batavia, N. Y., but finally returned to Buffalo, where he has resided for the most part since the war. His professional tastes, cultivated largely by association with his father, who was his preceptor, led him early into the field of surgery, and he has performed many of the more important operations, both in military and civil practice. Of late years he has given his entire attention to the treatment of diseases of women, and has performed many operations in the department of gynecic surgery. He is a permanent member of the American Medical Association (1878), and was chairman of the Section of Obstetrics and Diseases of Women in 1890; permanent member of the Medical Society of the State of New York (1883), and was president in 1891; member of the Medical Society of the County of Erie, president in 1892; member of the Buffalo Medical and Surgical Association, president in 1886; president of the Buffalo Obstetrical Society 1884-86; secretary of the American Association of Obstetricians and Gynecologists, 1888-94; member of the Southern Surgical and Gynecological Association; chairman of the Section of Gynecology and Abdominal Surgery of the Pan-American Medical Congress, 1893; Examiner in Obstetrics, New York State Medical Examining and Licensing Board, and is Consulting Gynecologist to the Woman's Hospital. He has been a frequent contributor to medical literature, and has likewise written many unpublished papers for medical societies and other bodies. Among his published writings may be mentioned the following: "Umbilical Hernia in the Adult," 1879; "Rectal Alimentation for the Relief of the Obstinate Vomiting of Pregnancy," "Remarks on Rectal Feeding in Diseases," 1880; "The Surgical Treatment of Epithelioma of the Cervix Uteri," Transactions of the Medical Society of the State of New York, 1881; "Genu-Pectoral Posture in Uterine and Ovarian Displacements," Transactions of the Medical Society of the State of New York, 1882; "The Gynecic Uses and Value of the Genu-Pectoral Posture," Transactions of the American Medical Association, 1882; "Induction of Premature Labor in Puerperal

Eclampsia," "Dysmenorrhea—Its Treatment by Dilatation," "Postpartum Hemorrhage—Remarks on its Treatment," 1884; "Pelvic Abscess in Women—Its Surgical Treatment," *Buffalo Medical and Surgical Journal*, 1885; "Observations on the Uterine Sound," *Buffalo Medical and Surgical Journal*, 1886; "Double Ovariectomy During Pregnancy—Subsequent Delivery at Term," *American Journal of Obstetrics*, 1888; "Dermoid Cyst of the Left Ovary, Operation, Recovery," "Field-Hospital Service with the Army of the Potomac," *Buffalo Medical and Surgical Journal*, 1889; "What is the Present Medico-Legal Status of the Abdominal Surgeon?" *American Journal of Obstetrics*, 1890; "How Should Girls be Educated?—a Public Health Problem for Mothers, Educators, and Physicians," Presidential Anniversary Address, Transactions of the Medical Society of the State of New York, 1891; "A Medico-Legal Aspect to Pelvic Inflammation," "Pelvic Inflammation in Women—a Pathological Study," *American Gynecological Journal*, 1891. Dr. Potter was married March 23, 1859, to Emily A., daughter of the late William H. Bostwick, of Lancaster, Erie county, N. Y., and his wife is a lineal descendant of Ethan Allen, of Revolutionary fame. Three children were born of this marriage—namely, the late Dr. Frank Hamilton Potter, Helen Blanchard and Alice F. Potter, the latter two are living in Buffalo with their parents.

POTTS, Jonathan, of Reading, Pa., was born in Berks county, that State, April 1, 1745, and died in October, 1781. He was a son of John Potts, the founder of Pottstown, Pa. After receiving a classical education, he went with Dr. Benjamin Rush to Edinburgh, Scotland, for medical study, and after his return he was graduated, in 1768, a "Bachelor of Physic" at the College of Philadelphia, at the first granting of medical degrees in this country, and in 1771 received the degree of M. D. His Latin thesis on the latter occasion, "De Febribus Intermittentibus Potantissimum Tertianis," was published in Philadelphia soon afterward. From 1768 till his death he was a member of the American Philosophical Society. He began the practice of his profession at Reading. Dr. Potts early identified himself with the struggle for independence, and was secretary of the Berks County Committee of Safety, and a member of the Provincial Convention at Philadelphia, on January 23, 1775. In 1776, he was appointed surgeon for Canada and Lake George, and returned with General Gates to Pennsylvania. In general orders, dated December 12, 1776, General Putnam directed that all officers that were in charge of any sick soldiers should "make return to Dr. Jonathan Potts at Mr. John Biddle's, in Market street." Soon after this order was issued, Dr. Potts was in service at the battle of Princeton. In April, 1777, Dr. Potts was appointed medical director-general of the Northern Department, and as such joined the army at Albany, N. Y. In November, 1777, he returned to Reading, having been furloughed, and while there was appointed by Congress director-general of the hospitals of the Middle Department. He was subsequently surgeon of the first city troops of Philadelphia." His brother, Thomas Potts, was one of the original members of the American Philosophical Society, and in 1776, was commissioned Colonel of one of the Pennsylvania battalions. Another brother, John Potts,

studied law at the Temple, London, became a judge in the city of Philadelphia, but sympathizing with the mother country during the Revolution, went to Halifax, Nova Scotia, until the war was over. His brother, Isaac Potts, is said to have been the person that discovered Washington at prayer in the woods at Valley Forge, and the country seat of David Potts, another brother, was Washington's headquarters at the latter place.

POWELL, Jehu Z., of Logansport, Ind., was born in Cass county, that State, August 13, 1848. He is of Welsh descent, and was educated at the high school of Logansport and University of Michigan. He studied medicine under the preceptorship of Prof. H. C. Cheever, of Ann Arbor, and was graduated M. D. from the University of Michigan in 1874. His medical education was supplemented by a post-graduate course at Long Island College Hospital, Brooklyn, N. Y., in 1875, and at the Post-Graduate Medical School of Chicago in 1890. While engaged in the general practice of his profession in the city of Logansport, since 1874, he has devoted especial attention to obstetrics and gynecology. He is a member of his County and State Medical Society, and of the American Medical Association. Dr. Powell takes an active interest in his profession, and is regarded as one of the most popular and successful physicians in his vicinity.

PRENTISS, Daniel Webster, of Washington, D. C., was born in that city May 21, 1843, as were his parents before him. His father, William Henry Prentiss was a son of Caleb Prentiss, of Cambridge, Mass. William Prentiss was a merchant and was associated with Joseph Greenleaf in building a row of brick houses on Greenleaf's Point, D. C., about the year 1793, in one of which houses William Henry Prentiss was born. William Henry Prentiss married Miss Sarah A. Cooper, daughter of Isaac Cooper, a merchant in Washington. Dr. D. W. Prentiss' grandmother, on the father's side, was Eunice Payne (Greenleaf) Prentiss, a niece of Robert Treat Payne, and a cousin of John Howard Payne, author of "Home, Sweet Home;" so that William Henry Prentiss was grand-nephew to Robert Treat Payne and second cousin to John Howard Payne. The general education of Dr. Prentiss was obtained in the schools of Washington and Columbian University, from which institution he received, in 1861, the degree of Bachelor of Philosophy and the degree of Master of Arts three years later. He received the degree of Doctor of Medicine from the University of Pennsylvania in 1864. He was married to Emilie A. Schmidt, daughter of Frederick Schmidt, of Renish Bavaria, October 12, 1864. Their children are Louise, married to Frederick W. True, of the United States National Museum; Eunice, who died at the age of seventeen, and three sons—Spencer Baird, Daniel Webster, Jr., and Elliott. In 1864 he became engaged in the general practice of medicine in Washington, and has since then continuously held a prominent position in the profession. Since 1879 he has been Professor of Materia Medica and Therapeutics in the medical department of the Columbian University. He was a member of the Board of Health, District of Columbia, in 1864; Lecturer on Dietetics and Administration of Medicines in the Nurses' Training School, and a Dean of the Medical Faculty

of the Training School from 1878 till 1883; a trustee in that school from 1880 till 1884, and president of the board in 1884; physician in charge of the eye and ear service of Columbian Dispensary from 1874 till 1878; visiting physician to Providence Hospital in 1882, and a commissioner of pharmacy of the District of Columbia since its organization, and president of the board since 1888. Dr. Prentiss is a member of the Medical Society, Medical Association, Obstetrical and Gynecological Society, the Philosophical, the Biological, Geographical and Anthropological societies of the District of Columbia; is a member of the American Medical Association, the American Association for the Advancement of Science, the Association of American Physicians, and was a delegate to the International Medical Congress at Copenhagen, in 1884, and to Berlin in 1890. He has delivered numerous lectures under various auspices in his native city. "Hypnotism in Animals," given in a popular course at the National Museum, appeared in the *American Naturalist*, September, 1882. By invitation of Spencer F. Baird, he delivered a course of lectures on *Materia Medica* at the National Museum in 1883. Some of the leading papers which Dr. Prentiss has contributed to medical literature are the following: "Report on Disinfectants to the Board of Health of the District of Columbia," 1867, in the *Journal of American Medical Science*; "Gunshot Wound through the Pelvis," October, 1865; "Case of Morphine Poisoning," 1867; "Diphtheria and Tracheotomy," "Membranous Croup," and "Operations for Radical Cure of Hernia," "Case of Inflammation of Fibrous Capsule of Eyeball," 1868; "Case of Spurious Labor Pains at Fifth Month," "Convulsions after Profuse Hemorrhage from Abortion at the Sixth Week," "Obstruction of Bowels in an Infant, with Autopsy," 1870; "Hysterical Tetanus," 1879; "Case of Mastoid Abscess Opening into Lateral Sinus, and Death from Pyemia," 1882; "Is Croupous Pneumonia a Zymotic Disease?" "Chorea in Pregnancy, and Abscess of the Liver," 1874; "Croupous Pneumonia"—report of eleven cases occurring in private practice, from February to June, 1878, read before the Medical Society of the District of Columbia; "Case of Double Hydronephrosis, with Specimen, and Remarkable Case of Hysteria with Paralysis and Aphasia," 1883; "Death from Diphtheritic Paralysis," "Remarkable Change in the Color of the Hair from Light Blond to Almost Black, in a Patient while under Treatment by Hypodermic Injections of Pilocarpine," "Case of Prolonged Anuria," "Membranous Croup Treated with Pilocarpine," "Change in the Color of the Hair," 1881; "Overdose of Podophyllin," "Maternal Impressions—Effect on Fetus," 1882; "Answer to a Protest Against the Use of the Metric System in Prescribing," 1883; a "Report of the Pharmacopeia Convention of 1880," as a delegate from the National Medical College; a "Review of the Sixth Decennial Revision of the Pharmacopeia," "Avifauna Columbiana," being a list of the birds of the District of Columbia, revised and rewritten by Dr. Elliott Cones and Dr. D. W. Prentiss, 1883; "Gall Stones or Soap," 1889; a "Report of Five Hundred Consecutive Cases of Labor in Private Practice," 1888; "Case of Change of Color of Hair of Old Age to Black, Produced by Jaborandi," "Three Cases of

Poisoning by Japanese Lacquer, by Pellets Labeled 'Rhus,' and by Cashew Nuts," "Report of a Remarkable Case of Slow Pulse," 1889; "Purpura Hemorrhage Rheumatica," "Cases of Poisoning by Atropia, by Opium, and by Quinine," "On Revision of Pharmacopeia of 1890;" "Apoplexy Following La Grippe," in the *Philadelphia Medical News*, August 29, 1891; a "Paper on Pilocarpin, its Physiological Actions and Therapeutic Uses," read by invitation before the New York Academy of Medicine, in April, 1893.

PRICE, Oscar J., of Chicago, Ill., was born at Adrian, Mich., April 4, 1845. He received his academic education at Adrian College, and commenced the study of medicine in the office

Oscar J. Price

of Nelson H. Kimball, of Adrian, pursuing his medical studies later at Michigan University, Ann Arbor, whence he graduated in March, 1866. As a first year medical student, at the age of nineteen, he was sent by the United States Sanitary and Christian Commissions to Memphis, Tenn., in 1865, where he assisted as a volunteer medical cadet in hospital and field, during the closing scenes of the Civil War. He was one of the first to respond to the rescue of the few survivors of the ill-fated steamship "Sultanna," which was burned to the water's edge with over 2,000 Union soldiers on board, just released on parole, from Andersonville prison. Dr. Price first started out in the practice of his chosen profession at Toledo, O., barely twenty-one years of age. It was during a reign of Asiatic cholera, and every effort was being made to put the city in the best sanitary condition possible. The city was divided into three districts, over one of which Dr. Price was installed as health officer, and the united work in this direction was such that not a single authenticated case of cholera occurred in To-

ledo during that epidemic. Feeling the need of a more extended hospital education, early in the year of 1868, he went to New York City, taking private courses of instruction and receiving more extended clinical observation, the better fitting him for his intended life work in Chicago, which he commenced upon during the latter part of the same year. Alone and unaided, and an entire stranger in the great west, those first years were the usual ones of patient-waiting, coupled with persevering labor, which was finally rewarded by a lucrative practice. He was married April 2, 1874, to Anna, daughter of Ebenezer Wilder, of Massachusetts. Dr. Price has held the position of Surgeon to the Chicago, Alton and St. Louis Railroad for nearly twenty years, and has been for several years Surgeon to Cook County Hospital.

PRITCHARD, Maurice, of Sierra Valley, Sierra county, Cal., was born in Newark, Oxford county, Canada, on May 8, 1837. He received a limited common school education; attended the medical department of the University of Michigan; was graduated at the Detroit Medical College on June 27, 1870; practiced in Richville, N. Y., San Francisco, Cal., also in Forest Hill, Cal., and in 1877 was practicing in Virginia City, Nev., where he was appointed by the board of supervisors president of the Board of Health; did some active and efficient work in improving the sanitary condition of the city and in preventing the sale of impure milk. In 1878 he went to Memphis, Tenn., at the call for physicians, in the great epidemic of yellow fever of that year. He is a member of the Howard Medical Association, and received a gold medal for services during that epidemic. He is a member of the California State Medical Society; and is president of the Sierra Valley Stock and Agricultural Association. Dr. Pritchard has always taken much interest in local affairs, and is president of the Board of Health of his town and district, also editor and proprietor of the *Sierra Valley Leader*.

PURDON, John Edward Blakeney, of Tampa, Fla., was born in Dublin, Ireland, May 25, 1839. He is the son of the late Alderman Edward Purdon, formerly Lord Mayor of Dublin, and his wife, Sarah Murphy, of Silver Hills, County Kildare. He entered Trinity College, Dublin, in 1857, and graduated in arts in 1862, as a Scholar of the House, having obtained the senior moderatorship and gold medal in Experimental and Natural Sciences at the Bachelor of Arts examination the previous year. In 1863 the separate degrees of Bachelor in Medicine and Master in Surgery were conferred upon him by the University of Dublin (Trinity College), and the M. D. in 1885. In 1865 he entered the British Army, by competitive examination, as assistant surgeon, and proceeded to India, where for several years he was engaged in the study of cholera, dysentery, malarious fevers and all the diseases incidental to life in the tropics. For his Indian service he received the special recognition of the British government, through the Director-General of the Army Medical Department, and was recommended for his zeal and ability. He was promoted to the rank of Surgeon-Major in 1877. In 1871 he took up the subject of Psychical Research, bringing to bear upon its recondite problems the insight and training acquired in his mathematical and physical studies. He

has written numerous essays upon mesmerism, hypnotism, animal magnetism and the psychophysical principles involved in the manifestation of extraordinary vital forces. In 1881, while in charge of the Military Hospital, Guernsey, Channel Islands, he made the important discovery of the existence of nervous attraction between different individuals, which he demonstrated by the aid of the sphygmograph, and which promises to supply the neu-

John E. Purdon

rologist with the scientific key to thought-reading, sympathetic sensation and brain waves. He has recently made a valuable application of generalized mathematical reasoning to psychological science, involving a new method in philosophy, which will be published next year. Doctor Purdon has resided in America since his retirement from the army in 1883, and is a member of some of the leading medical societies of the South, in which he is regarded as a prominent and energetic worker. He was married, in 1866, to Hannah Selina, daughter of Anthony Kilroy, Esq., of Ormand, County Cavan, Ireland. The eldest of their four surviving children, Edward Anthony H., is a physician engaged in practice with his father.

QUINE, William E., of Chicago, Ill., was born on the Isle of Man, February 9, 1847. His parents, William and Margaret Kinley Quine, were members of families of much local prominence. They came to this country in 1853, and settled in Chicago, in which city the subject of this sketch has continued to live. Dr. Quine was educated in the public schools and the High School of Chicago. He subsequently served an apprenticeship of four years in pharmacy, and acquired unusual skill in that field of usefulness. He graduated from the Chicago Medical College in 1869, at the head of his class. After serving for a brief period as an *Interne* at the Mercy Hospital, he was admitted to the

house staff at the Cook County Hospital, on competitive examination, and sustained himself as House Physician of that institution with such effect that, almost immediately upon the completion of his service, in 1870, he was elected a member of the medical board of the Cook County Hospital, and Professor of *Materia Medica* and Therapeutics in the Chicago Medical College. Dr. Quine continued in active service as Attending Physician to the Hospital for twelve years, and as a Professor in the Chicago Medical College for thirteen years, during a large part of which time he was also secretary of the Faculty and a member of the attending staff of the Mercy Hospital. He was elected president of the Chicago Medical Society in 1872, when he was but

H. E. Quine

twenty-five years of age, and was, by many years, the youngest president the society has ever had. In 1883 Dr. Quine was elected to the chair of Principles and Practice of Medicine and Clinical Medicine in the College of Physicians and Surgeons of Chicago, and in 1891 he was elected president of the Faculty of that institution. At the present writing he continues to hold both positions, and has recently completed service as president of the medical board of the Cook County Hospital. During the period of his connection with the Chicago Medical College Dr. Quine was one of the most popular and respected of the teachers of that institution. He immediately demonstrated uncommon aptitude for the exacting duties of the medical teacher, and very soon reached the distinction of being regarded as one of the best instructors in the profession of Chicago. He has never failed to sustain himself easily and creditably in any position he has attempted to fill, and to-day ranks as one

of the most earnest and successful teachers in the land. In earlier life Dr. Quine took active interest in the work of medical and scientific societies, and he still retains membership in the American Medical Association, Illinois State Medical Society, Chicago, Medical Society Practitioners' Club, Medico-Legal Society, Chicago Academy of Sciences, and other organizations of like kind. Dr. Quine has written but little for publication. His greatest reputation has been attained as a medical lecturer and practitioner. As a lecturer his natural earnestness of manner, his gift of oratory and his uncommon ability to simplify every subject he touched, have contributed to make him one of the most successful teachers of his day. As a medical practitioner Dr. Quine has achieved well-merited and honorable renown. For many years he has been one of the busiest practitioners in Chicago, and for a goodly number of years he has been, perhaps, the busiest strictly medical consultant in that city. At the present time Dr. Quine's business is almost exclusively that of a consultant, and his time is fully occupied. His skill in diagnosis and therapeutics, his warmth of disposition, his care for the reputation of fellow-practitioners, and especially for the younger members of the profession are bearing their legitimate fruitage. Dr. Quine was married in 1876 to Miss Lettie Mason, of Normal, Ill., a lady of great beauty, learning and social prominence, with whom he has lived a life of ideal peacefulness and happiness. They have had three children, and have buried them all.

QUINN, James Lacey, of Eaton, O., was born there September 21, 1841. He is of Irish descent, and is grand-nephew of Gen. John Lacey, commandant of the Pennsylvania Militia during the British occupancy of Philadelphia. He was educated at the Miami University, Oxford, O., and at the Miami Medical College, Cincinnati, receiving his medical degree from the latter institution in 1869. During the latter year he was Resident Physician to the Cincinnati Hospital, and practiced his profession at Cincinnati and at Muncie, Ind., for a short time, and then established himself in his native town, where he has been engaged in active medical and surgical pursuit since 1872. Among his professional publications may be mentioned "Stricture of the Urethra, Symes' Operation," and a "Case of Extra Uterine Pregnancy." Dr. Quinn has been for several years medical examiner and adviser for numerous leading life insurance companies.

RAMSEY, Douglas C., of Mt. Vernon, Ind., was born in Clay county, Ill., May 16, 1860. He is of Scotch descent. He received an education at one of the best academies in his native State, and under private tutors. He studied medicine with Dr. Geo. D. Ramsey, his father, and was graduated an M. D. at the St. Louis Medical College, of St. Louis, Mo., March 5, 1880, taking a graded three-years course, being at that time two months less than twenty years of age. He received the *ad eundem* degree from Marion-Sims College of Medicine, in March, 1893. He was elected secretary of the City Board of Health of Xenia, Ill., at the age of nineteen years, but resigned September 1, 1880, and removed to Mount Vernon, Ind., where he now resides. He was president of the City Board of Health of Mt. Vernon during the small-pox epidemic in the year 1882, and was re-elected for another term, but de-

clined to serve. He was elected County Health Officer of Posey county, January 1, 1884, which office he has held continually up to the present time. He was also elected City Health Officer of Mt. Vernon, January 1, 1892, by a solid Republican City Council, without his knowledge or consent (which was a high compliment, he being a Democrat). Dr. Ramsey was appointed a member of the Indiana State Board of Health by Governor Matthews, March 4, 1893. He was president of the United States Pension Board of Mt. Vernon during the Cleveland Administration, being then only twenty-six years of age, probably the youngest president of a pension board in the United States. He was surgeon of the Mt. Vernon Branch of the Evansville and Terre Haute Railroad, from the time of its construction in 1883 to January

Douglas C. Ramsey

1, 1892, when he resigned on account of its interfering with his private practice. He was president of the Posey County Medical Society, 1888 and 1889, and is also a member of the American Medical Association, Mississippi Valley and Indiana State Medical Societies. The following are a few of the important surgical operations he has performed: October 6, 1885, in a male, aged twenty-five years, he successfully ligated the left subclavian artery for an axillary aneurism, the sac of same containing sixteen ounces of blood by weight. May 28, 1888, he amputated the right leg at knee-joint for extensive necrosis of tibia and fibula, of forty-seven years' standing, in a male, aged sixty-one years, there being a perfect recovery. February 11, 1889, in a female, aged forty-six years, he amputated the entire left breast for carcinoma, patient at this writing being in perfect health, with no sign of any return of the disease. April 7, 1891, he operated on a male, aged twenty-six years, for a compound comminuted fracture of the left side of frontal bone (occasioned by the bursting of an emery wheel), removing twenty-five small

specula of bone that were imbedded in the brain and brain substance, equal in bulk to an ordinary adult thumb (there being some brain already adhering to particles of wheel), three-fourths of orbital arch and other bone two and one-fourth inches by one and three-fourth inches; with exception of loss of sight in one eye, the patient made a good recovery, and remains well and able to do manual labor. The following are his most important contributions to medical literature: February, 1884, in the *St. Louis Courier of Medicine*, Vol. XI, page 97, he was first to call attention to the use of salicylic acid in the treatment of cerebro-spinal meningitis, which article was extensively copied in native and foreign medical journals. He also wrote an article on "Medical Education" in the Eighth Annual Report of the Indiana State Board of Health, which attracted wide attention.

RAND, Benjamin Howard, of Philadelphia, Pa., was born in that city October 1, 1827, and died there February 14, 1883. His professional studies were begun in 1843 under the eminent Dr. Robert M. Huston, the then dean of Jefferson Medical College; he subsequently attended the usual courses of lectures at Jefferson College, and in 1848 received his degree of M. D. from that institution. During the last two years of his student life he was clinical assistant to Profs. Mütter and Pancoast. In 1850 he was elected Professor of Chemistry in the Franklin Institute, holding that position until his resignation in 1864. Upon the foundation of the Philadelphia Medical College—an institution which ceased to exist in 1861—he was elected to the chair of Chemistry, and from 1852 to 1864 he was secretary to the Academy of Natural Sciences. This latter office, as well as his professorship in the Franklin Institute, he resigned in 1864, in order to accept the chair of Chemistry in Jefferson Medical College, from which he resigned by reason of ill-health in May, 1877. He was elected a Fellow of the Philadelphia College of Physicians in 1853, and a member of the American Philosophical Society in 1868; and was also a member of the American Medical Association. Besides frequent contributions to scientific periodicals he has written: "Chemistry for Students," (1855); "Elements of Medical Chemistry," (1863 and 1875); and also edited Metcalf's "Caloric," (1859). He was married in 1853 to Hannah M., daughter of Jacob L. Kershaw, Esq. His first wife died in 1854, and fifteen years later, December 23, 1869, he married Mary M. Washington, great granddaughter of Fairfax Washington.

RANDALL, Edward, of Galveston, Tex., was born in Walker county, that State, October 7, 1860. The subject of this sketch is of a long line of medical ancestry. He received his academic education in Virginia, and was graduated from Washington and Lee University, of that State, in 1879. He entered the medical department of the University of Pennsylvania in 1880, and received the diploma of Doctor of Medicine in 1883. He was Resident Physician in the Philadelphia Hospital (Blockley) for one year, and from there he entered the European schools, studying under Virchow and E. Martin, in Berlin, Winckel, in Munich, and Carl Braun and Billroth, in Vienna. He began the practice of medicine in Galveston, in 1886. He was elected to fill the chair of Materia Medica and Therapeutics in the Texas Medical

College and Hospital in 1888, and in 1891 was elected to the same chair in the medical department of the University of Texas.

RANKIN, David Nevin, of Alleghany, Pa., was born in Shippensburg, that State, October 27, 1834. He received his preliminary education at Newville Academy, and entered the Jefferson Medical College, graduating therefrom in 1854. He then established himself in his native town in association with his father, a noted physician of that place. On the outbreak of the War of the Rebellion Dr. Rankin was appointed Acting Assistant Surgeon United States Army, and served in hospital and field, being detailed to assist in organizing several of the more important United States Army Hospitals. He was also a member of the Volunteer Aid Corps of Surgeons of Pennsylvania. After the close of the war he established himself in the city of his present residence, making a specialty of diseases of the throat and nose, but also attending the duties of a large general practice. He is a Fellow of the American Laryngological Association; member of the Eighth International Medical Congress, Copenhagen, Denmark; secretary of Laryngological Section of the Ninth International Medical Congress at Washington, D. C.; member of the British Medical Association in 1884 at Belfast, Ireland; member of the Tenth International Medical Congress in 1890 at Berlin, Germany; ex-vice-president of the Pittsburgh Obstetrical Society; member of the American Medical Association; American Association of Physicians and Surgeons; Pennsylvania State Medical Society; Alleghany County Medical Society, and is Medical Examiner for the Equitable Life Assurance Society, and of several other leading life assurance companies. He is also Physician to the Western Penitentiary of Pennsylvania, and Associate Physician to the Throat and Chest Department of the Pittsburgh Dispensary. Dr. Rankin has contributed reports of important cases to the leading professional periodicals.

RANDOLPH, Jacob, of Philadelphia, Pa., was born in that city November 25, 1796, and died there February 29, 1848. The following details of his life and professional achievements are derived from a memoir written by the late Dr. J. Aitken Meigs: He was the sixth son of Edward Fitz-Randolph, an ancestor of whom, bearing the same name, emigrated from England in 1630, and settled at first in New England, and afterwards, near the close of his life, in New Jersey. Edward Fitz-Randolph, upon the breaking out of the War of Independence, attached himself as an officer to that part of Wayne's brigade known as the Fourth Pennsylvania Regiment, and commanded by Col. Richard Butler. In this capacity he served during the greater part of the Revolutionary struggle, freely lending all his energies to the cause of liberty. He took part in the battles of Trenton, Princeton, Germantown, and Monmouth; he commanded the outlying guard at the surprise and fearful massacre of Paoli, and he suffered, in common with many other patriots, the biting hunger and cold of Valley Forge. The Revolution over, he settled in Philadelphia, entered into mercantile business, and was long known as a respected and influential member of the religious Society of Friends. At an early period of his life he dropped the first part of the

family name. His son Jacob received an English and classical education at the Friends' school-house, in Fourth street. Having completed his literary studies in 1814, he entered the office of Dr. Joseph Woollens, of the Northern Liberties, as a student of medicine. His preceptor dying soon after, he placed himself under the guidance of Dr. Cleaver, at that time a busy and reputable practitioner of the same district. Having attended for the prescribed time the medical lectures of the University of Pennsylvania, the degree of M. D. was conferred upon him in 1817. He was then twenty-one years of age. Shortly after his graduation he sailed for China, in the capacity of ship-surgeon. He suffered so much from sea-sickness, however, that he was compelled to abandon the vessel at her first stopping-place in England. During his absence he visited Scotland and France, and in a few months returned home, and opening an office in his native city, commenced his career as a practitioner of medicine. About this time he became acquainted with Dr. Philip Syng Physick and his family, and was united in marriage to his eldest daughter in 1822. In 1830 he was appointed surgeon to the Almshouse Infirmary, and in the same year commenced to lecture upon Surgery in the School of Medicine, an institution established for the purpose of summer teaching. For several years he faithfully performed the duties of these two posts, and obtained, at this time, his first success in that branch of practice in which he was destined to occupy so prominent a position. In 1835, his reputation as one of the leading surgeons of the country being now fully established, he was elected, upon the resignation of Dr. Hewson, one of the surgeons of the Pennsylvania Hospital. This important and highly responsible post Dr. Randolph still held at the time of his death. In 1840 he again visited Europe, and spent two years there, a close observer of the surgical practice of the Parisian hospitals. During his absence he was elected Professor of Operative Surgery in Jefferson Medical College. But as the acceptance of this appointment would have compelled his speedy return, he declined it at once. Upon the occasion of his return he was complimented with a dinner, the spontaneous expression of the high respect in which he was held by his professional brethren. He now resumed his practice as a consulting surgeon, devoting himself especially to the treatment of stone in the bladder. In 1847, after occupying for some time the position of lecturer upon Clinical Surgery to the University of Pennsylvania, he was elevated to the professorship of that branch, a chair created especially for him. In the early part of his medical career Dr. Randolph, according to the testimony of his most intimate friends, evinced but little or no inclination towards that department of practice in which he was afterwards destined to excel. It was not, indeed, until after his marriage, and after he had been engaged for several years in general practice among the poor of his neighborhood, that his views began to shape themselves definitely towards operative surgery. His father-in-law, Dr. Physick, appears to have urged him to this course, in consequence of recognizing in him those qualities of coolness, firmness and good judgment, combined with a certain manual dexterity, which constitute the basis of all

surgical skill. The zeal with which he subsequently pursued the details of surgery, and the success which accompanied him in this responsible field of labor, could not be better shown than by referring to the fact that, in 1829, being then in his thirty-fourth year, he successfully amputated, with consummate skill, the lower jaw of a patient afflicted with osteosarcoma. The details of this case, illustrated with a drawing of the patient as he appeared before and after the operation, were communicated to the *American Journal of Medical Sciences* for November, 1829. Thirteen months later—in February, 1831—Dr. Randolph published, in the same journal, an excellent paper on the nature and treatment of morbus coxarius. In this, as in the preceding article, he gave indubitable evidence of possessing that sound, discriminating judgment so necessary to the surgeon. At this time he was rapidly acquiring an enviable reputation for surgical ability; and this reputation he pushed to a still greater extent by taking up, in 1831, and introducing into this country, the operation of lithotripsy, which, in the hands of Baron Heurteloup, was at that time engaging so much attention in Europe. Attracted by the reports of the triumphant success which had attended the baron's efforts in destroying calculi in the bladder by means of percussion, Dr. Randolph studied the subject with much care and experimented upon it fully and laboriously. "He has frequently told me," says Dr. Norris, one who knew him intimately, "that it was by industry and perseverance alone that he had acquired skill in this delicate operation, and that before attempting it in his first case, he had not only made himself master of all that had been written upon it, but had also embraced every opportunity in the dead house, of which his situation at the Almshouse Infirmary at that time afforded him many, of putting a stone into the bladder, and catching and destroying it. These previous trials gave him a facility in the introduction, withdrawal and manipulation of the lithotritic instruments, as well as a prudent confidence in his abilities, which led to his success. All who witnessed his operations upon the bladder will admit the extraordinary skill and dexterity which he possessed in handling these instruments in that viscus; a dexterity which his biographer believed was not surpassed even by the eminent discoverer of the method himself. In speaking of these operations, it is said that he attributed much of his success to the use of the most simple instruments only, to not desiring to operate quickly, or to do too much at one sitting, and to invariably withdrawing the instruments when pain was complained of, and putting off the operation for another day. These opinions he always expressed when conversing on his results; and in his operations, no matter who might be present, or how large a number might be gathered to witness the procedure, he never deviated from them. The fear of the loss of fame, or the desire of notoriety as an operator, had no influence with him; and more than once, when unexpected difficulties arose in seizing the stone or its fragments, he would close and withdraw the instrument and disappoint the spectators. From the period he first engaged in the operation of lithotripsy, he devoted himself in an especial manner to the treatment of calculus, and with the

exception of the Professor of Surgery at Lexington, Ky., he is believed to have treated more cases of that disease than any other surgeon in our country. At the time of his decease, no less than three cases of this rare complaint were under his care. One, a child in the hospital, he had just prepared for lithotomy; the other two had both been brought from distant parts of the country by his reputation as a lithotritist. In one of them he had just commenced the operation, and in the other, a gentleman, who was the last patient he ever visited, he made a final, very careful examination, and had the satisfaction of finding him cured of his distressing affection." In the *American Journal of Medical Sciences* for November, 1834, Dr. Randolph published an account of six cases of stone in the bladder in which he had performed the operation of lithotripsy with signal success. Two of these cases were operated upon in the autumn of 1832, two in the spring, one in the summer, and one in the fall of 1833. With characteristic and commendable caution, Dr. Randolph delayed making known the details of these cases. The motives which prompted him to this course are shown in the following paragraph, with which he opens the account above alluded to: "A degree of surprise," he writes, "will probably be excited in the minds of some who read this paper, at my having so long delayed giving an account of the following cases, but I have been actuated by two motives in withholding their publication: in the first place, I wished that a sufficient length of time should elapse to test fairly and fully the results of the operations, and in the second place, the several cases presented themselves so simultaneously that I was unwilling to give an account of one until the whole were completed. Had I, in truth, consulted merely my own feelings, it is probable that I should not, even at this period, have consented to the publication of this brief outline of the cases; to this step I confess I have been principally induced by the advice of my valued friend, the editor of this journal, who urged that the alleged success of the operations might be called in question, unless an authentic report of them were made to the profession." Two years later, November, 1836, he published in the same journal "an account of seven additional cases of stone in the bladder, in which the operation of lithotripsy was successfully performed." Finally, in November, 1837, he gave to the public the details of four other cases successfully treated, making seventeen in all in a period of five years. Dr. Randolph was endowed in a high degree with all the attributes of the great surgeon. He was thoroughly grounded in the fundamental principles of surgery, and no one excelled him in his acquaintance with those practical details which so materially influence the results of operative surgery. His eye and hand were exceedingly steady, his sense of touch highly educated, and his judgment above all exact and reliable. He was remarkable not only for his skill as an operator, but also for his accuracy in surgical diagnosis and prognosis. "Surgery with him," as Dr. Norris has well observed, "was, what in the hands of the truly great in our profession it ever has been, a conservative art. His pride was to repair injuries and cure diseases without a resort to the knife, and the operative part of it he regarded as that of least moment."

His high reputation as a successful operator was attributable in no slight degree to the care with which he selected and prepared his patients, to his minute and methodical arrangements before the operation, to the wise admixture of caution and decision, of prudence and boldness, which characterized its performance, to the readiness with which he met and obviated any unforeseen difficulties, and the unceasing attention which he bestowed upon the after treatment. Sympathizing deeply with his patients in their sufferings, he made them feel that he was their warm friend as well as their skillful surgeon. Untried novelties in surgery and hazardous operations he always avoided, unless sanctioned by the most weighty reasons. He generally employed the most simple dressings and apparatus, and scrupulously avoided all vain parade or useless display while operating. Possessing such skill as a surgeon, and enjoying so many opportunities to improve his art, it is to be regretted that Dr. Randolph has not contributed more extensively to the literature of his profession. Besides the publication already mentioned, he communicated to the *North American Medical and Surgical Journal*, for 1829, the history of a case of femoral aneurism, in which the femoral artery was tied for the second time, in the city of Philadelphia. In the *Medical Examiner* he published an account of the removal of the parotid gland. Scattered through the pages of this journal will be found many of his clinical lectures delivered at the hospital. His most extensive literary production is "A Memoir on the Life and Character of Dr. Philip Syng Physick," which was read before the Philadelphia Medical Society, in 1839, and published by order of that body. From the pages of this able and well-written memoir of the Father of American Surgery, many of the exemplary traits of character of Dr. Randolph himself are clearly reflected. Dr. Randolph was a member of the American Philosophical Society, of the Philadelphia College of Physicians, and of the Philadelphia Medical Society. He was also one of the Consulting Surgeons to the Philadelphia Dispensary. He possessed a cheerful and amiable disposition; his manners were frank and prepossessing, and the firmness with which he adhered to his resolutions and opinions was only equalled by the slowness and caution with which they were formed. Throughout his whole career he exhibited a brilliant example of professional honor, conscientiousness, and straightforward dealing. Among those most noted in these particulars he towered up clearly conspicuous. Filled with a profound sense of the duties of a physician, to his patients on the one hand, and to his medical brethren on the other, and imbued with a thorough contempt for all the arts and practices which are so strongly discountenanced by a high sense of professional propriety, his daily walk was characterized by a remarkable degree of candor, courtesy, and kind consideration for the feelings and opinions of others. On some occasions he would express his views upon the subject of medical ethics with much emphasis; and as a proof that in his daily practice and professional intercourse he strictly adhered to his own high standard, we have not only the evidence of the medical men who had the best opportunities of observing his course, but the very significant fact of his great popularity in the profession

itself. No man probably had more warm friends and fewer enemies among physicians than he. To the younger members of the profession he was especially endeared, in consequence of his exceedingly kind, encouraging, and liberal treatment of them. For those of his patients who were in indigent circumstances, he performed many acts of charity and considerate kindness. Dr. Meigs writes that in early life Dr. Randolph was an exceedingly handsome man, and at all times he exhibited a remarkably commanding appearance. His face was oval, regular in its features, and expressive of the frankness, independence, and energy of his character. In stature he was somewhat above the middle height, and his whole person displayed the signs of an unusual amount of health and vigor. His sudden decline and death, preceded as they were by none of the usual signs of constitutional decay, painfully surprised both his family and his numerous friends. About two weeks before his demise, he was seized with what appeared to be an attack of intermittent fever. At first his case presented no alarming symptoms; in the course of a few days, however, a sudden and copious hemorrhage from the bowels supervened, with the effect of reducing his strength to such an extent, that it soon became evident that his end was approaching. With characteristic calmness he prepared for death, fully sustained and cheered in these, his last hours, by the hopes and promises of religion, in which, previous to his illness, his interest had been freshly awakened. Very soon the first hemorrhage was succeeded by several others, and though his robust frame enabled him to resist their weakening effects for some days longer than could have been expected, his strength at last failed him entirely, and he expired in the fifty-third year of his age, and in the height of his professional renown.

REAMY, Thaddeus Asbury, of Cincinnati, O., was born in Frederick county, Va., April 28, 1829. His father, Jacob A. Reamy, was a native of Virginia, of French extraction, and his mother, Mary W. (Bonfield) Reamy, of Scotch-English origin. His parents settled in Zanesville in 1832. He studied medicine in the Starling Medical College, and graduated M. D. in 1854. He subsequently received the degree of A. M. from the Ohio Wesleyan University. In 1861 he was elected member of the General Assembly of the State of Ohio from Zanesville. In 1862 he was appointed surgeon to the One Hundred and Twenty-second Regiment Ohio Volunteer Infantry. After the Rebellion he returned to his native State and settled in Zanesville, where he remained till 1870, when he removed to Cincinnati. His specialty is obstetrics and gynecology. He is a member of the American Medical Association; of the Ohio State Medical Society, of which he was president in 1870; of the Cincinnati Academy of Medicine; of the Obstetrical Society of Cincinnati; of the Gynecological Society of America; corresponding member of the Zanesville Academy of Medicine; of the Van Wirt Medical Society, and of the Northwestern Medical Association. His contributions to professional literature are found in the medical and surgical journals of the day; among these may be mentioned articles entitled, "Metastasis of Mumps to the Testicle Treated by Cold," "Typhoid Fever," "Epidemic Diphe-

theria," 1859; the "Obstetrical Report," in the Transactions of the Ohio State Medical Society, 1866; "Bromide of Potassium in Cerebral Diseases," "Puerpural Eclampsia," Transactions Ohio Medical Society, 1868; "Cancer of the Uterus," 1876; "Lacerations of Perineum," American Gynecological Society, 1877; "Advances in Medicine," and "Medical Education." He has also devised a modification of the obstetrical forceps and invented a uterine cervical dilator, an intra-uterine medicator, a uterine cervical syringe, and other useful instruments employed in gynecic surgery. He was elected Professor of Materia Medica and Therapeutics in the Cincinnati College of Medicine and Surgery in 1858, a position he held two years; in 1867 he was elected Professor of Diseases of Women and Children in the Starling Medical College. This he resigned in 1871, to take the chair of Obstetrics, Clinical Midwifery and Diseases of Children, in the Medical College of Ohio, at Cincinnati. He is now, 1893, Professor of Clinical Gynecology in that school. He is also gynecologist to the Good Samaritan Hospital in that city.

REESE, John James, of Philadelphia, was born in that city June 16, 1818, and died at Atlantic City, N. J., September 4, 1892. He was educated at the University of Pennsylvania, and graduated from the department of arts, and in 1839 received his degree of M. D. from the department of medicine. He established himself in Philadelphia, acquiring an extensive general practice and a prominent position in his profession. He was a Fellow of the College of Physicians, Philadelphia; honorary member of the New York Medico-Legal Society; also Physician of St. Joseph's Hospital; of the Philadelphia Orphan Asylum, and of the Gynecological Hospital and Infirmary for Diseases of Children. His contributions to standard medical literature have been of an important character, including his "Analysis of Physiology," "American Medical Formulary," "Manual of Toxicology," and a number of papers in the leading professional journals. He also was editor of the seventh American edition of Taylor's "Medical Jurisprudence." In 1861 he entered the United States Army as surgeon of volunteers, being put in charge of the United States Army Hospital, Christian street, Philadelphia. He was Professor of Medical Jurisprudence and Toxicology in the medical and legal departments of the University of Pennsylvania, and retired to an *Emeritus* Professorship of that chair in October, 1891. He was a toxicologist of national reputation, and had been identified with jurisprudential medicine and the University since 1865. He was in his seventy-fifth year at the time of his death, and had been a member of the American Medical Association during the last forty years of his life.

REEVE, John Charles, of Dayton, O., was born at Mells Park, England, June 5, 1826. His professional education was commenced at the Western Reserve College, from the medical department of which he graduated M. D. in 1851. After practicing for a time in Dodge county, Wis., he repaired to Europe for further study, passing for this purpose the winter of 1853-4 in London, and the following summer in Göttingen. He then returned to America and established himself in general practice at Dayton, where he has since remained. In

1860-61 he held the chair of Materia Medica and Therapeutics in the Medical College of Ohio at Cincinnati. Dr. Reeve is now Chief of Staff of St. Elizabeth Hospital, Dayton; Physician to the Montgomery County Children's Home; ex-president of the Montgomery County Medical Society, and of the Ohio State Medical Society, and is an active member of American Gynecological Society, and of the American Medical Association. He is Medical Examiner for the Etna, Equitable, Mutual Life and Mutual Benefit Insurance Companies. He has made important contributions to the *American Journal of Medical Science*. One of his most notable cases—the removal of a shawl-pin from the trachea, which was followed by a good recovery, is presented in the last edition of Gross' Surgery.

REICHERT, Edward Tyson, of Philadelphia, Pa., was born there February 5, 1855. His preliminary education was obtained in his native city. The degree of M. D. was conferred upon him by the University of Pennsylvania in 1879, at which time he was awarded "First Honors" for examinations and "Distinguished Merit" for his thesis. Subsequent to this his medical and scientific education was enlarged by studies chiefly in the universities of Berlin, Leipzig and Geneva. In May, 1879, he was appointed Demonstrator of Experimental Therapeutics in the University of Pennsylvania, later Demonstrator of Physiology, and in 1885 he was made Professor of Physiology, a chair which he continues to fill. He is an active member of the most of the leading medical and scientific societies of this country, and a corresponding or honorary member of a number of similar bodies of Europe. His voluminous original contributions to medical literature attest his busy life as an investigator in various directions of research, the following being the most important: "The Physiological Actions of Apomorphia Hydrochloras," *Philadelphia Medical Times*, December 6 and 20, 1879, and January 3, 1880; "On the Physiological Actions of Potassium Nitrite, with a note on the Physiological Actions on Man," by Dr. S. Weir Mitchell, *American Journal of Medical Sciences*, July, 1880; "A Text-Book of Physiology," by Michael Foster, first American, from the third English edition, edited with notes and additions, Henry C. Lea, October, 1880; "Notes on the Actions upon the Circulation of Certain Essential Oils (with Dr. H. C. Wood)," *Journal of Physiology*, Nos. 5 and 6, 1880; "The Kittanning Iron Spring," *Philadelphia Medical Times*, November 6, 1880; "Notes on a Case of Hysterical Arthritic Hyperesthesia," *New York Medical Record*, February 12, 1881; "A Case of Premature Labor Induced by the Ingestion of Two Drachms of Croton Oil," *Philadelphia Medical Times*, March 12, 1881; "Ethylene Bichloride as an Anesthetic Agent, with a consideration of Ethylene Methylethylate, Ethylene Ethylate, Ethyl Nitrate and Ethylidene Bichloride," *Philadelphia Medical Times*, May 7 and 21, and June 4, 1881; "Hydrobromic Acid: Its Actions on the Nervous and Circulatory Systems," *Boston Medical and Surgical Journal*, June 2, 1881; "Are All Anesthetics Dangerous which Contain Chlorine, Bromine or Iodine?" *American Journal of Medical Sciences*, July, 1881; "Amyl Nitrite, a Powerful Cardiac Stimulant," *New York Medical Journal*, July, 1881; "Notes on

the Actions of Curare on the Motor Nerve Endings," *New York Medical Record*, July 9, 1881; "Contributions to the Study of the Toxicology of Cardiac Depressants: Carbolic Acid—a Summary of Fifty-six Cases of Poisoning, with a Study of Its Physiological Actions," *American Journal of Medical Sciences*, October, 1881; "Convulsions Due to Depression of Spinal Reflex Inhibitory Centers, with Special Reference to the Convulsions of Apomorphine, Atropine, Strychnine and Certain Other Poisons," *Philadelphia Medical Times*, August 13, 1881; "Contributions to the Study of Cardiac Depressants: II. Aconite," *Philadelphia Medical Times*, November 19, 1881; "Hypospadias Simulating Hermaphroditism" (with Dr. T. N. Bradfield), *New York Medical Journal*, January, 1882; "A Text-book of Physiology," by Michael Foster, second American, from the third and revised English edition, edited with extensive notes and additions, Henry C. Lea's Son & Co., October, 1881; "Two New Kymographions and a Time Recorder," *Philadelphia Medical Times*, January 28, 1882; "A Contribution to our Knowledge of the Actions of Certain Drugs Upon Bodily Temperature" (with Dr. H. C. Wood), *Journal of Physiology*, Nos. 5 and 6, 1882; "Ethidene Poisoning," *Medical News*, February 25, 1882; "A Partial Study of the Poison of the Heloderma Suspectum—the Gila Monster" (with Dr. S. Weir Mitchell), *Medical News*, April 28, 1883; "Preliminary Report on the Venoms of Serpents" (with Dr. S. Weir Mitchell), *Medical News*, April 28, 1883; "Proximate Proteid Constituents of Egg-Albumen," *Medical News*, May 17, 1884; "New Method of Preparing Egg-Albumen," *Medical News*, June 14, 1884; "Observations on the Regeneration of the Vagus and Hypoglossal Nerves," *American Journal of Medical Sciences*, January, 1885; "A Text-book of Physiology," by Michael Foster, third American, from the fourth and revised English edition, edited with extensive notes and additions, Lea Bros. & Co., 1885; "Researches Upon the Venoms of Poisonous Serpents" (with Dr. S. Weir Mitchell), Smithsonian Contributions to Knowledge, No. 647, 4to, 1886; "A Contribution to our Knowledge of Fever and of the Agents which Produce and Arrest it" (with Drs. Wood and Hare), *Therapeutic Gazette*, December *et seq.*; "Calorimetric Notes," *University Medical Magazine*, December, 1888; "Experiments on the Direct Excitability of the Spinal Cord," *University Medical Magazine*, March, 1889; "The Velocity of Nerve-Impulses in Cut and Intact Nerves," *Journal of Nervous and Mental Diseases*, May, 1889; "The Actions of Cocaine on Animal Heat Functions," *University Medical Magazine*, May, 1889; "Heat Phenomena in Normal Animals, Part I, Calorimetry," *University Medical Magazine*, January, 1890; "Heat Phenomena on Normal Animals, Part II, Heat Production in Relation to Body-Weight," *University Medical Magazine*, February, 1890; "Heat Phenomena in Normal Animals, Part III, Normal Variations in Heat Production," *University Medical Magazine*, April, 1890; "The Actions of Alcohol on Animal Heat Functions," *Therapeutic Gazette*, February, 1890; "The Knee-Jerk After Section of the Spinal Cord," *Journal of Nervous and Mental Diseases*, February, 1890; "The Actions of Caffeine on the Circulation," *Therapeutic Gazette*, May, 1890; "The Actions of Caffeine on Tissue Metamorphosis

and Heat Phenomena," *New York Medical Journal*, April 26, 1890; "The Empyreumatic Oil of Coffee, or Caffeon," *Medical News*, May 3, 1890; "The Actions of Drugs which are Believed to Conserve the Tissues: Alcohol, Tea, Coffee, Coca, Maté, Kola, Guarana, Hemp, Tobacco and Opium," *University Medical Magazine*, October, 1890; "Notes on Certain Actions of Atropine," *University Medical Magazine*, February, 1891; "Heat Phenomena in Curarized," *Therapeutic Gazette*, March and April, 1891; "A Study of the Actions of Cocaine on the Circulation," *American Lancet*, May, 1891; "A Systematic Study of the Actions of Definitely Related Chemical Compounds Upon Animals," Part II (with Prof. Wolcott Gibbs), *American Chemical Journal*, XIII, No. 5, 1891; *Ibid*, Part III, *American Chemical Journal*, XIII, No. 6, 1891; "An Experimental Study of Certain Actions of Strychnine in Excitant and Paralytic Doses," *Therapeutic Gazette*, March, April, May and June, 1892; "Thermogenetic Centers, with Special Reference to Automatic Centers," *University Medical Magazine*, March, 1893; "Conductivity versus Irritability," "Aberrant Actions of Morphine," "The Actions of Pilocarpine on the Pulse-rate and Pressure," *University Medical Magazine*, April, 1893; "A Comparative Study of the Physiological Actions of Brucine and Strychnine," *Medical News*, April, 1893. Besides these contributions, he has been an extensive contributor to the editorial and book-review columns of a number of our leading medical, scientific and secular periodicals. Since his appointment to the chair of Physiology, Dr. Reichert has devoted his time entirely in original research.

REID, Robert King, of Stockton, Cal., was born at Erie, Pa., January 21, 1820. His father, Rev. Robert Reid, D. D., was an eminent divine of that city. Having received his preliminary education at the Erie Academy, he entered Jefferson Classical and Literary College, Canonsburg, Pa., and was graduated thence B. A. in 1842. Entering the medical department of the University of Pennsylvania, he was a student during the full course, and in 1846 received the degree of M. D. from that institution. After practicing for a year in South Carolina, he removed to California in 1849, and in 1850 finally established himself at Stockton. In 1851 he was elected, by the legislature, resident physician to the State Hospital, and in 1853 was elected by the same body resident physician to the State Insane Asylum. In 1858 he made a professional visit to Europe, studying in the leading schools and hospitals of England, France Germany and Italy. Returning to America just previous to the beginning of the Civil War, he was at the outbreak of that conflict appointed a surgeon in the United States Army, and served as such during the ensuing five years, at Benicia Barracks, Cal., at Salt Lake City, and at Sacramento. In 1866 he resigned from the army, and at the same time retired from practice. He is a corresponding member of the San Francisco Academy of the Natural Sciences; member, and president in 1856, of the California Natural History Society; member, and vice-president, in 1856 and 1874, of the California Medical Society; and member and president, 1872, of the San Joaquin Society of California Pioneers. In 1873 he was elected to the chair of surgery in the College of Phy-

sicians and Surgeons of Wilmington, N. C., but on account of ill health declined the position. His published writings consist of reports on the State Hospital, 1851; on insanity and the State Insane Asylum, from 1853 to 1856, and on diseases and climate of Salt Lake City, 1870. He married, June 7, 1854, Matilda Bassett, daughter of Benjamin Hayward, Esq., of Bermuda, W. I.

REULING, George, of Baltimore, Md., was born in Darmstadt, Germany, November 11, 1839. From 1860 till 1865 he studied medicine at the University of Giessen, being during four years of that period an assistant to Professor Phoebeus. In 1865 and 1866 he was student successively at Munich, Vienna, and Berlin, receiving his degree of M. D. in May, of the latter year, from the University of Giessen. During the Austria-Prussian War—June to September, 1866—he served as military surgeon in the Prussian army. Soon afterward he became Assistant Surgeon at the Eye Hospital, Wiesbaden, and was subsequently a student at Paris, under Wicker, Liebrich, and Meyer. In 1868 he came to America, establishing himself in Baltimore, and making a specialty of ophthalmology and otology. His success in these branches led to his appointment, in 1869, to be Surgeon-in-Charge of the Maryland Eye and Ear Infirmary. He is a member of the Heidelberg Ophthalmological Society, and of the Chirurgical Faculty of Maryland, as well as of numerous other medical organizations, both in this country and abroad. From 1871 till 1873 he was Professor of Eye and Ear Surgery in the Washington University. He is now (1893) Professor of Ophthalmology and Otology in the Baltimore Medical College. Among his publications have been articles entitled: "Detachment of the Choroid after Extraction of Cataract;" "On the Transplanting of the Conjunctiva of a Rabbit into the Human Eye;" "On Blood Tumors"—the latter paper possessing a secondary value in that it has appended to it a list of all works upon the subject, and a description of his important invention of a new microtome for vegetable microscopy.

REYBURN, Robert, of Washington City, D. C., was born August 1, 1833, in Glasgow, Scotland, and is of Scotch descent. His early education was received at the public schools of Philadelphia, Pa. He studied medicine under the preceptorship of Dr. Lewis D. Harlan, and was graduated M. D. at the Philadelphia College of Medicine in 1856. He received the degree of A. M. from Harvard University in 1871. He practiced Medicine in Philadelphia from 1856 to 1862, then entered the United States Army, as acting assistant surgeon, on May 7, 1862; was commissioned as assistant surgeon United States Volunteers on June 4, 1862; was recommended for immediate promotion and commissioned surgeon United States Volunteers on June 13, 1862. He was mustered out as brevet Lieutenant-Colonel Volunteers in 1866, and was commissioned as assistant surgeon United States Army, with rank of captain, in 1867, but resigned the same year and commenced the practice of medicine in Washington, D. C., where he has been located ever since that date. Dr. Reyburn was chief medical officer of the Freedmen's Bureau during the last two years of its existence, in 1871-1872; was surgeon in charge of the Freedmen's Hospital from 1867 to 1875; Professor

of Clinical Surgery, medical department, Georgetown University, 1866-1867; Professor of Surgery, medical department, Howard University, 1868; Professor of Anatomy, medical department, Georgetown University in 1878. In 1880 he was appointed Professor of Physiology and Clinical Surgery, in the medical department of Howard University, which he still retains. He is a member of the American Medical Association; member of the Medical Society, District of Columbia, and the Medical Association, D. C.; member and vice-president, 1891-2, of the National Microscopical Society; member of Microscopical Society, D. C.; member of Anthropological Society, member of Biological Society, member of the American Society of Anatomists, and of the Congress of American Physicians and Surgeons; consulting surgeon to Providence Hospital, D. C., and Freedmen's Hospital; visiting physician to St. John's Church Orphanage; member and president of Board of Health, D. C., in 1870-1; member of Board of School Trustees of Washington, D. C., in 1877, 1878 and 1879; and was one of the Board of Councilmen of Georgetown in 1865. He was married in 1854 to Catharine White, and to them were born eight children. In 1881 he was chosen as one of the six surgeons who had charge of the case of President James A. Garfield, from the time he was wounded until his death. Dr. Reyburn has written a large number of articles for the various medical journals, and has now in press the "Clinical History of the Case of President James A. Garfield."

RHODES, John Edwin, of Chicago, Ill., was born in the town of Bath, Summit county, Ohio, February 12, 1851. His father's family trace their descent from the early German settlers

John E. Rhodes.

in Western Pennsylvania. His mother's family are of Irish descent. His preliminary education was obtained in the public schools of Webster City, Iowa; South Bend, Indiana, and Bel-

videre, Illinois. Not being satisfied with so little training for his future work in life, he determined to enter college, and after a summer of preparatory study in Belvidere, and a winter spent in teaching school, he entered the preparatory department of the University of Chicago. He spent six years in this institution, taking a full course and graduating in 1876, receiving the degree of A. B. Three years later the degree of A. M. was conferred upon him by his *Alma Mater*. After his graduation in 1876 he settled in Sacramento, California, and gained much valuable business experience in his seven years of business life while there. In July, 1877, he was married to Miss Anna Louise White, of Chicago. In 1882 he decided to follow out the inclination of years and study medicine, and in the spring of 1883 he entered Rush Medical College. He attended both spring and winter courses, and graduated in 1886, receiving the honor of Valedictorian of a class of 160. After several months spent in travel through Europe he returned to Chicago and devoted himself to general practice, but his long association with Dr. E. Fletcher Ingals, the celebrated laryngologist, attracted him to special practice, and for several years he has devoted himself to the treatment of diseases of the chest and throat. Dr. Rhodes is a member of the faculty of Northwestern University Woman's Medical School, being Professor of Physical Diagnosis and Clinical Medicine. He is also Lecturer on Laryngology and Diseases of the Chest in Rush Medical College. He is a member of the American Medical Association; Illinois State Medical Society; Chicago Medical Society, and the Practitioners' Club, and is also the secretary and treasurer of the Rush Medical College Alumni Association. His family consists of his accomplished wife and two children.

RIESMEYER, Louis Theodore, of St. Louis, Mo., was born in Bielefeld, Germany, September 26, 1857. He received his first education at the Gymnasium at Bielefeld. His parents dying in short succession, he was left an orphan at the age of eleven. At the age of fifteen he emigrated to the United States, and became an apprentice in a retail drug store. In 1876 he graduated with highest honors at the St. Louis College of Pharmacy, and in 1883, he graduated at the Missouri Medical College, as the first of his class. Immediately after graduation he matriculated at the University of Berlin, Germany, where he studied surgery under V. Bergmann, and pathology under Virchow. He returned to St. Louis in 1884, and began to practice medicine and surgery. In 1885 he was appointed first assistant to the chair of Surgery at the St. Louis Post-Graduate School of Medicine, and in 1887 Lecturer on Surgical Pathology at the same institution. In February, 1891, he resigned both positions. In August, 1891, he was elected to the chair of Physiology at the Beaumont Hospital Medical College, and in 1892 he resigned this chair in order to accept the chair of Histology, Pathological Anatomy and Bacteriology at the same College. In 1893 he became chief editor of the *St. Louis Medical Review*. Among his contributions to medical literature are the following papers, read at various medical societies: "Report of Surgical Cases Treated at the St. Louis Post-Graduate School of Medicine," 1886; "Surgical Tuberculosis," 1887; "Multiple Tubercular Osteomyelitis,

and Primary Tuberculosis of the Female Breast," read before the St. Louis Medical Society, 1888; "Observations on the Treatment, of Wounds with Pyoktanin," *Courier of Medicine*, 1890; "Laparotomy for Parametric Abcess," read before the St. Louis Medical So-

L. T. Riesmeyer

ciety, 1890; "Pathology and Surgical Treatment of the So-called Strumous Inguinal Lymphadenitis," *Medical Fortnightly*, 1892.

RICHARDSON, James A., of Salem, Oregon, was born in Adams county, Illinois, November 15, 1840, and is of English and Irish parentage. His medical education was obtained at the Toland Medical School, San Francisco, California, and at the Bellevue Hospital Medical College, New York, graduating at the former institution in 1866, and at the latter in 1870. He first established himself at Amity, Oregon, but afterward removed to the city of his present residence, where he has been for several years engaged in an active and successful general practice of his profession. He has filled the chair of *Materia Medica* in the medical department of Willamette University; has been physician to the Oregon State Penitentiary, and to the Institution for the Deaf and Blind. He is a member of the Oregon State Medical Society, and has been a member of the Oregon State Senate.

RICKETTS, B. Merrill, of Cincinnati, Ohio, was born in Lawrence county, in the same State, May 20, 1857. His father was an eminent physician of that section. His classical education was acquired at Ohio Wesleyan University, Delaware, Ohio. He was graduated in medicine at Miami Medical College in 1881, and began the practice of his profession in Ironton, in his native state, on April 9, 1881. He was appointed City Physician and Health Officer on April 24th of the same year, to take charge of an epidemic of small-pox. During the following eight months

he had seen one hundred and fifty cases of this disease, and had made four thousand vaccinations. He removed to Columbus, Ohio, in

B. M. Ricketts.

July, 1883, where he was in general practice one year, at the end of which time he left for New York City. He matriculated in the medical department of Columbia College, and soon after received the appointment to fill a two weeks' vacancy in the surgical department of the Presbyterian Hospital, having charge of the out-door clinics and ambulance. During this time he was appointed House Surgeon to the New York Skin and Cancer Hospital for one year. During the following March he assisted Dr. George Thomas Jackson in the chair of dermatology at the New York Polyclinic. He became a Fellow of the New York State Medical Association at the time of its organization, November 20, 1884, before which he has since read several papers. He moved to Cincinnati November 16, 1885, where he has since confined himself to the practice of general surgery and dermatology. He has made many contributions to medical literature, some of which have been upon personal investigation in bone and intestinal surgery. Dr. Ricketts is one of nineteen of the name who have adopted medicine as a profession, his brothers, Edwin and Joseph, being associated with him at the present time. He has always taken a lively interest in the allied sciences to which he has devoted much time. He has several hospital appointments.

RIDLON, John, of Chicago, Ill., was born in Clarendon, Vermont, November 24, 1852, and is of Scotch descent. His preliminary education was received at Landsley's Commercial College, Goddard's Seminary and the University of Chicago, from which he received the degree of A. M. in 1875. His medical preceptors were Drs. Chas. B. Kelsey and E. C. Seguin, of New York. He was graduated in medicine at the College of Physicians and Surgeons, New York City, in 1878, and received the honor of Class Marshal. His medical education was supplemented with two years' expe-

rience as Medical and Surgical *Interne* at St. Luke's Hospital, N. Y. He continued in the practice of his profession in New York City from 1880 to 1892; since then in Chicago, devoting his attention mainly to orthopedic surgery. In 1882 he instituted crucial open incisions for the correction of severe forms of talipes varus—a surgical procedure known as Ridlon's Operation. In 1881 he devised a splint for correction of deformity in knee-joint disease, and in 1885 a splint for the treatment of hip-joint disease. He was Assistant Orthopedic Surgeon, St. Luke's Hospital, New York, from April, 1881, to January, 1888, and Assistant Surgeon New York Orthopedic Dispensary from June, 1881, to October, 1887. He was Clinical Assistant and Instructor of Orthopedic Surgery, Medical Department of the University of the City of New York, from September, 1881, to March, 1886; Attending Surgeon in dispensary of same college during the same time; Attending Surgeon to the first Orthopedic Department of Bellevue Hospital Dispensary from January, 1887, to January, 1889; Attending Orthopedic Surgeon St. Luke's Hospital, New York, from January, 1888, to January, 1889; Assistant Surgeon Vanderbilt Clinic, New York, from January, 1889, to June, 1892; and Consulting Orthopedic Surgeon to the Church Hospital and Dispensary, New York, from its foundation to June, 1892. He has lectured on Orthopedic Surgery in the Northwestern University Medical School, Chicago, since July, 1892, and has been Professor of Orthopedic Surgery in the Post-Graduate Medical School of that city since November, 1892. He has been secretary of the American Orthopedic Association since September, 1890, and was orthopedic editor of the *Epitome of Medicine*, New York, from 1887 to 1892; orthopedic editor of the *Medical Annual*, Bristol, England, since 1890; associate editor of the *Annals d'Orthopédie*, Paris, since 1890; American

John Ridlon.

editor of the *Zeitschrift Für Orthopädische Chirurgie*, Stuttgart, Germany. Dr. Ridlon

has made numerous contributions to orthopedic literature, and is engaged at present in writing a work on orthopedic surgery, and the orthopedic portion of the supplementary volume of the "Reference Hand-book of the Medical Sciences." He is now (1893) Professor of Orthopedic Surgery in the North-Western University Medical School.

RISLEY, Samuel D., of Philadelphia, Pa., was born in Cincinnati, O., January 16, 1845. He received his education in the public schools of that city, and at the State University of Iowa. His medical studies were pursued at the University of Pennsylvania, where he was graduated M. D. in 1870. He settled immediately afterward in Philadelphia. In 1872 he became associated with the Eye Dispensary of the University of Pennsylvania; in 1874 he was appointed surgeon on the Dispensary Staff of the Episcopal Hospital. In 1875 he abandoned the general practice of medicine and surgery and devoted himself to eye and ear diseases exclusively. In the same year he was appointed chief of dispensary for eye and ear diseases on the opening of the hospital of the University of Pennsylvania, and was appointed lecturer on ophthalmoscopy in the medical department of the university in 1877. He is a member of the Pathological Society, the Philadelphia County Medical Society, the Northern Medical Association of Philadelphia, and the American Medical Association, and as chairman of the Section on Ophthalmology, delivered an "Introductory Address" at the forty-fourth annual meeting held at Milwaukee, Wisconsin, in June, 1893, which was widely published and read with great interest. His contributions to the profession consist of numerous important papers and reviews of books relating to his special line of study and practice.

RISTINE, Charles Elliott, of Knoxville, Tenn., was born in Abingdon, Virginia, December 6, 1845. He is of German-Irish descent. His preliminary education was obtained at the University of Tennessee, and he studied medicine at the University of Pennsylvania, whence he graduated M. D. in 1870. He began the practice of his profession in Anderson county, but one year later, 1871, he removed to Nashville, Tenn., and in 1877 was appointed Demonstrator of Anatomy in the Nashville Medical College (nominally the medical department of the University of Tennessee). After serving two years as demonstrator of anatomy he was selected to fill the chair of Physiology. In 1882 Dr. Ristine resigned his position in the Nashville Medical College and removed to Knoxville, Tenn. In 1889 he was one of the organizers of the Tennessee Medical College, of Knoxville, and was elected registrar and treasurer of the Board of Directors and Professor of Obstetrics and Gynecology, positions which he now occupies. In 1890 Dr. Ristine was appointed Surgeon to the Mission Home, and in 1891 Consulting Surgeon and Gynecologist to the East Tennessee Sanitarium. He is a member of Knox County Medical Society, the Tennessee State Medical Society, the American Medical Association and the Pan-American Medical Congress. Dr. Ristine has contributed to the various medical journals numerous articles chiefly pertaining to his specialty, gynecology.

RITTER, Martin M., of Chicago, Ill., is a German, a native of Hamburg, who has sought

and achieved success in his adopted home and profession. His family has been prominent for many years in the commercial and banking business in his native city. Dr. Ritter preferred study to business precepts and began reading medicine after graduating with credit from the best institution of learning in Hamburg. Coming to America he continued his studies under the best teachers, and in due form was graduated from the College of Physicians and Surgeons of Chicago. The study of diseases of the eye, ear, nose and throat had interested him, particularly in his student days, and he decided to devote his entire attention to their treatment. He visited London, Berlin and Vienna, and secured in the leading hospitals and from the leading professors the instructions he desired. For several years he has practiced his specialty with the success that follows thorough education and intelligent, painstaking practice. In 1892 he went to Chicago and made it his home, as he found it a congenial field in which to exercise his talents, and has by this time built up a very extensive practice among the best classes. In September, of the same year, he established the Columbia Charity Dispensary, of which he is the superintendent, and also chief of the departments of diseases of the eye, ear, nose and throat. He is also chief of the nose and throat department in the Chicago Charity Hospital, instructor of rhinology and laryngology, Chicago Post-Graduate College and Hospital, and will fill the chair of Professor of Rhinology and Laryngology in the prospective Chicago Clinical College.

ROBINSON, Beverly, of New York City, was born in Philadelphia March 22, 1844. He received his preparatory education at Ferris school and in the collegiate department of the University of Pennsylvania, and graduated from the department of arts of the last named institution in 1863. He subsequently pursued his medical studies at the University of Paris, where he was graduated in 1872. Returning to America he established himself in general practice in the city of New York. Dr. Robinson is a member of the New York Pathological Society; New York Laryngological Society, and Fellow of the New York Academy of Medicine, and of numerous other medical organizations. He has been Physician to the New York Charity Hospital; Surgeon to the Manhattan Eye and Ear Hospital, and Lecturer on Diseases of the Throat at Bellevue Hospital Medical College. He has written extensively for medical periodicals, and is a recognized authority upon diseases of the nose and throat.

ROBINSON, Fred Byron, of Chicago, Ill., was born in Wisconsin. He is a son of William and Mary Robinson, farmers, who still live on the old farm of his birth. His early education was acquired in a little log school-house. He afterward worked his way through Mineral Point Seminary and Wisconsin University, graduating as B. S. in 1878. He was assistant to the Professor of Chemistry during his senior year. He was principal of high school for two years, during which time he studied medicine under Dr. U. P. Stain. He was graduated from Rush Medical College in 1882, and located and practiced at Grand Rapids, Wis., until 1889. He was a partner of Dr. G. F. Witter until 1884. In 1889 he accepted the offer of the chair of Anatomy and Clinical Surgery in Toledo Medical College, of Toledo,

O., and removed to that city, remaining there two years. In 1891 the Doctor removed to Chicago, where he was elected to the chair of Gynecology in the Chicago Post-Graduate Medical School. Dr. Robinson went to Europe in 1884-5; studied gynecology and surgery in Heidelberg, Berlin and London. In 1887 he made another trip, studying gynecology a year in Vienna. In 1891 he went to Birmingham, England, and remained a pupil of Mr. Lawson Tait for six months. Dr. Robinson began in 1887 a series of original experiments and researches on intestinal surgery, the comparative anatomy of the female genital organs and the sympathetic nerves of the abdomen and pelvis. He has prosecuted these experiments and researches up to the present. His experiments on the intestines of dogs number some 230. He devised for intestinal anastomosis the cartilage plate, the raw-hide plate

F. Byron Robinson.

and the segmented rubber plate. His latest device in this direction is his raw-hide anastomosis button, which can be employed without sutures. He presented to the profession the "stove-pipe" operation to displace circular enterorrhaphy. He devised invagination for circular enterorrhaphy without invagination sutures. He gave to the profession two methods to prevent intestinal invagination subsequent to operation. One was the rubber tube and the other, more valuable, was the suturing of the distal gut end to the proximal gut mesentary. His researches in the comparative anatomy of the female genital organs brought out what he terms the "automatic menstrual ganglia," situated along the tubes and uterus. These ganglia rule the rhythm of menstruation. He claims that there are automatic nervous ganglia situated in each viscus, and that each

viscus has its rhythm; *e. g.*, the liver rhythm is ruled by the "hepatic automatic ganglia," the spleen by the "automatic splenic ganglia," etc. He demonstrated that the corpus luteum of man and mammals is not a sign of pregnancy. It appears that Dr. Robinson was the first in this country to demonstrate spermatocystitis, which he attributed to gonorrhea, and that inflammation of the vesiculæ seminales was analogous to similar diseases in the fallopian tubes. For the past five years his contributions to medical literature may be found in the main medical journals. His most important publications are two volumes of "Intestinal Surgery," "Automatic Menstrual Ganglia," "Urochal Cysts," "The Abdominal Brain—Its Rhythm and Reflexes." Dr. Robinson is Attending Gynecologist to the Woman's Hospital, Gynecologist to the Chicago Charity Hospital and to the Post-Graduate Medical Hospital. He is a member of medical societies in Wisconsin, Ohio and Illinois. He takes pride in demonstrating and teaching facts and observations gained from nature. His practice is limited to gynecology and abdominal surgery. He spends his time, aside from his professional duties, in experiments and research.

ROBINSON, JOHN R., of Colorado Springs, Colo., was born August 11, 1855, at Mountain Dale, N. Y. His parents were of Scotch-Irish descent. They moved into Sullivan county, N. Y., in 1850, cleared a farm from the primitive forests, and raised a family of six children, of whom the Doctor was the youngest. At the close of the War of the Rebellion the two oldest boys were among those whose lives had been sacrificed for the Union, and the father had succumbed to disease. The subject of this sketch was then in his tenth year. He could not be spared from work upon the farm in summer, but attended the district school in winter. The meager facilities for an education thus afforded were supplemented by self-improvement and an academic course in the Union School of Lockport, N. Y. He continued at intervals to teach school and work on the farm until the fall of 1879, when he began the study of medicine with Dr. J. J. Ward, of Ellenville, N. Y. In the spring of 1880 he matriculated with Jefferson Medical College of Philadelphia. He attended four regular and preliminary courses of lectures and graduated in March, 1882. He immediately began practice in Woodbourne, N. Y., and met with marked success. An inherited tendency to asthma made a change of climate expedient, and after special preparation he located in Colorado Springs in the fall of 1888, restricting his practice to the eye and ear. In 1890 he was appointed Eye and Ear Surgeon of the Colorado Midland Railroad. He has held the offices of secretary, vice-president and president of the El Paso County Medical Society. Besides papers read at the State Medical Society, he has contributed to medical journals on subjects relating to the eye and ear. Aside from professional work Dr. Robinson devotes himself to the study of literature and to the lecture platform.

ROBINSON, John Albert, of Chicago, Ill., was born July 26, 1855, at Richland, Ind. His father was born in Kentucky, and is of Scotch descent, while his mother was born in South Carolina, and is of Irish descent. He received a classical education in Monmouth (Ill.) College, graduating in 1877, with the de-

gree of Bachelor of Arts, receiving degree of Master of Arts three years later. For one year he read medicine in the office of Drs. Wallace and Troutman, Monmouth; then took two winter and one spring courses in Rush Medical College (Chicago), graduating in 1880 with honor, being secretary of his class. After graduating he entered into partnership with Professor Joseph P. Ross, Professor of Clinical Medicine and Diseases of the Chest, Rush Medical College, and remained associated with him until 1889. From 1880 to 1888 he was Attending Physician for Diseases of Throat and Chest at the Central Free Dispensary, and also during this period was Lecturer on Materia Medica in Rush Medical College, and originated the cabinet of drugs used in teaching this branch. He was Attending Physician to

John A. Robison

Cook County Hospital, from 1885 to 1889, and from 1888 to 1890 was Professor of Materia Medica and Therapeutics in the Woman's Medical College; also, during these years was Instructor in Physical Diagnosis in Rush Medical College. During the winter of 1888 he gave the course of lectures in Clinical Medicine and Diseases of Chest, *vice* Professor Ross, who was irrecoverably ill. In 1883 he assisted Professor Ross in founding the Presbyterian Hospital, and has been Attending Physician for Throat Diseases, and secretary of the medical board ever since its organization. In 1890 he was, also, elected attending physician for medical diseases, in place of Dr. Ross, deceased. In 1891 Dr. Robison was elected Professor of General Medicine in the Post-Graduate Medical School of Chicago, which position he still occupies. In 1891 he traveled extensively through Germany, France, Italy, Eng-

land and Scotland, visiting the most renowned hospitals in these countries. He has, also, traveled through Colorado, California, and other western States, and observed noted health resorts. He is a member of the American Climatological Association, and a member of the Committee on Medico-Climatology of the World's Congress Auxiliary to the Columbian Exposition. His practice is that of general medicine, but more definitely in the line of diseases of the chest. He is a member of the Chicago Medical and Pathological Societies, American Medical Association, Illinois State Medical Society, American Academy of Medicine; is chairman of the Committee on Publication of Chicago Medical Society, which publishes the *Chicago Medical Recorder*, the official organ of the society. Recently Dr. Robison was appointed Adjunct Professor to the chair of Practice of Medicine, Rush Medical College. His contributions to medical literature have been principally clinical lectures that have been delivered at the hospitals or colleges with which he has been connected. He is now engaged in preparing a book for publication. Dr. Robison has an abiding interest in bacteriology, especially in so far as it relates to pulmonary affections. He has established a private home for medical cases, believing that home comforts, hygienic and dietetic treatment are more valuable than drug treatment.

ROCKWELL, A. D., of New York City, was born in New Canaan, Conn., May 18, 1840, where his father, David S. Rockwell, was for many years the principal and proprietor of a large academy. He received his literary education at Kenyon College, Ohio, and his medical at the Bellevue Hospital Medical College, where he graduated in the spring of 1864. He immediately entered the army as Assistant Surgeon of the Sixth Ohio Cavalry, and served with his regiment in the cavalry corps of the Army of the Potomac through the campaigns of 1864-5, until the surrender at Appomattox. A few months after entering the service he received his commission as Surgeon, and subsequently was appointed Surgeon of Brigade. After the war he engaged for several years in general practice, but in 1868 he associated himself with the late Dr. George M. Beard for the study of nervous diseases, and especially for the systematic development of electricity in its relation to the disease in general. This agent had been wholly neglected by the profession at large, and was almost entirely in the hands of charlatans, and in the labor of wresting it from such hands and placing it upon a scientific basis they were the pioneers in this country. In an article published in the *New York Medical Record* (1866) Dr. Rockwell was the first to describe the method of general electrization, by which the remarkable constitutional effects of electricity are obtained. To attempt to enumerate his many contributions to neurological and electrotherapeutical literature would require more space than is available here. His articles have been mainly of a practical nature and original in conception. His small work of lectures on the "Relation of Electricity to Medicine and Surgery" has had a wide circulation, as has also his brochure on "Electro-Surgery," published in 1878. He has twice re-edited Dr. Beard's original work on "Nervous Exhaustion," and completed and published Beard's

unfinished MSS. on "Sexual Neurasthenia." Dr. Rockwell has contributed not a little to general literature, and some of his war articles have received high commendation. In reference to one of them, Mr. Stoddard, the eminent poet and critic, writes: "Dr. A. D. Rockwell narrates a ride with Sheridan in a long and animated paper, which is written in frank, offhand picturesque English that brings before us the stormy scenes which he witnessed, and of which he was a part in a remarkably vivid way. It would have made the literary fortune of any novelist who could have written it, or anything approaching to it, in a story of the war." The work, however, upon which his reputation as a medical writer and investigator must mainly rest is the exhaustive treatise on "The Medical and Surgical Uses of Electricity," which, in 1872, he issued in connection with Dr. Beard. This work is now in its eighth edition, and has for years held its position as the standard work in this country upon the subject of which it treats, besides having been translated into both French and German.

ROGERS, Joseph Goodwin, of Logansport, Ind., was born at Madison, in that State, November 23, 1841. Confined to his bed from his twelfth to his eighteenth year, by Potts' disease of the spine, he pursued during this period a collegiate course of study. Upon his recovery he read law for one year, and then began the study of medicine. He then entered Bellevue Hospital Medical College, New York, and was graduated M. D. at that institution in 1864, and in the same year commenced the practice of his profession in his native town, and was until the close of the War, an Acting Assistant Surgeon United States Army, on duty at the Madison General Hospital. During the following two years he traveled in Europe, attending the hospitals of Paris, especially the Ophthalmic Cliniques of Demarees, Liebreich and Wecker. He also attended the clinics of Trousseau and Nelaton. On returning to America he resumed practice at Madison, paying especial attention to ophthalmology. In 1875-76 he was Professor of Materia Medica and Therapeutics in the Indiana College of Physicians and Surgeons. Shortly after this he was appointed superintendent of the Indiana Hospital for the Insane, and served in that capacity several years. He now (1893) holds the same position in the Northern Hospital for the Insane, at Logansport. Dr. Rogers is a member of numerous medical and scientific organizations, including the Indiana State Medical Society and the American Medical Association. He has contributed important articles on professional subjects to medical journals, and is regarded as one of the leading authorities of his State on diseases of the nervous system.

ROLER, Edward O. F., of Chicago, Ill., was born, March 6, 1833, near Winchester, Va. He is a son of P. W. and Catharine Carson Roler, of Virginia, the latter a member of one of the oldest families in the commonwealth. In 1850 he entered Asbury University, at Greencastle, Ind., to which State his father had emigrated several years before, and completed his collegiate course, becoming, in 1856, a student of Dr. W. H. Byford, of Chicago, and graduating from the Rush Medical College in 1859, taking a prize for proficiency in his studies. In 1861 he entered the army as assistant surgeon of the

Forty-second Illinois Volunteers, but before reaching the field was promoted by Governor Yates to the rank of surgeon, and transferred to the Fifty-fifth Regiment, remaining with it for a year, at the end of which he was assigned to duty as acting medical inspector, and subsequently as medical director of the Fifteenth Army Corps, serving on the staff of Gen. W. T. Sherman while corps-commander, and afterwards on that of Gen. John A. Logan, and participating in all the battles of these commanders. He married, in 1867, Doretta J. Doering, only daughter of the Rev. C. H. Doering, D. D., of Berlin, Prussia, and superintendent of the Methodist missions in Germany. He began the practice of his profession in Chicago, where he resumed it after the Civil War, having previously spent a year in the hospitals of Berlin and Vienna. Soon after his return to Chicago in 1867, he was appointed lecturer on Obstetrics and the Diseases of Women and Children in the Chicago Medical College, and in 1868 professor, conjointly with Professor Byford, though he still lectured on obstetrics for several years, which is his specialty as a practitioner. He is now emeritus professor of that chair in that school. He devised an improved obstetric forceps which bears his name, and which is highly prized by those who have had occasion to employ them in their practice. He is a member of the several medical societies of Chicago, and of the American Medical Association. He has contributed at various times to medical journals. He was for two years surgeon of the United States Marine Hospital in Chicago, and has since been one of the Board of Examiners for Pensions.

ROOKER, James I., of Castleton, Ind., was born July 22, 1833, in Hamilton county, that State. He is of English descent. His grandfathers both located near Indianapolis in 1821, and his is, therefore, one of the oldest families in Central Indiana. Dr. Rooker's early education was obtained by attending winter schools in a log cabin, and helping clear his father's farm in the summer. In 1847 he entered the Noblesville school, which he attended until 1853, when he entered Asbury University (now DePauw), taking a scientific course; in addition to this, taking Latin, German and French. He commenced reading medicine with Drs. Shaw and Garver, of Noblesville, in 1854, remaining there until the fall of 1855, when he matriculated in the Medical College of Ohio, at the same time becoming a private student of Profs. N. L. Marshel and Samuel G. Armor. He graduated in the class of 1857. After a competitive examination he was elected one of three resident physicians to the Commercial Hospital, a position he filled for one year, commencing March 10, 1857. In the summer of 1859 he located at Castleton, a small village ten miles north of Indianapolis, and within three miles of where he was born, and entered into the practice of his profession. When Fort Sumter was fired on, he tendered his services to Governor Morton for a position on the medical staff of the army. Owing to his knowledge of hospital management, he was selected by Governor Morton as one among others and sent to the field and to different hospitals to look after the interest of Indiana's soldiers. He was at Fort Donaldson, and remained there and at the Mound City Hospitals until the wounded of that bloody battle were cared for. He was again sent by Morton to

look after the wounded at Shiloh, assisting in removing the sick and wounded to Evansville, Cincinnati and Indianapolis. About this time the nation was expecting a great battle to be fought at Corinth, Miss. Indiana's great war Governor made application to the Secretary of War for the privilege of sending an additional surgeon to each of the Indiana regiments in front of Corinth. When his request was granted, Dr. Rooker was selected as one of the surgeons and assigned to the Eleventh Regiment Indiana Volunteers, remaining with the regiment until the evacuation of Corinth by the rebels. Shortly after returning home he was recommissioned assistant surgeon to the Eleventh Regiment Indiana Volunteers, and reported to the regiment at Helena, Ark. Shortly after he was assigned to this command, the principal surgeon resigned, leaving Dr. Rooker in charge of the medical department

James I. Rooker

of the Eleventh Regiment and also of the Second Ohio Battery. He remained until the spring of 1863, when, owing to overwork and sickness, he resigned and returned home, resuming the practice of his profession at Castleton. While he did not enter the army again, he devoted much of his time to the care of the sick and wounded soldiers that came home, and very seldom charging them or their families any fee. In 1875 he was recommended by Drs. Parvin, Todd and others to deliver lectures on Physical Diagnosis in the College of Physicians and Surgeons of Indianapolis, which he continued doing until that school consolidated with the Indiana Medical College. In 1879 he was one of the founders of the Central College of Physicians and Surgeons of Indiana, and elected to the chair of Physical Diagnosis and Diseases of Children, remaining with the institution four years. He was compelled to resign, owing to disease of the throat. Dr. Rooker is the

author of numerous medical papers, which have appeared from time to time in the past thirty-three years, in the leading medical journals of Cincinnati, New York, Philadelphia, Richmond, Va., New Orleans, Chicago, and Indianapolis. Some of these papers have been complimented by such able men as John S. Billings, Surgeon U. S. Army, and Professor Austin Flint, in his work on clinical medicine. He is also author of many papers that have been presented to the Indiana State Medical Society. He was one of the founders of the Hamilton County Medical Society, and is now a member of the Marion County Medical Society, the Indiana State Medical Society, permanent member of the American Medical Society, and was one of the delegates to the Ninth International Medical Congress. He has been married twice. The first time to Miss Jennie Lyle, of Cincinnati, by whom he had five children—two sons and three daughters. His eldest son, Dr. C. Nelaton Rooker, late of Indianapolis, and coroner of the county, but now resident of Pocatello, Idaho, and Wm. Velpeau Rooker, a well-known attorney of Indianapolis. His present wife was Miss Martha Maxwell, by whom he has no children. Dr. Rooker has always been in love with his profession. This can be detected even in the naming of his sons. He is a self-made man, and was so poor that he was compelled to pawn his half-dozen text-books, trunk, and overcoat for money to pay his graduation fee. Owing to close attention to his profession, to-day he is one of the largest land owners and wealthiest physicians in central Indiana. In 1893 Dr. Rooker was appointed United States Examining Surgeon for the Bureau of Pensions, and is now president of the board established at Indianapolis.

ROOSA, Daniel Bennett St. John, of New York City, was born at Bethel, Sullivan county, N. Y., April 4, 1838. He is descended from Dutch, French and English settlers in New York State, during the early part of the colonial period, and great grandson of Isaac A. Roosa, an officer (captain) in the Continental army during the war of the Revolution. He was educated at academies in Monticello, N. Y., and Honesdale, Pa., and under a private tutor in Boston, Mass. He entered Yale College in 1856, was dismissed on account of ill-health, but afterwards received the honorary degree of M. A. from this college. He pursued a special course in chemistry under Prof. John W. Draper in the university of the city, and was graduated in medicine from this institution in 1860. Subsequent to his graduation he was admitted by examination to the New York Hospital as junior walker, in the surgical division, and served in that capacity for eight months, and then as senior walker for five months, and as house-surgeon for eight months. For three months in 1861 he served in the field as Assistant Surgeon of the Fifth Regiment National Guard of New York. In 1862 he married Mary Hoyt, daughter of Mr. Stephen M. Blake, of New York. On leaving the hospital in the same year he spent a year in study, especially of ophthalmology and otology in Berlin and Vienna, under Von Gräfe, Kramer, Arlt and Jaeger. In the summer of 1863 he returned home and served in the field as Surgeon of the Twelfth Regiment National Guards, New York, under the special call for thirty day troops, established himself in practice in the autumn of 1863, at first

in general practice, but in a year or two he devoted himself specially and exclusively to the treatment of diseases of the eye and ear. He was Professor of Ophthalmology and Otolaryngology in the University of the City of New York from 1866 till 1882, and has held the same chair in the University of Vermont from 1875 till 1880. He was a founder of the Manhattan Eye and Ear Hospital, and is now (1893) Professor of Diseases of the Eye and Ear in the New York Post-Graduate Medical School, of whose Faculty he is president. "Dr. Roosa is a successful practitioner, eminent as a surgeon, and an acknowledged authority in the branch of his profession to which he has devoted himself, having performed the most difficult and delicate operations that occur in the prosecution of his specialty." He is a member and for two years was president of the American Otolaryngological Society; president of the International Otolaryngological Society; member of the American Ophthalmological Society; member of the New York County Medical Society; and corresponding member of the Medico-Chirurgical Society of Edinburgh. He was president of the New York State Medical Society in 1879. He received the degree of LL.D. from the University of Vermont in 1880. With Drs. Hackley and Bull he has translated "Stellwag on the Eye;" has singly translated "Von Trötsch on the Ear." He is the author of the Vest Pocket Medical Lexicon, 1865; and of a successful treatise on "The Ear," 1866, republished in London, translated into German, and which has passed through several editions; and in conjunction with Dr. E. T. Ely he wrote "Ophthalmic and Otic Memoranda," "A Doctor's Suggestions," 1880, and "On the Necessity of Wearing Glasses," 1887.

ROSENWASSER, Marcus, of Cleveland, Ohio, was born in the village of Bukovan, in Bohemia, Austria, October 27, 1846, of Jewish parents. The family emigrated in 1854, and settled in Cleveland, where the subject of this sketch received his early literary education, graduating from the public high school with high honors. His medical education was begun at the University of Prague, the capital of Bohemia, in 1864, and completed in the University of Würzburg, Bavaria, where he graduated August 1, 1867, under twenty-one years of age. He then spent five months at Prague and Vienna, in post-graduate studies, returning to Cleveland in 1868, where he opened an office on the first day of February and where he has resided and practiced since. For twenty years he labored as general practitioner, enjoying an extensive patronage, especially in the field of obstetrics and gynecology. During this time he had been for a number of years on the staff of the Charity Hospital, and Lecturer on Operative Obstetrics in Wooster University, both of which positions he (after having filled them for five years) resigned. In 1888 he was elected to the chair of Medical and Surgical Diseases of Women in the medical department of the University of Wooster, in which he has since continued, with change of title to Professor of the Diseases of Women and Abdominal Surgery. To further qualify himself for this new position he spent three months in the East, the greater part of the time in Boston, under the instruction of Dr. E. W. Cushing, at that time Surgeon to the Free Surgical Hospital for Women; some time also with Dr. Joseph Price, of Philadelphia, visiting with prominent op-

erators in New York before his return. In 1891 he was elected Dean of the Faculty, to which honor he has since been twice re-elected. He is president of the staff, and Consulting Gynecologist to the Hospital for Women and Children, the City Hospital, and University Hospital. He is ordinary Fellow of the American Association of Obstetricians and Gynecologists (1892), member of the American Medical Association, of the Ohio State Medical Society, Northern and Northeastern Ohio District Societies, the Cuyahoga County, the Cleveland Medical Societies and the Society for Advancement of the Medical Sciences. Among his contributions to medical literature are: "The Treatment of Pelvic Inflammations;" "The Comparative Merits of Abdominal Section and Vaginal Incision on the Treatment of Extra-peritoneal Hematocele;" "A Contribution to the Technique of Intra-ligamentary Operations;" "Pelvic Cellulitis in its Relation to Surgery;" a series of journal articles, entitled "Clinical Fragments," "What are the Indications for Abdominal Section in Intra-pelvic Hemorrhage?" "The Indication for Operative Interference in Extra-uterine Pregnancy," besides reports of cases, or groups of cases of special interest. After his return from the East he gradually dropped his general work, and on February 1, 1893, just twenty-five years from the date of entering on his practice, he announced his determination to limit his work to his chosen specialty.

ROSS, George, of Richmond, Va., was born in Culpepper county, of that State, October 22, 1838, and is of Scotch-Irish descent. He received his early education under a private tutor, and a full course, with graduation, at the Virginia Military Institute. He studied medicine under the preceptorship of Dr. Wm. Alex. Thom, Eastville, Va., was graduated M. D. at the University of Virginia in 1861, and has practiced his profession at Richmond from January, 1866, to the present time. He was First Lieutenant Commanding the Southern Guards at Harper's Ferry, Va., April, 1861; Major Commanding Battalion of Cadets, University of Virginia, from July 1 to November 1, 1861; Assistant Surgeon Confederate States Army on hospital duty at Richmond, Va., from December 1, 1861, to July, 1863; Associate Medical Director on staff of Lieut.-Gen. A. P. Hill (Third Army Corps, Army Northern Virginia) from September, 1863, to March, 1864; Assistant Surgeon Corps of Cadets, Virginia Military Institute, March, 1864, to April, 1865, and in charge of the battalion at the battle of New Market, Valley of Virginia, May, 1864. Dr. Ross was Adjunct Professor of Anatomy and Surgery, Medical College of Virginia, from 1867 to 1875. He rendered valuable service in the treatment of the cholera epidemic of 1866 at Richmond, Va., and was a member of the Board of Health, State of Virginia, from 1869 to 1874; also a member of the Board of Visitors of the Virginia Medical Institute from 1886 to 1890. He has been Chief Surgeon of the Richmond and Danville Railroad from 1886 to the present time; also District Surgeon of the C. & O. R. R., and served as vice-president of the National Association of Railway Surgeons from 1891 to 1892. He is Medical Examiner of the Penn Mutual, Brooklyn, New York and Fidelity Life Insurance Companies; also Surgeon of the U. S. M. Accident Association, New

York; Railway Officials and Employes, of Indianapolis. He has contributed numerous articles to various medical journals on cases from practice. Among his most important papers may be mentioned those under the titles of "Tetanus," "Dystochia," "Cystitis" and "Hemorrhoids."

ROSS, John Dean, of Williamsburg, Pa., was born in that State September 2, 1806. He received an academic education, and studied medicine in the office of Dr. James M. Stewart and in the medical department of the University of Pennsylvania, and was graduated M. D. in that institution in 1832. After practicing his profession six years in Huntingdon county, Pa., he removed to Williamsburg, Pa., where he has remained during the last fifty-five years. Dr. Ross is one of the oldest members of his profession in the Keystone State. He has been a member of the American Medical Association since 1854, and in 1865 was president of the Pennsylvania State Medical Society.

ROSS, Joseph P., of Chicago, Ill., was born, on a farm near what was then the village of Springfield, Ohio, January 7, 1828, and died at his home in 1890. A life sketch, by H. L. Conard, in the *Magazine of Western History*, says: The family to which he belonged was one noted among the early western pioneers for the bravery and heroism of some of its members in the Indian warfare incident to the westward march of civilization, as well as for the thrilling and, in one instance, romantic character of their adventures. The American progenitor of this branch of the Ross family was a Scotchman, who married in England and came to the United States where he located on the Potomac river, in northern Virginia, some time prior to the Revolutionary war. He himself fell a victim to the Indians before he had been many years in America, and five sons whom he had left behind were more or less conspicuous in the subsequent Indian wars. One of these sons, who was carried away from Virginia as a prisoner by the Indians, had an experience hardly less interesting and romantic than that of Captain John Smith in the historic episode which made famous the Indian Princess Pocahontas. Condemned to death, his life was saved through the intercession of the daughter of a noted Indian chief, who afterward became his wife. Another son, the grandfather of the subject of this sketch, fell into the hands of the savages and was ransomed by a French trader after a fire had been kindled for the purpose of cremating him alive after the Indian fashion. His son, William Ross, removed to Kentucky in 1788, and in 1797 to Ohio. He located first near Cincinnati, but a year later, four years before Ohio became a State, he removed to Clark county where he lived until he reached the advanced age of ninety-five years, his wife living to be ninety-four years old. Elijah Ross, one of the sons of this noted Ohio pioneer, was born in Kentucky in 1788, and in 1816 married Mary Laws Houston, of Delaware, O., who came of a family equally noted in the early history of that State. Dr. Joseph P. Ross was one of the six sons of Elijah Ross. When he was six years of age his father moved from Clark to an adjoining county, and located on a farm near Piqua, now one of the more thrifty of the smaller manufacturing cities of Ohio. On this farm Dr. Ross spent his early boyhood, and at the "district" school—as they

are called in Ohio—of that neighborhood, he received his early educational training. When he was nineteen years of age he had acquired a common school education, a sturdy physique and all the knowledge of farming as an occupation that he cared to have. He had in fact made up his mind that farming was unsuited to his tastes and decided to engage in some other business. Leaving the farm and starting out on his own account, he became interested in a woolen mill at Piqua, and his first business venture proved an exceedingly fortunate one for those days. In two years he had laid aside something like two thousand dollars as the profits resulting from his investment in the Piqua Woolen Mills, and he decided to use as much of this as might be necessary to educate and qualify himself for entering the medical profession. Severing his business connections he entered the Piqua Academy, where he pursued a scientific course of study. Soon after he completed his academic course he began reading medicine under the preceptorship of Dr. G. V. Dorsey, afterwards State Treasurer of Ohio, and for many years one of the eminent physicians of the Buckeye State. While reading with Dr. Dorsey he attended two courses of lectures at Starling Medical College of Columbus, and a third course at the Ohio Medical College of Cincinnati. He graduated from the latter institution in 1852, and first located at the town of St. Mary's, in his native State. After remaining there one year he decided to go to Chicago, where he became established in 1853. Soon after going to that city he formed a professional partnership with Dr. Lucien P. Cheney, which continued several years. In Chicago Dr. Ross found a field admirably suited to his capacities, and one in which his professional attainments were fully appreciated. His private practice built up rapidly, and his sympathetic and kindly nature was appealed to on behalf of various charities, with which he became prominently identified, while he was still young in the practice of medicine. He became Physician to the Orphan Asylum, a position which he held for many years, and also First Physician to the State Reform School, now located at Pontiac, Ill., but at that time located in Chicago. Very early in his history as a Chicago physician he became interested in hospital work. In 1858, in conjunction with other gentlemen, he leased what was known as the Old City Hospital of Chicago, which he conducted until 1866, when the Cook County Hospital, which had been used during the war as a government military hospital, was again taken charge of by the county authorities. At that time Dr. Ross became a member of the county board of commissioners for the sole purpose of building up this institution, and his services in that connection were hardly less important than those which he afterward rendered in connection with the inception and promotion of the Presbyterian Hospital enterprise. As a chairman of the Hospital Committee of the Board of Commissioners he devoted a vast amount of time and attention to the work of formulating rules for the government of the institution, arranging for its proper conduct and management, and providing for the proper care and accommodation of patients. He also succeeded in having additions made to the grounds connected with the hospital, and as long as he remained in active practice was one of its at-

tending physicians. In 1868 he became connected with Rush Medical College, accepting one of the two professorships added to the college curriculum, that of "Clinical Medicine and Diseases of the Chest." The position he retained as long as he remained in the practice of his profession, after which he became an *emeritus* professor. In the College Faculty, as in every other organization with which he was connected, he was an active and moving spirit, making his influence felt and leaving the impress of his personality upon the history and character of the institution. He was connected with the college during the most critical period of its history, and was one of those upon whom rested the heavy burden of its rehabilitation when the fire of 1871 left the handsome building a smouldering mass of ruins, and practically swept away all its resources, but a few days after the commencement of its annual course of lectures for that year. The extraordinary activity and energy of the members of the College Faculty at that time, the promptness with which they secured temporary quarters, and resumed the regular course of instruction, are interesting matters of record, not only in the medical, but in the general history of Chicago. To no one of those who showed themselves to be so deeply interested in the welfare of the college is that institution more deeply indebted for its subsequent and present prosperity than Dr. Ross. He contributed time, energy, business capacity and financial assistance toward bringing about the splendid results, which have been realized since the new college took the place of the old one. In the shadow of Rush Medical College, or rather overshadowing that renowned institution for the education of physicians, stands a massive and architecturally handsome building, which is devoted to the sweetest and grandest of all Christian charities: that of caring for those unfortunate sufferers from disease or accident who are without homes, or who lack the means of commanding the services of eminent physicians and surgeons. This magnificent hospital, for such it is, which has but recently been completed at a cost of more than \$250,000, stands as a monument to the generosity and liberality of two or three philanthropic citizens of Chicago, and the charitable impulses and well directed efforts of the subject of the sketch. It was this eminent physician who, had a few years since, noted the fact that the hospital accommodations of the city had failed to keep pace with its rapid growth, and conceived the idea of building up a great hospital which should be controlled and dominated, contrary to the general rule, by Protestant influences, and the doors of which should stand open at all times for the reception of indigent sufferers, who were deserving sympathy and assistance. It was Dr. Ross who perfected the plans for establishing this hospital, and then laid his plans before the members of the church with which he had been for many years identified, asking them to aid him in founding the Presbyterian Hospital. The first contribution towards its endowment came from Mr. Tuthill King, his father-in-law, and one of the pioneer merchant princes of the city. The other munificent donations which followed Mr. King's gift of \$10,000 were largely secured through the efforts of Dr. Ross, and by common consent he was looked

upon as the founder of this splendid charity. In recognition of this fact and for the purpose of perpetuating his name in connection with the great enterprise, to the building up of which he devoted his most active energies and the best years of his life, the main wing of the hospital building has been named the "Ross Wing." Absorbed in a great measure in his profession, Dr. Ross had at the same time interested himself largely in educational institutions, other than those designed, to prepare young men for the practice of medicine. He was trustee of Lake Forest University, a member of the board of directors of the McCormick Theological Seminary, an active participant in the work of the American Medical Missionary Society, and an elder in the Jefferson Park Presbyterian Church since its organization. In recognition of his services as an educator, the faculty of the Kenyon College of Gambier, O., some years since, conferred upon him the honorary degree of Master of Arts, and in his professional field he was honored by membership in the leading medical societies and associations of the country. While Dr. Ross' work as a public benefactor stands a monument to his success, the acts of his private life endeared him to his patients and friends. He was a born physician. Thoughtful and dignified in demeanor, and always kind in manner, his presence in the sick-room inspired the invalid with confidence, his genial smile cast sunshine into the chamber of gloom, and his sympathy made life-long friends of all those with whom he came in contact in a professional capacity. He was no respecter of persons; in fact he would answer the calls of the poor more promptly than those of the rich, for he said they had fewer friends about them in time of need. A man's true greatness is most conspicuously manifested in the courtesy shown by him towards his professional colleagues. Dr. Ross had none of the superciliousness of manner which frequently characterizes the old practitioner, in his intercourse with the younger members of the profession, but was always recognized as the friend of young physicians; and how many now successful practitioners owe him a debt of gratitude for assistance which he rendered them in the early years of their professional career. One of the cherished projects of his later life, which he was compelled to abandon by the illness which left him a confirmed invalid, was the building up of a great sanitarium on the famous battle-field of Look-out Mountain, which, aside from its historic associations, he looked upon as one of the most healthful and picturesque locations for an institution of this character to be found in the United States. His plans for carrying out this project were well under way when he began to feel himself breaking down under the numerous burdens which had been thrust upon him. Extensive travel, both in this country and abroad, failed to restore him to health, and thus was cut short the professional career of one who, for more than thirty years had been a most prominent figure among the medical practitioners of Chicago. As a physician, an educator, and a citizen, he was alike conspicuous for his ability, his integrity, and his high character, and few of the professional men of his city have left behind them a more enviable record or a greater amount of good accomplished as a result of their life's work.

ROSSE, Irving Collins, of Washington, D. C., was born, October 20, 1842, at East New Market, Dorchester county, Md. He is of Anglo-Scotch descent, his paternal ancestor being a Church-of-England clergyman, the Rev. John Rosse, rector of All Hallows. After preliminary academic training, he spent three years at St. John's College, Annapolis; was cadet at West Point, 1863-64; subsequently took up the study of medicine under Dr. Alexander H. Bayly, of Cambridge, and was graduated at the University of Maryland in 1866. His medical education was supplemented by private instruction in Philadelphia from Dr. J. Ewing Mears. He is a matriculate of the University of the City of New York, an alumnus and A. M. of Georgetown University and of the New York Post-Graduate Medical School, and is F. R. G. S. (England); further supplemental instruction he obtained in Edinburgh, London, Berlin and Paris. Dr. Rosse was clinical assistant to Baltimore Infirmary; medical officer in United States Army from 1866 till 1874, during which time he served at various posts with cavalry, infantry and artillery, and as quarantine officer at Savannah, Ga., being present at the cholera epidemic at Tybee Island; was also quarantine officer at Brazos Santiago, Texas, and post surgeon at Point Isabel; afterwards served at the Artillery School at Fort Monroe, Va., and on the staff of Gen. Henry Hunt, U. S. A., during the Ku-Klux troubles in North Carolina; detailed for duty in the Surgeon-General's office (1870-74), in connection with the preparation of the "Medical and Surgical History of the Rebellion;" prepared Circular No. 3, being a report of the surgical cases treated in the army of the United States from 1865 to 1871; and while on duty in the Army Medical Museum, did the principal work on the "Index Catalogue of the Library of the Surgeon-General, U. S. A." now publishing, and for which another person claims the credit; was offered the position of surgeon to Northwest Boundary Survey, but declined; quitting the service, was two years subsequently made medical examiner to Pension Office, after competitive examination; appointed surgeon to National Asylum for Disabled Soldiers at Milwaukee, December, 1878, but declined; employed as surgeon to Revenue Marine Bureau, 1877 to 1883; was in Africa during the Zulu War; has circumnavigated the coast of the United States and the great lakes; made a number of voyages on training ship, "Chase;" also, two polar expeditions on the "Corwin," in search of the exploring yacht "Jeannette," and was the first to climb a hitherto inaccessible spot, Herald Island, and to set foot on Wrangle Land, which achievement won recognition from the Royal Geographical Society. He was executive officer of Red Cross Hospital, Washington, D. C., 1887; juror to Paris Exposition, 1889; and for some time has been president of United States Examining Board. He is a member of the Medical Association, and of the Medical Society of the District of Columbia; of the American Medical Association; the American Congress of Physicians and Surgeons; the American Anthrometic Society; the American Neurological Association, and of the Congrès International d'Anthropologie Criminelle. Besides having been special correspondent to *The New York Herald*, the *Chicago Times* and *San Francisco Examiner*,

he has contributed largely to medical journals, especially the *Medical Record*, New York; *Boston Medical and Surgical Journal*, *Journal of Mental and Nervous Diseases*, *Journal of the American Medical Association*, and other leading periodicals; and, also, to Appleton's Cyclopeda, and to The Reference Hand-Book of the Medical Sciences. A number of his contributions have been translated and published abroad. Among the more important are: "Medical and Anthropological Notes—Cruise of the Corwin to Alaska and the Northwest Arctic Ocean," Washington, 1881; "The First Landing on Wrangle Island, with some Remarks on the Northern Inhabitants," American Geological Society, New York, 1883; "Cerebral Hemorrhage," "The Grape as a Food and Medicine," 1885; "Illustrations of Error in the Diagnosis of some Nervous Diseases," 1887; "The Electro-Static Remedy," "Reversive Anomalies in the Studies of the Neuroses," 1888; "Fallacies Regarding Athletes and Athletics," 1889; "Bathing and Boating Accidents," "Borderland Insanity," "Neuropathic States Involving Doubt," 1890; "The Neuroses from a Demographic Point of View," "Washington Malaria and Politics as Genetic Factors," 1891; "Triple Personality," "Sexual Hypochondriasis and Perversion of Genesic Instinct," 1892. He is also a contributor to *Witthaus' Medical Jurisprudence*. Dr. Rosse has a fine record as an all-round athlete. He is a well-known club man, and in a collateral way is interested in geography and out-door athletic sports. At present he is Professor of Nervous Diseases in the Georgetown University, and practices his specialty in Washington.

ROWE, L. M., of Indianapolis, Ind., was born in Columbus, Ohio, August 20, 1859, and is of English ancestry. His parents removed to Indianapolis soon after the close of the Rebellion, and he received his education in the public schools of that city, which was supplemented by instruction in private institutions. In 1879 young Rowe began the study of medicine, under the preceptorship of the late Dr. T. B. Harvey, and then entered the Indiana Medical College, from which institution he received his medical degree in 1882. Soon afterward he accepted the position of assistant to Dr. Harvey in his office and college work, which position he retained until the time of Dr. Harvey's death. Dr. Rowe is at the present time devoting his attention chiefly to diseases of women, having had superior advantages in this line of practice on account of his early association with his late distinguished preceptor. His work in this department has been highly satisfactory, having had almost unrivaled success in some of his operations. As a result of a considerable experience and study of fibroid growths, he believes that under the present methods of antisepsis, that all growths of this character, where cutting is dangerous, may be safely and efficiently treated by merely injuring them and causing suppuration, after which by means of thorough drainage and antisepsis the growths will disappear. Dr. Rowe was led to this conclusion by having charge of a patient suffering from an intramural fibroid. The woman was examined by Dr. Harvey and the tumor wounded, but not removed. The case being left in his care, recovered, and he concluded that a similar procedure would be ap-

plicable to the treatment of goitre. In 1890 he accordingly operated on a lady for goitre by introducing a drainage tube and establishing suppuration, which was followed in a few weeks by the total disappearance of the tumor, the patient now enjoying better health than for years. In this operation he was assisted by Dr. J. M. Dunlap. In January, 1891, he again operated on a patient affected with a fibro-cystic goitre, in which the growth was of enormous size, extending far up under the ears, and causing such disturbance that the patient was an invalid, verging upon insanity and threatening suicide. This tumor was as large as a man's head, and was estimated to weigh ten pounds. In this case Dr. Rowe could get no other doctor to assist him, so alone he introduced a large drainage tube through the body of the growth, establishing free suppuration, and in the course of a few months the treatment was followed by a complete disappearance of the tumor, and the patient is to-day a strong and vigorous man. He has also operated upon a number of other patients by this method with equally good results, and expects to report all his cases to his local medical society in the near future. Dr. Rowe is a member of various medical societies, and has spent some time in the hospitals of the Eastern cities. He has proved himself a competent and successful practitioner of medicine and surgery.

RUPP, Adolph, of New York City, was born in Brooklyn, N. Y., February 4, 1856, and is of German descent. His education was received at the public schools of New York, supplemented by private tuition, after which he began the study of medicine under the preceptorship of Dr. J. Harvi Dew, of that metropolis, and entered the medical department of the University of the City of New York, from which institution he was graduated in 1877. He served on the Charity Hospital Resident Staff from 1877 till 1879. During the latter year he supplemented his education by courses of study at Vienna, Austria, with Profs. Schroetter, Gruber, Ultzmann, Neumann, and others. During December, 1879, and up to April 1, 1880, he studied laryngology with Prof. Ertel at Munich, and while there attended Prof. Von Ziemssen's didactic lectures, and occasionally those of Nussbaum. From April to September, 1880, he studied rhinology and laryngology at Heidelberg, and during the following six months he continued his studies of the same branches at Leipsig, finally ending his foreign studies at Berlin during the spring and summer of 1881, and in the autumn of the same year he established himself in New York City, where he has since remained engaged in the treatment of diseases of the ear, nose, throat, heart and lungs. Dr. Rupp has served as Medical Examiner for the Ancient Order of United Workmen; was Attending Physician to the Northern Dispensary during 1881 and 1882, and was Aural Surgeon to the New York Eye and Ear Infirmary from 1882 till 1890. Dr. Rupp is an active member of the New York County Medical Society, and is a Fellow of the New York Academy of Medicine. He translated from the German "Anomalies of the Epidermis" for William Wood & Co.'s edition of Ziemssen's Medical Encyclopedia, and also translated an article on "Herpes Progenitalis" for the Journal of Cutaneous and Venereal Diseases. Of his original

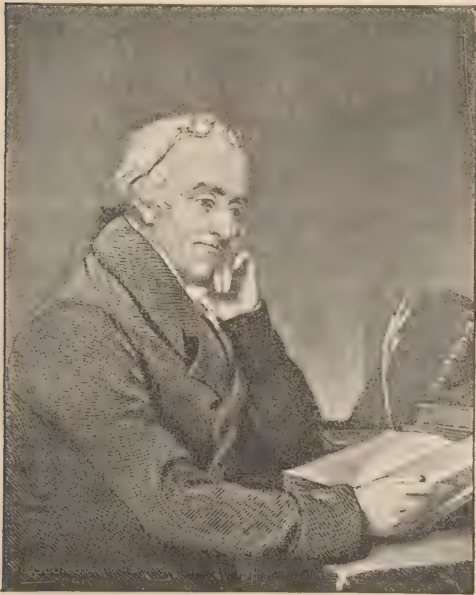

contributions to medical journals may be mentioned: "Remarks on Diphtheritic Croup," "Is the Operation of Tracheotomy in Diphtheritic Croup Dangerous?" 1885; "On Calcium Sulphide in Aural Inflammation," "On Syphilis of the External Ear," and "On Fracture of the Sternal End of the Clavicle Due to Muscular Action, Report of a Case Caused by Coughing," 1891, and other articles of professional interest.

RUPPNER, Antoine, of New York City, was born in Switzerland in 1825, and died August 2, 1892, at Pittsburgh, Pa. Prof. Agassiz, of Cambridge, was interested in young Ruppner, and through his instrumentality he took the Harvard medical degree in 1858. He began practice in Boston, adopting laryngology as his specialty, being among the pioneer specialists of Boston. About 1866 he removed to New York, locating for office practice at the Fifth Avenue Hotel. Latterly he removed to the Hoffman House. His offices were replete with objects of art, finely bound books and choice curios. He was a bachelor and without heir or near kin, although leaving an estate valued at over half a million. His contributions to the journals were among the first of their kind in this country, and in 1868 he published a small handbook on laryngology and rhinoscopy or diseases of the throat and nasal passages. This latter was probably the first brochure, indigenous in this country, at a time when even the term rhinoscopy had a strange and uncertain sound to American ears.

RUSCHENBERGER, William S. W., of Philadelphia, Pa., was born in Cumberland county, N. J., September 4, 1807. He received his academic education at Philadelphia and New York, and studied medicine, under the direction of Dr. J. P. Hopkinson and Dr. Nathaniel Chapman, in the Medical Department of the University of Pennsylvania, from which he graduated in March, 1830. His professional career was confined to the naval service of the United States, which he entered August 10, 1826, as surgeon's mate, and from which he retired September 4, 1869, as Medical Director, with the relative rank of commodore; having meanwhile served from March, 1835, to November, 1837, as Fleet Surgeon to the East India squadron, in which capacity he circumnavigated the globe; as Superintendent of the United States Naval Hospital, at Brooklyn, from 1843 to 1847, during which he organized the Naval Laboratory, for supplying the service with unadulterated drugs; as a member of the board to devise plans and regulations for the United States Naval Academy, in 1849, and subsequently as Surgeon of the fleet, Pacific squadron. He is a member of the American Medical Association; the College of Physicians of Philadelphia, of which he was elected secretary in July, 1854, and vice-president, May 5, 1875; the Academy of Natural Sciences of Philadelphia, of which he was elected vice-president in January, 1869, and president in the following December. He is also a member of the American Philosophical Society and Historical Society of Pennsylvania. The fruits of his observations and researches, afloat and ashore, appeared in a succession of works, entitled: "Three Years in the Pacific," 1834; "A Voyage Round the World," 1838; "Elements of Natural History," "Lexicon of Terms Used in Natural History," 1850; "A Notice of the Origin, Progress, and Present

Condition of the Academy of Natural Sciences of Philadelphia," 1852; and "Notes and Commentaries During a Voyage to Brazil and China, in 1848." He has also published several pamphlets on the rank of medical officers in the navy, edited with notes; Marshall's work on "Enlisting, Discharging, and Pensioning Soldiers;" and contributed various papers and reviews to the *Medical Examiner*, the *American Journal of the Medical Sciences*, the *Journal of Pharmacy*, and other medical and scientific periodicals. Several of his books have been published in London. Dr. Ruschenberger is one of the oldest and most widely known members of the medical profession in this country. He was married in October, 1839.

RUSH, Benjamin, of Philadelphia, Pa., was born on a hereditary farm belonging to his father, on Poquestion Creek, thirteen miles northeast of that city near the turnpike lead-

Benjamin Rush

ing to Trenton, December 24, 1745, and died at his home, in Philadelphia, April 19, 1813. For the details relating to the life and achievements of the subject of this sketch, the editor is mainly indebted to the memoirs written by Dr. Samuel Jackson, Dr. Jacob Randolph and the History of the University of Pennsylvania, by the late Professor Joseph Carson. Referring to the ancestry of this remarkable physician, Dr. Jackson writes as follows: His great-great-grandfather was John Rush, a captain in Cromwell's army, and highly esteemed by that keen observer of men. He came to America in 1683, and settled in Byberry township, Pa., near Philadelphia, where he lived on his farm and died in 1699, at the age of eighty. William, the great-grandfather, died in Byberry, in 1688. James, the grandfather, was so careful in his business that he left not

a single debt behind him. John, the Doctor's father, was a man of gentle and meek spirit, so perfectly just that to be as honest as John Rush was a proverb. He died in Philadelphia in 1751 and was buried in Christ Church graveyard. His wife's name was Susanna Morris; of respectable family she must have been, as the Rev. Dr. Samuel Finley, afterwards president of Princeton College, married her sister. She lived to 1795, her seventy-eighth year, and died in the Doctor's house. "Let me be buried by my husband," she said, "he was an angel to me." She was buried there, with the encomium, "best of mothers" on her tomb, and this subscribed B. Rush. Is there any mortal so obdurate as not to be thankful that this best of mothers lived to rejoice in the honors of her son? But whatever is attainable in relation to Rush's ancestry and their long residence in Byberry, can be learned from the following letter, with more satisfaction than from any other source. It was written about eight months before the Doctor's death, to his intimate friend, John Adams, ex-President of the United States. It is copied from Watson's *Annals of Philadelphia*: "I was called lately to visit a patient in that neighborhood, and having with me my youngest son, I thought I would avail myself of the occasion to visit the farm on which I was born, and where my ancestors for several generations had lived and died. In approaching it, I was agitated in a manner I did not expect. The access was altered, but everything around was nearly the same as in the days of my boyhood, at which time I left it. The family received me kindly, and discovered a disposition to satisfy my curiosity, and gratify my feelings. I asked permission to conduct my son up stairs, to see the room in which I drew my first breath, and made by first unwelcome noise in the world, and where first began the affectionate cares of my beloved and excellent mother. I next asked for a large cedar tree which once stood before the door, planted by my father's hand. It had been converted into the pillars of the piazza. Filled with emotion, I embraced the one nearest me. I next inquired for the orchard planted by the same hand, and was conducted to an eminence behind the house, where I saw a number of apple trees which still bore fruit, to each of which I felt something like the affection of a brother. The building, which is of stone, bears marks of age and decay. One of the stones I discovered the letters J. R. Before the house flows a small but deep creek, abounding in pan-fish. The farm consists of ninety acres, in a highly cultivated state. The owner did not want to sell, but I begged if he ever should incline to dispose of it, to make me, or one of my surviving sons, the first offer. While I sat in its common room I looked at its walls, and thought how often they had been made vocal by my ancestors—to conversations about wolves, bears, and snakes in the first settlement; afterwards about cows and calves, colts and lambs, and at all times with prayers and praises, and chapters read audibly from the Bible, for all who had inhabited it of my family were pious people, chiefly of the sect of Quakers and Baptists. On my way home I stopped to view a family graveyard, in which were buried three, and a part of four successive generations, all of whom were the descendants of Capt. John Rush, who, with six sons and three daughters, fol-

lowed William Penn to Pennsylvania, in 1683. He had been a captain of a troop of horse under Oliver Cromwell. I retain as his relics his sword, watch and Bible-leaf, on which are inscribed, in his own hand, his marriage, and children's births and names. My grandfather, James Rush, has his gravestone and inscription in the aforesaid graveyard. While considering this repository of the dead, then holding my kindred dust, my thoughts ran wild, and my ancestors seemed to stand before me in their homespun dresses and to say, 'What means this gentleman by thus intruding upon our repose?' and I seemed to say, 'Dear and venerable friends, be not disturbed. I am one who inherits your blood and name, and have come here to do homage to your Christian and moral virtues; and truly I have acquired nothing from the world, though raised in fame, which I so highly prize as the religious principles I inherited from you, and I possess nothing that I value so much as the innocence and purity of your character.'" Rush lost his father in his sixth year, when his mother, now left with a small property, went into business in Philadelphia. She has been uniformly represented as a good and prudent woman who, by industry and economy, supported her family respectably, and was ambitiously determined to bestow on her sons a liberal education. Even their bitter enemy, the celebrated Cobbett, says, "she was a very kind and pious Presbyterian." Jacob, the younger son, became an eminent lawyer, and finished his life in an honorable old age, being for many years president judge of a Philadelphia court. There was one sister who lived unmarried and died in 1793, at the Doctor's house. The Rev. Dr. Finley, mentioned above as his uncle by marriage, lived at Nottingham, Maryland, on the Patuxent, near that sorrowful spot where the British landed in 1814, on their way to Washington. Here he governed an academy with great reputation, acting at the same time as pastor of a church. To this place, propitious to study morality and religion, Benjamin was sent in his ninth year and received into the Doctor's family. Under the care of this good man, standing in the triple relation to him of teacher, pastor and near connection, he is supposed to have experienced something like paternal care; here, too, as the people around were religious and exemplary, he no doubt established those various good habits that were never broken. In his fourteenth year he was sent to Princeton College, then under the presidency of the Rev. Samuel Davies, a divine highly distinguished both for piety and eloquence. He graduated Bachelor of Arts in 1760, while yet in his fifteenth year. Dates show that he must have been a diligent, if not a precocious student, and that he had entered college by the Junior class. As he was remarkably happy in elocution and debate, his friends encouraged him to study law, as the province best suited to the display of his peculiar talents and the gratification of their laudable ambition; but Dr. Finley, knowing the genius of his pupil, diverted his attention to medicine. He therefore quickly began his studies under Dr. John Redman, the most eminent physician of Philadelphia; and so assiduous was he that, during his six years of pupillage here, he was absent from the duties of the office only two days. As a striking proof of his laborious devotion, he

now translated the Aphorisms of Hippocrates from Greek, and kept a common-place-book, in which he wrote concerning whatever he saw, read, or thought—a practice which he maintained to the end of his life, and recommended strongly to his pupils, as may be seen in his introductory lecture for 1809. To this journal he referred in the yellow fever of 1793, and found there the only record then known to be extant of the same fever, which he had witnessed in 1762—a memorable instance of the utility of a young man's care. In 1766, in his twenty-first year, he went to the great medical school of Edinburgh, then in the height of its glory under the fascinations of Cullen; and there is abundant proof that he became a favorite of this great teacher. In 1768 he graduated M. D., having defended a thesis, *De concoctione ciborum in ventriculo*. During his residence in Edinburgh, Dr. Witherspoon, of Scotland, was elected president of Princeton College, but he declined the honor and the office remained vacant more than a year. The trustees then, calling to mind the merits of their alumnus, Rush, deputed him as their commissioner to negotiate with Dr. Witherspoon, and to invite him a second time. This delicate trust having been successfully executed, an intimate friendship began between the young man and the eminent scholar, that lasted as long as they lived. The imported president became an American patriot and sat with Rush in the Congress of 1776, where they set another seal to their friendship, by signing together the Declaration of Independence. In his lectures and writings, Rush often quoted the authority of his venerable friend; and says, in his introductory lecture for 1809, that he was one of the three "most copious, methodical, and correct extempore speakers" in the house. The following winter, Rush attended the hospitals, lectures, and other sources of instruction in London. Dr. Franklin was then residing in that city, and he proved kind to his countryman, frequently introducing him to good society at his house and table. When Rush was preparing the next spring to return home, Franklin urged him to spend some time in France; when, finding, through the most affectionate inquiry, that funds were wanting, he fairly obtruded upon him a large sum. This shows conclusively that the prudent, economical, calculating Franklin plainly saw evidence of great worth in the young man. It is an old saying that facts speak louder than words, and here is one that speaks with the lungs of Stentor and the authority of Franklin. He then spent some months in the hospitals of Paris; and in August, 1769, after nearly nine years' study of medicine, he settled in Philadelphia, as a practitioner of what he had so faithfully learned. He was immediately elected Professor of Chemistry in the Medical College of Philadelphia, his colleagues being John Morgan, William Shippen, Adam Kuhn and Thomas Bond. He had brought from London a chemical apparatus, presented to the college by Thomas Penn, one of the proprietors of Pennsylvania, who had been promoting medical instruction in Philadelphia for some time. This institution was now in its fourth year, and had conferred the degree of Bachelor of Medicine on nine students at the previous session. He was still in his twenty-fourth year, and yet he had spent nine years in the study of medi-

cine—such are the great advantages of an early beginning in the acquisition of this “long art.” His biographers tell us that he was very successful in acquiring and retaining professional business; this is highly probable, for he possessed every requisite to the forming of friendships, and to the successful treatment of disease. In 1771 he appeared as an author, and spread his reputation among the Philadelphians, particularly through the benevolent Society of Friends, by essays on slavery, and by sermons to young men on temperance and health. He published, also, something on mineral waters, a subject in alliance with his professorship. These all appeared in the magazines of the times; and as native literature was scarce, they were no doubt generally read and talked of to the young physician’s advantage. In his introductory lecture for 1807, on “The Means of Acquiring Practice,” he mentions the utility of writing on a subject of public concern. In 1774, then only in the fifth year of his practice, he delivered the annual oration to the Philosophical Society, “An Inquiry into the Natural History of Medicine among the Indians of North America, with a Comparative View of their Diseases and Remedies with those of Civilized Nations.” With respect to health, strength, endurance, longevity, morals, and every virtue, he draws a comparison highly favorable to civilization in its uncorrupted state. But here he shows that his countrymen were even then running headlong in the evil ways of European nations; that they were relaxing their stamina by luxury and idleness. Here he makes his first attack on the use of spirits, and probably the first that was publicly made in Philadelphia. He concludes by setting forth most eloquently the possible future glories of Pennsylvania, under the fostering care of science and government. It is a work of great merit; and whether in style, manner, or force, it is not surpassed by any of his later writings. It ought to be read and studied by all the luxurious and idle, that they may see and feel how poor is their hope of preserving health or of attaining longevity. The portentous troubles with the mother country were now too clearly foreseen as at no great distance, and Rush, from the first sign thereof, became a decided patriot. He had been a member of a debating society in London, at which Dr. Franklin was sometimes present, and as he had there distinguished himself by his manly defense of his country, so he now wrote much in the newspapers in favor of colonial rights. A distinguished and reliable young man he must have been, or he could not have been found in that memorable house of Congress which, at the manifest risk of their lives, had the courage to liberate their country, by signing the Declaration of Independence. Honorable as a seat in this Congress was, it was given to Rush with more than usual honor, in the following manner: He was a member of the Provisional Conference of Pennsylvania, and chairman of the committee to which was referred the great question, whether it had become expedient for Congress to declare independence. The report they made was adopted, and sent to Congress the same day. It is a most animating document, most probably written by Rush, as he was chairman of the committee, and ever ready with his pen. The whole committee consisted of himself and Colonel James Smith. The

report includes all that has been so much praised in the Declaration of Independence, of which it might appear to be the protocol. When Congress had decided on their great measure, five members from Pennsylvania, who were in favor of postponing it, withdrew from the house, when the State Convention appointed Rush and four others to fill their places. Thus, our patriot went into Congress knowing what he had to do. He did not sign the tremendous parchment because he was a member, he became a member that he might sign it—a fact that greatly enhances the merit. This year, 1776, he was married to Julia, daughter of Richard Stockton of Princeton, who was also a delegate to Congress, and signed the Declaration; an alliance truly honorable and highly advantageous even to this rising man. Towards the end of his year, he was appointed Surgeon-General of the army for the Middle Department, which office he exchanged the following July for that of Physician-General. In the bustling discharge of his duties, he made many useful medical observations, which were afterwards interwoven with his writings; and in his “Medical Inquiries,” there is a paper entitled “Result of Observations made in the Military Hospitals of the United States.” Among the evils of war, one of the most affecting is that friends must sometimes face each other on the field. While walking over the ground after the battle of Princeton, Rush recognized in a dead officer the countenance of one who had been very dear to him. Captain Leslie, son of the Earl of Leven, attended lectures with him at Edinburgh, and often invited him to his father’s seat in the country, where, in the confidence of friendship, they often desecrated on the coming troubles. He pressed Leslie to consider him as a friend, should he be sent to America, and any misfortune befall him. On these terms they parted, to meet no more till that fatal day. Had Leslie been yet alive, they might have renewed the meeting of Glaucus and Diomed before the walls of Troy, and like these, they might have tenderly adverted to the paternal hospitality. Instead of this, there was found in Leslie’s pocket a letter of friendship he had written to Rush the previous day. Rush had the body of his friend carried away in their march to Pluckemin and buried in the churchyard with military honors. A relative of Leslie visited the grave after some years, with the intention of placing a monument, but he found that Rush had done the work, and he retired, as he says, with tears of gratitude. This monument, yet unimpaired by time, bears the following inscription, which does honor both to Leslie and to the grateful spirit of Rush: “In memory of the Hon. Captain William Leslie, of the Seventeenth British Regiment, son of the Earl of Leven, in Scotland. He fell January 3, 1777, aged twenty-six years, at the battle of Princeton. His friend, Benjamin Rush, M. D., of Philadelphia, hath caused this stone to be erected, as a mark of esteem for his worth, and of respect for his noble family.” Notwithstanding his many distracting duties—the battles of Trenton and Princeton, the inoculation of the army that winter, and then the battles of Brandywine and Germantown, with the awful sickness at Valley Forge, he found time for writing four very long letters to the people of Pennsylvania, commenting severely on their

Constitution of 1776, and urging an immediate revival. There was a party in the State who thought it too democratic; these called themselves Republicans, and Rush appears to have been one of their leaders. The letters descend principally on the dangers of giving the legislative powers to a single house, bringing forth authorities both ancient and modern. He shows that he was not a man of the Hippocratic genus merely, but also a prophetic politician, who foresaw all the monstrous evils resulting from the savage unity of the French legislature in a single house. The subject was not medical, philosophical, or literary, nor did it relate to the cause of Independence, which had been exercising his mind; it was entirely new to him, requiring, therefore, much appropriate reading and severe study, so that his present political seems to have equalled his future medical ardor. All tradition indeed relates that his exertions in letters and newspapers were very great, during the whole struggle for liberty and the organization of the general and State governments. The four letters just mentioned are the work of a master; they are a torrent of invective, not unworthy of Junius or Burke. In February, 1778, he resigned his office in the army, for which he had two reasons, either of them sufficient; first, his sense of duty to the soldiers had led him to complain of wrongs in a certain department; second, there arose some coldness between him and the Commander-in-chief. It was said then, what is still objected to him by his enemies, and by those loose talkers who are without affection either good or evil, and therefore neither know nor care, that he called against Washington. This charge was not proven to the world, and were it proven, it would come to nothing. As Hildreth, the historian, says, "Washington of that day was not Washington as we now know him, tried and proven." His command of three years had shown little else than a series of disasters, while Gates enjoyed the fortunate reputation of having captured a great army. Hence the Legislature of Pennsylvania addressed a remonstrance to Congress, in which, says Judge Marshall, "they manifested in very intelligible terms their dissatisfaction with Washington." A party, moreover, had gradually formed itself in Congress, of which the leaders were those renowned patriots, Samuel Adams and Richard Henry Lee. These imputed to Washington a want of energy and a system of favoritism. Now, surely it was not to Rush's dishonor to be found in company with these great men, or such as they would admit to their councils; it could not disgrace him to think as did the Legislature of Pennsylvania. They all lived to see Washington proved, and no doubt the minds of all were changed. Rush is no more to be blamed for undervaluing Washington in 1778, than for rejecting in a most dangerous case, a medicine he had not sufficiently tried. One ray of reason, however, dissipates the intended stigma. He had been a decided and active Whig from the very beginning, and the conspiring with a few of the best of men against the many and the powerful, strongly proves the vigor and warmth of his patriotism. "It only affords a melancholy proof," says an eminent writer, "that the purest of men may be led into error." But anonymous letters were written, and Washington imputed one of these to Rush.

The imputed letter is indeed without a name, but its whole tenor shows that the writer intended to be recognized by Patrick Henry, to whom it was addressed. He did not subscribe his name lest it might, in those slippery times, fall into other hands. It breathes throughout the most ardent patriotism, and truly it is what no honest man ought to be ashamed of. Suppose a parallel case: Hamilton is ill under Rush's care; Washington writes the patient an anonymous letter, but in such language that the author must be recognized, advising him to dismiss Rush and send for John Morgan, an older practitioner; but Hamilton is cured by Rush, who afterwards becomes a great physician; now has Washington done what ought to excite the ire of Rush's friends through all time, and that of their children then unborn? It was very wrong in Judge Marshall to publish this letter after twenty-six years, and send it abroad with an under current of scandal, to inform the world of its imputed author, calling it "a machination probably with good intent." This could not have been done in a Christian mind, for it was not necessary to Washington's fame. (See the letter, dated Yorktown, January 12, 1778, Marshall's *Life of Washington*). Had Marshall and others been disposed to relate the whole truth, they might have informed us that Washington stood so low at that time in the esteem of Congress,—of which Rush was not then a member,—that a majority were preparing to pass a resolution to arrest him at Valley Forge; a bad intention, prevented only by procuring during the night the hurried arrival from New York of an absent member. See "Dunlap's History of New York." It is, moreover, related on the reliable authority of the late Judge Jay, that the great and good man, his father, told him "there was a most bitter party in the old Congress against Washington from first to last." See "Irving's Life of Washington." Though poor at this time, Rush would not receive any compensation for services in the army, an example not commendable in either him or Washington, as thereby they made themselves objects of envy to many good men, whose wives and children could not forego their pay. He soon returned to Philadelphia and resumed his practice. The college had been interrupted by the presence of the British army, but it was reopened in the autumn of 1778 with a class of sixty, an auspicious number surely in the deplorable state of the country. We must now think of him for some years principally as a professor in the college and a practitioner of medicine, but that his tongue and pen were busy in the cause of his country, humanity, and science, there are many proofs. Soon after this, Dickinson College was projected, of which he was said to be the father, but for what reason is not ascertained. He was, however, one of the first board of trustees; and it was by his delicate management that Dr. Nesbitt was induced to leave Scotland and preside in this unpromising institution. So important were this gentleman's services, that Rush, if not the father, might not inaptly be called the grandfather of this college. In 1785 he published "Considerations on the Test Laws of Pennsylvania," which had disfranchised every man who could not swear or affirm "that he had not, since the Declaration of Independence, aided, assisted, or in any way countenanced the King of Great Britain, his generals, armies,

or adherents." He pleads the cause of the non-jurors through twenty-three closely printed pages, with a torrent of argumentation that would honor a professed and profound politician. About this time he projected the Philadelphia Dispensary, and went about the collection of funds with his usual vigor and success. The next year it went into operation, and proved to be a prolific example to other cities. Thus he had the comfort of seeing his good works multiply themselves. In 1786 he read to the Philosophical Society his very important essay "On the Influence of Physical Causes on the Moral Faculty," which we shall particularly notice in a subsequent page. This same year he published also an "address to the Legislature of Pennsylvania on the establishment of public schools, and on the mode of education proper in a republic." He shows herein that he had thought deeply on the subject, with his usual energy and zeal, republican fire and Christian principles. Dr. S. Weir Mitchell in his address as president of the College of Physicians at the Centennial anniversary of the institution, delivered January 3, 1887, makes an interesting review of the public services rendered by the early physicians of Philadelphia, which included the career of Dr. Rush. In this address he said: "We are met this evening to commemorate the hundredth birthday of the oldest medical society in America. The history of any profession in connection with the progress and growth of a new country is of the utmost interest, and of no profession is this more true than of ours. In this city, I may say in this State, from the first settlement until to-day the physician has held an almost unquestioned and somewhat curious pre-eminence. He is, and always has been, relatively a more broadly important personage here than elsewhere. I desire to show what breadth of liberty they had to do things which nowadays would scarcely be regarded as within the legitimate career of the largest-minded physician." In 1787 the College of Physicians was established, and he wrote for them a discourse on the objects of the institution, published afterwards in their Transactions for 1793. It is a performance of striking merit, showing great comprehension and foresight for that early period. Hardly anything could be added to it even at the present time. He points out all the duties of the college and the hopes that might be justly entertained of its future utility and beneficence; he shows the opportunities it would afford of mutual improvement, then everything which they ought to attempt for the advancement of science and for the public good. It is a manifestation of such a mind as no other man in the house possessed. His usual glow of patriotism concludes the work with the belief that "the influence of republican forms of government on science, and the vigor which the American mind had acquired by the events of the Revolution," would contribute greatly to the advancement of medicine. This same year we find him, for a busy practitioner and professor of medicine, entirely out of his place; to use medical language, he had suffered a dislocation. The kindred shades of Hippocrates and Sydenham might have pardoned his political avocation when his country needed his help, but now the claims of medicine on his time were paramount. Yet he became a member of the Convention of Pennsylvania for the

adoption of the Federal Constitution. In a letter to a friend, he says: "The new Federal Government will be adopted by our State. It is a master-piece of human wisdom, and happily accommodated to the present state of society. I now look forward to a golden age. The new Constitution realizes every hope of the patriot and rewards every toil of the hero. I love my country ardently, and have not been idle in promoting her interests during the session of the convention. Everything published in all our papers, except the *Foreign Spectator*, was the effusion of my Federal principles. The Legislature of Pennsylvania had lately made some criminal laws abhorrent, both to philosophy and humanity, and Rush could not go through Philadelphia without seeing his fellow-men chained to wheelbarrows or writhing at the whipping post. When the benevolent Chremes was asked how he could find leisure amidst his own affairs to attend to other people's business, he answered, "I am a man." Such was Rush; and therefore he read this year to a society, which was accustomed to meet at the house of Dr. Franklin, "An inquiry into the effects of public punishments on criminals and upon society." By this and subsequent exertions to the same end, he is known to have contributed greatly, if not more than all others, to the amelioration of the penal code. As above stated in 1787, he was chosen a member of the Convention of Pennsylvania for the forming of a State Constitution; but he probably undertook this extraneous business that he might have an opportunity of doing his utmost with respect to public punishments and public schools, concerning which he had been writing. He might, moreover, have hoped to impress his fellow-laborers with the principles he had defended in his four letters of 1777, on the vices of the existing constitution. Having rendered these services to his country and to his native State, having helped them to the utmost of his power in all their dangers and difficulties, in the establishment of their government and their security from anarchy, he said that he had now done with politics forever, feeling it his duty to devote himself to his profession and to the providing for his family. He had become a politician from principle. In his lecture on "The Duties of a Physician," 1789 (see "Medical Inquiries and Observations,") he recommends to his class "a regard for all the interests of their country," as their education and their influence qualify them for public usefulness. He says, "For the honor of our profession, it should be recorded, that some of the most useful men, both in the cabinet and the field, during the late War, were physicians." Though now devoted to medicine, the republican fire was still glowing in his breast; and as a means of kindling and fanning it through all future time in the hearts of his countrymen, he published "Thoughts on Female Education." He observes that a philosopher once said, "Let me make the ballads of a country, and I care not who makes the laws; he might, with more propriety, have said, let the ladies be educated properly, and they will not only make and administer the laws, but form manners and character." He says that the first signs of declension among a people are seen among the women; "their idleness, ignorance, and profligacy will be the harbingers of our ruin." He then draws a

picture of the evils resulting from the perverse education of females, not unworthy of Tacitus. In 1789, in his forty-fourth year, he was elected to the chair of Theory and Practice, in place of Dr. John Morgan, deceased. His introductory lecture was partly occupied by a memorial of his predecessor, who had been the founder of public medical instruction in America, and in this College. This memoir, since published in the *Philadelphia Medical and Physical Journal*, is believed to be nearly all that is attainable concerning the life of a highly educated and strong man in the profession, whose memory and services ought to have been cherished with pride and gratitude. In his early practice, Rush was a full disciple of Cullen; for in his oration before the Philosophical Society, 1774, he says, that the system of this great teacher "will probably last till some new diseases shall unfold other laws of the animal economy." In 1791, the Medical College of Philadelphia was merged in the University of Pennsylvania, and to Rush was assigned the chair of the "Institutes and Clinical Medicine;" the chair of "Practice" being confided to Dr. Kuhn. The year 1793, the forty-eighth of his age, exercised and manifested the great powers of Rush. The yellow fever spread devastation and terror over the city, utterly confounding the American physicians, to whom it was a perfect novelty. Their practice, as was to be expected, failed miserably; nor were the French physicians, who had seen the disease in the West Indies, a whit more successful. Every method failed, till the wretched doctors were almost struck dumb, as Lucretius says were those in the plague of Athens: *musabat tacito medicina timore*. Rush gives an awful history of the distraction of his mind at this time; but while turning over books, between hope and despair, he remembered a manuscript concerning a yellow fever in Virginia in 1741, which had been given him by Dr. Franklin. From this he learned that the debility was only apparent; that it was oppression of the vitals only; that if this was removed, the system would rise into open, free reaction in almost every recent case. He then began to purge freely, and finding this to relieve the oppressed system, and to raise the fever into inflammatory action, he tried bleeding; but, as Dr. James Johnson tried it, "with a trembling hand and a palpitating heart." The new practice was unexpectedly successful, and Rush quickly imparted it to the College of Physicians, to the apothecaries, and to the public. But now it happened, as was to be expected from the infirmities of man, that a furious storm was raised against this innovation. Rush, however, had some friends among the younger physicians, and some highly intelligent pupils,—these triumphed over the enemy by the new method, so that hardly any patient was lost to whom they were called during the first twelve hours. Even the apothecaries, some clergymen, and other intelligent persons whom he names, treated the disease with success. Many physicians, however, pursued other measures, and would not be taught by their own failures. Those, too, who were disposed to try the new method without the courage to pursue it to the requisite extent, were unsuccessful and contributed greatly to its discredit, so that complete success was confined to a few. The disputes among the physicians, in which

the people took an active part, soon became as epidemic as the fever itself. Whether the fever was imported or generated at home, was another source of acrimonious controversy. Rush proclaimed from the first and on all occasions, that it was of domestic origin, and thus he brought upon himself the hatred even of many who had been his sincere friends; for nothing could be more ungrateful to the property-holders and merchants than the opinion that their city, in the prosperity of which all their hopes of fortune were centered, had generated this fatal disease and therefore would probably do it again. Besides his labors and sorrows abroad, Rush had to struggle with sickness and sorrow at home. His maiden sister, who had refused to leave him, who had supported him in all his trials, who had been his casuist in his choice of duties, died in his house. He says: "I got into my carriage an hour after she expired, and spent the afternoon in visiting patients. According as a sense of duty, or as grief has predominated in my mind, I have approved or disapproved of this act ever since." In addition to this, his pupils who, to serve him most readily, had lived in his house during the epidemic, sickened, and one of them died, having become delirious, and therefore refusing all treatment. Another died in the country, whither he had gone with the intention of soon returning. His aged mother was too infirm to be removed; his wife with seven children was in the country. Hardly a day passed that one or more of his dearest friends, often the fathers of large families, were not seized, some of these his medical brethren. He visited from one hundred to one hundred and twenty patients a day, besides the crowds that he prescribed for in his house and in the street. He was sometimes so depressed with labor and care as to faint, and he was often obliged to lie down in the houses of sickness. In this debilitated state he was feverish, on the 15th of September, but having been bled and purged, he resumed his labors the next day, and continued them, though in a state of great weakness, with slow fever, irregular chills, and a troublesome cough. The second week of October was the most fatal of that year, and Rush was attacked; but by a timely and vigorous use of the new remedies, in the hands of his pupil, Mr. Fisher, then residing in his house, he was soon recovered. His convalescence was very slow, and he does not say that he saw any more of the fever that year. He published a full history of this epidemic the following year, which obtained unbounded praise throughout the medical world. Dr. Trotter, a man long versed in fevers, pronounced it "the best history that was ever written of any epidemic. Who would not travel through this vale of tears, amidst blasts of contagion, to share the well-earned fame of Dr. Rush." Dr. Zimmerman said that "he merited a statue, not only from Philadelphia, but from all humanity;" and Dr. Lettsom states, "that all Europe was astonished at his novelty and bold decision, his unprecedented sagacity and judgment." He concludes the history of this fatal year in returning thanks to his pupils for their support and sympathy. They were, Dr. Woodhouse, afterwards Professor of Chemistry; Edward Fisher, who became eminent in South Carolina; and John Redman Coxe, the late ex-Professor of the University

of Pennsylvania. "But wherewith, he says, shall I come before the great Father and Redeemer of men, and what shall I render unto him for the issue of my life from the grave? *Here all language fails. Come, then, expressive silence, muse his praise!*" There were numerous cases of fever in 1794, but it did not become epidemic again till 1797 and 1798. In these years, the new method, with occasional modifications, was as successful as in 1793. Rush says, however, that in 1798, the prostration was sometimes too great to admit of bleeding. Here we must do honor to his candor. The same principles, however, governed him, and led him to the same general success. Local bleeding, purging with calomel, sweats, blisters, counter-irritation, these conduced to the relief of the laboring viscera, which would have been still more oppressed by the old treatment. In most cases, however, copious bleeding was requisite, as we learn not only from Rush, but from his friends and from some of his opponents. His enemies now found a ready tool in William Cobbett, who soon became the most accomplished editorial villain this country had ever known. He published a paper called *Peter Porcupine's Gazette*, which was continually blackened with slandering Rush and his practice. Those who had been offended by the doctrine of domestic generation, assisted Cobbett with their countenance and their money; and having, as Johnson said of Junius, "the sympathetic favor of plebeian malignity," they made a very serious impression on the public mind. As the wayward Jews, to use Gibbon's comparison, were perpetually forgetting the miracles wrought in their favor, so the Philadelphians forgot their benefactor. Some who had found their own and their families' safety in the depleting treatment, now resorted to other physicians, and perished by their malignant ingratitude. Rush thought that it was owing to the malevolence of party that nearly as many died in 1798, as in 1793, though not half as many were affected. Had Rush been one of those calculating misers, who secure popularity by simply holding their tongues, his bleeding and purging would have been soon received and established, for even some medical enemies had adopted his treatment; but domestic generation and its impetuous advocate, could not be thought of without abhorrence; hence, bleeding and calomel were tortured by Cobbett and his friends, into something worse than poisoned arrows or *Porcupine's* quills. It was felt that Rush's medical character was injured, and he was encouraged to bring a suit against Cobbett. The jury mulcted him in \$5,000, which, Dr. John W. Francis says, Rush distributed among the poor. Cobbett's suborners finding him of no further use, now left him to his fate. He was sold out by the sheriff, and devastated, as he declares himself, to the amount of \$8,000. He then went to New York, where, as St. Paul says of the evil man, he waxed worse and worse, and established a newspaper which he called *The Rush-light*. In the prospectus of this, he says, "Rush's lawyer and the judge made it a crime in me not to have examined the system. Please Heaven, they shall not have to charge me with the like omission this time, for if I leave unexposed any one of its absurdities, if I leave unrelated one anecdote in the history of blood, it shall be for want of knowledge, or of memory, and not for want of

inclination." Soon after this, Rush began to suspect that he had indulged in a serious error in believing the yellow fever contagious. He was very slow and cautious in making this important change. At first he thought it fully contagious, then only in its concentration; lastly, he satisfied himself that it was not such under any circumstances whatever; and this opinion, notwithstanding some slanders to the contrary, he is known to have persevered in to his end. How early he had fully satisfied himself of this important truth is not known, but in October, 1802, he wrote a letter to Dr. Edward Miller, of New York, afterwards published in the *Medical Repository*, in which he argues most ably against contagion, and hopes this public recantation of his error may make some atonement for the evil he did by supporting it. He made this retraction at a time when the belief in contagion was general and strong, for he says, "the majority of our citizens who believe in it is greater, and they are more decided, than in former years." His change, then, was made in spite of its unpopularity, a fact in harmony with his usual independence. That he ever assented to the doctrine of contagion, has been made a very great detriment to his fame and to science, for his opinion was eagerly caught at by the favorers of this mortiferous belief, and it has been ignorantly or wickedly attributed to him, and propagated by European books ever since his public retraction. Even an American editor of Good's large book let it pass through his hands without a note in correction of this inexcusable error. The fever ceased with the frost, but the medical war—*bellum plusquam civile*—retaining its heat without intermission, refused to freeze. It took on an exacerbation at every fresh invasion of the fever; nor did the pertinacious spirit thereof die out till all these feverish spirits had gone "where the wicked cease from troubling and the weary are at rest." Meanwhile, the new method had finally triumphed, as proven by incontestable authorities whom we shall speak of in a subsequent page. Rush lectured and wrote, and turned his opponents into ridicule in the exercise of his professorial office; he published histories of the fever of every year to 1805, wherein he set forth his opinions and the success of his practice, denouncing, at the same time, that of his enemies. But these were now silent; they had become paralytic; their nervous centers were softened; they were now withering away, and not unwilling to be forgotten in relation to their inglorious war. Rush had now raised himself to a very high stand in the temple of fame. His name was quoted with admiration wherever medical science was known. He had been made a member of most of the scientific, literary and beneficent societies of his country, and similar honors had been conferred on him from abroad. He had obtained a most signal triumph over his enemies; he had established, *as he hoped*, a permanent method of treating the yellow fever, as also the salutary doctrine of domestic origin and non-contagion; he enjoyed the hope of confirming this doctrine in the minds of his future classes. One thing only seemed to be wanting to his happiness, and that was what comes home to the heart of every sensitive physician, his brethren's friendship. This had been sacrificed to the quiet of his conscience. Like his great prototype, Sydenham, he had resolutely

pursued the path of duty, and trusted to a good Providence that it would lead him to a good end. Nor had he any fear of the final judgment of men, knowing that his methods were founded in reason, and that they had proved successful. Posterity, he says, "is to the physician what the day of judgment is to the Christian;" and though the rewards of this affords no present help but faith and hope, these were enough for him, these supported Sydenham and Rush. It has been sneeringly asked, writes Jackson, why this man had enemies. The question may be justly answered with an equal sneer, that no good man, who faithfully acts a public part, is without them. It does not appear, however, that Rush was thus distinguished before the epidemic of 1793; for in his history of this, he speaks of having always lived in harmony with his brethren. It is a melancholy fact that any man of distinction, who nobly avows unpopular opinions conflicting with the accumulation of either public or private wealth, will bring upon himself a host of enemies. Such was the fate of Rush in a pre-eminent degree. He was the first to proclaim the yellow fever indigenous, and he did this almost from the very beginning of the first epidemic. Now, the merchants of every city are the most powerful body, and they infuse their spirit into all the various mechanics and laborers who must be always in their employ. That the new doctrine would draw upon its author the malice of these people, was no doubt what he foresaw, and therefore his resolute spirit is entitled to the highest praise. He sought his own approbation rather than fame or wealth; he preferred

"The peaceful night, the self-approving day,
Unsullied fame, and conscience ever gay,"

"to all the yellow sands of the Tagus, and to all the gold that is rolled into the ocean." The malignants of a community who happen to be offended by a physician, begin their attacks by undermining his professional skill. This is the doctor's vulnerable part, for he can not defend himself without violating propriety. Upon Rush, then, who had invented a method of treatment which appeared extravagant, adapted, as he thought, to an extravagant disease, they made their attacks with no little advantage. Their audacity was favored by the venal Cobbett of the *Porcupine Gazette*, and carried on with such success as to injure, for a short time, the Doctor's private affairs. But his pre-eminent abilities and prudence carried him with dignity through all his persecutions, and soon won over to his friendship many of his enemies. A few of his medical brethren, and some of his colleagues in the university, never forgave him; thus proving the maxim, which Tacitus appears to have adopted from Seneca, that men always hate those they have injured. In their hatred, however, there was supposed to be a spice of envy, for he had left them far behind in the respect of mankind. His fame had gone triumphant through all the nations of Europe, while they, for the most part, could see the circumscription of theirs from the tops of their houses. Horace says that poets are an irritable people; the same may be said of the physicians of that time; they might well have prayed in the words of the Litany, to be delivered "from envy, hatred, malice, and all uncharitableness." That Rush escaped without irritation, is not to be supposed; but certain it

is that he carried himself with becoming dignity and grace, thus proving the supremacy of virtue. He probably followed the advice of St. Paul—was very angry but sinned not. We have said that in 1791 he was made Professor of the Institutes and Clinical Medicine in the University of Pennsylvania. In this office he continued; and he filled also the chair of Practice resigned by Dr. Kuhn in 1797, though not formally elected by the trustees till 1805. In this triple professorship he continued the rest of his life, lecturing an hour every day, and towards the end of his course, an hour in the morning and one in the evening. His lectures, with his busy practice, his attendance at the hospital, his numerous consultations and correspondence, his hospitalities and unseasonable visitors, his studies, and his frequent publications,—these constituted the business of this much-occupied man during his old age; yet he went through the whole with proverbial punctuality, and even without any apparent haste, for he said that a physician should never be seen in a hurry. In a letter to Dr. Ramsay in 1803, he says: "I continue, through Divine goodness, to enjoy, in the fifty-ninth year of my age, uncommon good health;" and in one to Dr. Finley in 1809, he observes: "In my sixty-fifth year I continue to enjoy uncommon health, and the same facility in studying and doing business that I possessed twenty-five years ago." And about six weeks before his death, he says, in writing to the same: "I continue to enjoy uncommon health for a man in his sixty-eighth year. Now and then I am reminded of my age by light attacks of the *tussis senilis*, but they do not impair my strength, nor lessen my facility in doing business." He was, indeed, though delicate and frail in appearance, a vigorous, animated old man, whose mind neither knew nor desired repose. He was never absent from his daily routine; of this he never tired; for if fatigued with bodily labor, conversation or books were a certain refreshment. He never sought relief in the country from the heat and impurities of the city; he had a country-house for his family, and called it "Sydenham," but for himself he was always at home, and a ready help to his patients; even his father's house, with all the sweet attractions of the "*natale solum*," he did not visit from his sixth to his sixty-eighth year, and not then till brought into its neighborhood by visiting a patient. Justly has he concluded his Introductory Lecture for 1808, when he says, in allusion to his death, "when that time shall come, I shall relinquish many attractions to life, and among them, a pleasure which to me has no equal in human pursuits, I mean that which I derive from studying, teaching, and practicing medicine." His chief happiness consisted in doing good, and the plenitude of it in discharging his medical duties. It has been said by one of the biographers of Dr. Rush that all things conspired to render him illustrious, and that had he been placed in the cheerless vale of obscurity, or destined to struggle under a want of patronage, his genius might have withered and his ambition forsaken him, beneath the influence of disappointment and neglect. It is vain, however, to conjecture what might have been—it is the duty of the chronicler of one's life history to set forth what actually was. Nor should we forget how meritorious it is to become noted for greatness as well as benevolence, since so

few, though favored by every impulse, attain this two-fold eminence. The late Dr. Samuel Jackson, who enjoyed the intimate acquaintance of Dr. Rush during the last five years of his life, has given the following graphic description of his personal characteristics: "He was above the medium height, very erect, rather slender, with small bones, and rather thin; his hands and wrists, feet and ankles being small and finely formed. His face was thin; nose, aquiline; eyes beautifully set, large, blue, mild and benevolent; forehead broad and high; head long in the transverse diameter, and nearly bald from the crown forward; his hair clubbed behind and powdered. His face was of a fair and healthy complexion; not handsome, or what is called fine-looking, for his cheeks were fallen in, many of his front teeth lost, and age, with care, had left its wrinkles. His countenance in conversation was highly animated; when reading to himself or going abroad, it evinced intense thought, entire abstraction and firmness of purpose. His unfrequent smile was peculiarly gracious, but he hardly ever laughed. When walking in the street, which was seldom, he was very erect, step firm, elastic, and rather military never using a staff, his arms folded on his breast; he uncovered to every one, poor or rich, who uncovered to him, and his passing words were, 'I hope you are very well, sir,' uttered with his habitually strong, but mild voice. His dress was very plain, generally of drab-colored cloth; he rode in a plain vehicle with two wheels and one horse, the same little negro by his side who had lived with him more than thirty years—master and man now grown old together. In this open carriage we saw him facing the storms the last winter of his life. His bearing was very simple and artless, without a semblance of affectation, remarkable for kindness, cordiality and even condescension." In contested questions of his day he is said to have regarded his conscience more than public favor, and thereby made numerous enemies whose hatred has been transmitted long after his death. But even one of his earliest enemies, Dr. Caldwell, writing of his urbanity in the year 1797, says "the resources of his amenity and courtesy were all but boundless, for he was among the most polished men of that polished age." In conversation he was acknowledged by all to be pre-eminent, yet he did not appear to be at all self-complacent of his colloquial powers. He never interrupted another, as the fashion now runs, nor did he arrogate to himself an undue portion of the talk, an offense too often given in these later times. Piety and benevolence were to human perception his predominant feelings. In fine, he was the accomplished Christian gentleman whose "imposing first appearance" subdued every mind and every heart. How far he was subject to irritation is known only to his Maker, for he had acquired a perfect dominion over it in public. Of the six professors of our time, says Dr. Jackson, he was the only one who was never seen angry; over his face there never came the shadow of a cloud. Take the whole man, body, countenance and demeanor, there was, as Hamlet says of his father, "a combination and a form indeed to give the world assurance of a man." The portrait which accompanies this sketch is derived from one painted by the eminent Sully in 1812, and is supposed to be a perfect

likeness of Dr. Rush as he appeared engaged in the preparation of one of his last lectures. He had never been what is called robust. In early life, he had slight hemorrhages from the lungs, whence it was only through unceasing care, and the occasional use of bark as a tonic, that he escaped, as he thought, an early consumption; for he says that he had a hereditary predisposition to this disease. During several of his last years, he had a slight cough, the *tussis senilis*, and this increased during the last winter. Fearing some latent inflammation, he took less animal food and omitted wine, though his labors in lecturing, attending the hospital, and examining the graduating students several hours a day, were very severe for an old man. The *typhus pneumonoides*, moreover, appeared in March, and gave him, most inopportunistically, an oppressive increase of business. Thus, by incessant exertions of body and mind, now debilitated by cough and low diet, he became an easy prey to the prevailing fever; a disease from which the most robust of old people are in great danger. His friend, Dr. James Mease, visited him the night of the 14th of April, 1813, and found him with a pen in his hand. "What, Doctor, always at your studies?" He replied, "I am revising a lecture, for I feel every day more and more like a dying man. I am not indisposed, but I deem life, at my age, particularly precarious, and I am anxious to leave my manuscripts as perfect as possible." At nine o'clock he was taken with a chill, and went to a warm bed, where he spent a feverish night, with pains in his limbs and side. At daylight, perspiration broke out and the pain in his limbs subsided, but that of his side became more severe. A bleeder then took ten ounces of blood, with decided relief, and his colleague, Dr. Dorsey, was called. He approved of what had been done, but considering the importance of the patient, he desired a consultation, whereupon Dr. Griffiths, who had long been his intimate and steady friend, was selected. He remained the rest of the day, as also the next day and night, with a slight fever and some pain in his side, but only on taking a deep breath. Dr. Dorsey attended him, but what was done is not said. Dr. Griffiths had not been able to visit him. Saturday morning he awakened with an acute pain in his side, and Dr. Physick was called in consultation. Three ounces of blood were taken from his side by cupping, which relieved him so much that he fell into a comfortable sleep. On Sunday morning he awakened so well that his physicians pronounced him apparently free from disease. Dr. Physick said he was doing well, and that nothing appeared necessary but food. He probably entertained different thoughts himself, for it was this day that he gave much advice to his son, Dr. James Rush, and particularly with respect to his attending certain families without charge. His intimate friend, the venerable Bishop White, visited him this day, and prayed with him at his request, Rush himself quoting from St. James—"the fervent prayer of a righteous man availeth much." The physicians both saw him at five o'clock, and found him feverish; "at nine o'clock they became at last alarmed," and enjoined active stimulation. This was maintained through the night and the next day, as long as there was any hope. His wife saying to him that he was in a fine perspiration, he promptly answered,

"it is an unfavorable symptom," and soon added—"my excellent wife, I must leave you, but God will take care of you." Then clasping his hands, he prayed audibly from the Episcopal litany—"By the mystery of thy holy incarnation; by thy holy nativity and circumcision; by thy baptism, fasting and temptation; by thine agony and bloody sweat; by thy cross and passion; by thy precious death and burial; by thy glorious resurrection and ascension; and by the coming of the Holy Ghost, blessed Jesus, wash away all my impurities, and receive me into thine everlasting kingdom." What little he spoke afterwards could not be understood; he became gradually comatose, and easily quitted his earthly tenement at five o'clock in the afternoon. The above account of his sickness and death is extracted from his widow's letter to Dr. Mease, and from the letter of this reliable man to Dr. Lettson, both published in "Thatcher's Medical Biography." Something was obtained from his son, Dr. William Rush, and from "Rees's Cyclopaedia." Dr. Mease had been his pupil, had grown old in his friendship, and had nursed him through the whole of his last day, April 19, 1813. The sensation throughout the whole country was intense. Every one had heard of Dr. Rush, and all that were interested in medicine or philosophy, in common humanity or in the honor of their country, felt they had lost a friend and benefactor. "From one end of the United States to the other," says Dr. Charles Caldwell, "the event was productive of emotions of sorrow; for, since the death of Washington, no man, perhaps, in America, was better known, more sincerely beloved, or held in higher admiration and esteem. For nearly three thousand years past, but few physicians equal in greatness have appeared in the world, nor is it probable that the number will be materially increased for ages to come." Jefferson, writing to John Adams, said: "Another of our friends of '76 is gone, another of the co-signers of our country's Independence; and a better man than Rush could not have left us, more benevolent, more learned, of finer genius, or more honest." The members of the African Episcopal Church, of which he had been the active first promoter and steady friend, also other negro churches in the city, asked permission to precede his body to the grave; and it was followed by a greater concourse than had ever been seen at a funeral in Philadelphia. He was buried in Christ's Church graveyard, by the side of his parents, and next to her whom he has called upon her tomb the best of mothers. In the same grave, now overhung by two weeping willows, his widow, at the age of ninety, was buried, after having survived him thirty-five years. The appropriate quotation engraved on his tomb is not read by the pious mind as a mere eulogium, but is felt as the present echo of the Savior's salutation in heaven—"Well done, thou good and faithful servant, enter thou into the joy of thy Lord." His piety began early, and there was every reason to believe it was deep and habitual; this was the steady opinion of all his pious acquaintances, which was very extensive. In his earliest writings, he was careful to evince his belief in Christianity; and in all his works, in his lectures, and in his intercourse with the world, piety and benevolence are manifest. Whatever he says in this way appears to be the overflowing of a fervent mind,

without the least semblance of cant or hypocrisy. He seldom passed a Sunday without going to church. If he could not reach his own, he went to any other which was most convenient in his drives through the city. It was plain to those who knew him, that this was an act of duty, but his enemies twisted it into a craving of popularity; this it could not be, for he continued it in his old age, when he had become indifferent to public favor. He probably learned this charitable practice from his preceptor, Dr. Redman, whose biographer says, "he was a stranger to bigotry, often worshipping with sects that differed in principles and forms from his own." Rush preferred the Episcopal Church, hence Bishop White was the only clergyman who saw him in his last sickness; but he went most frequently to the Presbyterian, because his wife was of that communion. He was, however, a true cosmopolite in this respect, and ready to countenance sincere religion in every church, considering public worship and the observance of the Sabbath as truly made for man. In his "Address to Ministers," he says: "If there were no hereafter, individuals and society would be great gainers by attending public worship every Sunday. Rest from labor in the house of God, winds up the machine of both soul and body better than anything else, and thereby invigorates it for the labors of the week." He frequently read the Bible to his collected family, and wrote a powerful essay in defense of using that sacred book in schools. He was a first mover in the cause of the Philadelphia Bible Society; he drafted its constitution, and he was a vice-president from its origin till his death. He was perpetually making discoveries of wisdom in the Bible, and truths which had escaped others; he was, moreover, preparing to write a work on the diseases and cures therein described. So thorough was his faith in the sacred book that, finding both free agency and predestination taught therein, he piously believed them both, teaching us every year that they were not inconsistent with each other. He said, "our illustrious countryman, Jonathan Edwards, has shown that, however strange it may seem, they are both true." In his lecture on the "Pleasures of the Mind," he descants on the delights and comforts of this double and incomprehensible endowment, which gives to man a feeling of free agency, though he knows that all his volitions are governed by his benevolent Creator. He says, "we act most freely when we act most necessarily, and most necessarily when we act most freely." His benevolence embraced all races and conditions of man. As early as 1771 he wrote two essays against slavery, and he was, with Dr. Franklin, one of the founders of the "Society for the Protection of Free Negroes." Of this he was annually elected president after Franklin's death. He was the first to move in the establishment of the African Episcopal Church, in 1792, which has immensely benefited the blacks, and has done more good than any half dozen Caucasian churches in the city. It has not only done good directly, but it has been the promotion of negro churches of other denominations, all highly respectable and beneficial. It was his benevolence that led him to write a long paper of advice to immigrants; to write on public schools, spirituous liquors, tobacco, and many other subjects. Of his essays on ardent spirits and tobacco, he

published very large editions, and sent them, at his own expense, to the clergy and others for distribution. It is plain, from the mere titles of his essays, that he wrote to benefit his fellow-men, not for posthumous fame; nor did he consult his present reputation, for he generally defended the unpopular side. Many striking instances of his benevolence are mentioned by his eulogists, but they all center in the simple fact that he was ever ready to assist the poor and distressed with money as well as medical advice. It has been said that he never charged the clergy; this, one of his biographers writes, is a great mistake which ought to be corrected, for it is fraught with evil. In his introductory lecture for 1808, he excepts "the pious clergyman who subsists only on a scanty salary," but he does not excuse the rich, and we do certainly know that he charged these; we know, too, from the best authority, that one of them used to complain of the amount of his bills. In charging them, he followed Percival's Medical Ethics, and those of the American Medical Association have since settled the question that no profession is exempt, except on account of poverty. His patriotism shone forth at the very beginning of our troubles with England, and it was ever after a very conspicuous trait in his character. He wrote much on the subject, and he must have been a warm patriot, or he would not have gone into Congress, as we have related above, for the express purpose of signing the perilous Declaration. There is, moreover, a certain Americanism that pervades all his works. He was, it must be confessed, a little too enthusiastic; he expected more from mankind than they were ready to do. The goodness and greatness of his own heart represented all men as willing and as able as himself, each in his proper sphere, and therefore he hoped that great things would be done in the new republic. As an instance of his enthusiastic foresight, he predicted, in a patriotic discourse, that merchant ships would be built at Pittsburgh and freighted to Europe. This drew upon him the sneers of his enemies, nor were his friends pleased with what they called a mere flight of fancy. A little time showed them his foresight and their own dullness; he proved to be a Cassandra. It was not, however, the commerce and riches of his country that occupied his mind, but the wonderful expansion of intellect which he hoped had been caused by the collisions of the Revolution, and the establishment of a republican government. Sorrowful it is to relate that, towards the end of life, he found cause, in the violence of party and the venality of public men, to despair of that national happiness which had been the subject of his delighting reveries. His industry had become a habit almost as much as the beating of his heart. In his introductory lecture for 1809, on the means of acquiring knowledge, he copies certainly from his own life. He insists upon the students keeping a memorandum-book to be used "at all times and in all places; even when the pencil can not be employed, a knot on the pocket-handkerchief will preserve an idea." He insists, too, that the student shall read pen in hand; this was his own practice, and hence the proofs of extensive reading his works afford. Every moment of his time seems to have been occupied to profit. He had well studied the first aphorism of Hippocrates,

"life is short, art long;" and he had been taught by Rittenhouse that time was of more importance than even health. Above all, perhaps, the Divine admonition sounded in his ears: "work while it is light, for the night cometh." His fatal sickness found him with a pen in his hand, revising a lecture for the use of posterity. His punctuality and his industry went together as continual and faithful handmaids to each other. Notwithstanding his press of business, he never failed being in his chair at the minute; and it is said that, during his thirty years' attendance at the hospital, he was never known to be ten minutes after his time. In his valedictory to the class of 1810, he tells, with strong approbation, of a noble statesman who said that he would not disappoint the meanest of his tenants, if he had agreed to meet him only for the purpose of playing push-pin. He shows too, in this lecture, how punctuality facilitates not only our own business, but that of others also; and how greatly the want of this virtue frets and injures the sick, how it robs brother physicians of their time, and thus disorganizes the consecution of their several appointments. Mr. Thomas Sully, the eminent artist, who took several portraits of Rush, has said that he never failed to be present at the appointed minute. Upon Mr. Sully's remarking this, Dr. Rush replied, "punctuality in other business enables me to be punctual here." The characteristics of this great man in society are of course to be noted. Dr. Dorsey says, in the "Eclectic Repertory," "of all men I ever knew, Rush was the first in conversation." To this it will suffice to add the testimony of Dr. Caldwell from "Delaplaine's Repository": "In colloquial powers he had few equals; and no one, perhaps, could be held his superior. His conversation was an attic repast which, far from cloying, invigorated the appetites of those who partook of it." It is believed that the above traits have been conceded by all who knew him. He delighted in conversation, considering it as one of the readiest means of acquiring correct knowledge; and he reminds us that Fox said, "he had learned more from conversing with Burke than from all the books he had read." He says, "except in cases of extraordinary pride, I believe taciturnity, in nine cases out of ten, in civilized company, is the effect of stupidity." He makes an exception, however, to this rule in favor of those who write much for the press. He was noted for his total freedom from ostentation, and all pretense. His demeanor was perfectly natural, simple, and easy. Through the whole course of his lectures, we knew him only as the gentleman, philosopher, and physician. He never adverted to his services in the army or the Senate, or to his friendships among the great. He spoke of certain physiological observations made by officers, the dreadful nights before the battles of Trenton and Princeton, but he did not say he was there. All such things, of which most public men avail themselves in their ostentation, he forgot or passed by with contempt. In the title pages of his books, he omits all his memberships; what others find so necessary and useful, he must have looked upon as indecorous to him. He despised all singularities, asserting that men truly great are distinguished by going before others, and not on one side of them. This he says in relation to subscribing a name illeg-

ibly, or in disguise; a fashionable and troublesome folly, that he treated with contempt, as "generally characteristic of a frivolous mind." He wrote a very legible and fair hand, and he urged the practice of this on his classes every year; saying, that "to read or rather decipher the letters of young physicians, who apply to their superiors in age and experience for advice, often requires more study than to answer them." It has been matter of wonder to many that he found the leisure necessary to the general reading, so apparent in his conversations and works. One cause of his manifold information lies in a rule that he adopted early—to exclude all useless, false, and pernicious learning. "The understanding," he says, "should refuse admission to everything that is not in unison with truth and utility; in this way Dr. Johnson acquired his stupendous mass of knowledge." At the head of his expurgatory index, he placed the pagan theogonies, the study of which he considered not only as a waste of time, but as highly immoral in its tendency. Happy, indeed, would it have been for modern literature, had some authoritative scholars set forth this doctrine, before the vernacular language came into use in modern poetry. The pagan machinery must be tolerated in translation, but it makes no impression on our modern nerves; the reader passes it over with frigid indifference, with the *incredulus odi* of Horace, and hurries on to find something true in nature, to which his own nature responds. Blair thinks that Homer's description of Jupiter's nod is truly sublime. Such it no doubt was to the ancient vulgar, but such it can not be to a modern educated reader. But Dr. Rush strongly advised the reading of those poets, who copy from nature and truth. In these he found many illustrations of the secret workings of the mind, and his perpetual intercourse with the world, showed him their truth and their utility in medicine. He says, "they view the mind in all its operations, whether natural or morbid, with a microscopic eye, hence, many things arrest their attention which escape the notice of physicians." He objected strongly to the reading of novels, saying "they should be considered as offal matter, and carefully rejected by the student of medicine." A great outcry has been raised on account of his essay on learning the dead languages, as though he wished them extinct. This was far from his thoughts, and in contradiction to his wish expressed in the essay; but it seldom happens that oppositionists set forth the whole truth. He wished these languages preserved, like the knowledge of law or medicine; that is, by a distinct profession, to be paid for their services. He makes another proposition also—that when it is found, about his fourteenth year, that a boy is destined to a profession, he may learn all the needful Latin and Greek in two years. And in his introductory lecture, on "The Medical Student's Preparatory Education," he mentions Latin and Greek, among other things which, if neglected, ought to be attended to in the summer recess. "In the present mature state of your faculties," he says, "you will find no difficulty in acquiring them; and in so doing, you will add no less to your private honor and interest than to the credit of this university." Still, he thinks that both medicine and law may be acquired without these languages, and this he deduces very fairly from various

premises, and from the fact that some of the greatest and most popular lawyers in America had never learned any but their native tongue. Rush knew that modern languages could be written correctly without any knowledge of the ancient; he knew that one language can give very few rules to another; that the inimitable ancients did not perfect their style and their modes of thought by a seven years' study of dead languages, though they wrote with a vigor and polish that no moderns have attained to, even by studying *them*. He had, moreover, daily proofs that this study was not necessary to the development of mind. It was not this that placed Rittenhouse and Bowditch among the stars; it was not this, as Turgot says, that "wrested the scepter from kings and the lightning from the skies." And, had he lived to the present time, he might have seen that the study of words has not enabled us to hold converse with people in distant lands; has not covered our waters with steamboats, and our country with factories; has not lighted our houses from the bowels of the earth, and our cities with stars that vie with those of the skies. But amidst all these glories, he would have seen one sorry thing—a country filled with smatterers in Latin, who pass with the people, for learned men; for it is truly wonderful how a "little Latin and less Greek," will recommend a man to the public: as Boswell relates that a minister was not esteemed by an old lady of his church, because he was not like his predecessor, a "Latiner;" he did not quote Latin in his sermons. Rush wished to multiply effective and prolific learning, something really useful, as he says, "in making the earth a more safe and comfortable abode to man." This was the professed wish of the great Bacon, the object set forth in all his writings as the ultimate end of true philosophy. Now Rush might have asked in triumph, what have the Bemboes, the Porsons, the Bentleys done towards this attainment? His opponents have unwisely retorted upon him that his own sons were taught the languages. It was not for him to render his sons singular, and to bring them, perhaps, into contempt with the sciolists in Latin. He was a frequent declaimer against ladies' thin shoes; he knew it would contribute to the health of his wife and daughters to wear Steuben boots as high as their knees, and he could have given them from his "Inquiries and Observations," a greasy prescription for making them water-proof; but he did not insist, he wisely left them, as he did his sons' education, to the fashion of the times. His reasoning, however, on this important subject, is both profound and acute, nor can it be justly appreciated without long and severe study, not by the superficial, but by those deeply learned in the languages, with minds naturally adapted thereto. Rush underwent this study himself, for which he is justly entitled to our sincere gratitude and gravest attention; even the dreams, even the errors of such men ought to be regarded with kindness. As a teacher, we can not admit that he was not the delight and admiration of all unprejudiced minds. His lectures were always carefully written, and he read them seated in an elevated pulpit. They were revised every year, sometimes curtailed, oftener amplified; and so alive was he to every recent improvement, so cordially did he hail everything new that he often raised his glasses

to his forehead and strengthened or elucidated his pages with something he had recently read, even in that morning's newspaper. Each of his colleagues read the same introductory every year, but Rush, whose mind was a prolific hot-bed of thoughts, treated his classes every November with one entirely new. His subject was always something intelligible to the youngest student of the meanest capacity: would to heaven, continues Jackson, that our professors of the present day had the wisdom to imitate him in this humility. They often dash into abstruse subjects, of which the young students are entirely ignorant, involving technical language which they never heard before; when the hapless men leave the house without having acquired a single idea, except that of a great man spouting as Hamlet says "words, words, words." As well might we begin Euclid in the middle and proceed either backwards or forwards, as the beginning student hear an introductory lecture on "life forces," or the enigmata of chemistry. In the volume of sixteen introductory lectures published by Rush in 1811, there are sixteen bright examples of these compositions. Every idea and every word is intelligible to the youngest student; there is much novelty, and many striking passages which caused the young men to prick up their ears and to look with hopeful expectation to the pleasures of the coming course. His eloquence was very peculiar, and good judges have thought they never knew it surpassed. He had been when young an ardent admirer of Whitfield, and it is said by some who had heard them both, that he had caught the tones and cadence of that fascinating orator, whose eloquence compelled the parsimonious Franklin to open his purse, though predetermined not to give a penny. His voice was full and sonorous, strong and clear, so that he was easily heard in a large room of four hundred and thirty students, even in his sixty-eighth year. Dr. Caldwell, not a friendly witness, says in his autobiography that Rush was the best reader he ever heard. So great was the influence of his fine tones that if he saw any one, near the end of his lecture, now moving slyly towards the door, in order to be the first to scramble for a seat in the anatomical room, he would begin to read in his best manner, thus chaining every man to his seat; and those whose previous attendance apprised them that a glowing passage was soon to be read, were seen with the delights of expectation in their countenances. Sometimes his enthusiasm would seem to violate the sobriety of science, as when declaiming against nosology, he cried out, in imitation of Cato, "*delenda, delenda, delenda est nosologia.*" And when treating of debility as the predisposing cause of disease, he said, "I will associate this doctrine with an act which I hope will not be forgotten. Behold me, then, rising from my chair, imploring you by your regard for the lives of your patients, for your reputation, the peace of your conscience, and all that is dear to you, whether in earth or in heaven, to regard debility as the predisposing cause of nearly all the diseases of the human body." He then prayed them to transmit this doctrine to their pupils, hoping that it would be the means of saving the health and lives of millions yet unborn. Few there are, indeed, who could have done this without incurring ridicule, but done by this accomplished actor and venerable man, it proved to

be what he wished—a solemn, impressive and memorable scene. He possessed, in the highest degree, the faculty of inspiring others with his own enthusiastic love of the art. In this, says Dr. Caldwell, "he surpassed any other teacher I have ever known," and he further says, "whatever amount of medical knowledge I possess, I frankly acknowledge myself much more indebted to him than to all other men, whether living or dead." That is, indebted to Rush, not so much for knowledge communicated, as for that inspiration of medical enthusiasm which made the study his future delight. Caldwell further says, "from his influence and example has arisen much of that enlightened energy and spirit of enterprise with which, for the last twenty years, medical science has been cultivated in the United States. What Boerhaave was to the school of Leyden and Cullen to that of Edinburgh, was he to the school of Philadelphia; an awakening spirit that threw the minds of the pupils into a state of action and research, which must accompany many of them to the end of their lives, shedding light on their paths and diffusing around them the works of beneficence." Rush clearly saw and highly estimated the value of the art he taught; he fervently loved it; he believed he was in the way of improving it greatly; he had reason to hope that his principles would be widely diffused by his pupils. Such thoughts, reacting on a mind of unbounded benevolence, could not fail to burst forth, as they often did, in language and sentiment that reached the heart. Another characteristic of our teacher was his high-toned nationality, which led him to think that the human mind had received an impulse from the collisions of the Revolution and the establishment of a republican government. This plausible opinion has received no little confirmation from the wonderful development of mind by the tumultuous conflicts of the French Revolution; for, however much the actors therein are to be execrated, it must be confessed by all that the advancement of mind then made in France has no parallel in history. Then, as the government of his country had been regenerated and the collective mind ennobled, so he hoped that education and laws, domestic institutions and manners, even medical science, would be changed for the better. Hence his writings on education and criminal laws; hence, also, a stream of patriotism was ever flowing through his lectures in the highest degree delighting to his youthful audience. He has been ignorantly accused of trying to diminish the amount of medical education. Of this his candid and intelligent hearers do certainly know that he was not guilty. No man ever held forth stronger inducements to long-continued study; always showing the advantages of a third course of lectures, and often saying for himself that he hoped to be a student as long as he lived. It is true he thought the time formerly given to pupilage, for instance his own nine years, might be greatly shortened by excluding nosology and much other useless learning. He thought, too, that by the acquiring of principles, and the using of reason more and memory less, much time might be saved, and the road to the doctorate made more easy and pleasant. The nosologists and those taught to prescribe for the name of a disease, he said had excellent memory but poor judgment, all

which he used to illustrate with argument, anecdote, and ridicule, to the infinite amusement and satisfaction of his class. He always, however, treated Dr. Cullen with profound respect, and often expressed the sorrow he felt in opposing his doctrines. "Were it possible," he said, "for him to meet me in my study or my solitary walks, he would say, go on, my son, till not one idea be left of all my system of medicine; provided, only, that mankind be benefited by the work, and the science promoted we have loved and cherished." Rush had intensely studied his principles, and no great man can be easily persuaded that he has studied in vain. He felt assured that his doctrine had given him a mastery in the care of health, and the cure of disease, which he did not possess before; and if this was already attained, what might not be expected from time, and the collaboration of other minds? Reasoning and principles in our science were his favorite theme; without these he thought it a degrading art; hence, in concluding his Introductory for 1809, he says, "medicine directed by principles, imparts the highest elevation to the intellectual and moral character of man. In spite, therefore, of the obloquy with which they have been treated, let us resolve to cultivate them as long as we live. This, gentlemen, is my determination as long as I am able to totter to this chair; and if a tombstone be afforded after my death, to rescue my humble name for a few years from oblivion, I ask no further addition to it, than that I was an advocate for principles in medicine." It has been objected to Rush, that he was a man of reasoning rather than facts, and that he did not keep pace with the discoveries in morbid anatomy. It is true he did not make this a primary subject of personal inspection; how could he amidst his many imperative engagements? He always, however, encouraged others to do it, while he, professor-like, derived to himself a profit from their labors. In exchange for this he gave them notoriety. He always referred to morbid anatomy in his lectures, quoting Bonetus, Morgagni, Lieutaud, Baillie, and every authority. As early as 1789, he urged the subject in his valedictory charge: "give me leave to recommend to you, to open all the dead bodies you can, without doing violence to the feelings of your patients." He gave the morbid anatomy of yellow fever from Physick and Cathrell; that of hydrocephalus, tetanus, hydrophobia, and insanity from his own observations. His doctrine and treatment of dropsy is derived from morbid anatomy; and though he was the first to show that this long-known malady is a mere symptom of disease, his discovery has been lately claimed by an American, for the nosographers of France. His successful treatment of what was called hydrocephalus in children, was the result of his study of morbid anatomy; and those who were favored to hear his lectures, knew well that he used the same anxious scrutiny into the cause of every disease, and of every symptom. We should like to know, writes Jackson, what great practitioner and professor, with equal engagements, has ever become eminent in morbid anatomy. That some men less profitably employed in other things have done more in this department, we readily admit; but whether they have cured more patients than they have anatomized, might prove a grave and troublesome question. Rush had

the wisdom to study what belonged to his own chair, and to profit by the labor of others, in the department precluded to him by want of time. Lighting his candle by theirs, he sent their light into distant lands, whither many of them could not send it themselves. His alleged deficiency of facts is disproved by his writings, and had the excellent author of this unfortunate error been favored with a hearing of his lectures, he would have been more than convinced; he would have been subdued. His writing are loaded with facts, and so were his lectures—many original, and many quoted from the most reliable authors of all time. So desirous was he to appear as a man of facts that what he had called in his first editions *a theory of fever*, he finally named *outlines of the phenomena of fever*, because he thought it consisted of a series of facts, "obvious not only to reason, but in most instances to the senses." As to his writings, the necessary limits of the present biography forbid an extensive examination, and therefore we shall confine ourselves to those which set forth his most prominent doctrines. This is truly an ungrateful task, as we shall not only have to omit the exhibition of much that is brilliant and beautiful, novel and useful, but also to express some disapprobation, when truly it would be more cordial to commend. His "Inquiry Into the Cause of Animal Life" is a startling title which ought to attract the attention, and yet it appears to be misunderstood by some and neglected by many. Nothing can be more simple, nothing more useful in the metaphysics of medicine. Rush, adopting the language of Brown, begins in reality at the very beginning, taking excitability and the action of stimuli thereon as a fact in nature; thus he finds a sure basis on which to rest, which the mere medical dialectician can never find. So Newton began his philosophy. Attraction and repulsion he was contented to take as mere facts, and without troubling himself *at first* about the cause of these, he traced them through all their operations in nature, and thus established the system of the Universe. He found no exception to them, and hence, according to his third rule of philosophizing, he looked upon these principles as universal in bodies. Hence—

"That very law that moulds a tear,
And bids it trickle from its source;
That law preserves the earth a sphere,
And guides the planets in their course."

Thus Brown and Rush, seeing the effects of stimuli on living bodies, found the same effect from their action on bodies apparently dead; and as these bodies were divinely organized, they called this organism excitability; the effects of stimuli on this was life or excitement. The body, then, in a state of suspended animation, is in the very condition of Adam before his lungs were stimulated by air—it is dead. Air, then, being the first stimulus, the Creator breathed into his nostrils, "and thus excited in him animal, intellectual and spiritual life." The body is further stimulated by light, heat, food, drink, exercise, the pleasures of the senses, and the operations of the mind. All this is matter of observation, open to the senses, like Newton's attraction and repulsion. Whether this excitability is matter only, or matter endowed with a spirit, Rush did not inquire; he did not distract his mind with things wisely placed beyond human intelligence.

"It is not necessary," he says, "to be acquainted with the precise nature of that form of matter, which is capable of producing life from impressions made upon it. Sufficient it is for our purpose to know the fact." The age of hypotheses, with their dialectics, had passed away, and Rush was too wise to neglect the method of Bacon, or to think of outdoing Newton, by inquiring after the remote cause of the excitability of organized matter. So carefully did he avoid all slippery ground that he would not use Hartley's questionable word *vibration*; he substituted the word *motion*, implying thereby that either the nerves must be moved, or something pertaining to them, perhaps some elastic fluid therein contained—but what in reality might be the mode of communication, he cared not. Thus he escaped the folly of hypothesis—as the ether of Newton, the pre-established harmony of Leibnitz, the insensible vehicle of Wollaston and others, the infinitesimal elementary body of Hartley, with all the Platonic sophistry which these inflict on the reader. He considered this simple view of life not only as a philosophical, but even as a scriptural doctrine, and he supposed that it manifested to the human understanding the difference between man and his Maker; for the Bible teaches that God has life within himself, and that he has imparted it to one being only—"For as the Father hath life within himself, so hath he given to the Son to have life within himself." The various states of excitability and excitement, their accidental relations to each other and to stimuli, are all accurately considered and luminously set forth in three lectures, which every one who would preserve health and retard the advances of old age, would do well to study both night and day. These show how a just and natural use of stimuli contributed to health and longevity; on the other hand, how a prodigal, irregular and disproportionate use of them, wears away the organism, bringing on debility, disease, and premature death. Impressed then, as he certainly was, with the vast benefit which this doctrine would confer on mankind, in relation not only to their present but to their eternal welfare, his expanding soul is enraptured with the view, and he exclaims—I seem to hear his seraphic tones—"By means of this doctrine, revelation and reason embrace each other, and Moses and the Prophets shake hands with Dr. Brown, and all those physicians who maintain the sublime truth which he has promulgated. Think of it, gentlemen, in your closets and in your beds, and talk of it in your walks and by your firesides. It is the active and wide-spreading seminal principle of all truth in medicine." We must here guard the reader against considering Rush a materialist. It is true, he denied that an immaterial principle was necessary to a future state; for he said matter was as immortal as spirit, and that nothing could destroy it but the fiat of the Almighty. He thought a sound Christian might adopt either doctrine; but he said, "my education and my prejudices are in favor of immateriality." Hence he says that God breathed into Adam, and excited in him animal, intellectual, and spiritual life. This, too, is the doctrine of Brown. It would, perhaps, have been wiser and more philosophical also, to have treated on the effects of stimuli on excitability, and of the various relations of each to the

other, without using the phrase, *cause of animal life*; but the subject was new, and ultimate wisdom was not to be expected. At the time he succeeded Dr. Morgan in the chair of Practice, was the beginning, perhaps, of those prolific meditations on the Brunonian system which led to his inquiry into the cause of life, and finally to another doctrine, not however a necessary consequence of it, *the unity of disease*. This wonderful vision may be thus explained: Excitement or life is a unit, and this can be accurately divided into healthy and morbid only; hence there can be but one disease, that is, morbid excitement. This position involves a huge universality which very few minds who have seen diseases can at all comprehend. It has been said that every very great man has at least one kink in his head. That the great Rush, after having reduced all the diseases of the earth into a unit, should have described every distinct disease most accurately and minutely in his lectures on Practice, is one of the most inscrutable mysteries in the absurdities of learning. That he had some faint conceptions or some mysterious reasonings which he could not convey to others, that he had hopes which cheered him in his benighted way, that like Brown, he saw "a gleam of light like the break of day now dawning upon him, must be conceded to this good man. It seems, however, that he could not have persisted much longer in this abstraction, for he was the very antipodes of those stolid mortals who are ashamed to change their opinions. He made a public sacrifice of his belief in the contagion of yellow fever; and as he still adhered to nomenclature, distinguishing and defining diseases with the utmost care, there is reason to think that a few years more would have taught him that his unity was an impracticable abstraction and that his "gleam of light" was a mere will o' the wisp,

"Which oft they say some evil spirit attends,
Hovering and blazing with delusive light."

Such an acknowledgment would have made his lectures more popular and useful. The doctrine of unity, whatever he thought for himself, was not a necessary part of his integral system. It must be noted here that every system-maker has equally failed. Boerhaave and Stahl, Cullen and Darwin, men of the greatest abilities and learning, have failed as did Rush in this conflict with nature. The Zoonomic philosopher expressed his hope that he had laid the foundation of a permanent system, "a beautiful edifice, which might not moulder, like the structures already erected, into the sand of which they were composed; but which might stand unimpaired, like the Newtonian philosophy, a rock amid the waste of ages." This rock was soon broken down and given to the winds. These system-makers, however, profited greatly by their labors. They were led to scrutinize nature, whereby they not only acquired a more thorough knowledge of her mysterious ways, but they also gained superior astuteness in the contemplation of disease. In the same way did those profit who became their devoted disciples and partisans. Nor have their theories been found detrimental to their practice, for experience triumphs over opinion at the bedside; a fact that is evident even in the writings of Sydenham. His "Inquiry Into the Influence of Physical Causes on the Moral Faculty," is a most important

paper, and one that ought to be studied by all who are capable of comprehending its truth and utility. The term "moral faculty" he adopts from Dr. Beattie. It has been called the "moral sense" by Rousseau; it is St. John's light, "that lighteth every man;" the "*lex vera atque princeps*" of Cicero; the "light within" of the Friends' Society. He shows how this important faculty is influenced through the mind and through the body by innumerable causes which are within the power of every one who has a strong will he can call his own. These causes are climate, food, drink, hunger, thirst, sleep, idleness, cleanliness and many others. The doctrine he says "is calculated to beget charity towards the failings of our fellow-men; and thus our duty to practice this virtue is enforced by motives drawn from science as well as from the precepts of Christianity." He then names philosophers and poets whose faculties can not be contemplated without wonder, and adds, "that if the history of mankind does not furnish similar instances of the versatility and perfection of our species in virtue, it is because the moral faculty has been the subject of less culture and fewer experiments than the body and the intellectual powers. From what has been said the reason of this is obvious. Hitherto the cultivation of the moral faculty has been the business of parents, schoolmasters, and divines. But if the principles we have laid down be just, the improvement and extension of this principle should be equally the business of the legislator, the philosopher, and the physician; and a physical regimen should as necessarily accompany a moral precept as directions with respect to air, exercise, and diet, accompany prescriptions for the consumption or the gout." He then shows how the moral faculty is independent of all others, and that it may be cultivated and brought into use though the understanding may be feeble or neglected. He says, "It must afford great pleasure to the lovers of virtue, to behold the depth and extent of this moral principle in the human mind. Happily for the human race, the intimations to duty and the road to happiness are not left to the slow operations or doubtful inductions of reasons, nor to the precarious decisions of taste. Hence we often find the moral faculty in a state of vigor in persons in whom reason and taste exist in a weak or in an uncultivated state." He concludes by insisting upon the utility of education in strengthening the moral faculty. "Virtue," he says, "is the soul of a republic. To promote this, laws for the suppression of vice and immorality will be as ineffectual as the increase of jails. There is but one method of preventing crimes and of rendering a republican form of government durable, and that is by disseminating the seeds of virtue and knowledge through every part of the State, and this can be effectually done only by the Legislature." Two years after this he wrote an "Address to the Clergy of Every Denomination," in which he embodied the most practical portions of the above inquiry; showing in a strong light that philosophy may beget morality and even religion itself. His introductory lectures, moreover, for the year 1799, is a continuation of the same subject—showing how greatly the intellectual faculties are influenced by physical causes. He says, "The degrees of vigor and the number and celerity of motions which the mind is capable

of receiving by all the causes that have been enumerated, elude our present powers of calculation. Our inability to measure its attainments will be felt more sensibly when we reflect that knowledge and the intellectual faculties will mutually increase each other, to the latest period of our lives." He then gives his class that comforting assurance which had, no doubt, been long present to himself, and had been one cause of his own mental development. "It appears," he says, "that the enlargement and activity of our intellects are as much within our power as the health and movement of our bodies. This lesson has often been obtruded upon us by the entertaining spectacles of learned pigs, dogs, and other animals." As a practitioner, Rush escaped only by death from the malignity of his enemies, nor have they ceased to persecute his memory to the present day. When he was a young man, the practice of medicine was directed by English writers, who reigned alone till the invasion of yellow fever. Whether Rush questioned their authority with respect to bleeding before this period is doubtful; but now he found that a freer use of the remedy was necessary, and the dissections of Dr. Physick convinced him of this. Other physicians fell into his wake, and the practice was established in the minds of many. Physick, Griffiths, Barton, Cathrall, Currie, and others, all pursued his method and bled freely. The two last named published their experience without naming Rush as the author of their salutary measures. Barton was his enemy, and yet in his lectures and conversations he readily conceded to Rush the praise of having invented the true method. That bleeding has not been so generally successful of late, is not an argument against its use in the last century; diseases change with time and so does the body. Even in 1798, Rush says there were many cases of the fever which would not bear bleeding; and in 1802, he relied upon moderate evacuations and sweating. He did not bleed as freely in later times and in other diseases as many other physicians; Dr. Physick far outdid him in this particular. But Rush wrote, lectured, and declaimed in favor of bleeding, and thus brought himself into suspicion even among some of his best friends; all his declamations, however, was made in relation to English practice, as inadequate to the violent rapidity of American inflammation. Hence the imputation of bleeding too much was fixed upon him; and as "fame increases by traveling," he and his cups were outrageously caricatured. His good name has been still more injured in another way. His perpetual praises of bloodletting instilled into many of his pupils a sanguinary spirit, and these, being ungoverned by the experience of Rush, poured out blood as he never did, a practice that reacted sadly on the fame of the great master. Dewees and Physick thought themselves sometimes fortunate in their pounds of blood; these cases they reported to the credulous and delighted ears of Rush; he sent them to the world through his lectures and books, and thus they became the precedents of multiplied extravagance and mischief. This, the injured Rush did not live to know, or we should have had some additional chapters on the loss of blood. That he may, however, have sometimes carried a principle too far, is very probable, for much good is seldom attained without

some evil. Ardently benevolent minds can not leave death unresisted, nor would it be easy to prove that a homicide from bleeding too much is worse than the same misfortune from bleeding too little. He has been often represented, not only as neglecting the *efforts of nature* in the cure of disease, but as using a standing expression of contempt for them—"turn her out of a sick-room as you would a noisy cat." This is true as far as it goes, but as it is not the whole truth, it becomes a falsehood. He always added—"in violent diseases and in those of feeble reaction, where she is doing nothing but mischief." No man ever attended to the indications of nature more closely than he. In the syllabus of his lectures he has a chapter "on the operations of nature in the cure of diseases, and of the danger of trusting her in such as are violent." A chapter also "on the advantages of observing the tendency of her operations in certain diseases." On this subject he used to descant very largely, pointing out numerous instances in which nature was to be followed in her efforts. In one of his notes to Sydenham, he says, that "however excessive or deficient nature may be in her attempts to throw off febrile diseases, she rarely errs in pointing out the manner or emunctory in or through which they ought to be discharged. The business of a physician is to follow her, but it should be with depleting or cordial medicines, in order to assist, restrain, or invigorate her." And again he says: "One of the greatest attainments, and frequently the last in the practice of physic, is to know when to do nothing." In his Introductory for 1806 he recommends the old precept, paraphrased from Hippocrates, that "no medicine is sometimes the best medicine," saying that it is of "the utmost importance, and generally the last attainment of skill in a physician's life." In accordance with these precepts, he often carefully inculcated that a portion of inflammation left after proper depletion, nature would safely wear away. His noble independence in practice can not be exaggerated; this was proverbial among his enemies. In dangerous cases, therefore, he was resolute, determined to persevere in the right through evil report, regardless of his reputation. If he was resisted, he would propose a consultation or to give up the patient. This he often recommended to his class, assuring them that it would end to their advantage as well as to their peace of mind. His treatment of phthisis has been most grossly abused and then misrepresented. Bleeding, salivation, and the stove-room, are said to be his radical remedies. It is true, he thought, that in the United States this disease is generally caused by half-cured catarrh and pneumonia; that, in the beginning, it is a mere chronic inflammation, to be generally cured by the antiphlogistic treatment. Now, during this course, seclusion from cold is important, and a little mercury may not be injurious, if there is no hereditary predisposition—a medicine fully admitted even by the renowned author of the "Chronic Inflammations." Rush alludes no doubt to these cases when he says, "a salivation generally succeeds in the recent disease." He thought that genuine phthisis was always preceded by genuine debility, particularly in the blood vessels; that it was always, in its onset, a disease of the whole system; that it was to be prevented or cured only by chronic

exercise in the open air as a tonic. He spends thirty pages of his two essays ("Inquiries and Observations," third edition), in the vehement enforcing of this opinion; and he says, too, that if there exist a medicine adequate to the cure, it will be found in the class of tonics. He gives the signs of this predisposing debility, and thinks it may be counteracted by flying the causes, by the use of tonics, and long-continued hard exercise or labor in the open and dry air. Rush's ardent and benevolent mind rendered him very credulous with respect to the powers of medicine; he was earnest in the cure of phthisis, and, like other men, not unwilling to believe any plausible story of the success of his own method. It is true, he thought he had himself made some cures by mercury, but here we must call to mind that the diagnosis was not then always certain, and that mere symptoms are often illusory. But respecting these cures, mark well what he says, after having set forth all his remedies except exercise: "*Many of these under certain circumstances, I have said, have cured the disease, but I suspect that most of these cures have taken place only when the disease has partaken of an intermediate nature between a pneumonia and a true pulmonary consumption.*" He then begins to treat of exercise as almost the only hope. If we examine his two essays, we shall find that he spends thirty pages in vehemently trying to prove that chronic exercise in the open air is the only hope of a radical cure; and that all medical apparatus are either preparatory to this in hopeful cases or merely palliative in those that are desperate. Dr. Carson, in his "History of the Medical Department of the University of Pennsylvania," says: To trace the course of medical science through its phases of doctrines and opinions, from the commencement of the eighteenth century, when a remarkable impulse was given to it, to the time when Dr. Rush terminated his labors, would be an agreeable and instructive task. It would present the account of the contest between the lingering power of scholasticism, monkish credulity, bigotry and dogmatism, and the teachings of experiment, observation and reason. In medicine, as in other sciences, the victory declared itself upon the side of humanity. There had previously been a fearful struggle, when death and the dungeon were the awards for the temerity of proclaiming God's own natural revelations, and of reading, by means he had bestowed, the truths of science; yet through such a terrible ordeal had science passed, and placed its heel on superstition. The difficulty is great of being entirely freed from illusive dogmas and long-continued prejudices, which have become a part of the mind itself, and tintured its mode of operation and expression. This has been the case with medicine. The metaphysical connection between the soul and body hung like an incubus upon all endeavors to ascertain the nature of the vital processes, and gave a bias to every effort to determine the secret of their production. For centuries the agency of the rational soul was the phantom of medical philosophers, who deviated from the natural history arrangement of the vital actions devised by Aristotle, and, not content to study them in their manifestations to the senses, plunged headlong into the pit of blind, conjectural subtleties connected with causation. In this publication frequent mention has been made as to the for-

eign origin of the physicians who first settled in the Colonies, and of the education of those who at an early period went abroad to the University of Leyden, where Boerhaave was the presiding genius. "He was the dictator of medical opinions, not only on the Continent, but in England, and hence their transfer across the Atlantic." We have the authority of Dr. Rush for stating that until the period of the institution of our first medical school (1765), the system of Boerhaave governed the practice of every physician in Philadelphia. This world-renowned physician was a vigorous reformer, and did yeoman's service in exploding the fallacies of dogmas. "He was versed in the mathematical sciences and natural philosophy, and although too strongly mechanical in his notions, saw clearly the importance of bringing to bear upon medical inquiry a correlation of the sciences." The whole system which he inculcated may be judged of from the creed which he uttered: "Let anatomy faithfully describe the parts and structure of the body; let the mathematician apply his particular science to the solids; let hydrostatics explain the laws of fluids in general, and hydraulics their actions as they move through given channels; and lastly, let the chemist add to all this whatever his art, when fairly and carefully applied, has been able to discover; and then, if I am not mistaken, we shall have a complete account of medical physiology." But Boerhaave had not disabused himself of the belief in the animal spirits as a motor force, and although inferring that each motor nerve had a separate origin, and hence an office, he did not, in his physiological system, take very enlarged or correct views of the vital properties of organized beings, or of the dependence of their properties on the state of the nerves. "When Cullen came into estimation as a teacher, he reigned supreme both in Great Britain and America. His views and opinions superseded those of Boerhaave, and were without challenge until the rise of the Brunonian system, a competitor for credence. From his immediate connection with Cullen as a pupil, Dr. Rush, as we have seen, returned to America imbued with his doctrines and warm in admiration of his mental qualities. But extensive observation, reading and reflection had taught, in subsequent years, the enthusiastic student that the line of speculation was not exhausted, and from a vast experience in the maladies of a new world, materials for thought were presented to him which were not dreamed of in Cullen's philosophy." Referring to Dr. Rush, the same authority (Carson) previously quoted writes: "It is a difficult task, after the lapse of more than half a century, to enter fully into an estimate of the qualities of this brilliant teacher of the medical sciences. We receive the impression of his ardor and enthusiasm from his early letters, when he first entered the portals of the temple of science, and we must appeal to the records of his life for the character he bore and the influence he exercised, when, in the position of priest, he ministered at its altar. For forty-four years he continued to expound the science of medicine to admiring listeners, attracted by the polish of his language, the smoothness of his diction, and the clearness of his expositions. As age advanced, he truly became the "old man eloquent," and had the satisfaction of witnessing the progressive in-

crease of the class in attendance upon his lectures, from the small number with which he began his career to over four hundred at its close. He died with the satisfaction of knowing that the popularity that had been attendant upon his labors, and which had contributed so much to the success of the university, had not ceased nor waned, for his eye was not dimmed, nor was his mental energy abated." A careful review of the writings of Dr. Rush, and of the testimony of those who have listened to his teaching, by no means justify those cases of horrible salivation or exhaustive effusions of blood from debilitated patients perpetrated by others after his death. Although these unwise therapeutic measures have resulted in the defamation of this skillful and conservative physician, and caused him censure by enemies for methods and offenses unsanctioned by his precept or example, yet such is the tribute this great man pays for his high position in the temple of fame. Referring to the professional work of the subject of this memoir, one of his biographers says: If it be inquired what Rush did for medicine, we answer, more than any other, except Jenner and Laennec—men rather fortunate than great—more than the present generation of physicians can possibly comprehend; but whoever might attempt to show this would have to deplore the want of his manuscript lectures, without which all he could say would prove defective and lame. He taught more correctly than Brown all that can ever be known of the causes of life, all that can ever be useful; and that here all further inquiry is stopped, that here the presumptuous mind is arrested—"thus far shalt thou go and no farther." He taught how to reason on the correlations of excitability and stimuli adopting all that was true in Brown's system, and carefully showing those errors thereof which have sadly deluded European writers. Brown made war on nosology without entire success, because his system was complicated with errors; Rush entirely destroyed this mortiferous monster, and taught us to consider diseases in their mutual relations, their causes, combinations, conversions, translations. He showed the precipitate delusions which very often arise from the naming of a disease, and the blind, headlong practice sometimes resulting therefrom. Nomenclature, it is true, remains in part and must remain forever a necessary evil; but Rush ought to have the honor of showing its delusions with more success than Brown—the honor of bruising some of the hydra's heads and of guarding posterity against the rest. Two vehement attempts have been made since his death to revive the evils of nosology in America, but they have utterly failed. The principal reason adduced by these authors—Caldwell and Hosack—is the fact, cheerfully conceded, that system is found useful in the several departments of natural history to assist the memory; but poor indeed must be that memory and utterly unfit for any profession, that can not embrace all diseases in whatever detail. But the nosologists can not agree in their genera and species; moreover they must coin new names, as does Mason Good, from Greek, Hebrew, Chaldaic, Coptic, Arabic—all these to help the memory, that needs no help. Well did Rush exclaim from his pulpit—where was human reason when it was adopted, where was the mighty genius of Sydenham when he proposed it?"

Rush taught more clearly than any other the utility of attending to the remote, predisposing, and exciting causes of disease. He assiduously shows how men may pass through a long epidemic, fully possessed by the remote and predisposing causes, and yet escape an attack by simply guarding against the exciting causes. In no other book is this fact so strongly urged; it is the result of his meditations on the doctrine of life. He carefully showed how far and in what states of the system nature is to be trusted—when she is to be encouraged and when restrained. Hippocrates says, "the physician is the servant of nature;" this was true in his time, but the art has been so far improved that nature is now the servant of the physician. He reasons and wills, which she does not. The dispute might be settled by calling them co-laborers, "each needing the help of the other," as Sallust says of the comparative value of mind and body in war. Rush taught that diseases of violent reaction must be brought down to a level with nature's salutary efforts; that in those of feeble reaction, the system must be raised to the same point; that in diseases, however, where she was doing nothing but mischief, she was to be counteracted entirely. The careless or perverse reader is apt to think that his whole treatment consists in lowering or raising the system, in adding to, or in taking from—the *prosthesis kai aphairesis* of his Coan master. Even Dr. Ramsay is guilty of this unpardonable error; and if this able man could make such blunders, what may not be expected from common minds? To correct this error, it is only necessary to look into Rush's syllabus of therapeutics. He taught more clearly and urgently than any other to distinguish diseases and their effects. Inflammation was called a disease; he called it an effect of disease, *error loci*, red blood in serous vessels; hence he escaped all the self-tormenting unprofitable folly of inquiring, what is inflammation?—a question that can never be answered. To go behind this *error loci*, inquiring into the mysteries of the formal cause, must forever be vain; as well might you inquire, as Newton vainly did, what is the cause of attraction and repulsion. Almost every disease destroys by some ascertainable effects, very seldom does any annihilate directly the excitability; and as the principal deadly effect of fever is inflammation, to prevent this he summoned his utmost energy. He had learned from a French writer two words, of which he made frequent use—centrifugal and centripetal; hence all his hopes in yellow fever and other centripetal diseases were placed in timely depletion, or revulsion, or in changing the deadly excitement by mercury. Here is one of the diseases in which the physician is the master, his reason directing; nature is the servant, acting by necessity and of herself doing nothing but mischief. Had Rush lived to see Broussais' book, he would have hailed the pathological portions thereof with delight, his entire medical soul harmonizing therewith. He has done much service to medicine by teaching that debility is to be looked upon as a predisposing cause of disease. In this he departed from Brown, who considered predisposition as the beginning and part of the disease itself, and that the causes thereof are the same that cause the disease. If it be argued that Brown is right, as shown by contagion, we answer, no;

for even here debility predisposes to an easy infection. Nor was Rush so stupid as not to teach that the remote cause is often so strong as to seize upon the robust, as does contagion, thus being at once the remote and predisposing and exciting cause. Brown's *predisposition* appears to be the *irritation* of later times. He taught the peculiarities of American diseases, showing that we are not to be guided wholly by English books. He found the Philadelphia constitutions similar to those of London in the seventeenth century, hence he drew his practice from Sydenham. From him he learned to distinguish debility from depression; and as this last is a frequent symptom in our fevers, he lectured on it with great care and effect. This is one of the most difficult of diagnoses, requiring much experience and precarious ratiocination; nor will these secure the anxious doctor from error in every case. Nothing in the cure of fever shows so strongly the truth of Hippocrates' first aphorism,—*"life is short, the art long—judgment is difficult—opportunity fleeting—experiment dangerous."* Rush amplified and elucidated what he had learned, certainly bringing forward more for serious consideration than any other writer. It is impossible to set forth in this brief biography all that he did for medicine; but we must not omit to state the great impulse he gave to the study thereof in his own country. It was his greatness in teaching and writing that brought students from great distances to Philadelphia, and made that city the metropolis of medical science in the United States. They came, they admired, they loved, they believed. When Charles Caldwell came from Carolina in the year 1792, a talented, hopeful, aspiring youth, he looked with ineffable contempt on all the introductory lectures, except that of Rush. This filled him with medical enthusiasm and even with the hope of raising himself to the same bright eminence. We have referred above to Caldwell where he says, in his eightieth year, that he had profited more from Rush than from all other physicians, whether living or dead; not so much, however, in the amount of learning as in the cultivation of his medical mind,—his greatest comfort during a very long, ambitious, and laborious life. The fame of Dr. Rush was such as to make him a member of nearly every medical, literary, and beneficent institution in his country; he was distinguished also by many honors from Europe. He was a member of the Society of Arts and Sciences of Milan, of the Society of the *Naturæ Curiosorum*, of the National Institute of France, of the School of Medicine of Paris; he was created LL.D. by Yale College, was treasurer of the United States Mint from 1799 to his death, when, in memory of him, the office was given to his son; thus it remained in his family thirty years, through the official terms of four Presidents. He was addressed by the Prussian Government on the subject of yellow fever, receiving from the king a coronation medal, as a compliment for his answer. He received the thanks of the King of Spain for his answer to queries on the same subject. He received a gold medal from the Queen of Etruria as a mark of respect for his medical character and writings. The Emperor of Russia presented him on the same account with a costly diamond ring. His writings are numerous, and may be set forth here, showing in what state they were originally found in the

book stores. Between the years of 1789 and 1804 he published five volumes of what he entitled "Medical Inquiries and Observations." Of these he printed in 1805 a second edition in four volumes, in 1809 a third edition in four volumes, and they have often been reprinted since his death. They comprehend the following: "An Inquiry into the Cause of Animal Life," "Natural History of Medicine among the Indians of North America,"—read before the American Philosophical Society in 1774; "Inquiry into the Influence of Physical Causes on the Moral Faculty,"—read to the Philosophical Society, 1786; "On the Influence of the American Revolution on the Human Body and Mind," "An Inquiry into the Relation of Tastes and Aliments to each other, and into the Influence of this Relation to Health and Pleasure;" "Result of Observations made on the Diseases of the Military Hospitals During the Revolutionary War;" "An Inquiry into the Effects of Ardent Spirits on the Body and Mind;" "Observations on Tetanus;" "On Diseases Caused by Drinking Cold Water;" "On the Cure of Several Diseases by the Extraction of Decayed Teeth;" "Upon Worms and Anthelmintic Medicines;" "On Arsenic in the Cure of Cancer;" "An Inquiry into the Cause and Cure of Sore Legs;" "Observations on the Duties of a Physician, and on the Methods of Improving Medicine;" "On the State of the Body and Mind in Old Age;" "On the Climate of Pennsylvania;" "Two Essays on Consumption;" "On the Cause and Cure of Dropsies;" "On Internal Dropsy of the Brain;" "On the Cause and Cure of Gout;" "On the Cause and Cure of Hydrophobia;" "On the Cause and Cure of Cholera Infantum;" "Observations on Cynanche Trachealis;" "Account of the Remitting Fever of 1780;" "An Account of the Scarlatina in 1783 and 1784;" "On the Measles of 1789;" "Account of the Influenza from 1789 to 1791;" "Outlines of the phenomena of Fever;" "His Various Histories of the Yellow Fever in Philadelphia, from 1793 to 1796;" "Histories of the Yellow Fever in Philadelphia, from 1797 to 1805;" "An Account of the Measles in Philadelphia," 1801; "An Account of the Diseases in Philadelphia, from 1806 to 1809, inclusive;" "An Inquiry into the Various Sources of Summer and Autumnal Diseases in the United States, and the Means of Preventing Them;" "Facts to Prove Yellow Fever not Contagious;" "A Defense of Blood-letting;" "An Inquiry into the Comparative State of Medicine in Philadelphia, between the years 1760 and 1809;" A volume of "Essays, Literary, Moral, and Philosophical," originally published in the periodicals of the day; collected and published in one volume (1798), and frequently republished. The volume consists of "A Plan for Establishing Public Schools in Pennsylvania, and for Conducting Education Agreeably to a Republican Form of Government," 1786; "Of the Mode of Education Proper in a Republic;" "Observations on the Study of the Ancient Languages, with Hints of a Plan of Liberal Instruction without them, Accommodated to a Republic;" "Thoughts on the Amusements and Punishments Proper in Schools;" "Thoughts on Female Education, Accommodated to the Present State of Society, Manners, and Government in the United States;" "A Defense of the Bible as a School-book;" "An Address to Ministers of the Gos-

pel of every Denomination, upon Subjects Interesting to Morals;" "An Inquiry into the Consistency of Oaths with Reason and Christianity;" "An Inquiry into the Consistency of the Punishment of Murder by Death with Reason and Revelation;" "A Plan of a Peace Office for the United States;" "Information to Europeans Disposed to Migrate to the United States;" "An Account of the Progress of Population, Agriculture, Manners, and Government in Pennsylvania;" "An Account of the German Inhabitants of Pennsylvania;" "Thoughts on Common Sense;" "An Account of the Vices Peculiar to the Indians of North America;" "Observations upon the Influence of Tobacco upon Health, Morals, and Property;" "An Account of the Sugar-Maple Tree of the United States;" "The Life and Death of Edward Drinker, aged 103 Years;" "Remarkable Circumstances in the Life of Ann Woods, a Woman of Ninety-six years;" "Biographical Anecdotes of Benjamin Lay;" "Biographical Anecdotes of Anthony Benezet;" "Paradise of Negro Slaves—a Dream;" "Eulogium on Dr. Cullen;" "Eulogium on Rittenhouse;" six introductory lectures published in 1801, to which ten others were added and published in 1811; "Medical Inquiries and Observations on Diseases of the Mind," 1812; "The Works of Sydenham, Pringle, Cleghorn, and Hillary," published during the last three years of his life, with original notes. No portion of his MS. lectures has been published since his death. "Sermons to Young Men on Temperance and Health," 1770; "Two Essays against Negro Slavery," 1771, and numerous contributions to medical journals. The same to the newspapers and magazines of the passing time on literary subjects; during the war, on politics and the establishment of the general and State governments. Among these may be noted his four letters to the people of Pennsylvania on the constitution of 1776; also his vehement denunciation of the test law; a highly interesting and instructive memoir of Christopher Ludwick, baker-general of the Revolutionary Army, republished by the Charity School Society of Philadelphia. It does not appear that Rush was ever ambitious of the elegant style of professedly literary men; perspicuity and vigor were enough for his purpose, and these are all that he appears to have sought. In pursuing these, however, he attained, and that very early, a style of uncommon beauty and various excellence. He used to commend Swift as the best model for general use; but if he took this fluent and careless writer for his own imitation, it must be confessed that he greatly surpassed his master in polish and grammar. Rush's style is natural and easy, fluent and perspicuous, lively and vigorous; his idiom is pure, for he knew enough of both ancient and modern tongues to guard himself against impurities in our polyglot English. He never introduces new words nor does he fantastically modify old ones, as some of our medical authors now do; but taking the language as others used it, he found it sufficient to all his ideas and to all his notions of beauty. He makes no struggling attempts at elegance, shows no ambition of plucking flowers on Helicon; yet the mere fervor of his subject sometimes makes him highly eloquent, apparently in contrariety to his own intentions. In every work of his there is much to praise and little to blame; his beauties are many, of

deformities he has not one. As Johnson wrote on Goldsmith tomb, *nil quod tetigit non ornavit*, whatever he touched upon he was sure to adorn; hence his works abound in what Lucretius calls the *aurea dicta*, those golden sentences which every reader of taste will stop to admire and even commit to memory. In all his writings his resolute and fearless mind was generally admired; and it does not appear that he wrote for either present or posthumous fame, but for the present benefit of suffering humanity. This he did with a fearless mind, for many of his startling and novel thoughts, such as are sure to offend, and are therefore suppressed by the timid and wary, were published by him in Philadelphia while yet a young man and a candidate for popular favor. Some affect to look upon his novel thoughts as rather superficial; to this he himself would not have objected, for it was his opinion that many truths which have often been sought for at great depths, are not unfrequently found on the surface: as a great writer says, "the reader of the Seasons wonders that he never saw before what Thomson shows him, and that he had never felt what Thomson impresses," so the student is surprised to find that what he had sought in vain by the deepest reasoning, is shown by Rush as obvious to common perception. But what is above all other fame, there runs through his works, and did through his lectures, such a vein of humble piety and cordial devotion as must have impressed many a youthful, careless, or doubting mind with the truth of revelation, and thus have sown the seeds of faith, to spring up and ripen their fruit through all succeeding time. Of such it is said by Divine authority, "they shall shine as the brightness of the firmament, and as the stars forever and ever."

SAFFORD, James Merrill, of Nashville, Tenn., was born in Zanesville, O., August 13, 1822. He graduated A. B. in 1844 and A. M. in 1848, from the Ohio University, at Athens, Ph. D. from Yale College, in 1868, and M. D. in 1872 from the Medical Department of the University of Nashville. He became connected, in 1848, with the Cumberland University, at Lebanon, Tenn., as Professor of Chemistry and Natural History, and in 1873 with the Faculty of the Medical Department of the University of Nashville as Professor of Chemistry. In 1874 this faculty also became the Faculty of the Medical Department of the Vanderbilt University. He has been State geologist of Tennessee for many years, and is now Professor of Natural History in Vanderbilt University. He is also vice-president of the Tennessee State Board of Health. Dr. Safford's publications are chiefly of a geological character.

SANDS, Henry Berton, of New York, was born in that city, September 27, 1830, and died there November 18, 1888. His preparatory education was obtained at a high school in that city, and his medical education at the College of Physicians and Surgeons, New York, whence he graduated M. D. in 1854, and established himself immediately after in New York in general practice, but giving special attention to surgery. He contributed articles on professional subjects to the New York medical and surgical journals. He was a member of the New York Medical and Surgical Society; and of the New York County Medical and Pathological Societies; was president of the second-named from 1874 to 1876, and of the last-named

during 1866-67, and was president of the New York Surgical Society in 1883. From 1860 to 1870 he was business partner of Dr. Willard Parker. He has held the position of House-physician, and, in 1854-55, House-surgeon to Bellevue Hospital. He then visited Europe, and, returning in the autumn of 1856, became Demonstrator of Anatomy in the College of Physicians and Surgeons, New York, a position he retained for ten years. In 1881 he was made Attending Surgeon to the New York Eye Infirmary, and St. Luke's Hospital; these he retained until 1863. He was also Attending Surgeon in Bellevue Hospital, from 1866 to 1876, and at the Stranger's Hospital from 1869 to 1871. He was Consulting Surgeon to St. Luke's Hospital; Attending Surgeon to Roosevelt Hospital and the New York Hospital; and Professor of Anatomy in the College of Physicians and Surgeons, New York, from 1867 till 1879, and then became Professor of Surgery in that institution. Dr. Sands was widely known as a successful operating surgeon. Among the descriptions of operations that he has contributed to surgical literature may be mentioned: "Case of Cancer of the Larynx, Successfully Removed by Laryngotomy," 1865; "Aneurism of the Subclavian, Treated by Galvano-Puncture," 1869; "Case of Traumatic Bronchial Neuralgia, Treated by Excision of the Cords which go to form the Bronchial Plexus;" "Case of Bony Ankylosis of the Hip-joint Successfully Treated by Subcutaneous Division of the Neck of the Femur," 1873; "Esmarch's Bloodless Method," 1875; "Treatment of Intussusception by Abdominal Section," 1877; "The Question of Trephining in Injuries of the Head," 1883; and "Rupture of the Ligamentum Patellæ, and its Treatment by Operations," 1885.

SATTERLEE, Richard Sherwood, of New York, was born in Fairfield, Herkimer county, N. Y., December 6, 1798, and died in the former city November 10, 1880. His father was Maj. William Satterlee, who died of wounds received at the battle of the Brandywine, a few months after his son's birth. His grandfather was one of the sufferers at the massacre of Wyoming. After graduating, he commenced the practice of medicine, in 1818, in Seneca county, N. Y., but subsequently removed to Detroit, then in the territory of Michigan. The association with army officers there, and the remembrance of his father's military career, which had always inclined him to a military life, led him to accept the position of attending surgeon in a neighboring garrison. He accompanied Governor Lewis Cass to Washington a few months after, and by the Governor's influence with Mr. Calhoun, then Secretary of War, and with Dr. Lovell, Surgeon-General of the United States Army, obtained the appointment of Assistant Surgeon United States Army in February, 1822. His first official duties were performed on the Niagara frontier, then on the lakes and Indian Territory. In 1837 he accompanied the troops to the Florida war, and was assigned to duty as medical director on the staff of Gen. (then Col.) Taylor, of the First Infantry. He took active part in the war against the Seminole Indians, and after the battle of Okechobee joined the headquarters of Gen. Scott, in the Cherokee campaign in 1838. After two years' service on the Canada frontier he returned to Florida, to active duty

there, and after a lapse of two years, during which he was stationed on the sea-board, he accompanied the troops, in 1846, to Mexico, joining Gen. Scott at the rendezvous on Lobos Island; he landed with him at Vera Cruz, in 1847, and was immediately assigned to duty under Gen. Worth as Chief Surgeon of the First Division of Regulars, serving with him during the capture of Vera Cruz, the battles of Cerro Gordo, Cherubusco, Molina del Rey, the storming of Chapultepec and the gates of Mexico. On the occupation of the city he was made medical director of the army, on the staff of Gen. Scott, and commenced, with the aid of his associate surgeons, the establishment of hospitals for the sick and wounded. He continued here till the treaty of Guadalupe-Hidalgo was signed, and then joined the staff of Gen. Butler, who had succeeded Gen. Scott in his command. Being relieved from duty with the army in Mexico, he reported in Washington, and after another brief service on the sea-board, left New York with the Third Regiment of Artillery, in the "San Francisco," to make the voyage to California round Cape Horn. After the wreck of this vessel in the Gulf Stream, and the return to New York of the troops who were on board of her, in February, 1853, he was assigned to duty as medical purveyor of the army, a position which he held till the close of the War of the Rebellion. Having now advanced to the head of the list of army surgeons, he was, in 1866, made brevet brigadier-general, "for diligent care and attention in procuring proper army supplies as medical purveyor, and for economy and fidelity in disbursing large sums of money." Under the operation of the law making the "Peace Establishment," he became chief medical purveyor of the army, during which time he disbursed and accounted for nearly twenty millions of dollars. He was retired by President Johnson in the last days of his administration. The active duties of Gen. Satterlee in a peaceful branch of the military profession prevented his giving that exclusive attention to any special department of the medical profession. The noted care of the troops under his charge and their efficient organization speak for him as a surgeon and a physician as well as an organizer.

SAYRE, Lewis Albert, of New York City, was born at Bottle Hill, now Madison, Morris county, New Jersey, on February 29, 1820. He came of a family long and honorably known in that section of the country, his grandfather, Ephraim Sayre, having been a quartermaster in the Revolution, and a devoted patriot, at whose house Washington made his headquarters previous to the battle of Springfield. His father, Archibald Sayre, was a wealthy farmer of Morris county, prominent in local affairs, and a worthy member of the community. The son received his primary education at the local academy, and was subsequently placed under the tuition of a cousin, Edward A. Stiles, a graduate of Yale, and, at a latter period, Superintendent of Public Education for New Jersey, who at that time presided over Wantage Seminary, at Deckertown, N. J. Young Sayre spent two years at that institution, and then went to live with an uncle, David A. Sayre, a banker, in Lexington, Ky. He attended Transylvania University, and after passing through the full course of study, was graduated in 1839. His uncle had hoped that

he would devote his life to the ministry, but the gifts of nature, and a set purpose, drew him in another direction. Medicine was his ambition, and going east again he began its study under Dr. David Green, of New York. He then entered the College of Physicians and Surgeons, and in 1842 received the degree of Doctor of Medicine, presenting, at graduation, a thesis on "Spinal Irritation," that was recognized as an evidence of unusual ability, and was published in the *Western Journal of Medicine and Surgery*. Dr. Sayre immediately received the appointment of Prosecutor of Surgery, under Prof. Willard Parker, in the institution from which he had just graduated, and in 1852, being compelled to resign because of his extensive practice, he was appointed *Emeritus* Prosecutor. In 1853 he was appointed Surgeon to Bellevue Hospital, and in 1859 Surgeon to the Charity Hospital on Blackwell's Island, and of this institution he became Con-

Lewis A. Sayre

sulting Surgeon in 1873. He was one of the prime movers in the organization of the Bellevue Hospital Medical College, in 1861, and upon the formation of its Faculty was made Professor of Orthopedic Surgery and Fractures and Luxations, and afterward of Clinical Surgery, which chairs he yet fills. Dr. Sayre was also one of the founders of the New York Pathological Society, and active in the formation of the New York Academy of Medicine and the American Medical Association, and was elected vice-president of the latter in 1866, and president in 1880. The address delivered by Dr. Sayre at the thirty-first annual session, held at New York in June of that year, and published in the Transactions of the Association, is a model of its kind in its terseness and clearness of expression, and illustrative of his views upon important questions. In 1866, Dr. Sayre was appointed Resident Phy-

sician of the City of New York, and made great efforts for the improvement of the hygienic conditions of the city. His reports to the board of health upon cholera, compulsory vaccination, drainage, sewerage and other questions of vital import show a careful consideration of the best interests of the community, and a thorough knowledge of the subject of hygiene. In 1876, Dr. Sayre was appointed by the American Medical Association a delegate to the International Medical Convention, held at Philadelphia in the same year. In that learned body he read a paper on "Morbus Coxarius," or hip-joint disease, having been the first American surgeon who performed the operation for the remedy of this affection, with a successful result. Dr. Sayre also at this time performed the operation before the congress, at the conclusion of which Prof. Lister remarked: "I feel that this demonstration would of itself have been a sufficient reward for my voyage across the Atlantic." His first operation was performed in 1854, and reported in the *New York Journal of Medicine* for January, 1855. Although others had tried before him, this was the first successful operation in America, and was, indeed, a success in every respect, the deformity being slight, and motion perfect. He has since performed this difficult operation seventy-three times. In 1871 Dr. Sayre made a visit to Europe, and widened and extended his professional fame on that side of the sea. By special invitation he lectured upon hip-joint diseases and its remedy before several medical societies, who extended a warm welcome, and greeted his demonstrations with marked enthusiasm. Of late years he has given much attention to the treatment of Potts' disease, and lateral curvature of the spine. His method being by suspension of the body, and the application of plaster-of-Paris bandages, in Potts' disease, from which the most astonishing results have been obtained. In lateral curvature the same treatment with the addition of proper gymnastic exercises, is followed by the greatest success. In 1877 he was appointed by the American Medical Association a delegate to the British Medical Association, held at Manchester, England, in the same year. The fame of his wonderful success in the healing of spinal affections had preceded him, and, as upon former occasions, he was invited to lecture before the leading medical societies and at the principal hospitals. In London he gave lectures upon, and demonstrations of, his mode of treatment, at the University College Hospital, Guy's, St. Bartholomew's, St. Thomas' and the Royal Orthopedic. He subsequently accepted invitations from Liverpool, Manchester, Birmingham and Cork, at each of which places he lectured and gave demonstrations, being afforded abundant opportunities for public tests of the value of his mode of treatment and appliances, and being greeted with great cordiality by his professional brethren. At one of his lectures, before the British Medical Association, he received the most flattering acknowledgments of that body, in an editorial comment by the *British Medical Journal* of August 18, 1877, as follows: "Resolutions were carried by acclamation warmly thanking him for the generous and devoted course which he pursued in spending so large an amount of time and trouble in bringing under the notice of the profession in this

country the methods and details of proceedings, by which he carried out his treatment of angular and lateral curvature of the spine, which constitutes a new era in that department of surgery, and of which the already proved success entitles us to say that this method of treatment will prove an estimable boon to thousands of persons now and hereafter." The *Lancet* of July 4, 1877, in concluding a most complimentary notice of his demonstrations and lectures at the University College Hospital of London, said: "We are not blind to the fact that much of the success obtained is due to Dr. Sayre's own rare physiological and mechanical skill, but his principles are as sound physically as their application is mechanically expert, and we thank him most heartily for the trouble he has taken in England to illustrate and enforce them." A correspondent of the *Medical Record*, September 5, 1877, speaking of Dr. Sayre's demonstration at Manchester, says: "He spoke an hour and a half, in a manner which delighted these men amazingly. They expressed their gratification in the most complimentary terms which could be employed. They declared, and with great earnestness, that Prof. Sayre, by his lectures and demonstrations in the surgical treatment of spinal deformities, and the unanimous thanks of the association were tendered him amid applause which was little less than deafening." While abroad upon this occasion Dr. Sayre prepared "An Illustrated Treatise on Spinal Disease and Lateral Curvature," which he dedicated to the medical profession of Great Britain, in grateful acknowledgment of their generous and cordial reception. As a lecturer, Dr. Sayre's style is very vigorous and clear, terseness and simplicity adding to its impressiveness, while his ready logic and power of illustration, with his rich fund of humor and fancy, stamp him as one peculiarly endowed for imparting instruction. His many professional writings are marked by the same characteristics, and seldom fail to convey the full meaning of the author. The following are some of the principal contributions to medical literature: "Chorea Induced by Mental Anxiety;" "Cases of Chronic Abscess in the Cellular Tissue of the Peritoneum;" "Spina Bifida, the Tumor Removed by Ligature;" "Case of Perforation of the Rectum, Followed by an Extensive Ischio Rectal Abscess and Caries of the Coccyx, and Sacrum;" "Exsection of the Head of the Femur and Removal of the Upper Rim of the Acetabulum for Morbus Coxarius;" "Treatment of Croup by Inhalation of Steam;" "Lead Palsy from the Use of a Cosmetic;" "Mechanical Treatment of Chronic Inflammation of the Joints of the Lower Extremities;" "Partial Paralysis from Reflex Irritation Caused by Congenital Phymosis;" "A Simple Dressing for Fracture of the Clavicle;" "On Anchylosis;" "Clinical Lectures on Disease of the Hip-Joint;" "Spinal Anemia, with Partial Paralysis and Want of Co-ordination from Irritation of the Genital Organs;" "Report on Fractures;" "Report on Potts' Disease, or Caries of the Spine Treated by Extension and Plaster-of-Paris Bandage;" "On Disease of the Knee-Joint;" "On the Deleterious Results of a Narrow Prepuce and Preputial Adhesions;" "Spondylitis and Rotary Lateri. Curvature of Spine;" "On the Necessity of Cutting Contractured Tissues in Cases of Deformity before Traction

is Attempted;" "Results in Cases of Hip-Joint Disease Treated by the Portable Traction Splint." This paper, which was published in the *New York Medical Journal*, April 30, 1892, presents a series of cases of *hip-joint disease* treated in this country and Europe without *immobilization*, except during the inflammatory stage of the affection, and the perfect cures reported renders it a most valuable contribution to orthopedic surgery. Other papers than these might be mentioned, but enough have been named to clearly show the variety of his surgical labors, and the width of the field in which he has so successfully worked. Dr. Sayre has also published "A Practical Manual of the Treatment of Club-foot," which is highly esteemed and has already passed through several editions, and "Lectures on Orthopedic Surgery and Diseases of the Joints," a large volume of some five hundred pages, illustrated by nearly three hundred wood cuts, which is regarded as the leading authority in that department of surgery, and which has not only reached its second edition, but has been translated into French, German and Spanish, and also into the Japanese language. Some years ago the *British Medical Journal* (which is probably the highest authority recognized by the medical world), in speaking of a recent German translation of this work, said: "Dr. Sayre's methods have now such universally recognized currency and value throughout English-speaking countries, and are so well known and largely practiced throughout Europe, that it is surprising these valuable lectures have not before been translated into German. Time, which tries all things, has set its seal of emphatic and general approval both on the principles and methods which Dr. Sayre has ingeniously devised, ably illustrated and successfully carried into practice. He has removed a great mass of painful, tedious and almost incurable complaints into the region of curable and easily managed affections. He has substituted a simple and practical method, within the reach of every practitioner, for costly, complicated and heavy mechanical devices which were accessible only to the few, and which only imperfectly and occasionally fulfilled their objects. Few men have in their generation accomplished so much for the relief of humanity, and his name will go down to posterity, with that of Marion Sims, as among the most distinguished benefactors whom the American medical profession has produced for the glory of medicine and the good of mankind during this century." Dr. Sayre's wonderful success is not only recognized abroad, but tributes of a high character are paid him continually here at home, in these latter days. Out of the many that might be chosen, we select one, from the presidential address, delivered by Dr. E. H. Bradford, before the Orthopedic Association, and published in the *Boston Medical Journal* of September 26, 1889. After giving a history of orthopedic surgery from the beginning, he said: "It is scarcely necessary to mention the name of Dr. Sayre in connection with the subject of orthopedic surgery. His fame in this regard is world-wide; one achievement alone would be sufficient for his renown—the well-known plaster corset; but it is not for this, or for his able advocacy of excision, for which alone are due our special thanks, so much as to the one great fact of the influence he has

exerted. It is to him we owe the wide-spread interest which brings help to us from all over the country. Orthopedic surgery is no longer—thanks to the energy of Dr. Sayre, his brilliancy as a writer and a teacher—a neglected branch of surgery. The surgeon no longer looks upon the treatment of orthopedic cases as a forlorn hope of despairing surgical duty, or as a matter to be relegated to the commercial instincts of the maker of trusses. Dr. Sayre has not only promoted the cause of the treatment of deformities; he has broadened the field of general surgery." He is also the inventor of several instruments which have proved efficient aids to the surgeon, among which is the uvulotome, club-foot-shoe, scrotal clamp, flexible probe, improved tracheotomy tube, and various splints and appliances for use in orthopedic surgery, which have proved of the highest value to the profession and of remarkable utility in the treatment of deformities. During Dr. Sayre's first visit to Europe, in 1871–1872, he was created a Knight of the Order of Wasa by Charles IV., of Sweden, in recognition of his valuable services to science, the king being personally cognizant of the accuracy of his method of diagnosis, and the success of his modes of treatment through the skill displayed by him in the case of a member of the royal family, whom he was called upon to attend. The Medical Society of Norway concurred in this action of the Swedish monarch by electing Dr. Sayre an honorary member. Dr. Sayre is yet engaged in the various labors of his profession, with a skill that has been heightened by years of experience and a vigor that has been strengthened by the success that has followed his labors in the past. In practice, in teaching to others, the knowledge he has learned, and with his pen, he is benefiting mankind through divers channels, and adding to the fame that was long since secure. In addition to the positions already enumerated, he is consulting surgeon to St. Elizabeth's Hospital and to the Northwestern Dispensary, and a member of the American Medical Association; the New York Academy of Medicine; the County Medical Society; New York County Medical Association; New York State Medical Association; the New York Pathological Society, of which he has been president; an honorary member of the New Brunswick Society; and also an honorary member of those great European bodies, the British Medical Association, the Medico-Chirurgical Society of Edinburgh, and the Medical Society of St. Petersburg, Russia. He has been too busy in his profession to accept any positions of a civic or political character, except a service from 1845 to 1861 as Surgeon General of the First Division of the New York Militia. It may be said that Dr. Sayre's great success in his profession is due primarily to a natural gift made effective in hard work; while the special features of that success are an accuracy of observation, clearness and decision in making his diagnosis, promptness in execution when necessity requires, and the courage to do what he thinks ought to be done, and to abide by the consequences. A conversationalist of the highest order, social in his intercourse with his fellows, he has been, and is, one of the leaders in the great world of medicine and surgery. The position to which he has attained can be described in no better words, and certainly from no greater authority, than to

quote the conclusion of the remarks made by the eminent Dr. S. D. Gross, of Philadelphia, before the class of Bellevue Hospital Medical College, on January 10, 1880, as stenographically reported by Dr. G. F. Gundrum. Dr. Gross said: "Dr. Sayre has done wonders in the field of surgery. He has not only made a fame for himself throughout the civilized world, but has also made a fame for the nation. I shall probably not be here, when he shall pass away, to write his biography—as I am a number of years older than he—to tell the world of his wonderful achievements; but he will need none, for the world is already his biographer. It has erected to him a monument more durable than brass!" The eminence to which this famous representative of the medical profession of New York has attained, stands as the sum of two factors that have been conspicuous all through his career. A native genius for this particular work, that has kept him in it against all diverting calls, and a capacity for mental and physical labor that has brought the best possible results, whether in study, investigation, or the application of knowledge in actual practice. Men may leap to fame in some professions or occupations in a single hour; in that of medicine, years of proved capacity and a first call that might almost be said—as in the ministry—to have come from a voice higher than any of earth, are the essentials of such fame as a reputable man would have. Such recognition, in its best form, has long since come to Dr. Sayre, and the people know that it is deserved.

SCHADLE, Jacob E., of St. Paul, Minn., was born of German-American parents in Clinton county, Pa., June 23, 1849. Until twenty years of age he worked on his father's farm and attended school in the winter. At that age he entered the Millersburg State Normal School, defraying his expenses by teaching in the public and private schools. In the summer of 1876 he entered the office of Dr. John S. Crawford, of Williamsport, Pa., as a student, and pursued his medical studies at Jefferson Medical College, Philadelphia, from which institution he graduated in March, 1881. Dr. Schadle located as a general practitioner at Shenandoah, Pa., in September, 1881. He continued in general practice until the spring of 1885, when he took a post-graduate course in diseases of the upper respiratory tract, at Philadelphia, under the supervision of Dr. Charles E. Sajous, of that city. From this time he gave special attention to diseases of the nose and throat until 1887, when, having met with a considerable degree of success in that specialty, he determined to seek a more extensive field of operation. He accordingly moved to St. Paul, Minn., and limited his practice to diseases of the nose and throat. Since coming to his new home his success may be said to be little short of phenomenal. In less than four years he had built up a most extensive practice in his specialty, and become known as one of the leading laryngologists and rhinologists in the northwest. In the spring of 1884 an epidemic of small-pox broke out at Shenandoah, and Dr. Schadle was appointed by the Board of Health to take charge of it. By rigid quarantine, and the establishment of a station to which all cases were taken as soon as recognized, the epidemic was controlled in about three months, during which time he treated forty-nine cases with ten deaths. For

the public service thus rendered the Doctor received the most generous appreciation from the community. In 1886, while at the same place, the Doctor had the opportunity to treat five cases of mushroom poisoning, a report of which is given in the last number of the *Medical and Surgical Reporter* for that year. As far as known he was the first to administer atropia as an antidote for mushroom poisoning in the human being. Dr. Schadle is consulting laryngologist to the City and County Hospital, and to St. Luke's Hospital, St. Paul, and surgeon-in-chief of the nose and throat department of the St. Paul Free Dispensary. He is a member of the following societies: The American Medical Association; the Minnesota State Medical Society; the Ramsey County Medical Society, and the American Rhinological Association. Among his principal contribu-

J. E. Schadle.

tions to medical literature are a paper on "The Relation of Spasmodic Asthma to Intra Nasal Disease" (*New York Medical Record*, 1888), and a paper on "The Effects of Cocaine on the Genital Organs" (*Philadelphia Medical Register*, 1889). He was the first to report this effect of cocaine. Perhaps his most important contribution was the report in the *Journal of the American Medical Association*, 1888, of a case of "Chorea of the Soft Palate," due to a diseased state of the nasal fossæ, together with its permanent cure by removal of the morbid tissue.

SCHAFER, Charles, of Philadelphia, Pa., was born in that city February 4, 1838. Dr. Schaffer was educated by private tuition, and after studying medicine entered the medical department of the University of Pennsylvania and was graduated M. D. from that institution in 1859. He then settled in his native city where he has since remained engaged in the active duties of his profession. He is a member of the College of Physicians of Philadelphia, of the Philadelphia Academy of Natural

Sciences, and of the Historical Society of Philadelphia.

SCHAUFFLER, Edward W., of Kansas City, Mo., son of Rev. W. G. Schaufler, D. D., a missionary to Turkey, was born at Vienna, Austria, September 11, 1839. He was educated at Williams College, Mass., and after studying medicine entered the College of Physicians and Surgeons, New York City, and was graduated M. D. from that institution in 1866. He practised his profession one year in New York and has since 1868 been established in Kansas City. He is an active member of the American Medical Association, and was secretary of the Missouri State Medical Society from 1872 to 1876, and was then made vice-president of that organization. From 1871 to 1874 he edited the *Kansas City Medical Journal*, and has published in this and other medical periodicals a number of monographs and reports of professional interest. Dr. Schaufler was one of the translators of Ziemssen's "Cyclopedia of the Practice of Medicine." He is Professor of the Principles and Practice of Medicine and Clinical Medicine in the Kansas City Medical College, and president of the Faculty of that institution.

SCOFIELD, Darius, of Washington, Ia., was born in Hadley, Saratoga county, N. Y., July 31, 1834. He was educated at the Cambridge Academy, Washington county, N. Y. He entered the Albany Medical College in his native State and received his medical degree from that institution in 1858. He first established himself at Corinth, N. Y., where he remained in general practice from 1859 to 1863, when he entered the Union Army as Assistant Surgeon. After the close of the Civil War he located at Daytonville, Ia., but removed to the city of his present residence in 1869. His medical education was supplemented by attending the Bellevue Hospital Medical College in 1877-'78. He is a general practitioner, but has always devoted special attention to surgery and diseases of a surgical nature. He has served as physician of the commission of insanity for his county, and as medical examiner and surgeon for several life assurance and railroad companies.

SCOTT, William, of Kokomo, Ind., was born in Clark county, Ohio, April 22, 1831. He was the eldest of a family of nine children. His father, Charles Scott, was a native of Pennsylvania, of Scotch-Irish descent, a son of Timothy H. and Hannah (White) Scott; his mother, Sarah (Bloxsom) Scott, was a native of Virginia. Dr. Scott's father was by profession a school-teacher, under whose instructions he received his earlier education. At the age of eighteen years he entered the Marion Seminary, at Marion, Ind., where he took a four years' course of study, teaching at intervals during this time. After completing his course there, he turned his attention to civil engineering for about one year. He assisted in surveying the present railroad line from Union City to Logansport, Ind.—now a branch of the Pan-handle system. Dr. Scott began the study of medicine under the direction of Dr. William Lomax, of Marion, Ind., in 1853, remaining with him for about three years. In 1856 he removed to Greentown, Ind., and began the practice of medicine in connection with Dr. William J. Morgan. In 1857 he took his first course of lectures in the Ohio Medical College, at Cincinnati; after which he continued the practice of medicine at Greentown, until 1862, when he graduated at Rush Medical Col-

lege, Chicago. He afterwards supplemented his medical education by graduating from Bellevue Medical Hospital College, in 1870. In 1862 he passed the required examination, and entered the service as contract surgeon in Hospital No. 14, in the Union Army. After serving in this capacity for a short time he was appointed Assistant Surgeon in the Eighty-ninth Indiana Volunteer Infantry. He was soon after made a Major-surgeon of the same regiment, in which capacity he served until the close of the war. In 1866 he located in Kokomo, Ind., where he has since been engaged in the practice of his profession. In 1881 Dr. Scott accepted a call to the chair of Diseases of the Throat and Respiratory Organs in the Fort Wayne College of Medicine, which position he filled until 1883. He was then appointed Professor

William Scott

of Diseases of the Rectum and Genito Urinary Organs, and filled that chair until 1888, when he resigned. He is a member of the Howard County Medical Society; the Indiana State Medical Society; the American Medical Association; the American Association of Railway Surgeons; a Member of the Kokomo Board of U. S. Pension Examiners, and Trustee of the Indiana Medical College, of Indianapolis, Ind. Dr. Scott was united in marriage to Miss Sarah R. Thorp, of Marion, Ind., in 1854, who departed this life in 1869. He was married to his present wife, Jennie E. Snorf, also of Marion, in 1871. He is the father of three living children by each wife, three sons and three daughters.

SCOTT, Xenophon Christmas, of Cleveland, Ohio, was born at Hayesville, Ashland county, in the same State, December 4, 1842. He prepared for college at Vermillion Institute, Hayesville, and completed his collegiate course at Jefferson College, Cannonsburg, Pa., graduating A. B. in 1865, and A. M. in 1868. He

served two years in the army during the Rebellion as a private, and afterwards as chief clerk in the quartermaster's department of the Army of the Mississippi. He began studying medicine in 1864, during his last year in college, under Dr. John Weaver (deceased); continued his medical studies in Cleveland, under his uncle, Dr. D. H. Scott, and graduated M. D. at the Cleveland Medical College in 1867. From 1867 to 1869 he was connected with various New York and Brooklyn hospitals as Resident Physician and Surgeon, and during this time studied diseases of the eye, ear and throat. In 1869 he took the degree of M. D. at the College of Physicians and Surgeons of New York, and his thesis entitled "A New Method of Treating Fractures of the Forearm by Extension and Counter Extension and Forced Supination," is specially mentioned by Frank H. Hamilton in the late editions of his book on "Fractures and Dislocations." After graduating in New York he continued his studies in Heidelberg, Berlin and London, being connected the most of the time with the Heidelberg University Eye Hospital, as first Assistant Surgeon, a position in Germany but rarely attained by Americans or foreigners. During the Franco-Prussian War, he had charge of a military hospital in Heidelberg. In the autumn of 1871 he returned to New York, and remained a year in the New York Ophthalmic and Aural Institute as Resident Surgeon. In 1871 he was elected to the chair of Ophthalmology, Otology and Laryngology in the Cleveland Medical College, but did not settle there until 1872. He devotes himself entirely to ophthalmic, aural and laryngeal diseases. In 1875 and 1876 he was defendant in the famous *Bobbitt vs. Scott* case, of blackmail, and came out overwhelmingly victorious, causing the plaintiff to flee from the country to keep from being arrested for perjury and murder in the case. He is a member of the American Medical Association; the Ohio State Medical Society; the Northeastern Ohio Medical Association; the Northwestern Ohio Association; the Cuyahoga County and Cleveland Medical Society, and the Mississippi Valley Medical Association, of which he was elected president at its nineteenth annual meeting, held at Indianapolis, Ind., in October, 1893. In 1872 he founded the Cleveland Eye, Ear and Throat Institute, and became Surgeon-in-Chief, being formerly Visiting Physician and Surgeon to the Cleveland City Hospital.

SEGUIN, Edouard, of New York City, was born in Clamecy, Department of Nièvre, France, January 20, 1812, and died October 28, 1880. He was educated at the Colleges of Auxerre and St. Louis, Paris. His life was mainly devoted to formulating and putting into practice a rational and effective system for the physiological training and education of idiots; a noble work, in which he was for a long time absolutely alone, and in which he was at the time of his death, throughout the world, the recognized leader. So early as 1837 he commenced treating an idiotic boy, with the advice of Itard, later with Esquirol, and before 1839 opened the first school for idiots. This school, and the first exposition of the method used in it, published in the *Annales d'Hygiène*, was the mother of the seventy-five institutions for idiots since erected in civilized countries, eleven of which in the United States are among the most flourishing. Dr. Edouard

Seguin was the president of the American Association of the medical officers of these institutions. After the revolution of 1848 he came to the United States, and during the ensuing ten years was resident in Ohio, at first in Cleveland, and subsequently in Portsmouth. After revisiting France, he established himself in New York, where he completed his studies, interrupted by his practical labors and emigration, and graduated M. D. at the University College in 1861, and became a resident of that city. He was elected a member of the American Medical Association in 1862. To Dr. Seguin, more than any other person, is due the honor of showing to what degree the congenital failures of nature can be redeemed and educated to comparative usefulness. According to his testimony: "Not one idiot in a thousand has been entirely refractory to treatment; not one in a hundred has not been made more happy and healthy; more than thirty per cent. have been taught to conform to social and moral law, and rendered capable of order, of good feeling, and of working like the third of a man; more than forty per cent. have been capable of the ordinary transactions of life under friendly control; of understanding moral and social abstractions; of working like two-thirds of a man; and twenty-five to thirty per cent. come nearer and nearer to the standard of manhood, till some of them will defy the scrutiny of good judges when compared with ordinary young men and young women." Since 1866 he devoted much time to the study of animal heat, adding greatly to the fund of knowledge concerning this subject by the instruments that he invented, and the methods of thermography which he devised, of which the physiological thermometer, largely used by physicians, is the most important. In 1873 he represented, as Commissioner of Education, the United States Government at the Vienna Exposition. He had been for many years a most industrious author, and his collected writings constitute in themselves an excellent working library, so far as his specialty is concerned, and are far from inconsiderable in other fields. Besides his early foreign publications, the following important contributions to medical literature may be mentioned: "Historical Notice of the Origin and Progress of the Treatment of Idiots," 1852; "Idiocy and its Treatment by the Physiological Method," revised by the son of the author, Dr. E. C. Seguin, 1866; "New Facts and Remarks Concerning Idiocy," 1870; "Medical Thermometry" (with Wunderlich), 1871; "Prescription and Clinic Records," "Mathematical Tables of Vital Signs," "International Uniformity in the Practice and Records of Physic," and "Medical Thermometry and Human Temperature," 1876.

SEILER, Carl, of Philadelphia, Pa., was born in Switzerland, April 17, 1849. He was educated at the University of Pennsylvania, and also at the University of Berlin, and pursued his medical studies in Vienna and Heidelberg, graduating M. D. at the University of Pennsylvania in March, 1871. He settled in Philadelphia in general practice, but devoted himself specially to laryngoscopy and otoscopy. Dr. Seiler is lecturer on laryngoscopy and chief of the laryngoscopic department of the University of Pennsylvania. He is a member of numerous medical and scientific organizations, including the Philadelphia County Med-

ical and Pathological Societies; and has been recorder of the biological and microscopical section of the Academy of Natural Sciences. Dr. Seiler is widely known throughout the country as a skillful aurist and laryngologist, and is a recognized authority in his specialty.

SHAKESPEARE, Edward Oram, of Rosemont, Pa., was born May 19, 1846, in New Castle county, Delaware. Through his father, Wm. M. Shakespeare, of Dover, he is descended from Edmund Shakespeare, one of the brothers of the poet, and through his paternal grandmother from the "Lords of the Isles" and the Thanes of Argyle and Kintyre; while through his mother, Catharine Haman, he inherits the blood of the ancient barons of Crèvequer and Cetham. Beginning his academical course at Reynolds' Classical Academy at Dover, in his native State, he finished it at Dickinson College, from which he graduated in June, 1867, when he at once entered the medical department of the University of Pennsylvania, graduating in March, 1869. He first settled in Dover, but in February, 1874, removed to Philadelphia. He held the position of lecturer on Refraction and Accommodation of the Eye, and Operative Ophthalmic Surgery in the University of Pennsylvania, operative ophthalmic surgery being his specialty. He is a member of the Delaware Medical Society; the Northern Medical Society; the Philadelphia County Medical Society; the Pathological Society of Philadelphia, and other medical organizations. He contributed to the *American Journal of Medical Sciences* for January, 1876, a paper on "A New Ophthalmoscope and Ophthalmometer, devised for Clinical Use, and for Physiological and Therapeutical Investigation on Men and Animals." In 1873 he was clerk of the Senate in Delaware. Dr. Shakespeare was sent a few years ago to investigate the cause of an epidemic of typhoid fever that prevailed in Plymouth, a town in the Wyoming Valley, of eight thousand inhabitants, situated on the left bank of the Susquehanna river, two and a half miles below the city of Wilkesbarre, Pa. The epidemic excited great interest throughout this country on account of its extent, its fatality, and its unknown cause. There were in all some twelve hundred cases, and one hundred and thirty deaths. He studied and reported the etiological factors with great care. The circumstances were such that the milk and food supply could not have caused so general a development, and it was proved that it was not from drinking the water from the Susquehanna river, contaminated by the sewers of Wilkesbarre. The hypothesis remained that the mountain water—the town's usual supply—conveyed to the homes of the people the sole cause of the disease. This supposition, on being followed up by Dr. Shakespeare, was soon converted into positive proof. This water, after the spring thaw, had been contaminated by the excreta of a patient suffering from typhoid fever during the preceding winter. His report of this epidemic shows how easy it is, without care or knowledge, to attribute results to wrong causes; that sewage-defiled water alone does not produce typhoid fever, though pure mountain water containing typhoid dejecta does; that refrigeration does not destroy the activity of the typhoid poison, and emphasizes the vital importance of disinfection of the dejecta, and of protecting the water supplies of towns and cities against a

fecal contamination which often comparatively innocuous may at any time become deadly. (See article on Enteric Fever in Woods' Reference Hand-Book of the Medical Sciences, vol. 3, page 84). In 1885 he was sent as the representative of the United States to Spain and other countries in Europe where cholera existed in order to investigate the causes, progress and proper prevention and cure of that disease. He spent six months in studying the subject, and made a voluminous report to Congress which is now issued as a public document.

SHARP, Levi N., of Minneapolis, Minn., was born at Springfield, Kings county, New Brunswick, on March 18, 1832. His literary education was received in the common schools and at the Academy of Sackville. He is descended from an old family of Sharps, of Bradford, England. His grandfather was one of the English officers engaged in the battle of Bunker's Hill, in Revolutionary times. He studied medicine in the office of, and under the direction of, James Christie, M. D., of St. John, N. B., and was graduated from Pennsylvania Medical College in 1861, and from the Royal College of Surgeons and Royal College of Physicians, Edinburgh, Scotland, in 1868, where he had the instruction of such men as James Syme, Matthews Duncan, and Sir James Y. Simpson. For several years he was Surgeon to Princess Louise Regiment of Cavalry. He practiced his profession in his native county, where he occupied a prominent position, holding several positions of trust, and took a leading part in politics. He married Miss E. A. Fenwick, whose family came from Yorkshire, England. In 1883 he found it necessary to seek a dryer climate, and went to Minneapolis, Minn., where he now resides.

SHATTUCK, Frederick C., of Boston, Mass., was born in that city November 1, 1847. He received the degree of B. A. from Harvard in 1868, that of A. M. in 1872, and that of M. D. from the same institution in 1873. He then visited Europe and studied medicine in Vienna, Berlin, Strassburg, London, Paris and Lyons from 1873 to 1875. He was appointed Visiting Physician to the Massachusetts General Hospital in 1886, and Jackson Professor of Clinical Medicine in the Medical Department of Harvard University in 1888, both of which positions he now holds. He is editor of a translation of Strümpell's Text-Book of Medicine; author of articles in Woods' "Reference Hand-Book of the Medical Sciences," Keating's "Cyclopedia of Children's Diseases," and Hare's "System of Practical Therapeutics," and of various articles in periodical medical literature; also of auscultation and percussion in *Physicians' Leisure Hour Series*.

SHAW, Alexander B., of St. Louis, Mo., was born in Cincinnati, March 5, 1847. He is of so-called Scotch-Irish extraction, though really of pure Scottish blood on his father's side, who was a lineal descendant of the Shaws, of Greenoc, Scotland, whose estates and titles passed, by entail and marriage, to the family of Shaw-Stewart, of Scotland, which still enjoys them. He moved to Illinois in 1856, enlisted in the Federal service when but thirteen years and four months of age. After receiving an honorable discharge, he devoted his time to study, and, in 1867, received the degree of M. D. from the St. Louis Medical College.

Soon after graduating he began the practice of his profession in Washington county, Ill., where he remained for eighteen months, and then went to Europe. Returning in the fall of 1869, he opened an office in that city, where he has been ever since, excepting a short time spent abroad in 1871. In the fall of 1871, he married Miss Favola, daughter of Rev. Henry Allen, of Jersey City Heights, New Jersey. In 1873 he received the *ad eundem* degree from the Missouri Medical College, with which he was associated as adjunct to the chairs of Clinical Medicine and Principles of Diagnosis and Diseases of the Mind and Nervous System. For about seven years Dr. Shaw was associate physician to the St. Vincent's Institution for the Insane, in St. Louis. After about eleven years' service in the Missouri Medical College, he became the prime mover in the organization of the Beaumont Hospital Medical College, in which he has filled the chair of Diseases of the Mind and Nervous System since its organization in 1886. For a number of years he has been consulting neurologist to the City Insane Asylum, City Hospital, Poor House and Female Hospital, Alexian Brothers and Railway Hospital, and is now engaged in preparing a text-book on diseases of the nervous system. Dr. Shaw has recently been appointed by the Board of Managers of the St. Louis Baptist Hospital to take charge of the department of nervous and mental diseases, which position he has accepted, we are pleased to state. Dr. Shaw enjoys the eminent distinction of being the presiding officer of the St. Louis Medical Society. He is an ardent advocate of trepanization wherever local lesion of the brain can be diagnosed, and is one of the few neurologists who do surgery of the brain themselves. He has been for many years a liberal contributor to various medical journals, and by earnest work has attained to enviable distinction in his profession.

SHAW, William Conner, of Pittsburgh, Pa., was born in Versailles township, Allegheny county, Pa., February 7, 1846. His paternal grandfather was born in County Down, Ireland, whose ancestors came there from Scotland, in 1648. His maternal grandmother, also, came from Ireland; the other grandparents were of Irish descent, but born in this country. Dr. Shaw took his degree of A. B. at Washington and Jefferson College, Pa., in 1869, and received the degree of A. M. from the same college in course, in 1872. He read medicine with Dr. W. R. Hamilton, Pittsburgh, and graduated at Bellevue Hospital Medical College, February 29, 1872. He then prepared, under the late Dr. Joseph W. Howe, for special examination to enter Bellevue Hospital. He entered Bellevue Hospital, October 1, 1872, and served two years, acting the first six months as one of its ambulance surgeons, after which he was assigned to the Second Surgical Division. His visiting surgeons on the division were Frank H. Hamilton, H. B. Sands, Alex. B. Mott, Lewis A. Sayre, and Stephen Smith. During his last year he was made Assistant to Dr. Stephen Smith, in the Medical Department of the University of City of New York. He located in Pittsburgh, November 5, 1874, where he has continued to reside, and from the first month has secured a large share of patronage. He was Physician to the Pittsburgh Free Dispensary, from 1876 to 1882, becoming thereby a life member;

Physician to Mercy Hospital, from 1876 to 1878, inclusive; Surgeon to Mercy Hospital, 1878 to 1887; Surgeon Alternate to the Pennsylvania Railroad, from January 1, 1877, to January 1, 1880, and the same to P. C. & St. L. Railroad from January 1, 1877, to January 1, 1882. At present he is Physician and Obstetrician to the Bethesda Home. He has been Chief Medical Examiner at Pittsburgh for the Equitable Life Assurance Society of New York, since 1881, and examines for a dozen other old-line companies. He carries \$104,000 on his own life, in addition to \$20,000 accident. He is a member of the Allegheny County, the State, and the American Medical Societies; also, of the American Academy of Medicine, and the Society of the Alumni of Bellevue Hospital, New York. Dr. Shaw is a Life Member of the Western Pennsylvania Exposition Society; Life Member of the American Society of Scotch-Irish, also of the Pennsylvania Scotch-Irish Society. He has contributed articles to local medical journals, and to the *Medical Record*, New York, and *American Journal of Obstetrics*. He is a director in a company manufacturing the National Reaper and Mower; also in another financial concern, and interested in several other enterprises.

SHIPPEN, William, Sr., of Philadelphia, Pa., was born in that city, October 1, 1712, and died in Germantown, Pa., November 4, 1801. He descended from a noted Quaker family of New England, and was the son of Joseph Shippen, who moved from Boston to Philadelphia in 1704, and became one of the men of science in his day, and who, in 1727, joined Benjamin Franklin in founding the *Junto*, "for mutual information and the public good." Dr. Shippen, the subject of this sketch, applied himself in early life to the study of medicine, for which he had a remarkable genius. He speedily obtained a large and lucrative practice, which he maintained throughout his life. He aided in founding the Pennsylvania Hospital, of which he was the physician from 1753 till 1778; also the Public Academy, and its successor, the College of Philadelphia (now the University of Pennsylvania), being chosen in 1749 one of the first trustees of the Academy. He was one of the five prominent physicians serving as member of the Board of Trustees in 1765, when the first medical professorship in America was established and conferred upon Dr. John Morgan. Dr. Shippen was a trustee of the college from 1755 to 1779, and was a member of the American Philosophical Society, of which he was vice-president in 1768 and for many years after. He was one of the founders of the Second Presbyterian Church, of Philadelphia, and was a member of the same for nearly sixty years. On November 20, 1778, he was chosen by the Assembly of Pennsylvania to the Continental Congress, and was re-elected in 1779. He was for thirty years a trustee of Princeton College. Dr. Shippen was noted for his deeds of charity, and not only gave his professional services and medicine to the poor, but oftentimes assisted them by donations from his purse. He retained his physical vigor until very late in life, and it is said that "at the age of ninety he would ride in and out of the city on horseback, without an overcoat, in the coldest weather." His son, also a physician, was one of the first medical teachers in America.

SHIPPEN, William, Jr., of Philadelphia, Pa., was born in that city October 21, 1736, and died in Germantown, Pa., July 11, 1808. The subject of this sketch received his elementary training from the Rev. Dr. Finlay, of Nottingham, Md. He entered the College of New Jersey, then established at Newark, under the direction of President Burr. He graduated in 1754, and being distinguished for oratorical talent, was advised by Whitfield to devote himself to the clerical profession. He entered the office of his father, Dr. William Shippen, Sr., a noted practitioner of Philadelphia, and a public spirited citizen, by whom he is said to have been trained with reference to his future course as a lecturer. "The old gentleman must have been made sensible by his own personal experience of the value of an European medical education," and his son was sent to Europe in the year 1757, soon after he was twenty-one years of age. In London he studied anatomy with, and resided in the family of, John Hunter, but was also associated with Dr. William Hunter and Mr. Hewson. While in the British Metropolis, in addition to anatomy and surgery, he devoted a share of his attention to the rising department of obstetrics, attending in the summer season the lectures of a celebrated accoucheur, Dr. McKenzie, which were delivered near St. Thomas' Hospital. As he removed to this neighborhood, we may suppose it was in consequence of the practical advantages afforded by proximity to the poor, as Dr. William Hunter was then at the height of his reputation as a teacher and practitioner of midwifery. He next proceeded to Edinburgh, where he graduated in the spring of 1761. His thesis was entitled "*De Placentæ cum utero necu.*" This production evinces a continued interest in obstetrical studies. He afterwards traveled in France, where he formed an intimate acquaintance with Senac and other physicians of Paris. Dr. Shippen, as has been stated, went to Europe in 1757, where he remained until 1762, while Dr. Morgan arrived there in 1760, and returned to this country in 1765. They were therefore together between one and two years in Europe. As these two zealous and enthusiastic young men, natives of the same city and imbued with the same aspirations, were treading abroad the same ground of preparation for their calling, it is natural to conceive that they should have possessed similar sentiments with respect to the urgent wants of their common country—that they should have conferred with those interested in the subject, and that the scheme of establishing, on this side of the Atlantic, systematic medical education, which was subsequently put into operation, was there entertained by both of them. In support of this opinion, Dr. Rush may be quoted, who, in his account of Dr. John Morgan, states that it was during his absence from home that he concerted with Dr. Shippen the plan of establishing a medical school in Philadelphia. Dr. Shippen returned accordingly to Philadelphia in 1762, entered on the practice of his profession, and on November 16th of the same year, he began the first course of lectures on anatomy that was ever delivered in this country. "The first were delivered at the State-house, and the subsequent ones in rooms that were constructed by his father for the purpose in the rear of the latter's residence. After the first lecture he made the following an-

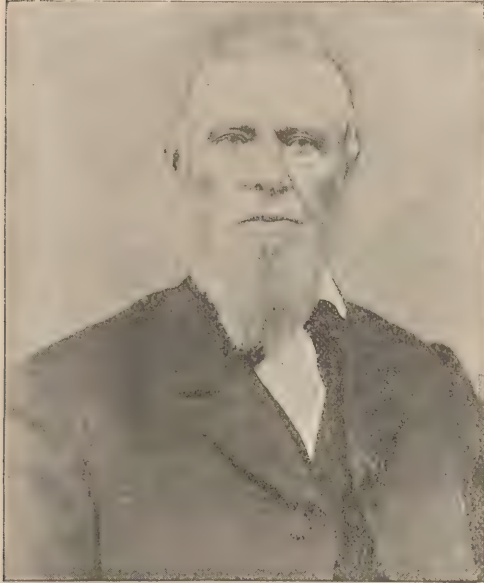

nouncement in the *Pennsylvania Gazette*: "Dr. Shippen, anatomical lecturer, will begin tomorrow evening, at six o'clock, at his father's house in Fourth street. Tickets for the course to be had of the Doctor at five pistoles each, and any gentlemen who incline to see the subject prepared for the lecture, and learn the art of dissecting, injecting, etc., are to pay five pistoles more." Dr. Shippen's school of anatomy was continued until September 23, 1765, when he was elected Professor of Anatomy and Surgery in the newly established medical school of the College of Philadelphia, of which he was one of the founders. This was the first medical school established in America. Dr. Shippen retained this position till 1780, when he was chosen Professor of Anatomy, Surgery and Midwifery in the University of the State of Pennsylvania, and in 1791, on the union of these institutions, under the name of the University of Pennsylvania, he became Professor of Anatomy in the latter, retaining the place until 1806. On July 15, 1776, he was appointed chief physician of the Flying Camp. In March, 1777, he laid before Congress a plan for the organization of a hospital department, which, with some modifications, was adopted, and on April 11, 1777, he was unanimously elected "Director-General of all the military hospitals for the armies of the United States." He was charged with improper administration of the office and arraigned before a military court which led him to resign the post June 3, 1781. The investigation did not develop any matter reflecting on his integrity. In 1768 he was unanimously elected a Fellow of the Royal College of Physicians of Edinburgh. In 1778-9, and again from 1791 till 1802, he was one of the physicians of the Pennsylvania Hospital. He was for more than forty years a member of the American Philosophical Society, in which he held the office of curator and secretary. In 1805 he was chosen president of the College of Physicians of Philadelphia, succeeding as the second president the venerable Dr. John Redman. This office he held until his death. "His skill and eloquence as a teacher, exercised during forty years in the first medical school in this country, made him widely known at home and abroad, and won for him permanent distinction and respect in the medical world." Referring to Dr. Shippen, one of his biographers says his career had been a distinguished one, and that nature had been uncommonly lavish in his form and endowment. "His person was graceful, his manners polished, his conversation various, and the tones of his voice singularly sweet and conciliatory. In his intercourse with society he was gay without levity, and dignified without harshness or austerity." With respect to his powers of teaching, it is stated that those pupils who went abroad "declared that they had met with no man who was superior to Dr. Shippen as a demonstrator of anatomy, and very few, indeed, who were equal to him." "In explaining the success of Dr. Shippen in teaching anatomy, we may take into view another faculty which he also exerted with great effect. He went through the subject of each preceding lecture by interrogation instead of recapitulation—thus fixing the attention of the students; and his manner was so happy that this grave process proceeded like a piece of amusement. His irony was of a delicate kind, and so blended with humor

that he could repress forwardness and take notice of negligence so as to admonish his class without too much exposing the defaulter." In speaking of Dr. William Hunter, it was remarked by Dr. James that it was under the tuition of this truly ingenious anatomist and physician that the late amiable and sagacious professor of anatomy and midwifery in this university laid the foundation of that celebrity which many years of extensive professional employment nurtured and matured. It was by forming himself after this model that, in the delivery of his interesting lectures, he at once delighted the gay and instructed the grave by the amenity of his manner and the utility of his practical precepts.

"Methinks I hear him now, his plausible words
He scattered not in ears, but grafted them,
To grow there and to bear."

On the decease of Dr. Shippen, the full duties of his professorship in the University of Pennsylvania were assumed by Dr. Casper Wistar.

SHIVELY, James Scott, of Marion, Ind., was born in Morgantown, Monongahela county, Va., April 8, 1813, and died at his home April 11,

James S Shively

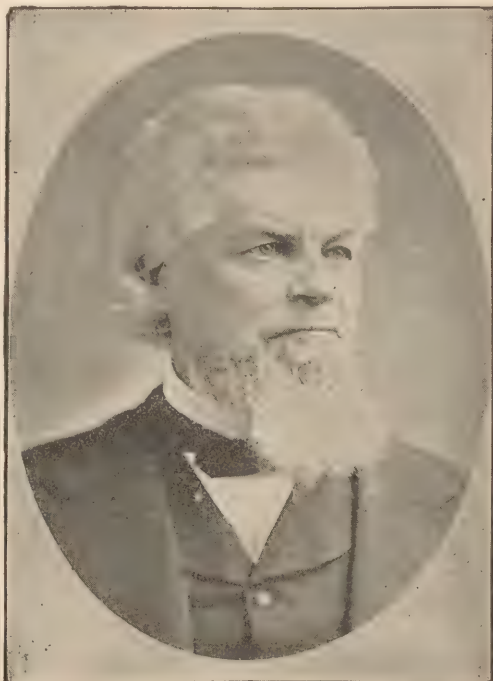

1893. His father, John Shively, was of German, his mother, Theresa Scott, of Scotch-English descent. His maternal grandfather, James Scott, and great-grandfather, David Scott, held respectively the rank of colonel in the War of 1812 and the War of the Revolution. In 1829 he removed with his father's family to Rush county, Ind., and shortly after began the study of medicine, with Dr. William Kerr, at New Castle, with whom he remained a student for two years, when he joined Dr. J. A. Clark, at Muncie, in the practice of his profession. In 1836 he removed to Marion,

where he continued to reside until his death. On locating in Marion, he formed a partnership with Dr. Trask, an eminent scholar and physician. A few years later he graduated from the Ohio Medical College. In 1837 he was married to Harriet O. Marshall, daughter of Riley Marshall, one of the earliest and most prominent pioneers of Grant county, Ind. He was successful in his profession from the start, and as a general practitioner he had few, if any, superiors in the State. Remarkably energetic and of a strong constitution, for over half a century he had a very large, though not correspondingly remunerative, practice, for the reason that he made it a rule of his life to relieve human suffering whenever called upon, regardless of the pecuniary circumstances of the patient. His patients, as a rule, became strongly attached to him, and once a patron always a patron, was his usual experience in the practice. Dignified but courteous and affable withal, of fine physique and commanding presence, he was a leader of men, and was frequently called to serve the people of his locality in a public capacity, being thrice elected to the State Legislature, in 1839, 1841, and 1844. In 1884 he was elected to the State Senate, and for four years represented in that body the counties of Grant and Madison. It was during his term as State Senator, that he rendered the profession his most signal and valuable service, introducing and securing the passage of the Indiana State Medical Law. He was a Charter Member of the Grant County Medical Society, organized in 1848, and also a member of the Indiana State Medical Society and the American Medical Association. His life record stamps him as one of the ablest physicians and foremost citizens of Indiana. He left surviving him his widow and three children, one of whom, an only son, Dr. M. T. Shively, is a successful and honored member of the profession.

SHOEMAKER, John Veitch, of Philadelphia, Pa., was born in Chambersburg, Pa., March 18, 1852. After obtaining a good preparatory education in his native town he entered Dickinson College and was graduated in 1872, receiving the degree of A. B., and three years later A. M., from the same institution. Deciding to become a physician he removed to Philadelphia, and was made a Doctor of Medicine by Jefferson Medical College in 1874. His success in his chosen profession was immediate and satisfactory. The same year of his graduation he was appointed Demonstrator of Anatomy at Jefferson; held the position six years, and in the meantime taught classes on other branches. He organized the Jefferson Quiz Association; was its Quiz Master in Materia Medica and Therapeutics for six years, and also was a lecturer for two years in the Philadelphia School of Anatomy. In 1875 he was chosen a member of the Philadelphia County Medical Society, and the Pathological Society, and elected Physician to the Foster Home. The same year he established a dispensary for the treatment of diseases of the skin, in which he taught physicians and students. Hospital accommodations were added to the dispensary in 1880. Since 1877 Dr. Shoemaker has taken a prominent part in the proceedings of the Medical Society of Pennsylvania, and the American Medical Association, having read a large number of papers before them covering a wide range of subjects. In

1879, together with associates, he founded the *Medical Bulletin*. The next year he became its sole editor and proprietor, and soon made it one of the leading professional journals in this country. His large private practice required him to entrust the business interests of this publication to others in 1881, but he still continues its editor, and also writes extensively for other medical journals in this country and Europe. From 1881 to 1884 he was secretary of the American Association of Medical Editors. From 1883 to 1885, was lecturer on diseases of the skin at Jefferson Medical College. He was chairman of the section of Practice of Medicine, Materia Medica, and Physiology, of the American Medical Association, held in Washington in 1884, and delivered the annual address on "Practice of Medicine" at this meeting. He was appointed a delegate to attend the sessions of the different medical societies of Europe that year. His visit abroad amounted to an ovation. At the meeting of the British Medical Association, held in Belfast, he read a paper on "The Oleates." At the International Medical Congress in Copenhagen, Denmark, one on "The Treatment of Diseases of the Skin by Novel Means and Methods." He was chosen a Fellow of the London Medical Society, a member of the British Medical Association, and a Fellow of the American Academy of Medicine. In 1885 Dr. Shoemaker was elected president of the Association of American Medical Editors, and at the meeting in 1886, held in Chicago, delivered the annual address before that organization. In 1886 he was called to the chair of Materia Medica, Therapeutics and Clinical Professor of Skin Diseases in the Medico-Chirurgical College of Philadelphia, a position which he now holds. He is also physician to the Medico-Chirurgical Hospital of Philadelphia; treasurer and a trustee of the same institution, and a trustee in the Medico-Chirurgical College. In this same year, Dr. Shoemaker was the guest of the British Medical Association at their meeting at Brighton, England, and of the Congress of Physicians and Naturalists, held at Berlin, Germany. In 1887 he was secretary of the organization committee of the Ninth International Medical Congress. At the meeting held in September, 1887, at Washington, D. C., he was one of the vice-presidents of the section of dermatology, and read papers before this section and the section of therapeutics. In September, 1890, Dr. Shoemaker was a member of the Tenth International Medical Congress, held in Berlin, Germany. He has been a voluminous writer in medical literature. Among his published works are "Ointments and Oleates," which has passed through a second edition, published by F. A. Davis Co., Philadelphia; "Charts on Skin Diseases," "Materia Medica," and "Poisons and their Antidotes;" "A Practical Treatise on Diseases of the Skin" (which has reached its second edition, with an extensive circulation, and is recognized as one of the best books on that subject in the language), published by D. Appleton & Co., New York; "Heredit, Health and Personal Beauty," and a "Treatise on Materia Medica and Therapeutics," which has likewise passed through a second edition. The two latter works are published by the F. A. Davis Publishing Co., Philadelphia.

SHURTLEFF, George A., of Stockton, Cal., was born in Carver, Plymouth county, Mass., August 5, 1819. He is a lineal descendant in the sixth generation of William Shurtleff, an English immigrant, who was among the earliest settlers in the old Plymouth colony. By marriage connections he is also a descendant of Robert Cushman, the leading Puritan, and of Rev. John Lothrop, one of the founders of the town of Barnstable, Mass. His parents were Charles Shurtleff and Hannah (Shaw) Shurtleff. His preliminary education was received in the common schools of his native town, and at Pierce Academy near by. In 1842 he commenced the study of medicine with his cousin, Dr. Samuel Shaw, of Wareham, Mass., continuing the same at the Berkshire

G. A. Shurtleff

Medical College in Pittsfield, Mass., in 1844, and at the Vermont Medical College at Woodstock, Vt., in 1845, from which he received the degree of M. D. He practiced about four years in Wareham. In 1849 he went to California and finally located in Stockton. Dr. Shurtleff was appointed a director of the State Insane Asylum in 1856, and again in 1863. He was influential in upholding and advancing the interests of the institution at this period, not only by his official course, but more widely by the instructive employment of his pen. In 1865 he was elected its Medical Superintendent. In 1872 he was appointed a commissioner to locate a new State asylum for the insane (the Napa). The same year he was elected president of the Medical Society of the State of California. He was Professor of Mental

Diseases and Medical Jurisprudence in the Medical Department of the University of California from 1875 to 1885, when, on the acceptance of his resignation, he was elected *Emeritus* Professor thereof, which position he still (1893) retains. He has been an active member of the Association of Medical Superintendents of North American Institutions for the Insane; is a member of the American Medical Association; of the State Medical Society, and of the Historical Society of California. His contributions to medical literature are: An address before the State Medical Society on the "Medical Jurisprudence of Insanity," in 1873; a paper on the "Obscure Forms of Epilepsy and the Responsibility of Epileptics," in 1876; a paper on "Suicide," in 1877, and many other papers and reports on various subjects mainly connected with the branch of his profession, which has been his specialty. In 1878 he delivered the address, in behalf of the Faculty, at the commencement exercises of the Medical Department of the University of California on the subject of "The Elements of Professional Success." He was the Medical Superintendent of the State Insane Asylum at Stockton upwards of eighteen years, resigning on account of a failure of his health in the latter part of 1883. He was pronounced, some years ago, by one of the judges of California, in the trial or decision of a case, a recognized authority, in that State, on questions of Insanity.

SIMS, J. Marion, of New York City, was born January 25, 1813, in Lancaster county, S. C., and died at his home in New York, November 13, 1883. He graduated at South Carolina College in 1832, and studied medicine at Charleston and at Jefferson Medical College, Philadelphia, from which he graduated in 1835. "He began practice in Lancaster, where his parents resided, but he became discouraged at the loss of his first patients, and removed to Mount Meigs, Montgomery county, Ala., and after his marriage, in 1836, to Macon county, same State. He was successful there, but severe attacks of malarial fever impelled him to change his residence. Near the close of 1840 he settled in Montgomery, where in a short time he gained a good reputation as a surgeon. He remained in that city thirteen years. He was the first practitioner in the South to operate for strabismus, or to treat club-foot successfully." Dr. Sims removed, in 1853, to the city of New York, where he remained, excepting the intervals of his sojourn in Europe, until his death. His specialty was surgery and gynecology, of which latter he has been called the father. In 1845 he announced a new hypothesis in explanation of *trismus nascentium*, which was published in the *American Journal of Medical Sciences*. In the same year Dr. Sims conceived a method of treating vesico-vaginal fistula, an affection for which physicians of various countries had in vain sought a cure. He fitted up a hospital beside his house, into which he collected cases from the neighboring country, maintaining them at his own expense. After experimenting for three years and a half, he finally devised the silver wire suture, which remain sacculated in the living tissues, and which has since been employed in many branches of surgery, and with which he effected a perfect cure. He invented va-

rious instruments during his experiments, chief of which was the "duck-bill" speculum, commonly called the Sims speculum. This revealed the seat of other serious complaints and rendered them amenable to surgical treatment. He had before paid no attention to gynecology, but the possession of this instrument, which has raised that branch from the level of empirical experiment to that of certain knowledge, induced him to devote his attention henceforth to the study and treatment of diseases of women. In 1851, on his sick bed, on his dying bed as he believed, he prepared his paper on the treatment of vesico-vaginal fistula, which was published in the *American Journal of Sciences* for January, 1852. His health, which had been so reduced by chronic dysentery, was not yet restored, when he removed, in 1853, to New York. In that metropolis he demonstrated to prominent surgeons the success of the silver suture in operations in fistula of the bladder and lacerated perineum, and his methods came into use in the hospitals; yet their author met with a cold reception, and his proposition to open a hospital for the treatment of women's diseases was opposed by the other doctors until it was auspiciously presented before the public. The project was welcomed by influential women, and in 1855 a temporary hospital was opened. The necessity for a larger institution was soon recognized. In 1857 the Legislature granted a charter for the Woman's Hospital of the State of New York, and in the following year appropriated \$50,000 for the purpose, while the common council of the city gave as a site the old Potters' Field, between Fourth and Lexington avenues, consisting of an entire block of ground, now valued at over a million of dollars. Dr. Sims was not satisfied with the architectural design adopted by the Board of Governors, and went abroad in 1861 expressly to study hospital architecture, and, having convinced himself that the pavilion system is the correct one, returned in 1862, and procured the adoption of a design according to that system, which was at once acted upon, one of the pavilions having been ready for the reception of patients in 1866, the other being finished in 1876. The Woman's Hospital of the State of New York is not merely a monument of his personal energy and professional zeal, but of his professional genius, since it was his achievements in surgery that reclaimed for treatment the particular class of diseases to which the institution is devoted. While in Europe he operated, by invitation, in many of the great hospitals of Dublin, London, Paris and Brussels, with unflinching success and the most generous recognition. In Paris he operated in the presence of large classes, for Velpeau, at la Charité; for Huguier, at Hôpital Beaujon; Verneuil, at St. Louis; Demarquay, at Maison du Bois; Logier, at Hotel Dieu; Richard, at Cochin; Gopelin, at St. Antoine; Nélaton, at Hôpital des Cliniques, and for others in private practice. For this work the French government, upon the recommendation of Baron Larrey, Nélaton, Sir Joseph Olliffe, Dr. Johnston, and Mr. Dayton, then minister to France from the United States, conferred on him the Order of Knight of the Legion of Honor. While in Paris, he was invited by Prof. Déronbaix, surgeon to the king of Belgium, to go to Brussels and demonstrate his peculiar operations there, which he did, spending a whole day in

the St. John's Hospital, and performing several operations, for which he was elected correspondent fellow of the Imperial Academy of Medicine of Brussels, and was offered by the Belgian government the order of Leopold the First, but the American minister at the Belgian court (Mr. Sanford) objected to his receiving it on the ground that he was a Southerner, the Civil War being then at its height. In July, 1862, he again went to Europe, intending to leave his family there for educational purposes and return to New York the following November, but his reputation soon drew him into so wide a practice that he decided to remain longer, and in fact did not return until 1868, when he took up his residence permanently in New York, though his family remained in Paris to complete the education of his younger children. He was decorated by the Spanish and Portuguese governments, and twice by the Italian, Professor Botta, of New York, aiding the American minister, his excellency, the Hon. George P. Marsh, in pressing his claims to this honor upon the latter government. He was, besides, an honorary member of the learned societies in London, Edinburgh, Brussels, Berlin, Christiana, and other foreign capitals, and of the State medical societies of New York, Connecticut, Virginia, South Carolina, Alabama, and other States; and was a member of the American Medical Association, of which he was elected President in 1875, and before which he delivered the Centennial Annual Address, in 1876. His literary contributions to medicine embrace, in addition to the address just mentioned, papers on "Trismus Nascentium;" "Silver Sutures in Surgery," and "Clinical Notes on Uterine Surgery." This work was published simultaneously in London, Paris, and Berlin, in the English, French, and German languages, in 1865. The publication described novel methods of treatment, which were not readily adopted by the profession, but which, in a few years, revolutionized the practice of gynecology. He was, also, the author of valuable monographs, entitled, "Intra-Uterine Fibroid Tumors," and the "Microscope in the Sterile Condition," a "Treatise on Ovariectomy," and a "History of the Discovery of Anesthesia." Dr. Sims began, but did not finish, a work on accidents of parturition and another on sterility. He read papers on these and many other subjects before the medical associations of the United States and England, and described in medical journals new operations and instruments and advanced theories in pathology and practice, that attracted the universal attention of medical men. Not long before his death he wrote "The Story of my Life," which was published in 1884. His military record is not the less interesting because it was abroad. Being in Paris on a visit to his family when the Franco-Prussian War began, he was requested, on behalf of the "American Colony" in Paris, to take command, as surgeon-in-chief, of an ambulance corps organized by the "colony," a request with which he at first declined to comply, on account of his age and professional obligations to return home at an early day, but, adopting the suggestion of his wife that it was a fitting occasion to repay in some sort the obligations they all felt for the generous hospitality they had received from the French people and government, he accepted

the appointment; although the corps, when ready for work, fell to pieces from dissensions as to its field of work, he and his staff resigning, and forthwith organizing themselves into the "Anglo-American ambulance corps," composed of eight Americans and eight Englishmen, with him as Surgeon-in-Chief. This was on the 27th of August, 1870. He went immediately to the headquarters of the société de secours aux blessés and offered his corps to Dr. Chénu, the superintendent, who promptly accepted it, furnishing it with everything necessary for a complete outfit, and on the next day he and his comrades left Paris, passing through Belgium to Mézières, where he heard that a battle had been fought the day before in the neighborhood of Sedan, to which, consequently, he pushed on, arriving just as the great battle began, August 31, the military train on which he entered the city receiving almost the first fire of the Prussians, and the bridge over which it passed being blown up an hour afterwards. His ambulance, the first to reach Sedan, was assigned by the mayor to the Cazerne d'Asfeldt, containing nearly 400 beds, and in the course of an hour, the wounded from the battle-field began to come in, keeping the corps busy for many days, about 1,600 Frenchmen and 1,000 Germans having been treated by it. During his stay at Sedan he formed a part of the escort which attended Marshal McMahon from the battle-field to his headquarters in the city on the occasion of his having been wounded by the fragment of a shell, the attention rendered so pleasing the Marshal that he presented him with a thousand francs to purchase delicacies for the sick and wounded in his ambulance. He remained at Sedan about a month, when, the work at that place being finished, he, with his first and second assistants, Dr. Wm. McCormac and Dr. Frank, resigned and returned to their respective homes, his son-in-law, Dr. Thos. T. Pratt, of Alabama, succeeding him as surgeon-in-chief, and going with the ambulance to Tours and Orleans. The military service which he thus concluded he performed when fifty-seven years of age, being the oldest man who left Paris in charge of an ambulance. A record of the work done by the Anglo-American ambulance was carefully prepared by his first assistant, Prof. Wm. McCormac, surgeon to St. Thomas' Hospital, London, and published in London in 1870, having since been translated into several languages. From the opening of the Woman's Hospital, in 1855, to the beginning of his prolonged sojourn abroad he was surgeon-in-chief to the institution, having as his consulting board at the outset Drs. Mott, Stevens, Francis, Delafield and Green, all of whom now rest in honored graves. He returned from Europe in 1868, and in 1872 was re-appointed a member of the Board of Surgeons of the Woman's Hospital. His return increased the reputation of the institution; its second pavilion was completed; many surgeons from abroad attended to witness his operations. But finally, the board of governors, out of a supposed regard for the modesty of the patients, made a regulation restricting the number of visitors to fifteen on any one occasion. Dr. Sims was touched in his professional dignity by this invasion of his professional province, and on the first day of December, 1874, resigned his position. As

stated, the American Medical Association elected him to preside over its meetings at Philadelphia, in 1876, and in 1881 he served as president of the American Gynecological Society. Among his benefactions is the J. Marion Sims Asylum for the Poor in Lancaster, S. C. His son, H. Marion Sims, now Professor of Gynecology in the New York Polyclinic, was a member of the ambulance corps organized during the Franco-Prussian War, and was present at Sedan, Orleans and other battles, and rendered active field service in Paris during the Commune. He has also published important papers connected with his specialty, and has prepared an American edition of Dr. Grailly Hewitt's work on "Diseases of Women," with additions showing the later improvements in gynecology in this country.

SKENE, Alexander J. C., of Brooklyn, N. Y., was born in the parish of Fyvie, Aberdeenshire, Scotland, in the year 1838. It is pleasing, indeed, to be able to trace one's ancestry, but unless our ancestors have left the means, it becomes a difficult task, and one in which there is an exceeding tendency to arrogate the names of the proud, the powerful and the pretty. In these times, when there is so much of the commonplace about men and things, it is entertaining, at least, to have one individual now and then who is capable of going back a few centuries and pointing out the stock from which he sprang, more particularly if such stock has played an important part in the affairs of a nation or the world. A race of warriors, statesmen and professional men, closely identified with a great part of the history of Scotland, is the family in which the subject of this sketch claims kindred and which he honors in no less degree than any of the eminent ones who have gone before him. The genesis of the history of the Skenes begins with a circumstance that would make delightful reading in any novel. It appears that when Malcolm II, King of Scotland, was returning from the defeat of the Danes at Mortloch, in Moray, in 1010, he was pursued by a ravenous wolf, which was about to attack him, when a young son of Donald of the Isles thrust his arm, which was wound in the plaid, into the wolf's mouth, and with his dagger slew the beast. The King, appreciating the boldness of the action, gave to the young man certain lands which now form the parish of Skene, in Aberdeenshire. This incident gave rise to the family name, Sgian, which means a dagger, or a dirk, and which occupies, together with three wolves' heads, a very conspicuous place in the family's armorial bearings. John De Skene, in the thirteenth century, joined the forces of the usurper, Donald Bain, but afterward proved his loyalty to his King, Alexander, and was forthwith restored to the royal favor. His great grandson, John, who lived during the reign of Alexander III, was so well informed politically and so esteemed for his impartial virtue as to be chosen one of the arbiters between Bruce and Baliol, both of whom were contestants for the crown. A grandson, Robert De Skene, was a firm friend of Bruce, fought at Bannockburn and received a charter from his leader in 1318. Coming down through the centuries, we find Alexander Skene fighting at the side of King James during the horrible battle of Flodden, and later we see James Skene, his direct descendant, leading the charges at the

battle of Pinkie, where he fell, in 1547. Major George Skene distinguished himself under the Duke of Marlborough, in the wars that were fought during the reign of Queen Anne, and in 1720 purchased the estate of Careston in Forfarshire. Two more Skenes were soldiers, and both died fighting, one in Spain and another at the battle of Preston in 1745. While in the early history of the Skene family we find warriors plentiful, it must be remembered that there were litterateurs and lawyers also, though their attainments did not shine with the luster of the martial doings, a fact that was owing, in great measure, to the turbulent condition of the times. However, at a later date the non-martial of the Skenes found fame and fortune in the pursuance of their respective professions. In 1575 history records the fact that

Alex J. C. Skene

John Skene and Sir James Balfour were appointed a commission by Regent Morton to examine and make a general digest of the laws of Scotland. So thoroughly was the work done that Skene, who performed the more arduous duties connected with the undertaking, received a public commendation and was pensioned in addition. In 1587, so great was his favor with the king, he was chosen to proceed to Denmark for the purpose of concluding a marriage with the Princess Anne. This Skene is reputed to have been a very scholarly man. According to Sir James Melville, who wrote a short biography of him, he was able to harangue in Latin and could think and speak as well as any man. He was, without doubt, the most celebrated of the Skene litterateurs. Coming down to 1590 we read of one Gilbert Skene who was Professor of Medicine

in the King's College, Aberdeen, and afterward Physician to the King, which position he resigned in 1594. He was afterward knighted. One of the most interesting of the Skene family was James Skene, the long and faithful friend of Sir Walter Scott, co-worker and co-partner with him and responsible for many of the most interesting scenes which Scott has so cleverly portrayed. Andrew Skene, who in 1834 succeeded Lord Cockburn as solicitor general of Scotland, was also a member of this fine old family. And this date brings us close on to the birth of a man who, in the fair light of this century, will rank high above his noble and literary ancestry. This is Dr. Alexander J. C. Skene, dean of the Long Island College Hospital, and one of the most famous as well as the most widely known physicians in the world. The childhood and youth of the subject of this sketch were spent in Aberdeenshire, Scotland, and at the age of nineteen, hearty and full of health, with more knowledge than the average of youth of that age possesses to-day, he embarked for this country. During his stay in Scotland he had become deeply enamored of the medical profession and expressed a strong desire to study the science. He was also intensely fond of zoological studies and often spent whole afternoons viewing the life that fills "the peopled grass." Immediately on his arrival in this country he entered the University of Michigan, and from there he proceeded to the Long Island College Hospital, from which institution he graduated in the year 1863. The young M. D. took his diploma when the Civil War was in its hottest period, when everybody, man, woman and child alike, were on the *qui vive* night and day to await developments and learn the issue. Young Skene had good, honest martial blood in his veins, and the moment he saw an opportunity for his usefulness he proffered the government his services and went to the front to stanch the blood flows of the Union troops. He rendered a signal service, and between his spells of bandaging and amputating he found time to evolve a beautiful plan, which is adopted to-day in the army corps and among the State militia, namely, an ambulance corps. By the terms of his thought, the soldiers were made physicians *pro tem.*, and, if that appear too exalted, then a trained nurse of the government. Dr. Skene, at his entrance on the battle-field, was delegated assistant surgeon at Port Royal and Charleston Harbor, S. C., and afterwards at Decamp's Hospital, Davis' Island. Previous to his entrance into the army, Dr. Skene had been appointed an assistant to Dr. Austin Flint, Professor of the Institutes and Practice of Medicine, and when the war was over he returned to his *alma mater*, and received the appointment of Adjunct Professor at the Long Island Medical College. And here the real fame of Dr. Skene begins. While connected with the hospital, he was brought into consultations on a thousand critical cases which he carefully diagnosed, recommending courses of treatment that proved effective. In this way his name and his ability have spread throughout the broad extent of this country, and across the ocean into the most famous medical centers of the world. From his student days he has been the most persevering kind mortal. His time has largely been spent in study and the observation of diseases,

which is a splendid explanation for the varied and extensive character of his knowledge to-day on all things medical. He is a keen-eyed individual, whose glance does not miss the least visible details, but is kind and gentle in manner, and a most charming companion when he grows reminiscent. Dr. Skene has no superior, it is fair to say, in the matter of diagnosing a case. That has always been his *forte*, though it must be said, in addition, that few men are able to control instruments with the same deft hand. All readers of medical journals have invariably met his contributions, which have always been characterized by their abundance of thought and nice easy style. He is the author of the admittedly best work ever written on the diseases of women. It was published by Appleton, in 1883, and contains choice cullings of twenty years' experience. The book has had a vast circulation, and was lauded by the medical authorities of Europe as liberally as it was here. In addition to being dean of the Long Island Medical College, he also occupies the chair of Gynecology. He was formerly Professor of Gynecology in the New York Post-Graduate Medical School; president of the American Gynecological Society, of the Kings County Medical Society, and the New York Obstetrical Society; and is corresponding member of the British, Boston, Detroit, and Belgian Gynecological Societies. Apart from Dr. Skene's conquests in medicine, there is another side to his career that may be information for the readers, as it is entertainment for him—he is a sculptor—an amateur sculptor, in the terms of his own modesty. When at leisure, which is not often, he delights in chipping the polished marble block, and bringing cold, regular features into being. He is also something of a litterateur, having read extensively and written for magazines on hundreds of subjects. He lives in a modest house on Clinton and State streets. He drives a great deal, and thoroughly enjoys life, always preserving the best of health. He is a large man, of fine physique, and wears a black mustache and beard. He is still in the flush of ambition and of life, and will undoubtedly add brighter days to his brow before his usefulness will be declared over by age. Dr. Alexander J. C. Skene, as dean of the Long Island College Hospital, has not only taken a high position in the ranks of his profession, but is conceded to be one of the ablest gynecologists in the United States. Nor is he interesting for these considerations alone, for he shines as a lover of the fine arts, not altogether an admirer of the moment, but an ardent and penetrating student, and one who endeavors to put in practice the suggestions received from his readings. Young men have no greater friend than Dr. Skene. He has always been careful to encourage talent wherever and whenever he found it, and did not at the proper time fail to tell others that many a promising youth was retarded by reason of the ignorance or obstinacy of those to whom his future was intrusted. In addition he has been, in war and in peace, a defender of the Union, and a lover of the free institutions of the country. A thoroughly upright citizen, a Brooklynite in sympathies, and a courteous man at all times, are the striking traits of Dr. Skene's personality.

SLOCUM, Charles Elihu, of Defiance, Ohio, was born at Northville, N. Y., December 30,

1841. His surname originated from the Sloe-Combe, in Southwestern England, and was brought to America in the time of Charles I. His ancestor affiliated with the Quakers on their first appearance in New England, and throughout the nine American generations the blood has been preserved in purely English lines. His earlier education was obtained in the public schools at Northville and the Fort Edward Collegiate Institute. Several years of his early life were passed in teaching schools of different grades. Among his medical preceptors were the late Prof. Zina Pitcher and David O. Farrand, of Detroit. He was graduated M. D. at the College of Physicians and Surgeons, New York City, in 1869, and later passed parts of several years in special studies in New York and Philadelphia, receiving a degree from Jefferson Medical College, and the degree of Doctor of Philosophy in course at the University of Pennsylvania. He also

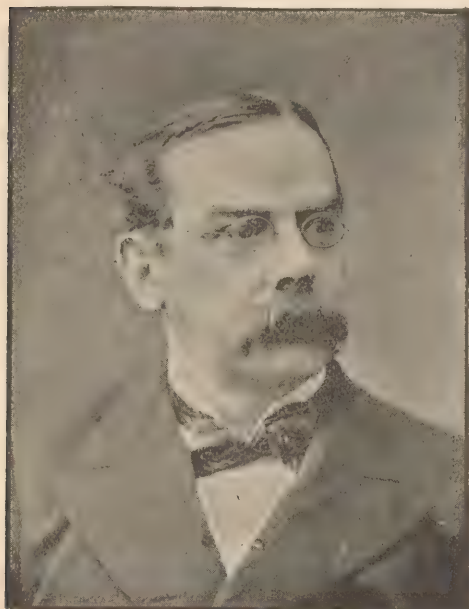

pursued studies in Europe, principally in Vienna and London. He began the practice of medicine with his brother, Dr. John C. Slocum, at Shelbyville, Ind., and removed to Defiance, O., in 1871, where he has practiced medicine and surgery in all their branches, including the more difficult operations. He has always enjoyed a large professional following, and his studious habits and careful attention to details have assured him a good degree of success. He has been several years railway surgeon and examining surgeon for pensions. He early became member of local and State medical societies, and has been member of the American Medical Association since 1874. He is also a member of a number of scientific societies, State and national, including the American Microscopical Society, of which he was a charter member, the American Association for the Advancement of Science, and the

American Academy of Political and Social Science. He is also favorably connected with several of the principal business and financial interests of his town. Although his time is quite fully given to professional work, he believes in a due amount of diversion, which he seeks in business matters and genealogical and scientific studies.

SMITH, Albert, of Peterborough, N. H., was born in that town, June 18, 1801, and died there February 22, 1878. He was prepared for college at Groton Academy, Massachusetts, and graduated at Dartmouth College in 1825, where he subsequently studied, and also in the medical department of that college, receiving his degree of M. D. in 1833. The degree of LL. D. was also conferred upon him by the same institution in 1870. He commenced practice at Leominster, Mass., and after about five years removed to Peterborough, N. H., and continued in active business till within a few years of his death. In 1849 he was appointed Professor of Materia Medica and Therapeutics at Dartmouth College, and delivered the lectures in this department at the annual session of the school for twenty consecutive years. The same course was delivered at Castleton Medical College, in 1857, and at Bowdoin, in 1858. He resigned in 1870, and was subsequently appointed Professor *Emeritus* of Materia Medica and Therapeutics. He was a member of the New Hampshire Medical Society; was president in 1853—his inaugural discourse on "Conservatism in Medicine" was published in the Transactions of the society for that year. He was also a member of the New Hampshire Historical Society and honorary member of the New York Medical Society. He published a "Commemorative Discourse Upon the Life of the Late Dr. Amos Twitchell," of Keene, N. H.; also lectures on "Hippocrates and Paracelsus," and contributed several papers published in various medical journals. In 1876 he completed and published his greatest work, entitled "A History of Peterborough, New Hampshire." He was a representative to the Legislature, and examining surgeon for pensions, and also president of the Peterborough Savings Bank.

SMITH, Charles Gilman, of Chicago, Ill., is the only son of Josiah Gilman and Frances Eastham Smith, and was born in Exeter, N. H., on January 4, 1828. He began his studies at the Phillips Academy of that place in his eleventh year, and remained there until his sixteenth, when he entered the sophomore class of Harvard College, graduating in 1847. Soon after this he commenced the study of medicine in his native town, and took his first course of medical lectures at the Harvard Medical School in the season of 1848-49. As these lectures were soon temporarily interrupted by the Webster-Parkman murder, Dr. Smith continued his studies at the University of Pennsylvania, from which institution he graduated in 1851. He then returned to Boston, and after two years' service in the Alms-house Hospital at South Boston, removed to Chicago in February, 1853. In that city he soon inaugurated a highly successful practice as a family physician, and later gained much valuable experience as one of the six physicians in charge of the prisoners at Camp Douglas during the Civil War. In 1868 he went abroad to study in the hospitals of France, Germany and England, and on his re-

turn to Chicago accepted an invitation to lecture in its Hospital for Women and Children. He was next made a Consulting Physician of that hospital, and since then has received the same appointment at the Presbyterian, with both of which institutions he is still connected. Dr. Smith is also one of the trustees of the Peck Home for Incurables, one of the most useful charitable institutions of the city, in which he has taken an active interest since its organization. In addition to this, Dr. Smith serves several of the most prominent life insurance companies as their Medical Examiner, a line in which he has probably had more experience than any physician in Chicago. Some of the most interesting experiences of his medical career occurred during the cholera epidemics of 1854 and 1866. During the first and most violent of these he was present in a tenement house where eleven deaths occurred in a single night. Dr. Smith

Charles Gilman Smith

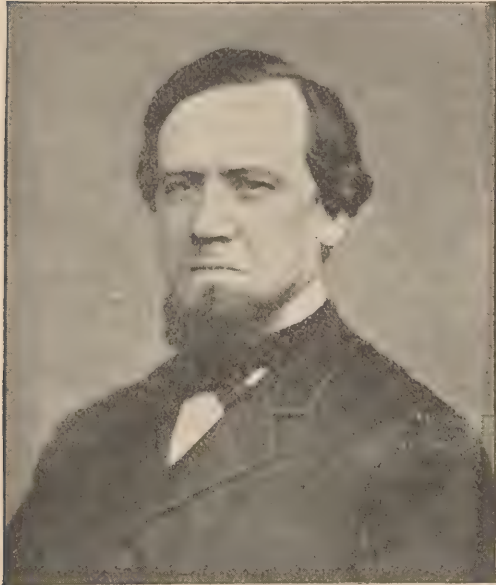

is a man of fine literary taste and attainments; has been president of the Harvard Club, and of the Literary Club of Chicago, and has been elected recently to the presidency of the Society of Graduates of the University of Pennsylvania. He has accumulated a large and well-selected library, in which are a number of literary oddities, including a collection of eighty volumes of epitaphs. Dr. Smith was married in 1873 to Harriett, youngest daughter of Erastus F. Gaylord, one of the earliest settlers of Cleveland, Ohio, and his home has always been a center of cordial and unostentatious hospitality. Although he has never adopted any specialty, Dr. Smith is a man of thorough training in his profession, and a leader among the eminent physicians of the Northwest. (Died January 10, 1894.)

SMITH, Edward Loomis, of Seattle, Washington, was born at Pittsford, Munroe county,

New York, in 1840, and died suddenly from heart disease, July 12, 1893. He received his literary training at the Genesee Wesleyan Seminary, at Lima, N. Y. He took two courses at the Medical Department of the University of Buffalo, and afterwards received the degree of M. D. from the Cooper Medical College, at San Francisco. He served as a medical officer with the Twelfth United States Infantry, at Angel Island, California, during 1873 and 1874, after which he practiced in the towns of Quincy and Laporte, in that State, and went to Seattle to locate in 1877. His genial disposition and open generosity, together with his professional ability, soon won him a host of friends, and made him one of the best known surgeons in the Pacific Northwest. He inspired confidence in his patients, and was always kind to his brother practitioners. His surgical experience was very extensive, he having been Chief Surgeon at Providence Hospital for many years. He was one of the organizers of the King County Medical Society, and was the first president of the Washington State Medical Society; he was also a member of the Seattle Medical and Literary Association, California State Medical Society, and the American Medical Association. Dr. Smith always took great interest in the State militia, having served as a brigade surgeon and Surgeon-General on Governor Ferry's staff. He held the same position on Governor McGraw's staff at the time of his death, and was buried with military honors.

SMITH, Francis Gurney, of Philadelphia, Pa., was born in that city March 8, 1818, and died there April 6, 1878. He was the fifth son of Francis G. Smith, a prominent merchant of Philadelphia. He received both his academic and medical education in the University of Pennsylvania, taking his degree of B. A. in 1837, and those of M. A. and M. D. in 1840. For about a year after receiving his diploma he was one of the resident physicians of the Pennsylvania Hospital, giving special attention to the department of the insane. After establishing himself in practice in Philadelphia he turned his attention specially to midwifery and diseases of women. He was a member of the College of Physicians of Philadelphia, Philadelphia County Medical Society, College of Physicians and Surgeons of Reading, Academy of Natural Sciences, Pathological Society, American Philosophical Society, California State Medical Society, Rocky Mountain Medical Society, and Burlington County Medical Society, New Jersey. He was the first president of the Philadelphia Obstetrical Society, and was vice-president of the meeting of the American Medical Association, which was held in Washington in 1870. He was well known in professional literature as one of the authors of the "Compendium of Medicine," which has passed through numerous editions. He also edited several of the American editions of Carpenter and Marshall's works of physiology, and other scientific works, as well as translated, for the first American edition, Barth and Rogers' "Manual of Auscultation and Percussion. For a period of nine years he was one of the editors of the *Philadelphia Medical Examiner*. As the author of frequent contributions to medical literature, he was best known as the author of an elaborate series of experiments on the celebrated Canadian, Alexis St. Martin, on the

"Physiology of Digestion." In 1842 he was elected Lecturer on Physiology by the Philadelphia Medical Association, and ten years later professor of the same branch in the Pennsylvania Medical College. In 1863 he succeeded Prof. Samuel Jackson in the chair of the Institutes of Medicine in the medical department of the University of Pennsylvania, which he resigned, on account of failing health, in May, 1877, and was elected *Emeritus* Professor of the same branch in that institution. He was one of the first medical staff of the Episcopal Hospital. In 1859 he became one of the Attending Physicians and Clinical Lecturer at the Pennsylvania Hospital, and retained that position until 1865. During the war he was connected with the medical staff of the army, and was one of the physicians in charge of a military hospital. He founded and established the first physiological laboratory in which physiology was taught experimentally and by demonstration in the University. For

Francis G. Smith.

several years he held the position of Medical Director of the National Life Insurance Company, after having organized the medical department in that company.

SMITH, Henry H., of Philadelphia, Pa., was born in that city, December 10, 1815, and died there, April 11, 1890. His father was a distinguished lawyer. Dr. Smith was graduated at the Collegiate Department of the University of Pennsylvania, in 1834; studied medicine with Professor William E. Horner, and graduated in medicine at the university in 1837. He was then Resident Surgeon of the Pennsylvania Hospital two years, under Drs. Thomas, Harris, Randolph, and Norris, and visited London, Paris, and Vienna Hospitals in 1839; spent eighteen months in study in various European institutions, and on his return, in 1841, commenced instructing private classes in surgery, and delivering lectures on bandaging, and other surgical topics. In October, 1843, he married Mary Edmunds, oldest

child of Professor William E. Horner. He was widely known as an author in medical literature. He commenced his career in 1841, with the translation of a "Treatise on the Medical and Prophylactic Treatment of Stone and Gravel," by the distinguished French surgeon, Civiale. In 1843 he published an "Anatomical Atlas," to illustrate "Horner's Special Anatomy," and the next year a treatise on "Minor Surgery," of which several editions were issued. He also edited the "United States Dissector." His "System of Operative Surgery," in two volumes octavo, with a very extended and bibliographical index to the writings and operations of American surgeons, for a term of two hundred and thirty-four years, was first issued in 1852, and re-issued three times within the following ten years. In 1855 he gave the profession an essay on "The Treatment of Disunited Fractures by Means of Artificial Limbs;" and followed it the next year with the "Practice of Surgery," in two octavo volumes. He also published, in these and subsequent years, numerous surgical articles in the *American Journal of the Medical Sciences*, and other leading professional periodicals. He was chosen one of the surgeons of St. Joseph's Hospital, Philadelphia, in 1849, and Surgeon of the Episcopal Hospital soon after. He was elected one of the Surgical staff of the Blockley Almshouse Hospital; having been for several years Assistant Lecturer on Clinical Surgery in the University of Pennsylvania, he was chosen Professor of Surgery there in May, 1855. In all of these various positions he was constantly engaged in performing the most important and often capital operations; while a large private practice enabled many to profit by the fruits of a singularly extended and well-grounded experience. At the commencement of the Rebellion he was selected by the governor of the commonwealth to organize the Hospital Department of Pennsylvania that had been authorized by the Legislature. And at the same time Governor Curtin appointed him Surgeon of Pennsylvania, with the same military rank as that held by the Surgeon-General of the United States Army. He contributed much to the efficiency of the medical service of the Pennsylvania reserves, and other State regiments in this capacity. He inaugurated the plan of removing the wounded from the battle-field to large hospitals, after the first battle at Winchester, between Gen. Shields and "Stonewall" Jackson, sending many to Philadelphia, Reading, Harrisburg, and other places. He won the warmest thanks of uncounted relatives, by inaugurating the system of embalming the dead at nearly the same time. No act in the medical and hospital department of the army won more praise than was at the time and has since been awarded to this. He also organized and directed a corps of surgeons, under Pennsylvania authority, at the siege of Yorktown, with steamers as floating hospitals. They were furnished with stores by private contributions. He also assisted Surgeon Tripler and the general government in organizing similar hospitals. He participated in the surgery following the battles of Williamsburg, West Point, Fair Oaks and Coal Harbor, and rendered the greatest service in directing and aiding the operations after the bloody battle of Antietam. Having seen the department thoroughly organized and efficient, he was constrained to heed the calls of private

practice, and resigned his commission as Surgeon-General in October, 1862, and was for several years afterward actively employed in ordinary professional duty. He resigned the Professorship of Surgery in the University of Pennsylvania in March, 1871, after thirty years' labor as a teacher, and was elected Professor *Emeritus* in that institution. As a lecturer he is described as "excellent and unexceptionable in his style of speaking—quiet, fluent, self-possessed, systematic and thorough. As a

Henry N. Smith.

surgeon he was regarded as conservative and very considerate of final results, and therefore successful."

SMITH, J. Lewis, of New York City, was born at Spafford, Onondaga county, N. Y., October 15, 1827. His ancestors were farmers, of New England descent, his grand-parents participating in the War of the Revolution. He was educated in the public schools of Onondaga county, and in Homer Academy; also at Yale College, graduating from the academic department there in 1849. He read medicine with Dr. Caleb Green, and Drs. Goodyear and Hyde, in Cortland county in 1850, studying also botany in the valley of the Tioughnioga (an upper branch of the Susquehanna). He attended lectures in the Buffalo Medical School in 1851 and 1852; was one year an *interne* of the hospital kept by the Sisters of Charity in Buffalo, and graduated at the College of Physicians and surgeons, in New York, in 1853, settling there and commencing practice also in that year. He is the author of a "Treatise on Diseases of Children," a work which has gone through several editions; also of various contributions to Pepper's "System of Medicine," and Woods' "Reference Hand-Book of the Medical Sciences," and to medical journals, chiefly on subjects relating to children. He has served for many years as physician to the Charity Hospital; the New York Foundling Asylum; the New York Infant Asylum; consulting physician to the children's class in the Bureau for the Relief of Out-door Poor, and

clinical professor of diseases of children in Bellevue Medical College.

SMITH, Joseph Rowe, of the United States Army, was born at Madison Barracks, N. Y., April 18, 1831. He received a liberal education, and the degrees of A. B. and A. M. from the University of Michigan, in 1848 and 1851. From 1849 till 1851 he served as engineer and was employed by the Topographical Bureau, United States Army, to determine the boundary between the Creeks and Cherokees, and to lay out territorial roads in Minnesota. He graduated in medicine in Buffalo in 1853, came before the Army Medical Board, passed, and was commissioned assistant surgeon in 1854. After constant frontier service on many Indian expeditions and the Utah expedition as Chief Medical Officer, Sixth Column, he was captured by the rebels in San Antonio in April, 1861, paroled, and under an agreement between the United States and Confederate States, was soon released from his parole. On arrival in Washington, in June, 1861, he was at once selected to organize the first general hospitals for the receipt of the wounded from the first battle of the war, Bull Run, and organized Seminary Hospital and other hospitals in Georgetown, which he administered until selected by Surgeon-General Hammond as Executive Officer in July, 1862, having been promoted to a majority in June, 1862. In August, 1862, he was appointed by President Lincoln Acting Surgeon-General. In November, 1863, he was ordered to Little Rock and served as Medical Director Department and Army of Arkansas and Seventh Army Corps, with rank of Lieutenant-Colonel, under act February 25, 1865, until assigned as Medical Director Fourth Military District, Vicksburg, in 1867. During this time he was brevetted Lieutenant-Colonel United States Army "for superior ability and excellent management of the affairs of his department," being the only officer in whose case this language was used, and also Colonel for "meritorious services and devotion to the sick during the prevalence of the cholera at Little Rock, Ark., November 22, 1866." The Department Commander, Gen. Ord, urged that he be brevetted Brigadier-General. After the war he served as follows: Post Surgeon at Jefferson Barracks, Fort Wayne, and Fortress Monroe, successively, until 1879; Medical Director Department of Texas, to 1885; Attending Surgeon New York City to December, 1887; Medical Director Department of Dakota to December, 1888; Medical Director Department of Arizona to July, 1892; Medical Director Department of California until fall of 1893, and Medical Director Department of the East until the present time. He was promoted Lieutenant-Colonel in January, 1885, Colonel in February, 1890, and Assistant Surgeon-General in 1892. Besides performing his full share of duty on boards and courts martial, he was selected by Gen. Twiggs for special duty as Judge Advocate, and traveled to various posts in the Department of Texas, trying cases, and when retiring boards were first instituted, in 1851, he was selected by the War Department as a member on the first boards. In 1862-3 he was twice selected as member of board for examining assistant surgeons for promotion, and in 1887 as president of the Army Medical Examining Board for examination of candidates or applicants for assistant sur-

geons and assistant surgeons for promotion. In 1887 he was selected as member of board for preparing rules and regulations for the then newly organized hospital corps. He was selected and detailed by the Secretary of War to represent the Medical Department of the United States Army at the annual meetings of the American Medical Association from 1874 to 1877 and from 1882 to 1885; of the Public Health Association in 1880; of the International Medical Congress in Philadelphia, 1876, and in Washington, 1887. He was elected vice-president of the American Medical Association in 1887; of the Ninth International Medical Congress and of its Section of Military and Naval Medicine and Surgery the same year; also honorary president of the Section of Military Medicine and Surgery of the Pan-American Medical Congress, and member of the Eleventh International Medical Congress, in 1893. Besides his purely official reports he has written many papers on various subjects of a scientific nature or of interest to military surgeons, among which may be mentioned "Compulsory Retirement" and "Retirements in General in the Army;" "Comparative Sickness and Mortality in the Army;" "Diseases Among Texas Cattle, Their Temperature and Relative Weight of Their Livers and Spleens;" "On the Best Form of Report of Sick and Wounded;" "On the Ration of the Soldier;" "On the Duties of Military Surgeons." Some of these have been published in the proceedings of the American Medical Association, the International Medical Congress, and Woods' Reference Hand-Book of Medical Sciences, and are authority on the subjects. He is a Fellow of the American Academy of Medicine, and of the American Academy of Political and Social Science; an active member of the American Medical Association; the American Public Health Association, and honorary member of the State Medical Societies of New York, Texas, Arkansas, and California. He was detailed by the Secretary of War as delegate to represent the medical corps of the army at the Eleventh International Medical Congress, held at Rome, Italy, in 1894. He traveled in China and Japan to study the subject of transportation in litters with reference to carriage of sick and wounded.

SMITH, Nathan, of New Haven, Conn., was born in Rehoboth, Mass., September 13, 1762, and died in the former city, July 26, 1828. From a life sketch in Appleton's *Cyclopedia of American Biography*, we derive the following details relating to the personal history of this eminent pioneer of the medical profession: He enlisted in the Vermont militia during the last eighteen months of the Revolutionary War, and accompanied his father to an unsettled part of Vermont. Subsequently he led the life of pioneer and hunter, having no education and no advantages. He decided to become a physician when he was twenty-four years of age, studied under Dr. Josiah Goodhue, and practiced for several years in Concord, N. H., when he entered the Medical Department of Harvard, and received the degree of M. B. in 1790, being the only graduate of that year, and the third of the department. At that time the practice of medicine was at a low ebb in the State, and physicians were poorly educated, and unskillful. To procure better advantages for them, he established the Medical Department of Dartmouth, in 1798,

was appointed its Professor of Medicine, and for many years taught all, or nearly all, the branches of the profession unaided. He held the chair of Anatomy and Surgery till 1810, and that of Theory and Practice of Medicine till 1813. He was given the degree of A. M. by Dartmouth in 1798, and that of M. D. by that college in 1801, and by Harvard in 1811. He went to Great Britain about 1803, attended lectures in Edinburgh for one year, and on his return resumed his former duties. He was elected Professor of the Theory and Practice of Physic and Surgery in the Medical Department of Yale in 1813, and held the chair from that date until his death; also delivering courses of lectures on Medicine and Surgery, at the University of Vermont, from 1822 to 1825, and at Bowdoin on the Theory and Practice of Medicine from 1820 to 1825. It is said that his practice extended over four States, and while he was conservative in his methods he was more than ordinarily successful as an operator. It has been asserted that he was the first in this country to perform the operation of extirpating an ovarian tumor, and that of staphylophthorphy. He devised and introduced a mode of amputating the thigh, which, although resembling methods that had previously been employed, is sufficiently original to bear his name, and he developed important scientific principles in relation to the pathology of necrosis, on which he founded a new and successful mode of practice. He also invented an apparatus for the treatment of fractures, and a mode of reducing dislocations of the hip. He published, "Practical Essays on Typhus Fever," in 1824. His "Medical and Surgical Memoirs" was edited with addenda, by his son, the late Dr. Nathan R. Smith, of Baltimore, in 1831.

SMITH, Nathan Ryno, of Baltimore, Md., son of the preceding Prof. Nathan Smith, was born in Concord, N. H., May 21, 1797, and died in the former city July 3, 1877. He received his early education at Hanover, N. H., and his literary and classical education at Yale College, whence he graduated A. M. in 1817. He spent about a year and a half in the South, in the capacity of private tutor, and returning to New Haven, commenced the study of medicine under his father in Yale College, and received his degree of M. D. in 1823. In 1824 he married Juliette Penneman, and established himself in Burlington, Vt.; subsequently resided for a brief period in Philadelphia; removed to Baltimore in 1827, and with the exception of two years between 1838 and 1840, when he was in Transylvania University, Kentucky, resided there until his death. He was appointed Professor of Surgery and Anatomy in the University of Vermont, in 1825, the winter of which year he spent in Philadelphia, attending the lectures at the University of Pennsylvania. At this time Prof. George McClellan, of that city, was organizing the medical department in Jefferson College, in which Prof. Smith became Professor of Anatomy, a position he retained two years. In 1827 he accepted the chair of Surgery in the School of Medicine of the University of Maryland, and also that of Clinical Surgery in the Baltimore Infirmary. In 1838 he became Professor of Practice of Medicine in the medical department of Transylvania University, Lexington, Ky., continuing, however, to reside in Baltimore during the vacant part of the year. He resumed his chair

in the University of Maryland in 1840. He resigned his professorship in this institution in 1870, having been connected with it nearly fifty years. He was president of the Maryland State Medical Society. He was the author of a voluminous work on the surgical anatomy of the arteries, a work which has passed through several editions, as well as many monographs on various scientific subjects to the journals of the day. He was the inventor of an instrument for the easy and safe performance of the operation of lithotomy, an operation in which he had been eminently successful, having performed it some two hundred and fifty times, in almost all cases with success. In 1860 he invented and introduced an apparatus for fractures of the lower extremity, termed the anterior suspension apparatus, and a few years after published a volume descriptive of its application. Both this and the former invention are employed by the first physicians in this country and in Europe. In 1867 he visited Europe, where he was received with distinction by the distinguished members of the profession in Paris and London. His son, Dr. Alan P. Smith, is actively engaged in medical and surgical practice, and is Professor of Surgery in the University of Baltimore. He is connected as consulting physician and surgeon with nearly all the hospitals of that city, and has performed the operation of lithotomy more than one hundred times, successfully in every instance.

SMITH, Stephen, of New York City, is a son of a farmer of Onondaga county, N. Y., where he was born February 19, 1823. He passed his childhood and youth on his father's farm. His preliminary education was obtained at a country school during the winter months, and at the age of eighteen, having learned all then that could be learned there, he continued his education by private study. When he arrived at the age of twenty he had mastered many of the higher branches of mathematics, geometry, surveying, had a knowledge of trigonometry, and something of Latin and Greek. He then attended two terms at Cortland Academy, Homer, N. Y.; afterwards he entered the office of Dr. Caleb Green, of Homer, and commenced the study of medicine, at the same time attending the lectures of the Geneva Medical College. He next studied under Prof. Hamilton, of Buffalo, attended lectures at the Buffalo Medical College, and became the resident pupil in the Buffalo Hospital of the Sisters of Charity. In 1849 he studied at the College of Physicians and Surgeons, New York, graduated M. D. in 1850, and soon after became one of the Resident Physicians of Bellevue Hospital. On leaving the hospital he took up his residence in New York. In 1853 he married a daughter of Judge E. D. Culver, of Brooklyn, subsequently minister to Venezuela. He has tied the common iliac artery for aneurism, and was the second in this country to perform Symes' amputation at the ankle-joint. He was among the first to propose the organization of Bellevue College. While still a resident of Bellevue Hospital, he published a monograph of seventy-five cases of rupture of the urinary bladder, for which he received much praise, and which was subsequently translated into French and German. In 1861 he published a hand-book of operations for the benefit of surgeons in the field, which rapidly ran through five editions, and is now out of print. He is

the author of the Official Report of the Condition of New York City, published in 1865. He is also author of a work Principles and Practice of Operative Surgery, 1879. Besides the above he had contributed largely to the leading medical journals. He is a member of the New York Pathological Society; of the Medical Journal Association of the City of New York; of the Medical Society of the County of New York. In the International Medical Congress, Philadelphia, 1876, he was appointed president of the section on sanitary science. Dr. Smith is president of the National Board of Health; member of the American Medical Association; member of the American Public Health Association, and founder of the same; Fellow of the New York Academy of Medicine, and in 1890 was president of the New York State Medical Association. He is at this date (1893) Consulting Surgeon to Bellevue and Columbian Hospitals, and Visiting Surgeon to St. Vincent's Hospital, having held the former position nearly forty years. Dr. Smith has held the chair of Anatomy and Surgery in Bellevue Hospital Medical College. Subsequently he became Professor of Clinical Surgery in the University of the City of New York, and is now *Emeritus* Professor of Clinical Surgery in that institution.

SMYTH, Andrew Woods, of New Orleans, La., was born near Londonderry, Ireland, February 15, 1833. A biographer in Appleton's Cyclopedic of American Biography, says: He settled in New Orleans in 1849, and was graduated from the Medical Department of the University of Louisiana, in 1858. He became House-surgeon of the Charity Hospital in 1858, and served in that capacity during the following twenty years. In that institution he performed on May 15, 1864, the first and only recorded operation of tying successfully the *arteria innominata* for subclavian aneurism. All previous attempts had failed, and his success was attributed to ligating where secondary hemorrhage had occurred, the vertebral artery, which prevented regurgitant hemorrhage. Dr. Valetine Mott, who first performed this operation, in New York, in 1818, and who never doubted its ultimate success said that Dr. Smyth's operation had afforded him more consolation than all others of a similar character. Dr. Smyth also made the first successful reduction of a dislocation of the femur of over nine months' duration, in 1866, and performed the operation of extirpation of the kidney, in 1879, then almost unknown to the profession (nephrotomy), and in 1885, that of nephorrhaphy, attaching a floating kidney to the wound to retain the organ in its place instead of extirpation. From 1862 until 1877 he was a member of the Board of Health of Louisiana, and from 1881 to 1885 he was superintendent of the United States Mint in New Orleans. Since then until the present date (1893), he has practiced his profession in that city. Dr. Smyth has published a brochure on the "Collateral Circulation in Aneurism" (1876), and a paper on "The Structure and Function of the Kidney," giving original views on the anatomical and physiological construction and action of the malpighian bodies, contending that a communication between the interior of the capsule of these bodies and the uriniferous tubules could not exist, and that excretion in the organ is car-

ried on by systolic pressure, and diastolic relaxation, which are correlative and effected by constriction of the efferent artery of the glomerule.

SOLLY, Samuel Edwin, of Colorado Springs, Colo., was born in London, England, May 5, 1845. He is the son of the eminent London surgeon, Samuel Solly, F. R. S., whose work upon the human brain has become a medical classic. The family are English, having lived and held land in the Isle of Thanet in Kent since the conquest. He was educated at Rugby school, and then became apprentice to his father at St. Thomas' Hospital, graduating at the Royal College of Surgeons in May, 1867. He held in succession the office of House-surgeon and Medical Registrar, and worked at the various special hospitals and visited the continent, and practiced his profession in London until 1874, when he left England on account of his health and settled at Colorado Springs. Though not strictly a specialist, his success and reputation has come chiefly from his treatment and observation of pulmonary, laryngeal and nasal disease, to which his practice is now chiefly limited. He was president of the Colorado State Medical Society in 1887; is a member of the Association of American Physicians; of the Climatological Association; American Medical Association; the British Medical Association, and Fellow of the Royal Medico-Chirurgical Society. He has written much on climate and meteorology, and contributed numerous papers on medical subjects, especially phthisis, to societies and journals; some of the most recent being the article on "Climate in Hall's System of Therapeutics;" "The Personal Equation in the Treatment of Phthisis," and "The Influence of Diathesis on the Progress of Phthisis."

SOTHORON, James T., of Washington, D. C., was born in St. Mary's county, near Charlotte Hall, Md., on July 9, 1842, his ancestors being among the first settlers of Southern Maryland. His father, with his family, removed to Georgetown, D. C., in 1843, subsequently removing to Washington, D. C., where his son, James T., attended the Grammar School and the Washington Select School. In 1858 he entered the academical department of Georgetown University, continuing his studies there until the outbreak of the late Civil War, when he returned to his native place, and was engaged as tutor until 1862. In 1863 he matriculated in the medical department of Georgetown University, and pursued his studies under the guidance of Dr. Thomas Antisell, Professor of Physiology and Military Surgery. He was graduated in 1865, and whilst he was a student, was appointed Medical Cadet United States Army, and served in Campbell Hospital, District of Columbia. Dr. Sothoron was one of the organizers and a member of the first board of trustees of the Church Orphanage, one of the petitioners for the organization of St. Paul's Protestant Episcopal Church, a vestryman for fifteen years, and its treasurer for the past eight years. He is a delegate and a member of the Central Board of Managers of the Associated Charities of the District of Columbia, a member of the Medical Society, and Medical Association of the District of Columbia, the American Medical Association and the Ninth International Medical Congress. Dr. Sothoron began the practice of medicine in 1865, in Washington, D. C., and has prac-

James T. Sothoron

ticed his profession continuously for twenty-seven years, being quite successful in obstetrics and diseases of children.

SOUTHALL, James H., of Little Rock, Ark., was born in Smithfield, Isle of Wight county, Va., Nov. 5, 1841, and is of Welsh descent. He received his preliminary education at Norfolk, Va., studied medicine under the preceptorship of Dr. R. B. Tunstall, and was graduated M. D. at the University of Louisiana March 1, 1861. He entered the Confederate Army (Northern Virginia) September, 1861, and continued in the field as Assistant Surgeon of the Fifty-fifth Virginia Infantry until May 27, 1862, when he was promoted to full surgeon of the same regiment, in which capacity he served until the close of the war, or surrender of Gen. R. E. Lee at Appomattox C. H., in 1865. He then returned to Norfolk, Va., and engaged in the general practice of medicine until December, 1865, when his residence was changed to Crittenden county, Ark., where he was continuously engaged in the duties of his profession until February, 1872, excepting six months that he was located in Memphis, Tenn. On March 1, 1872 he changed his location to the city of Little Rock, where he has since remained. While in the Confederate Army, Dr. Southall served as surgeon of his regiment in all the battles of the Army of Northern Virginia, under the generalship of Gen. T. J. Jackson (Stonewall) and Gen. R. E. Lee. From 1873 to 1876 Dr. Southall was Physician to the Deaf Mute Institute of the State of Arkansas. In 1876 he was secretary of the Arkansas State Medical Association. He served as Medical Director of Knights of Honor, State of Arkansas. From 1879 to 1887 he was Professor of Physiology and Institute of Medicine in the Medical Department of the Arkansas Industrial University. In 1887 he resigned

this chair, and was elected to fill that of Theory and Practice of Medicine, made vacant by resignation of Dr. P. O. Hooper. The position was accepted and has been occupied by the subject of this sketch ever since. In 1882 he was elected president of the State Medical Society of Arkansas. He has contributed many reports of cases to medical journals, as well as articles on "Epidemic Cerebro Spinal Meningitis;" "Epidemic Cholera Morbus;" "Ergot as an Oxytocic," and other important medical subjects.

STANDISH, Myles, of Boston, Mass., was born in that city October 17, 1851. He is a son of Francis and Caroline Amanda Standish, and is a descendant of the Pilgrim Captain who came in the Mayflower to Plymouth in 1620. Dr. Standish fitted for college at the Roxbury Latin School, and entered Bowdoin College in 1871 and was graduated A. B. in 1875; entered the medical school of Harvard University in 1876 and was graduated M. D. in 1879. He received the degree of A. M., Bowdoin College, 1878. Upon graduation he was appointed House Physician of the Carney Hospital, Boston, and remained one year, when he went abroad and spent one year in the study of ophthalmology in Berlin, and subsequently one semester in Vienna. Upon his return home he was appointed House-surgeon at the Massachusetts Charitable Eye and Ear Infirmary. Upon leaving this institution in 1884 and establishing himself in private practice, he was elected during the same year Assistant to the Ophthalmic Surgeons of the Boston City Hospital, Ophthalmic Surgeon to out-patients at the Carney Hospital, and Assistant in the Ophthalmic Department of the Massachusetts General Hospital. In January, 1886, Dr. Standish was appointed Instructor in Ophthalmology in the Boston Polyclinic, and in February, 1888, he was appointed Assistant Ophthalmic Surgeon at the Massachusetts Charitable Eye and Ear Infirmary. Upon receiving this appointment he resigned the positions held at the Massachusetts General Hospital and the Boston City Hospital. In April, 1888, Dr. Standish was elected Dean of the Boston Polyclinic. On June 1, 1889, he was nominated and appointed Ophthalmic Surgeon on the staff of the Carney Hospital. In May, 1892, he was appointed Assistant to the chair of Ophthalmology in the Medical School of Harvard University, and in October of the same year he was elected Ophthalmic Surgeon on the staff of the Massachusetts Charitable Eye and Ear Infirmary. He was elected a member of the American Ophthalmological Society in 1884, of the Boston Society for Medical Improvement in 1887, and of the Boston Medical Library Association in 1886. He passed his examination for entrance to the Massachusetts Medical Society in 1880. Dr. Standish has written a number of important papers which have been published in the *Boston Medical and Surgical Journal* and the *Transactions of the American Ophthalmological Society*.

STANLEY, James Philip, of Pine Bluff, Ark., was born in Haywood county, W. Tenn., August 29, 1833. His early education was received in the private and public schools and the High School of Fayette county in his native State. He studied medicine under the preceptorship of Dr. Josiah Higginson, and entered the Medical Department of the University of Pennsylvania, receiving the degree of M. D. from that insti-

tution in 1858. He also took a private course in microscopical and pathological anatomy. He remained in Philadelphia and practiced his profession until 1862. He then entered the Confederate Army, and served as surgeon, with the rank of lieutenant-colonel during the following three years. After the close of the Civil War, he established himself at Selma, Ala., where he continued in active general practice until April, 1888. He then removed to Pine Bluff, where he has since remained. Dr. Stanley has the reputation of an accomplished physician and surgeon. He has successfully performed all the amputations, from hip to toes, and from shoulder to the fingers, that are described in the late works on surgery. On September 5, 1888, he trephined an old man, whose skull was mashed with a beer-bottle three days before. The patient was seventy-two years of age. The operation resulted in complete recovery, and was the only successful case ever performed in that section of his State up to that date. Dr. Stanley is an active member of the Arkansas Medical Association, and ex-president of the Jefferson County Medical Society in his adopted State. He has made important contributions to professional literature, among which may be mentioned recent articles entitled, "Malarial Hematuric Fever," "Pseudarthrosis," and "Effects of Quinine in Malarial Hematuric Fever."

STAPLES, Franklin, of Winona, Minn. was

Franklin Staples

born in Raymond (now Casco), Cumberland county, Me., November 9, 1833. He received an academic education and began the study of medicine in the office of Dr. Chas. S. D. Fessenden, of Portland, Me., in 1855; attended lectures in the medical department of Bowdoin College in 1856, and was one of the first students in the Portland School for Medical

Instruction, under the instruction of the late Prof. W. C. Robinson, and Prof. Israel T. Dana, now of the Maine Medical School. In 1861 he entered the College of Physicians and Surgeons, New York, and was graduated thence M. D. in March, 1862. As the student and assistant of the late Dr. David Conant, he then went to the Maine Medical School (medical department of Bowdoin College), having been appointed Demonstrator of Anatomy for that year. In the summer of 1862 he established himself as a general practitioner in Winona, Minn. He married, June 4, 1863, Helen M., daughter of Ezra Harford, Esq., of Portland, Me. Dr. Staples was one of the founders of the Winona Preparatory Medical School. In 1871 he was elected president of the Minnesota State Medical Society, and in 1874 was appointed a member of the Minnesota State Board of Health, which position he continues to hold. He has been the president of the State Board of Health since 1889. He is a member of the American Medical Association, was one of the judicial council of this association from 1875 to 1877, and vice-president of the association during the latter year. From 1883 to 1887 he held the chair of the Practice of Medicine in the Medical Department of the University of Minnesota, when this Faculty constituted the Medical Examining Board of the State. Dr. Staples has been known especially by his study and practical work as a surgeon, and has been able to witness and have a part in the great progress which, in the last quarter of a century, our country and the world has witnessed in this department of scientific work. It may be said of him that he has enjoyed the confidence and respect of the medical profession, especially in that part of the Northwest where has been his field of labor. His writings on medical and surgical subjects have from time to time been published in scientific and professional journals; but of late years his attention and interest have been given to sanitary science and to practical work in this department. Among the first of his writings in this line was his report on "The Influence of Climate on Pulmonary Diseases in Minnesota," published in the Transactions of the American Medical Association, 1876.

STEELE, Daniel A. K., of Chicago, Ill., was born in Eden, Ohio, March 29, 1852. His father, the Rev. Daniel Steele, a Presbyterian clergyman, was a native of County Tyrone, Ireland, who came to this country in 1851. When the subject of this sketch was two years old his parents removed to Illinois and located near Pinckneyville, in Perry county. The country was at that time wild and new, and the first school young Steele attended was at a little log school house in Grand Cote Prairie, where the rural youngsters were trained after the most primitive fashion. While the elder Steele was engaged in ministerial work he was at the same time living on one of the new farms of that portion of "the Far West," and on a somewhat limited scale he carried on farming operations along with his neighbors. He looked upon industry as chief of all the virtues, next to genuine piety; as soon as his son was old enough to make himself useful on the farm there was no lack of tasks for him to perform. He divided his time between the farm and the country school-room until he was fifteen years of age, and during that time the farm claimed the larger share of his atten-

tion. However he made fair progress in his studies, and in 1866 he went to Oakdale Academy, in the town of Oakdale, only a few miles distant from his home, where he completed his academic course of study. Then he removed with his father to Rantoul, in Champagne county, Ill., where, in 1868 and 1869, he taught school a portion of his time. In 1869 he commenced reading medicine under the preceptorship of Dr. D. P. McClure, of Rantoul, and at the same time he began to acquire a knowledge of drugs and medicines as clerk in a well-stocked and well-managed drug store.

D. A. K. Steele

In 1870, after reading under the direction of Dr. McClure one year, he went to Chicago and entered the Chicago Medical College, where he took a three years' graded course and graduated in 1873. During his senior year at the college he was appointed Prosecutor of Anatomy in that institution, and after his graduation he became Demonstrator in the Chicago School of Anatomy, an institution modeled after the Philadelphia School of Anatomy, which became famous some years since under the management of Dr. John B. Roberts. Being anxious to add as much as possible to his knowledge of operative surgery, he entered a competitive examination of applicants for appointment to the position of *Interne* in the Cook County Hospital, and as a result of the examination, received the appointment of House Physician and Surgeon. He was connected with the hospital for nearly two years, and at the end of that time he had demonstrated conclusively that he had a genius for surgery. He then engaged in general practice, although paying particular attention to surgery, becoming at the same time clinical assistant to the late Prof. Moses Gunn, of Rush Medical College, one of the most noted surgeons the West has produced. In 1875 he was appointed one

of the Attending Surgeons of the South Side Dispensary of Chicago, and in 1876 Lecturer on Surgery in the Chicago Medical College. In 1882 he severed his connection with the Chicago Medical College, and was associated with some of the most prominent physicians of his city in founding the College of Physicians and Surgeons of Chicago, which now ranks high among the medical educational institutions of the West. In this institution he became Professor of Orthopedic Surgery, a position which he held until 1886, when he advanced to the chair of Principles and Practice of Surgery and Clinical Surgery. He was appointed to this latter position to fill the vacancy occasioned by the resignation of Dr. Nicholas Senn, a distinguished surgeon, then of Milwaukee, and at the time of his appointment his age was about ten years under that which constitutes the average age of physicians called upon to fill this important chair in the medical colleges of the country. Notwithstanding his comparative youthfulness, he has sustained the character given to this professorship by his distinguished predecessor, and among the many able educators connected with the Chicago Medical Colleges, few instructors are listened to by classes of more deeply interested students. In delivering medical lectures he has mastered the secret of being at the same time instructive and entertaining. His lectures abound in striking figures of speech, and are sufficiently entertained by the witticisms which spring spontaneously from a strain of Irish blood to render them unusually attractive. Outside of his educational work, Dr. Steele has been prominently identified with the inception and building up of various organizations designed to promote the welfare of the profession, to aid in the dissemination of important information, and to stimulate the ambition of members of the medical fraternity. He was one of the originators of the Chicago Biological Society, since merged into the Pathological Society, and a charter member of the Chicago Medical Club, an organization of limited membership, which meets once each month, to promote social intercourse among its members, and discuss matters of professional interest at the same time. He was the first president of the Chicago Medico-Legal Society, which was organized in 1886, and which, as its name indicates, deals with the legal questions, problems and principles which are either directly or indirectly of interest to the medical profession. The society meets four times a year, and the results of its discussions has been to very materially broaden the information of its members relative to their legal obligations, rights, and responsibilities. For eight years Dr. Steele was Attending Surgeon at the Cook County Hospital, and was president of the medical board of the hospital in 1887 and 1890. In 1886 he was president of the Chicago Medical Society, and of both the State and National Medical Associations he is a member of recognized high standing. At the session of the Illinois State Medical Society, held in 1886, he was chairman of the Committee on Surgery, and acting in that capacity he submitted a report on the progress of surgery during the year, which was notable for its admirable classifications of the matters dealt with, its clear statements relative to new discoveries, operations and results, and the amount of

statistical information which it contained concerning the latest developments of surgical science. In 1888 he was accredited by the American Medical Association a delegate to the British Medical Association at Glasgow, Scotland. It was while traveling in England on this occasion that he called upon Dr. Lawson Tait, of Birmingham, who, for some reason or other, failed to extend to him the courtesies which he had, without exception, met with elsewhere, and which have come to be looked upon as requirements of an unwritten law of the medical profession. With the spirit of a man who prides himself upon his American citizenship and the honorable standing of the profession to which he belongs, the visiting American took the distinguished English practitioner to task for his lack of courtesy in a series of letters, which were afterwards published by consent of both parties to the controversy, and in which the principles of what may be called the international comity of the medical profession were broadly enunciated. His companion for a portion of this trip was Rev. John Hall, his father's college mate at Belfast, and they visited many places of historic interest together. While abroad at that time Dr. Steele pursued a careful course of investigation and research, visiting the principal medical institutions and hospitals of England, France, Germany and Switzerland, and forming the acquaintance of such noted medics as Lister, MacCormick and Heath, of London; Kocher, of Berne; Kronlein, of Zurich, in Switzerland; Martin, of Berlin, and Volkmann, of Halle; Schede of Hamburg, and McEwen, of Glasgow. Recently Dr. Steele has been one of the prime movers in an enterprise which will vastly benefit the medical profession of Chicago—the founding of a public medical library. An association has been organized which proposes to erect a library building at a cost of thirty thousand dollars, and a fund of considerable magnitude is already available for the purchase of books. The venerable Dr. N. S. Davis, who has done so much for his profession in the West, and particularly in Chicago, is at the head of the enterprise, while Dr. Steele and other equally prominent physicians and active workers compose the Board of Directors of the Library Association. Among the most important of Dr. Steele's contributions to medical literature have been the following papers: "Report of a Case of Hydrophobia," "Gunshot Wounds of the Brain," "The Microbic Revolution in Surgery," "The Differential Diagnosis of Scrotal Tumors," "Surgical Treatment of Empyema in Children," "Reports of Three Operations of Ovariectomy," "Reports of Cases of Uterine Fibroids Treated by Ergot," "Double Congenital Oblique Inguinal Hernia," "The Medico-Legal Aspect of Criminal Abortion," "A Chicago Physician's Impressions and Observations of European Surgery," and "Diseases and Treatment of the Minor Articulations." The last-named monograph has been given a place in Keating's *Cyclopedia of the Diseases of Children*. Dr. Steele was married in 1876 to Miss Alice L. Tomlinson, of Rantoul, Illinois, a lady who has made his home a center of culture and refinement and contributed her full share to the measure of his success.

STEINER, Lewis Henry, of Baltimore, Md., was born May 4, 1827, in Frederick, Maryland,

and died in the former city February 18, 1892. He was educated in arts at Marshall College, Mercersburg, graduating in 1846. Three years later, he was graduated in medicine at the University of Pennsylvania. His membership in the American Medical Association dates from 1852. At the time of his demise he was librarian of the Pratt Free Library, and for ten years past had given nearly all his time to literary pursuits. During the civil war he served as Chief Inspector in the Army of the Potomac for the United States Sanitary Commission. He interested himself in the establishment of schools for the benefit of the freedmen in his State, presiding for three years over the School Board of Frederick county. For twelve years he was a member of his State Senate, the sole representative at times of the minority party. At different periods in the earlier years of his professional life, Dr. Steiner filled positions as lecturer or professor in the branches of chemistry and pharmacy in the Maryland College of Pharmacy, in the Columbian College, in the Maryland Institute, in the National Medical College, and in the College of St. James, at Hagerstown. His address before the Medical and Chirurgical Faculty of Maryland in 1856 dealt with the relations of modern chemistry to the medical profession. In conjunction with Dr. Breed, he prepared an American edition of the Chemical Analysis of Heinrich Will. In 1861 he served as assistant editor of the *American Medical Monthly*. He was the librarian for several years of the Maryland Historical Society. In 1876 he was vice-president of the American Public Health Association, as well as public orator at the annual conventions at Philadelphia and Baltimore. In 1877 he was president of the American Academy of Medicine. He was a member of the International Medical Congress in Philadelphia. He belonged to numerous scientific and historical societies, and was ever ready and helpful with his pen in their encouragement.

STERNE, Albert Eugene, of Indianapolis, Ind., was born in Cincinnati, Ohio, April 28, 1866. He is the second son of Charles F. and Eugenia Fries Sterne, formerly of Peru, Indiana. His education was received in various private schools before entering Harvard University in the autumn of 1883, as a member of the class of 1887. He received the degree of A. B. *cum laude* at the end of the regular four years' course. In the fall of 1887 he sailed for Europe to take a full course of medical studies in the universities of Germany. In Strassburg he spent two and one-half years, and in Berlin three years, receiving the degree of M. D. *magna cum laude* from the University of Berlin in 1891. During vacation terms, and at other times, he visited the various countries of Europe and Northern Africa, studying hospital work. He was *Interne* in the Charity Hospital of Berlin, division of nervous diseases, and also *Interne* of the Rotunda Maternity of Dublin, Ireland. The major part of his studies was carried on in Strassburg, Berlin, Paris, Dublin and London hospitals during a period of six years' absence from America. He returned in December, 1892, and has, since February, 1893, practiced medicine in Indianapolis. He intends to confine practice entirely to diseases of the nervous system, and to the surgery of the brain and vertebral column. He has written articles upon

"Arthropathia Tabidorum," or "Charcot's Joint Disease;" on "Tabes Dorsalis," "Specific Diseases of the Nervous System," and "Syringo-Myelia." These papers were read before various medical societies. He is a member of the American Medical Association; the Mississippi Valley Medical Association; the Indiana State Medical Society; the Marion County Medical Society; the Mitchell District Medical Society; the Indianapolis Surgical Society; the Association of American Physicians of Berlin, Germany, and the Indiana Harvard Club.

STERNBERG, George Miller, of Washington City, D. C., was born in Otsego county, N. Y., June 8, 1838. He began the study of medicine early in life, and entered the College of Physicians and Surgeons, New York, from which institution he received his medical degree, in 1860. He was appointed Assistant Surgeon United States Army, May 28, 1861. His first duty was with the command of Gen. George Sykes, in the Army of the Potomac, and after four months' hospital duty in Rhode Island, he joined Gen. Nathaniel P. Bank's expedition to New Orleans, and then served in the office of the medical director of the Department of the Gulf until January, 1864. Subsequently he was on hospital duty in Cleveland and Columbus, Ohio, till April, 1866, and afterward was stationed at various government posts, being promoted December 1, 1875, Surgeon with rank of major. Subsequently Dr. Sternberg was on duty in Baltimore, where he was engaged in experimental researches in bacteriology in Johns Hopkins University as a Fellow by courtesy in that institution. In 1879 he was sent to Havana, as a member of the yellow fever commission, by the National Board of Health, and in 1885 he was a delegate to the International Sanitary Conference, in Rome, Italy. Dr. Sternberg is an honorary member of the Royal Academy of Medicine of Rome, Rio Janeiro, and Havana, and a Fellow of the Royal Microscopical Society of London; and, besides membership in other medical and scientific societies, at home and abroad, was, in 1887, president of the American Public Health Association. The Lamb prize of five hundred dollars was awarded to him by the last-named association, in 1885, for his essay on "Disinfectants;" and he has invented automatic heat regulating apparatus. Besides contributions to scientific journals on his specialties, he has published, "Photo-Micrographs, and How to Make Them," 1883; "Bacteria," and "Malaria and Malarial Diseases," 1884. In 1893 Dr. Sternberg was appointed Surgeon-General United States Army, with the rank of brigadier-general.

STEWART, Francis Edward, of Watkins, N. Y., was born at Albion, Orleans county, New York, September 13, 1853, and is the son of Jonathan Severance Stewart and Ada Erie Nicholson. His father's family belong to the Perthshire branch of the Scottish Stewarts. Governor Robert Morris Stewart, of Missouri, was a brother of his father. His mother is a descendant of the Robinson, Fay, Mathews and Morris families, of Vermont, David Mathews, his great-grandfather, having built the famous "State Line House," located between New York and Vermont, at the intersection of Rensselaer, Washington and Bennington counties, and the town lines of White Creek, Hoosic, Shaftsbury and Bennington. Dr.

Stewart graduated at the Philadelphia College of Pharmacy, class of 1876, and from the Jefferson Medical College, of Philadelphia, in 1879, as a pupil of Dr. F. V. Green, United States Navy. His inaugural thesis at the latter institution, which received first honorable mention, and a subsequent paper introducing *Sanguinus Bovinus Exiccatus* (dried bullock's blood), attracted the notice of the house of Parke, Davis & Co., manufacturing chemists, of Detroit, and he accepted an engagement with this corporation which resulted in the establishment of a scientific department of leading experts, represented by a "Working Bulletin System for the Collective Investigation of Drugs." This system, which was devised by Dr. Stewart, has resulted in the publication of "The Pharmacology of the Newer Materia Medica," a book of 1,300 pages. Dr. Stewart was for some time associate editor of the *Therapeutic Gazette*, published by Mr. Geo. S. Davis, of Detroit. By adopting a plan of his devising, the journal has now become the leading periodical in therapeutics in the English language. During the six years in which he was connected with the work above referred to, Dr. Stewart made his home in New York City. Here he was a member of the Hospital Committee of the State Charities' Aid Society, chairman of the Committee on Almshouses of the County of New York, one of the incorporators and Physician of the Loan Relief Association, and a member of the Fifth Avenue Presbyterian Church. From New York he returned to Philadelphia in connection with the *Therapeutic Gazette*, and became Demonstrator and Lecturer in Materia Medica at the Jefferson Medical College and the Medico-Chirurgical College; also being Master in Chemistry and Theoretical Pharmacy at the Philadelphia College of Pharmacy, and Professor of Pharmacy in the Powers College of Pharmacy. His residence at that time was Wilmington, Delaware, near Philadelphia, where he practiced medicine seven years; was a prominent member of the State Medical and Pharmaceutical Societies, and Electrician of the Delaware Hospital. He was also a member of the judicial council of the Ninth International Medical Congress, and a member from Delaware of the Convention for Revising the United States Pharmacopeia, of 1890. For many years he has been a member of the American Medical Association, and for some time one of its officers, and he was also appointed one of the officers of the first Pan-American Medical Congress. In 1886 he was interested in original research at the University of Pennsylvania, and Assistant Demonstrator of Therapeutics. He did the laboratory experimental work that introduced hydrobromate of hyoscine. Further work in the laboratory on food stuffs brought him in contact with the celebrated expert, Alphonse Bieudot, of Paris, France, for many years in charge of the palace of the King of Greece, at Athens. In association with this gentleman and his sons, he has been instrumental in founding and building up the large business of the Franco-American Food Company, whose soups are now so familiar to the American public. Of this corporation he is the secretary. Dr. Stewart is a well-known author. His "Compend on Pharmacy" is now in the fourth edition. A number of his "Working Bulletins" have reached a large circulation.

His many papers before various societies have been favorably received. In 1891 the National Medical Association sent a memorial to Congress asking that body to carry out the provisions of the paper read by him, entitled "The Working Bulletin System, National Pharmacological Association, National Laboratory, and a Proposed Investigation of the Materia Medica of the World, Under the Auspices of the Government of the United States." In this connection he studied up the laws of patents and trademarks, and clearly shows in his paper the unethical, unscientific and illegal nature of the so-called patent or proprietary medicine business. He is an acknowledged authority in this branch of law, and his paper before the Congressional Committee on Patents resulted in convincing that body as to the correctness of his position. As a physician, Dr. Stewart has been eminently successful, numbering among his patients at Cape May Point, in the summer time, the family of President Harrison and that of Postmaster-General Wanamaker, while at Wilmington his list contained Ambassador Thos. F. Bayard and many other prominent persons. He is now engaged in the study of sanitariums, with the view of writing a book on the subject, and is at present located at the Glen Springs Sanitarium, at Watkins, N. Y.

STEWART, J. T., of Peoria, Ill., was born in Bond county, Illinois, June 20, 1824. His father, William Stewart, was a native of Pennsylvania, of Scotch descent. His mother, Elizabeth Willis, was a native of South Carolina, also of Scotch descent. His preliminary education was received in the common schools of the country. His classical education at Knox College, Galesburg, in his native State. His preceptor in his medical education was Dr. Joseph C. Frye, of Peoria. He graduated at the University of Pennsylvania in the spring of 1850. He began the practice of medicine in Peoria immediately after graduating, and continued in the practice there until the War of the Rebellion. In December, 1861, he was commissioned Surgeon of the Sixty-fourth Regiment Illinois Volunteer Infantry. He served in that capacity until Sherman's campaign in Georgia, when he was promoted to Surgeon-in-Chief of the Fourth Division Sixteenth Army Corps. He served in that capacity until July 19, 1864, when he was wounded by a shell crushing his hip and breaking the thigh bone in the neck. The following spring he went to Hilton Head Island, and was there when Charleston was evacuated. As he was too lame from his wound to go into the field, he was put in charge of the Post Hospital in Charleston, which was established immediately after the surrender of the city. This he conducted for six months, that was to September 1, 1865. The war being over he returned to Peoria and resumed his professional pursuits, and where he is still in active practice. While conducting a general practice, he has devoted special attention to surgery, and has since the war done a large share of the surgery of Peoria and vicinity. He has performed most of the operations which have ever been done in surgery, including removal of the entire womb and ovaries, and numerous ovariectomies. He was six years United States Pension Examiner. He is Surgeon of and Chief of Staff of St. Francis Hospital. Fifteen years ago he devised a hinge elbow splint for

fractures of the elbow, which is superior to any other that was then in use. All the surgeons of Peoria now use it. Ten years ago he devised an apparatus for fracture of the clavical, which is also used by the surgeons of his city. It is so perfectly simple and efficient that it needs only to be seen to be adopted. He has devoted much time to the study of botany, and has the best private herbarium in Illinois. He is president of the Scientific Association of Peoria, and has made many contributions to that society and to various periodicals, and is the author of a pamphlet on Shade Trees, Indigenous Shrubs and Vines.

STEWART, William Shaw, of Philadelphia, Pa., was born at Stewart's Station, near Pittsburgh, of Scotch-Irish parents, the third generation in this country. He is a graduate of Jefferson College, Cannonsburg, Pa., and of Jefferson Medical College, Philadelphia, 1863.

William S. Stewart

After graduating in medicine he entered the Army of the Potomac as assistant surgeon, and afterward located in Philadelphia (1865), where he entered into general practice. He soon gained a large and successful practice, and was honored by being elected to three terms of three years each, on the school board, serving as president of same; also, Surgeon of First Infantry Regiment, National Guard of Pennsylvania. He is a member of the Military Order, Loyal Legion; was one of the founders of the American Academy of Medicine; was Professor of Obstetrics and Clinical Professor of Gynecology of the Medico-Chirurgical College, of Philadelphia, for ten years, five of them as Dean, and was afterward made *Emeritus* Professor of the same. Dr. Stewart is a member of the Philadelphia County, Obstetrical, and Medico-Legal Societies; American Medical Association, Academy of Natural Sciences, Academy of Political and Social Science, and various other medical and scientific organ-

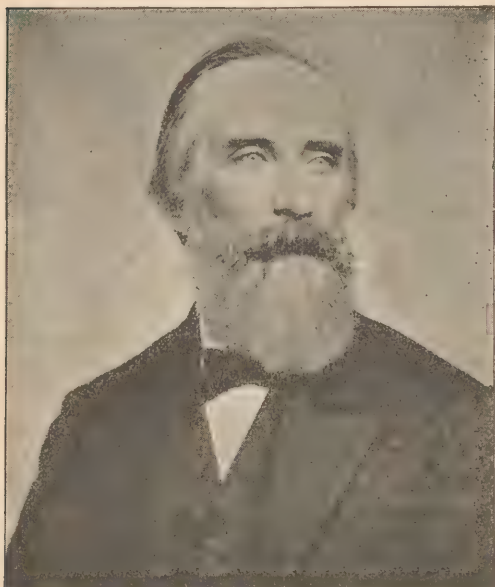

izations. He is a Trustee of the Charity Hospital, Philadelphia, and the Western Pennsylvania Theological Seminary, Allegheny City, Pa. He was a delegate to the Ninth and Tenth World's Medical Congresses, which met at Washington and Berlin, respectively, and read papers at each which are printed in the Transactions. He is the inventor of an obstetrical forcep, with parallel handles, having traction and grip all in one direction, and the application of either blade first. Also, the inventor of a preputial dilator, an instrument with four expansive blades, designed to prevent the bloody operation of circumcision, when it is not required as a religious rite. Dr. Stewart is the author of numerous papers and articles, and has had a large experience of all kinds of surgery, but more recently of abdominal. The largest tumor he has removed weighed ninety pounds, a multilocular cyst, from which the patient recovered. He delivered a living child, at full term, from a woman who had a retroflexed uterus—the only case on record where both mother and child survived. (See Vol. II, page 446, Transactions of the Ninth International Medical Congress.)

STILLE, Alfred, of Philadelphia, Pa., was born in that city October 30, 1813. He was the eldest son of John and Maria Stillé. Upon his father's side the family was of Swedish origin, its earliest member, of whom anything positively is known, being Olof Person Stillé, who emigrated to this country with the first Swedish colony, in the year 1638, under a passport or letter of recommendation from Eric Bielke, Lord of Wyk, Peningby and Nyñas, in Upland, Sweden. Shortly after their landing on the banks of the Delaware, the Swedes established numerous settlements, principally on the western bank of the river. Olof Stillé's place of residence, marked on Lindstrom's map as "Stillé's land," was situated on what is at present termed "the Neck," and is said to be the only homestead now known of any of the Swedish families whose names are on the list taken in the year 1693, for the information of William Penn. On the maternal side, Dr. Stillé was descended from the family of the Wagners, one of whom came over to this country and settled as a clergyman in Reading, Pa., in the year 1759. Mr. Wagner's father and grandfather were both of them clergymen, also; his great-grandfather was Tobias Wagner, Chancellor of the University of Tübingen in 1662. In the *Biographie Universelle* he is described as one of the most skillful and fertile theologians of the Seventeenth Century. Few Americans can look back to a longer line of ancestry, settled in this country, than the family to which the subject of this sketch belongs; and the tenacity with which they have clung to the spot where their first ancestor settled is, in our country at least, somewhat remarkable. Dr. Stillé was graduated at the University of Pennsylvania A. B. in 1832, and M. D. in 1836. In the same year he was elected Resident Physician of the Philadelphia Hospital. In 1839 he became Resident Physician at the Pennsylvania Hospital, and held that position until 1841. Between the date of graduation and 1839 he pursued his medical studies in Paris and other European capitals. From 1844 to 1850 he lectured on pathology and the practice of medicine to the Pennsylvania Association for Medical Instruction. In 1849 he

was appointed Physician to St. Joseph's Hospital. In 1854 he was elected Professor of the Theory and Practice of Medicine in the Pennsylvania Medical College, and filled the chair until 1859. On June 20, 1864, he was chosen to occupy a similar chair in the University of Pennsylvania. This position he held until 1884, when he became Professor *Emeritus*. He was president of the American Medical Association in 1871; the Philadelphia County Medical Society in 1862, and of the College of Physicians of Philadelphia in 1885. From 1865 to 1871 he was Physician and Lecturer on Clinical Medicine in the Philadelphia Hospital. The honorary degree of LL.D. was conferred on him by the Pennsylvania College, Gettysburg, in 1876. He is the author of numerous publications. In association with Dr. J. Forsyth Meigs, he translated "Pathological Hematology" from the French of G. Andral, 1844. His other publications are: "Medical

instructor"—*Edinburgh Medical Journal*, September, 1860. It was also highly commended by numerous other American and European journals. Respecting his "War," Dr. C. P. Krauth, Jr., wrote in 1862: "His address may be justly reckoned among the most thoughtful, finished, and valuable of their class." Alluding to his "Epidemic Meningitis," the *American Literary Gazette*, 1867, says: "This is a very valuable monograph upon a very interesting and fatal disease. It is ably and carefully written, with large reference to the bibliography of the subject." Dr. Stillé contributed an essay on "Dysentery," to *Military-Medical and Surgical Essays*, edited by W. A. Hammond, M. D., 1864; and is the author of numerous reviews, in the *American Journal of Medical Science*. In 1860 he published a new edition of *A Treatise on Medical Jurisprudence*, by Drs. Francis Wharton and Moreton Stillé, issued in 1855, the medical part being revised and corrected with numerous additions. He was associated with John M. Maisch, in the preparation of the *National Dispensatory*, 1879. Dr. Stillé has been a successful physician, writer and teacher for more than a half-century, has attained his four-score years, and is one of the most distinguished members of the medical profession in this country.

STILLÉ, Moreton, of Philadelphia, Pa., was born in that city October 27, 1822, and died at Saratoga Springs, N. Y., August 20, 1855. The academic education of the subject of this sketch was obtained at Edge Hill Seminary, Princeton, and at the University of Pennsylvania, and after studying medicine with his brother (Dr. Alfred Stillé), he graduated at the medical department of that institution in 1844. Subsequently he spent three years in the medical schools of Dublin, London, Paris and Vienna, and on his return settled in Philadelphia, where he began practice. Early in July, 1848, he was elected one of the Resident Physicians of the Pennsylvania Hospital. Towards the latter part of June, in 1849, malignant cholera, then epidemic throughout the whole country, broke out in its most virulent form in the Philadelphia Almshouse, Blockley. The care of the patients was at first undertaken by the resident physicians, but the number of the sick so rapidly increased that their duties became too arduous for them, and a separate cholera service was instituted by the board of guardians; to this Dr. Stillé and Dr. Edward R. Mayer were appointed physicians, in connection with a medical board, consisting of the Chief Resident Physician, Dr. Benedict, and the Consulting Surgeon and Physician of the Hospital, Dr. Page and Dr. Clymer. The excessive malignity and rapid spread of the disease are shown by the fact that, out of a population of about 1,400 persons residing in the house, the cases admitted into the Cholera Hospital from its opening on the seventh day of July, until its closure on the fourth day of August, numbered 222, of whom 192 died. The services rendered by the medical board and their assistants, during this period, were not only harassing and laborious, but involved in their discharge, as may be supposed, great personal risk. So poisonous, indeed, was the miasma that the health of several of them soon became seriously affected, and two of them, Mr. T. M. Flint, of Philadelphia, and Mr. J. Warren White, of Mississippi, gentlemen who had nobly offered their gratuitous services to the

Alfred Stillé.

Instruction in the United States," 1845; "Elements of General Pathology," 1848; "Report on Medical Literature," 1850; "Unity of Medicine," 1856; "Humboldt's Life and Character," 1859; "Therapeutics and Materia Medica," a systematic treatise on the action and use of medicinal agents, including their description and history, 1860; second edition revised and enlarged, 1864; third edition, 1868; fourth edition, 1874, a translation of this work into German, by Professor Oscar Lübreich, of the University of Berlin, was published in 1877; "War as an Instrument of Civilization," 1862; "Epidemic Meningitis, or Cerebro-Spinal Meningitis," 1867. Of his "Therapeutics and Materia Medica," the following commendation appeared: "We recognize in Dr. Stillé the possession of many of those more distinguished qualifications which entitle him to approbation, and which justify him in coming before his medical brethren as an

sick, fell martyrs to it, dying in the city, a few days after their removal from the hospital. Ten days after the commencement of his duties, Dr. Stillé was himself attacked with cholera, and narrowly escaped with his life. It took him a long while to recover from it, even as it was, so shattered was his constitution by the disease. In 1855 he was appointed Lecturer on the Theory and Practice of Medicine in the Philadelphia Association for Medical Instruction, and completed his first course of lectures there. Dr. Stillé's contributions to the journals will be principally found in the *American Journal of Medical Sciences*, between the years 1848 and 1855, inclusive. All of them gave evidence of ability. They are exceedingly well written, also, and many of them may be read with interest and instruction even now. For specimens of his critical powers, style and mode of treating his subject; his view of Dr. Addison's Experimental and Practical Researches, his notices of Chomel's Elements of General Pathology, and of Dr. Stokes' Treatise on the Diseases of the Heart and the Aorta, may be consulted. His paper on "The Psychical Effects of Ether," published in the *Philadelphia Medical Examiner* for December, 1854, is well deserving of notice, also, as a valuable contribution to our knowledge upon a question of much interest. The subject is carefully and candidly discussed, and the conclusions arrived at may be fairly considered to be established. His treatise on Medical Jurisprudence was the joint production of Mr. Wharton and himself. The share assigned to Dr. Stillé in its composition, consisted of the articles on the "Fetus and New-born Child," on "Sexual Relations," on "Identity," and on the "Causes of Death." Referring to the manner in which this portion of the work was executed, one of his biographers, Dr. Hollingsworth, says: The unanimous sentiment of the profession, so far at least as it has been expressed in the numerous reviews that have been written upon it, is that it is a most valuable addition to our medical literature. It certainly occupies a position in advance of all previous works upon the same subject, for much of its information, owing to its being gathered from sources almost entirely unexplored before, is positively novel. Almost every page in it testifies, by its numerous references, to the extended research of the writer in these exotic regions. The death of Dr. Moreton Stillé at the comparatively early age of thirty-three years, and at a time when, apparently, a brilliant future awaited him, was a great loss to the medical profession of this country. He was the youngest of the three noted brothers of this name. The life and achievements of his eldest brother, Dr. Alfred Stillé, have already been presented. Another brother, Charles Janeway Stillé, was Professor of History in the University of Pennsylvania, and Provost of that institution from 1868 till 1880. It was mainly through his influence that the new buildings in West Philadelphia were erected, and the Scientific Department founded.

STILLSON, Joseph O., of Indianapolis, Ind., was born in Bedford, in the same State, May 28, 1850. He is a son of Joseph Stillson, a native of Connecticut, a man of liberal education, who came to Indiana in 1838, and was for a time a teacher in Bedford Academy. He was appointed Judge of the Circuit Court, and at the end of his term studied medicine, and

practiced the same successfully for forty years, being called not only throughout Lawrence county, in which he lived, but into Monroe, Martin and Davies counties as well. The subject of this sketch pursued a classical course at Hanover College, during the presidency of Dr. Heckman, from which he received the degree of A. B. in 1871. Soon after this he studied medicine with his father, and at Louisville University, under Drs. David and Lansford P. Randall. Among the pupils of his father in Bedford Academy was a young man named Williams, who afterwards became one of the most famous ophthalmologists of the world. Dr. Williams was at the time young Stillson came back from his first year at Louisville at the summit of his fame, and wrote his old time teacher and friend at Bedford asking that he allow his son to come to Cincinnati, where he would afford him the benefit of his help and good offices. The invitation was ac-

Joseph O. Stillson.

cepted and he became a student of Miami Medical College, from which he was graduated M. D. in 1873. He then became a student in Dr. Williams' private office, where he remained a year. In 1874 he attended Bellevue Medical College, and the New York Ophthalmic and Aural Institute, and studied at the New York Eye and Ear Infirmary. The years 1875 and 1876 were spent by Dr. Stillson in Europe, where he first passed his time in the hospitals of Berlin, Dresden, Leipsic and Vienna. At the last named city he became acquainted with Dr. Arlt, the former preceptor of Dr. Williams, of Cincinnati, from whom he bore letters of introduction. In Vienna he devoted much time in studying general surgery, pathology and microscopy, also pursuing special courses on diseases of the eye, under Stellwag and Jaeger. He also became acquainted with the eminent Billoth, and pursued a special course, under Politzer, on diseases of the ear. After this he went to Paris, where he formed the acquaint-

ance of Claude Bernard, De Wecker, Galezowski and Charcot. The last-named was at the time beginning his experiments in hypnotism. He took four months' special work in the College of France, in histology, and in the laboratory of the illustrious Ranvier. The following year he went to London, where he spent the most of his time at Moorfields, the largest eye and ear hospital in the world. At this date the leading men on the eye were Bowman and Critchett, from whom he received special instruction, and from Esmarch in general surgery, and also received teaching from Hutchinson, noted for his investigations in syphilography. After his return from abroad, Dr. Stillson, in 1878, formed a partnership with Dr. A. D. Williams, of St. Louis, nephew of the noted Cincinnati oculist, but in 1879 he moved to Evansville, where he opened an office for himself. In 1880 he married Miss Mathilde R., daughter of Victor Bisch, a leading lawyer of Southwestern Indiana. In 1884 Dr. Stillson accepted the chair of Ophthalmology in the Central College of Physicians and Surgeons, and removed to Indianapolis. In the fall of the same year he was appointed Oculist on the staff of the City Hospital; also Consulting Oculist at the City Dispensary. Four years later he was appointed Oculist at the State Institute for the Blind. In October, 1893, he was appointed a member of the City Board of Health, and was made secretary of the same. He is a member of the American Medical Association, American Society of Microscopy, Mississippi Valley Medical Association, Indiana Academy of Science, Indiana State Medical Society (of which he is treasurer), Indianapolis Surgical Society (charter member and treasurer), Marion County Medical Society, and of other medical associations.

STOCKDALE, John Lark, of Talladega, Ala., was born in Edgefield District, S. C., August 12, 1831. He is the son of the Rev. James S. Stockdale, and grandson of John Stockdale, who emigrated to Charleston, S. C., from County Down, Ireland, in 1791. His mother's maiden name was Sarah Lark, daughter of John Lark, of Edgefield District, S. C. His education was acquired principally at Talladega High School, in which school he was subsequently made Professor of Ancient Language and Mathematics. He commenced the study of medicine in 1850, under the guidance of Drs. Moore and Taylor. In 1854 he graduated from the Medical College of the State of South Carolina, with the degree of M. D. He subsequently attended lectures at the Augusta Medical College, Georgia, and at the Medical College of Nashville, Tenn. He commenced the practice of his profession near Talladega, Alabama, in the spring of 1854. He afterwards removed to Fife, in that State. He was enjoying an extensive and lucrative practice when, in 1861, the Civil War broke out, and he was appointed Assistant Surgeon in the Confederate Army. He served in that capacity with the army of the West, and was present at the battles of Belmont, Shiloh, Corinth, Baton Rouge and Port Hudson, La., and other minor engagements. He was appointed Major of Cavalry in 1862, and being made a prisoner of war at the surrender of Port Hudson, served as Surgeon at the Confederate officers' barrack on Johnson Island, Lake Erie and Fort Lafayette, Del. At the close of the war he returned to his home near Talladega, and resumed the

practice of his profession, gaining considerable reputation in the treatment of typhoid fever, and making a specialty of diseases of women. He married in 1865 Annie E., daughter of Maj. J. Terry, of Talladega. In 1879 he was made president of the Medical Society of Clay county, in his adopted State; also a member of the Medical Association of Alabama, and afterwards a Fellow of the Surgical and Gynecological Society of Alabama.

STONE, John Osgood, of New York City, was born in Salem, Mass., February 1, 1813, and died in the former city June 7, 1876. He received his general education at Harvard and was graduated there in 1833. He also received the degree of M. D. from the Medical Department of that institution in 1836. He then went abroad, and after acquiring considerable hospital experience in London and Paris, established himself in practice in New York City, where he was identified with many medical charities and scientific organizations, and attained eminence in his profession. He was for many years a surgeon at Bellevue Hospital, but resigned in 1857, on account of his extensive practice. In 1866 he became a member of the first Metropolitan Board of Health, and was subsequently its president, in which connection his services relative to the sanitary condition of tenement houses and in the management of quarantine were of great value. Dr. Stone made important contributions to surgical literature, among which may be mentioned articles entitled "Amputations and Compound Fractures, with Statistics," 1849; "Treatment of Suppurative Inflammation of the Joints," 1852; "Necessary Amputation of the Lower Extremities," 1854, and "Rupture of the Heart."

STONE, Richard French, of Indianapolis, Ind., was born near Sharpsburgh, Bath county, Ky., April 1, 1844. A writer in a recent publication, Biographical Memoirs of Indianapolis, says: "He is of English and Scotch-Irish lineage. His paternal ancestry (Stone-French), and maternal (Lane-Higgins), were among the early pioneers of Virginia and Kentucky. His mother, Sally (Lane) Stone, a lady noted in early life for her beauty and social accomplishments, is yet living, and though nearly eighty years of age, still retains to a remarkable degree her intellectual vigor, literary taste, and rare conversational power. She was the youngest daughter of Colonel James H. Lane, who constructed the first house in Montgomery county, Ky., and a sister of the late Hon. Henry S. Lane, United States Senator, and first Republican Governor of Indiana, who, at Philadelphia in 1856 presided over, and was made permanent chairman of the first National Republican Convention, and whose eloquent address upon that occasion fired the delegates with an enthusiasm and confidence that presaged almost certain victory for that political organization four years later." On his father's side Dr. Stone is a descendant in the fourth generation from Josiah Stone, a native of England, who, in the early part of the last century, came to America as a cabin-boy. It is said that the only recollection he had of his family was his mother coming to the vessel and weeping at his departure. On his arrival in Prince William county, Va., the captain of the ship left him until his return from another voyage, but the vessel in which he sailed was lost at sea with all on board.

Josiah Stone was thus, when a mere lad, left alone in the world, but was apprenticed to a Mrs. Magaw, a wealthy lady, who raised him to manhood, and at her death bequeathed him a considerable fortune. "He married a Miss Coleman, who bore him three sons and four daughters. Some of these, with their descendants, remained in Virginia; others settled in Kentucky, Mississippi, Missouri, and Texas; some of whom had been members of Congress and governors of States, and many have distinguished themselves in almost every avocation of life. Valentine Stone, the third son of Josiah Stone, and grandfather of Dr. Stone, was a soldier in the War of the Revolution. He was married twice, and the father of five sons and five daughters. His second wife was the daughter of Wm. French, of Virginia, the grandfather of Judge Richard French, the famous orator of Kentucky, for whom the subject of this sketch was named." Valentine

R. French Stone

Stone is described as being a man of remarkable strength. He was five feet ten inches in height, broad-shouldered and muscular, whose average weight was 225 pounds. Many anecdotes are related of his physical prowess in Old Virginia. He was naturally of a peaceable disposition, but of sanguinary temperament and quick to resent an injury. It is said that the man who insulted him was invariably "sprawled" at the first blow from his powerful arm. He passed through the trackless wilderness from Virginia and settled near Boonsboro, Ky., in 1790, and was an associate of Daniel Boone before the territory was admitted as a State. He acquired the title for two thousand acres of land lying on Bald Eagle Creek, in what is now Bath county, which is to-day perhaps as rich a body of land as can be found within the borders of Kentucky. The patent received covering the same was signed by Patrick Henry, Governor of

Virginia, and is now on file among the archives of the Louisville Public Library Association. Valentine Stone removed to the above tract of land in 1799, when his son, Samuel Stone, was but two years of age. Referring to the latter, who was the father of Dr. Stone, one of his biographers, Mr. V. B. Young, in the "History of Bath County, Ky.," says: "His education was the best afforded in his day. He early entered political life and became an active member of the Democratic party, and was frequently elected to office, serving many terms as Representative in the Legislature, being elected the first time in 1824, when but twenty-seven years of age. From 1816 to 1846, a period of thirty years, he was connected with the Kentucky State Militia, beginning at the age of nineteen, as ensign, and rising by promotion to the rank of brigadier-general, holding the latter position ten years. He took great interest in military affairs. He possessed the physique and personal characteristic of his progenitor, and when in full dress uniform was of fine appearance, and by his courteous and soldierly bearing commanded the respect of all his subordinate officers, and implicit obedience from his men. He was an able politician, and his speeches were impressive and convincing. He was noted for his firmness, judgment and discretion. He was a man of generous impulses, but his kind and sympathetic nature was often concealed by outward brusqueness and even sternness. He was very fond of anecdotes and could tell one as well and as laughable as any man in Kentucky, and it is said that no man ever lived in his section of the State who had warmer or more numerous friends. He was a prominent slave-holder, and his slaves were well cared for, and he maintained his moral and constitutional right to own them. He believed, however, that his sons would be more likely to acquire habits of industry and self-reliance in a State where slavery did not exist, and for that reason he removed to Putnam county, Ind., in 1851, and carried on his farm and lived a retired life up to the outbreak of the late Civil War. His cousin, Gen. John B. Hood, and many of his other relatives and friends had enlisted in the cause of secession, and although at that period too advanced in years himself to take active part in military affairs, yet being Southern born and Southern raised, it was natural that he should be a zealous sympathizer with the South in that struggle for independence. In consequence of this he often engaged in heated discussions with his neighbors of opposite views, but always commanded their respect and friendship by the manner in which he asserted his political opinions, and conceded to every one the right to take whichever side of that unfortunate conflict that his conscience dictated. Of his six sons three entered the service of the Union Army, one being the late Maj. Valentine H. Stone, of the Fifth United States Artillery, who was twice promoted by the personal recommendation of Gen. Grant for gallant conduct in the field, and who had the immediate charge of Jefferson Davis while a prisoner of war at Fortress Monroe. He died a victim of yellow fever during the epidemic of 1867, while in command of Fort Jefferson, Dry Tortugas. Another son, however, the Hon. H. L. Stone, now a prominent lawyer of Louisville, Ky., fully coinciding with

the views of his father went South and gave his services to the Confederate Army as one of Gen. John Morgan's men, participating in all the battles and adventures of that noted chieftain, including his famous march through Tennessee, Kentucky, Indiana and Ohio, which has been regarded as the most brilliant, the most extended, and the most daring raid of the Civil War. On that expedition he was captured, but made his escape from prison; rejoined Gen. Morgan; was with him when killed, and remained with the command until the close of the Rebellion. Gen. Samuel Stone died near Bainbridge, Ind., January 11, 1873, and was buried with Masonic honors, having been a member of that order for more than fifty years." Soon after Gen. Stone removed to Indiana he settled near the village of Carpentersville, in that State. At this time Dr. Stone was a lad eight years of age, whose next years of life were occupied in laboring on the farm and attendance at common schools and Bainbridge Academy, in a town near by. His early education was also supplemented by home study and instruction under private teachers, by which he acquired a knowledge of languages and some of the sciences. Having, also, by this time a good physique, and all the knowledge of farming that he cared to possess, he now determined to battle with the world, relying upon his own resources. He selected the "healing art" as his future mission in life. In order to defray the expenses of his medical education by means of his own earnings, he passed the requisite examination and was granted a school teacher's license, but there were no schools available except one in an outlying district, which others in the pursuit of this avocation had not only utterly failed to manage and control, but had even been forcibly deposed by overgrown and insubordinate pupils. Young Stone was then but sixteen years of age, but feeling able for the emergency, resolved to teach that school. He met the unruly leaders with their own weapons, and by such modes of physical punishment as were allowable in those days, soon brought the refractory classes under perfect discipline and was master of the situation. It is said that this notable and unexpected victory by one so young was an achievement that secured for him the entire confidence of the community in his capacity as a teacher, as well as in his ability to do almost anything else that he might undertake. The following four years were devoted to this pursuit and the study of medicine, under the preceptorship of the late Dr. J. B. Cross, then a leading physician and surgeon of that vicinity. In 1863 he entered Rush Medical College, and attended his first course of lectures in the days when its Faculty was represented by the late Daniel Brainard, J. Adams Allen, and other leading medical men of the Northwest. It is said while Dr. Stone was a medical student in Chicago, that he made several efforts to call upon his brother, previously mentioned, who was then a Confederate prisoner in Camp Douglas, but owing to the rigid rules of the commanding officer this permission was not granted. His brother, however, being aware of the difficulty of the arrangement, succeeding one dark night in scaling the prison walls and effecting his escape, concluded to do the calling himself. Dr. Stone was, therefore, greatly

surprised on the following morning to meet him in disguise at the college. But as their mutual fraternal affection was never marred by a diversity of political opinion, they went to one of the leading hotels, partook of a "square" meal, and spent the day together viewing the city. They then bade each other adieu, and met no more until the war was over. During the following spring, which may be considered the darkest period of the Rebellion, Dr. Stone tendered his medical services to the National Government; was ordered before an examining board at Cincinnati; passed a competitive examination, and was appointed by the Secretary of War a Medical Cadet in the United States Army, with rank and pay of a West Point Cadet. The duties of the position were those of hospital dresser and ambulance attendant in the field. In May, 1864, he was assigned duty at the United States General Hospital, Madison, Ind., and in September following received orders from Surgeon-General Joseph K. Barnes to report for duty to the Medical Director of the Department of the East, for assignment to one of the large military hospitals of Philadelphia, Pa. He was for a short time associated with Dr. J. M. Da Costa and Dr. R. J. Dunglison in the United States General Hospital on Filbert street, that city, but was soon after transferred to the United States Officers' Hospital at Camacs Woods, and later on Chestnut street, near the Schuylkill river. While on duty at Philadelphia he obtained permission to attend his second course of medical lectures, and accordingly entered the University of Pennsylvania, where he had the distinguished honor of receiving the degree of Doctor of Medicine during the centennial anniversary of the foundation of that world renowned institution. At this time (March 11, 1865) Dr. Stone was not quite twenty-one years of age, and was the youngest in a class of 117 graduates. On this occasion, and also as a testimonial of his efficient services at the hospital, he was presented by the officers and patients with a very fine and valuable case of surgical instruments. He then made application to be transferred to the front in order to be with his brother, who was an officer of the Fifth United States Artillery, and to take part in the active service of the Army of the Potomac, but this was refused on the grounds that his assistance could not be dispensed with at the hospital. It was not long, however, before an opportunity was presented to test his courage, but in another way. On the expiration of his term of office as Medical Cadet he received his discharge, indorsed by the late Surgeon Samuel A. Starrow, United States Army, in command of the hospital, with the words: "Moral character excellent; duties always faithfully performed." Dr. Stone was then appointed Acting Assistant Surgeon in the United States Army, and was the only one of the eighty holding that position in the city to volunteer his service for the following dangerous mission: An appeal from Key West, Fla., was made to the Surgeon-General for medical aid during the prevalence of a very fatal epidemic of yellow fever among the United States troops stationed there, which was referred to the Medical Director at Philadelphia. In response to this call, Dr. Stone, although entirely unacclimated, went to that most southern limit of the United States possessions and

faced the pestilence on that panic-stricken island. He remained at Key West until the epidemic had about subsided, not, however, escaping a serious attack of that terrible malady which, as has been mentioned, proved fatal to his brother at the same place two years later, and a coincidence still more singular is that they were both sick on the same vessel, the schooner "Matchless," a small government transport, which plies between the surrounding islands. In June, 1865, Dr. Stone was ordered to take charge of the United States troops and Union Refugees at Cedar Keys, on the southwest coast of Florida, near the mouth of the Suwanee river, some two thousand in all, mostly suffering with scurvy and malignant dysentery, which was attended by great mortality, the deaths at times being as high as twenty-five per day. On his arrival he found these deplorable results to be almost entirely due to deficient and improper diet and bad hygienic conditions, which being corrected by his orders, checked the mortality and rapidly diminished the sickness on the island. Soon after this, he was ordered to the mainland of Florida and placed in charge of the First and Second Florida Cavalry, which had been recruited in that State. Dr. Stone was at this time perhaps the youngest man in the Medical Department of the Army to hold positions of such responsibility. Within a few months an effort was made to consolidate the regiments with which he was connected, and being the only medical officer with these troops, was ordered before the Army Board at Tallahassee, passed the examination, and was officially recommended by Major-General John G. Foster, commanding the Department of Florida, to be full surgeon, with rank of major, but unfortunately for him, before his commission was received, an order was issued by General Grant mustering out all volunteer cavalry east of the Mississippi river. He was then placed in command of the Post Hospital at Monticello, Fla., and also had charge of a part of the Seventh United States Infantry, and remained in the Department of the Gulf until April, 1866. Dr. Stone was offered remunerative positions in the line of his profession if he would continue in the service, but the war being over, he was at his own request released from duty at Tallahassee and returned to Indiana. In 1867 he established himself at New Albany, that State, where he soon secured a desirable practice, but shortly afterward returned to the village in which he lived during his childhood, and where he remained the following two years; then located in Bainbridge, a flourishing town in the same county. Dr. Stone remained there in active general practice until 1880, having pursued his professional avocation in that vicinity about fourteen years, during a part of which time he was associated in business with three of the most distinguished and popular physicians of that locality, one of them being his former preceptor. In 1879 he was requested to aid in the organization of the Central College of Physicians and Surgeons, at Indianapolis, and removed to that city the following year. On the establishment of the above institution he became Professor of *Materia Medica*, Therapeutics, and Clinical Medicine, and held that position until his resignation, in 1886. "His didactic lectures were noted for their clear, concise, and practical character. Many years

experience in the general practice of his profession had not only made him familiar with disease in its varied forms, but gave him a just conception of the powers of nature, an abiding faith in the resources of medical art, and a well defined knowledge of the uses, effects, and capabilities of remedies suggested for its cure. He was thus enabled to reject as useless that which was speculative in therapeutics as well as to speak with authority of all that was valuable in that department of medical science. Having been a close and almost constant student of medical literature for many years, having also studied disease in the great book of Nature, at the bedside in private practice, and in the wards of civil and military hospitals in various parts of the United States, from the Mississippi Valley to the Atlantic seaboard, and from the northern lakes to the inter-tropical regions, there was no lack of material to illustrate the subject-matter of his clinical teaching. These circumstances enabled him to form opinions of his own, and these opinions he did not hesitate to express throughout his lectures with reference to many controversial points of pathological and therapeutical importance. He recognized the fact that to be a skillful physician involves not only a thorough understanding of diseases, but the application of the right remedies, at the right time, and in the right manner. Therefore the typical features of a given malady, its pathological history and phenomena, its diagnosis general and differential, as well as indications for treatment, were presented with such accuracy and force that the student saw before him all that was distinctive and important in the case, while the principles of treatment were expressed before his classes with a clearness and precision that warranted its intelligent management in the future." Since 1882 Dr. Stone has been a member of the Consulting and Clinical Staff of the Indianapolis City Hospital and City Dispensary, and has been for many years a member of the Medical Board of Examiners for those physicians seeking positions in these institutions. In 1883 he was appointed Visiting Physician to the Indiana Institute for the Blind, and held that position seven years. He was the first physician to publish annual reports concerning the general health of the pupils; sanitary condition of the buildings, and statistics of the various forms of ophthalmic diseases, and causes of blindness affecting the inmates of that institution. In 1885, soon after the first inauguration of President Cleveland, he was appointed United States Examining Surgeon of the Pension Bureau at Indianapolis, and in 1889 was reappointed to the same position under the administration of President Harrison. During the six consecutive years that he served in that capacity it is said that he attended every session of the Board, and personally assisted in the examination of more than seven thousand soldiers for pensions. He is a member of the Grand Army of the Republic, and has served several years as Surgeon of Maj. Robert Anderson Post, of his city, which, in point of numerical strength, is next to the largest in his State. He was formerly Visiting Physician to the Marion County Asylum. He has also served for a number of years as medical examiner and adviser for several leading life and accident insurance companies.

In 1890 he was elected president of the Marion County Medical Society, Indianapolis, and presided over its deliberations for the period of one year. He has also been for many years an active member of numerous other medical organizations, including the Indiana State Medical Society and the American Medical Association. On March 23, 1893, Dr. Stone was appointed by Governor Claude Matthews a member of his staff, with the rank and commission of colonel, and was made Surgeon-General of the Military Forces of Indiana, which position he now holds. He has devised some useful instruments, among which may be mentioned one possessing superior advantages for the treatment of chronic nasal catarrh, in that it prevents the introduction of fluids through the Eustachian tubes, thereby preventing *otitis media* and resulting deafness, and is known as the "Pneumatic Douche," which, with a pamphlet descriptive of the apparatus and comprising improved methods of treating diseases of the nose and throat, was presented to the profession in 1879; thus anticipating by many years the recently claimed invention of a similar instrument by E. Pins, of Vienna. (See Reports on Surgery, Transactions of Indiana State Medical Society, 1892.) Among his more important contributions to medical literature may be mentioned, "Epidemic Cerebro-Spinal Meningitis," Indiana State Medical Society, 1882; "Zymotic Diseases Considered with Reference to their Cause, Extent and Prevention," Report of Indiana State Board of Health, 1886, and "Etiology of Specific Diseases," American Medical Association, 1892. This paper, being an argument against the so-called "germ theory" of disease, was widely published, and met with a very favorable reception, both in this country and Europe. "In this paper," an editor of *The International Medical Journal* has said, "the writer has succeeded in a very happy way in solving and explaining one of the most difficult and abstruse problems within the entire domain of medicine." Dr. Stone is also the author of a well-known reference-book, "Elements of Modern Medicine" (D. Appleton & Co., New York, 1885.) This work, which includes the principles of pathology and therapeutics, has met with an extensive sale. It may be said that the professional career of Dr. Stone has been that of an all-round practitioner, possessing equal skill in the three great divisions of medicine. In former years he devoted considerable attention to general surgery, having performed many times most of the important and capital operations. But his success as physician and accoucheur have, perhaps, caused him to be more widely-known, and secured for him a well-deserved popularity. As an obstetrician he has the remarkable record of having never lost a mother in all the many hundreds of cases of childbirth that he has attended, including nearly every variety of complications and instrumental deliveries. Although his entire professional life has been devoted to general medicine, he has of recent years given more than ordinary attention to the medical and surgical treatment of gastro-intestinal and rectal diseases and office and consultation practice. Dr. Stone has been an advocate and defender of the Union in time of peace as well as in war, and believes in commercial freedom, and in equal and exact justice to all and exclu-

sive privileges to none. While a life-long adherent to the principles of Jeffersonian Democracy, having always endeavored by every honorable means to secure and promote the success of the political organization with which he is identified, yet he is not a partisan in the ordinary sense of the term, and has never aspired to any office, and has persistently refused to hold any position not in the line of his chosen profession. On November 24, 1869, he married Miss Matilda C. Long, the accomplished daughter of the late Dr. William Long, a noted pioneer physician of New Maysville, Ind., and it should be stated that to this faithful companion much of his success in after life is justly due. One living child is the result of this union, Donald L. Stone, born October 16, 1886, a bright, healthy, and handsome lad, now in school, and to whom his parents are devotedly attached.

STONE, Warren, Sr., of New Orleans, La., was born in St. Albans, Vt., February 3, 1808, and died December 6, 1872. For the interesting details concerning the life and professional

Warren Stone, Sr.

achievements of this noted physician and surgeon of the South, the editor is indebted to Prof. Jos. Jones, M. D., LL. D., of the University of Louisiana, who prepared the following sketch of his friend and colleague in March, 1878, but which until now has never been published: "He was the son of Peter Stone, farmer, St. Albans, and of Jerusha Snow. He was the youngest of their children; his brother, Chancey Stone, died several years ago, of the same disease of which he himself fell a victim. He left behind him a sister much older than himself, and a venerable mother, on whom he lavished to the hour of his death all the devotion and tender regard of his loyal and affectionate nature. From her he inherited his physical development and the noble figure for which he was so distinguished; from her he derived the high intellectual and moral tone that spurred his ambition to fields of noble enterprise beyond his

narrow home. It was from her precepts and her example he imbibed the principles of truth, honesty, philanthropy, and self-reliance that appeared so conspicuous in every sphere of his after life. Although his advantages for school instructions were very limited, he exhibited an early preference for medicine, and went from his early home to be placed as a student under Dr. Amos Twitchell, an eminent physician and surgeon in Keene, N. H. Dr. Stone always acknowledged that he received the greater part of his professional knowledge from Dr. Twitchell, and ever spoke of him with respect and affection. From Keene he proceeded to the Medical School at Pittsfield, Mass., where he graduated as Doctor of Medicine in 1831. Opportunities for practice being few, he took passage October 10, 1832, from Boston, on the brig *Amelia*, to New Orleans. The ship encountered frequent storms, the cholera appeared among the crew and passengers, and on October 30, the vessel, with a valuable cargo and 108 passengers, was beached on Folly Island, being leaky and having made an ineffectual effort to put into Charleston harbor. The passengers and crew were landed on this island, where Mr. Andrew Milne appropriated to their use his two extensive dwellings and other buildings. The city of Charleston sent down the most ample supplies, provisions, clothing and hospital stores, and as they were badly affected with the cholera, dispatched for two other physicians to assist in giving proper attendance. On November 7 the physicians employed by the authorities of Charleston were so broken by their exertions that they requested to be relieved from duty, and Prof. Thomas Hunt, late Professor of Physiology and Pathology in the Medical Department of the University of Louisiana, at this time a young, distinguished physician of Charleston, was appointed to take sole charge of Folly Island and of all the passengers and crew of the brig *Amelia*. Under his administration the disease soon abated, and the mortality in a short time was completely extinguished. Dr. Hunt received the most flattering testimonials from the inhabitants and strangers of the island. The Board of Health and City Council of Charleston presented a magnificent silver vase, now in possession of his son, Carleton Hunt, Esq., of New Orleans. Dr. Hunt attended Dr. Stone when he was ill of the cholera, and afterwards gave ample accounts of his valuable services in taking care of the sick. The *Amelia* was burned, and another vessel chartered to carry her passengers to Mobile and New Orleans, where Dr. Stone landed early in December. He was sick, poor and without sufficient clothing to protect him against the very cold weather of that season. He made ineffectual efforts to procure any kind of labor to provide for his wants, when the late Dr. Cenas, Professor of Obstetrics in the Medical Department of the University of Louisiana, and at that time a Physician to the Charity Hospital, procured him employment in a very subordinate capacity in the Charity Hospital. He there gave much evidence of ability and industry. Again meeting with Prof. Hunt, now removed from Charleston to New Orleans, and appointed Resident Surgeon of the Charity Hospital, August 31, 1833, he received from him the following recommendation to the administrators of the Charity Hospitals. The result of this application we do not know, but in

the following year we find him acting as assistant surgeon under Dr. Picton, and performing the greater part of the surgical duties of the hospital. After urging the necessity of an assistant surgeon, and of an immediate appointment, Dr. Hunt continues: "I subjoin, at the request of Dr. Warren Stone, the following certificate and recommendation: I became acquainted with Dr. Stone when he was in attendance on the passengers and the crew of the brig *Amelia*, wrecked in 1832 on Folly Island. It gives me pleasure to state, from my personal knowledge, that Dr. Stone is a humane and worthy man, and a well-informed, skillful and, for his age, an experienced surgeon. He is in every respect qualified for the office of Assistant House-surgeon, for which he is a candidate. I respectfully recommend him to your favor as one whose appointment as assistant surgeon would prove valuable to myself and highly advantageous to the public." Dr. Stone held this office of assistant surgeon and performed the greater part of the services until 1836, when, by the unanimous and unsolicited action of the Board of Administrators and with the sanction of all the medical men, he was elected Resident Surgeon. Known and endeared to the people by his services in the hospital, particularly in the free dispensary, which was filled by a large and anxious crowd every mid-day in the week, he was elected in 1836 Lecturer on Anatomy, and in January, 1837, Professor of Anatomy by the petition of the admiring class, and, on the resignation of Professor Luzenburg, Lecturer on Surgery, he became, at the next session, Professor of Surgery in the Medical Department of the University of Louisiana—the leading and most eminent physician in New Orleans, the most celebrated and popular professor in the school, until his resignation in the spring of 1872. In the early years of his residence in the Charity Hospital of New Orleans, without many associates and few intimate friends, Dr. Stone devoted his whole time to the study of the cases and to dissection in the dead house. The knowledge of anatomy and surgery he had acquired from Dr. Twitchell and the elder Professor Nathan Smith, became in a brief time equal to that of his teachers. The study of the anatomy of all the regions was so thorough that there was no local injury or disease which he was not capable of diagnosing, no surgical operation he was not prepared to undertake. He pursued such a system of daily autopsies of those who died in the various wards of the hospital, that in a few years none were so capable of establishing the real nature or seat of the disease, none were more able to indicate during life the organs and tissues most seriously involved. In conjunction with Dr. William E. Kennedy, an eminent physician of New Orleans, Dr. Stone built, in 1839, an extensive and commodious private hospital on the corner of Canal and Claiborne streets. This private institution was very useful, and enjoyed a great reputation, people being brought to it from the city and wide space of the surrounding country. But the projectors, like most medical men, having no experience in managing the financial and domestic arrangements of so large an establishment, found it very unprofitable. Dr. Kennedy retired in 1845, and Dr. Stone retained the property, but never devoted it to any purpose profitable to himself. It was

here, in 1841, that he lost his eye from a specific inflammation, contracted from a child. It was a source of great pain and suffering for years, and detracted much from his personal appearance. In the year 1843, Dr. Stone was married to Miss Malvina Dunreith Johnson, of Bayou Sara, and a few years afterwards built a fine dwelling next to his hospital, where he resided with all the elegance and comfort of a happy home, so congenial to one of his affectionate and devoted nature. The domestic life and intellectual development of Dr. Warren Stone are forcibly and truthfully given by Dr. James Jones, who knew him as a friend and fellow professor in the Medical Department of the University of Louisiana. He says: "His marriage was followed in a few years by a young family. His devotion to his little children was of the most tender character, and among the few misfortunes that cast their shadows on his path, nothing was borne with so inconsolable and profound affliction as the death of his little children. The people who knew him transiently knew nothing of the paternal affection that welled up in every throb of that kind and gentle nature of that noble and manly heart. It was the cherished hope of his existence, the long-wished-for consummation of his devotion to the future of his family, that he might see them elevated, by early advantages of education and society, above the disadvantages of the difficulties and humiliations of his early life, and that they might stand beside him on the same high platform that he had reached by his own exertions and abilities; to make his son the educated and accomplished successor to occupy the rostrum he had himself so long occupied without opposition, and to keep alive that reputation which he wished to transmit. A year had just elapsed; disease, hopeless disease, was making rapid inroads upon his mental and physical energies. He often complained at home of his inability to deliver his lectures; he made an ineffectual effort to call in the aid of the one he had educated and prepared to assist him; unexpected opposition manifested itself; his feelings were deeply wounded by some from whom he anticipated more consideration, and he resigned the professorship he had held for thirty-six years and retired heart-broken, with all his long-cherished hopes scattered and lost forever. Oh, Warren Stone, how few like thee stand in the world ready to sacrifice much for others; how few like thee would have smothered in silence the beatings of thy proud heart—would have stood before God uncomplaining, that, although not blameless themselves, they had been unkindly treated by others!" In politics, he was a man of the people, and always a leading Democrat. He always pleased and instructed with his vast display of political knowledge, and by the force and ability with which he announced and developed the elevated and stern principles he had adopted as the foundation of his doctrines. What man seeking appointment did not besiege him for recommendation, knowing that no man was more honorable or more influential. "When the War of 1861 was brought upon the South, Dr. Stone went with his party, and, like the other leading members of his profession sympathized with those among whom he had so long resided. He had a regular commission in the Confederate service,

was appointed surgeon-general of the State, and by his advice and labor added valuable aid to the cause of humanity." The points in our late friend we approach with the greatest diffidence are the acknowledged excellences in his intellectual development, his professional characteristics, and his high moral philanthropic character. If the extraordinary development (twenty-three inches in circumference) of the brain be an accepted indication of the degree of the power of the intellectual and emotional manifestation, then should he by this evidence have been admitted among the most gifted of mankind. His memory was unsurpassed, what he observed, what he read, what he heard, he seemed never to forget. During the greater part of his life he used no memoranda in his extensive business, no notes in his lectures or addresses, no written record of the vast amount of interesting facts daily submitted to his careful examination. Patients the most transient, returning after a long interval to his care, have been astonished and pleased to find that the recollection of their persons, their diseases, and the very prescriptions were fresh in his memory. He read more than was generally credited. His reference to historical facts, his wonderful political knowledge, in everything that was really important on modern history of the United States and Great Britain, made him a formidable opponent in a discussion; his knowledge of general literature, and more particularly of the English poets and essayists, whom he often aptly quoted, was an unexpected pleasure to many. In his profession what he saw and what he learned he never forgot. It was from this vast accumulation, ever at his command, that he contributed those general principles he formed in every department of knowledge. Indeed, there were few subjects on which he had not adopted opinions or some general principles. In referring to his personal characteristics and methods of practice, Prof. Jones, his biographer, continues as follows: His judgment in pronouncing the nature of a case, particularly of one properly surgical, was the most distinguished quality of his mind. The treatment, the operation, the time, the manner of operating, and above all, the after-treatment, were the points in which he excelled all others of his contemporaries. In his frequent consultations with Dr. Wederstrandt, he pronounced several obscure and fatal cases of pulmonary disease to be cancer of the lungs, and in two cases of heart disease, one of which occurred lately, and baffled the diagnosis of all the experts, he also positively announced, what was proved by autopsy, that there were cancerous affections of that important organ. In the ends of his fingers appeared a *tactus eruditus* that surpassed all other examples of the wonderful education of touch. He declared the presence of pus, when none of us could feel it, and the knife decided the opinion. On his last visit to London, where he was received with great attention, an eminent surgeon pointed out to him a very obscure case in the neighborhood of a joint that no one could decide. Dr. Stone applied his fingers to it. "There is pus," said he. The scalpel was brought, and a deep incision proved the truth of the assertion. His improvements in surgery were many. He did much to inculcate the propriety of opening diseased joints. From the first to the last of his career he in-

sisted on the use of frequent nourishment, of alcoholic and malt stimulants, and of the whole class of medicines and materials considered as tonic and analeptic. He advocated in the medical journals for many years the use of cod-liver oil in combination with the phosphate of lime in diseases of the nutritive functions. He was the most persistent and judicious prescriber of mercury in various forms of disease I ever knew. Quinine was probably the medicine he particularly excelled in the use of. He claims and deserves the reputation of being the first to introduce it in the treatment of yellow fever, and of all malarious diatheses, also in disease of nervous type, he resorted to it with singular success. "As a surgeon he was a conservative, and when he visited the bloody fields of Bull Run and Shiloh, his presence contributed to the salvation of many a wounded limb to be consigned to the amputating knife. We have spoken of his generosity and of the unpaid services that he dispensed to thousands of grateful recipients. He never acknowledged the importunities of stout beggars; he rarely made an exhibition of his charity by public subscription, and yet we have it on the authority of himself and his excellent lady, that every year he provided her with a fund of from fifteen hundred to two thousand dollars to be dispensed by her for the benefit of the poor. From his early years he was of a genial and frank disposition, but not hilarious. He enjoyed all innocent amusements, and although not gifted with original wit or humor, had the kindest perception of what was flavored with either, and a fund of anecdote and quotation with which he was wont to illustrate every point in his discourse that he desired to impress most forcibly on the mind of the listener. Envy and personality he never indulged in, but his honest and truthful nature exhibited a peculiar dislike to presumption, pretension, and the thousand arts by which ignorance and mediocrity attempt to practice upon the credulity of mankind. To the lowly, the unassuming, he was peculiarly indulgent. How often have I seen him cast a white ballot for some illy educated candidate for graduation, as if recalling parts of his own history, with these remarks: "He ought to be rewarded and encouraged for making so many sacrifices to raise himself to a reputable position." Few of the unfortunate and clientless of his profession ever sought counsel or aid who did not enjoy his commendation and material encouragement. Of all men of his just and high title to honor, I never saw one so modest and unpretending, although by no means unconscious of his own merits; so overwhelmed by expressions of strong commendation; so charmingly moved by gentle and sincere and grateful declarations of gratitude and admiration for his knowledge and skill. The following are the positions held by Dr. Warren Stone: Assistant House-surgeon from 1833 to 1835, and House-surgeon from 1835 to 1839, in Charity Hospital, New Orleans; Demonstrator of Anatomy, Medical College of Louisiana, from January, 1835, to July, 1836. In September, 1834, the Medical College of Louisiana was organized in New Orleans by the private enterprise of Dr. Thomas Hunt, Professor of Anatomy and Physiology; Dr. John Harrison, Adjunct Demonstrator in Anatomy; Dr. Charles A. Luzenberg, Professor of Surgery;

Dr. J. Munro Mackie, Professor of Practice; Dr. Thos. R. Ingalls, Professor of Chemistry; Dr. Aug. H. Cenas, Professor of Midwifery, and Dr. Edwin B. Smith, Professor of Materia Medica. (Dr. Ed. H. Barton, Professor of Materia Medica, was substituted for Dr. Smith, who withdrew from the Faculty before the first session began.) Dr. Warren Stone, during the first session, discharged the duties of Dr. John Harrison, disabled by indisposition, and was associated with this institution uninterruptedly from the first session to the date of his resignation—in the spring of 1872. He was Lecturer on Anatomy from July 27, 1836, to January 28, 1837; Professor of Anatomy and Lecturer on Surgery from January 28, 1837, to May 31, 1837; Professor of Anatomy and Surgery, May 31, 1837, to April 3, 1839, and was Professor of Surgery in the Medical Department of Louisiana from April 3, 1839, to resignation in May, 1872. Dr. Stone was editor of the *New Orleans Medical and Surgical Journal*, from September, 1857, to January, 1868. The following list embraces his chief contributions to the sciences of medicine and surgery, which have appeared in the *New Orleans Medical and Surgical Journal*, and the *New Orleans Monthly Medical Register*: "Trismus Nascentium," Hospital Report, 1840; "Dislocation and Fracture of Spine;" "Concussion of Brain;" "Fracture of Skull and Fracture of Brain;" "Amputation of the Mammary;" "Ligature of the Femoral Artery;" "Ligature of the Corotid Artery;" "Observations on the Treatment of Wounded Arteries," 1845; "Phosphate of Lime in Scrofula, and other Depraved States of the System," 1851; "Lectures on Venereal Disease," 1852; "Case of Traumatic Aneurism;" "Ligature of the Posterior Tibial Artery;" "Osteo Sarcoma of the Lower Jaw;" "Operation and Removal of one-half of the Inferior Maxilla;" "Lateral Operation for Stone in the Bladder;" "Observations upon Hernia and Obstruction of the Bowels;" "Case of Epilepsy Trephined three times with Relief," 1858; "Comminuted Fracture of the Thigh, Amputation and Recovery;" "Ligature of the Common Iliac Artery;" "Tracheotomy;" "Pulmonary Tuberculosis;" "On Inflammation," 1860; "On Mania a Potu;" "On Cholera," 1866. In addition to the foregoing articles, which partly indicate his service in the surgical wards of Charity Hospital, "Clinical Memoranda" and "Notes from the Lectures of Professor Warren Stone," were published by his son a short time before his death.

STONE, Warren, Jr., of New Orleans, La., was born in that city in 1843, and died there January 3, 1883. He was a son of the preceding late distinguished physician and surgeon of the same name, who was called to attend General Grant when he was thrown from his horse, near New Orleans, in September, 1863. Dr. Stone was educated at the Jesuit College, New Orleans, and served in the Confederate Army during the War of the Rebellion. On returning to his native city he began the study of medicine; was graduated at the University of Louisiana in 1867, and at the opening of the Charity Hospital Medical College of New Orleans, in 1874, was appointed Professor of Surgical Anatomy. In 1873 he made what is thought to be the first recorded cure of traumatic aneurism of the subclavian artery by digital pressure. Like his father, he was noted for the attention that he gave to va-

rious epidemics of yellow fever which have visited the South. He volunteered his services to the people of Brunswick, Ga., during the prevalence of the malady in 1874 and in 1878, and when that disease was raging in the Southwest he left his home and large practice and traveled about from one stricken village or town to another, giving his services gratuitously. Dr. Stone became a member of the American Public Health Association in 1880. "He did not long survive the death of his father." His professional career was brief but brilliant. He was regarded as the most accomplished surgeon in New Orleans at the time of his death." It is said that both father and son died of Bright's disease and fell victims to the ingratitude of those whom they had befriended and advanced in life.

STONE, Willis Claude, of Chicago, Ill., was born in Smithfield, Madison county, N. Y., April 21, 1855, of Scotch-Irish descent on both

Willis C. Stone.

sides. His father was Captain James Riley Stone, of the One Hundred and Fifty-seventh New York State Volunteers, who died a rebel prisoner at Macon, Ga., after having been held eleven months at Libby and Andersonville. His mother was Pamela Coe Ellinwood daughter of George W. Ellinwood, of Silvain, Madison county, N. Y. Dr. Stone, up to the age of fourteen years, attended the Evans Academy, of Peterboro, N. Y., when the family moved to Reedsburg, Wis., at which place he attended High School; afterwards teaching in common schools and attended Oshkosh State Normal School for two years, beginning in 1876. He afterwards spent one year in Wisconsin State University, in the meantime spending one year with Dr. Samuel Hall as medical preceptor, at Reedsburg; graduated at Rush Medical College in 1884, in which year he went to Potter county, South Dakota, then Dakota Territory. He practiced

his profession while there for two years, and also represented his county at the Sioux Falls Convention which formed the State Constitution. In 1890 he was appointed Clinical Assistant to the Chair of Gynecology in Rush Medical College. Though he does not as yet make gynecology a specialty, he has recently been appointed Professor of that chair at the Harvey Medical College of Chicago.

STORER, David Humphreys, of Boston, Mass., was born at Portland, Me., March 26, 1804, and died in the former city, September 10, 1891. He received his early training in his native town. He was an *alumnus* of Bowdoin College, of the class of 1822, graduating at the early age of eighteen. In 1876 that same institution conferred upon him a Doctorate in Laws. He studied medicine with Dr. John C. Warren, of Boston, obtaining his medical degree from the Harvard School in 1825. Five years later he, with Drs. Oliver Wendell Holmes, Jacob Bigelow and one or two others, founded the private medical school which was known as the Tremont Street School, and which was a pioneer in that kind of systematic tuition and drill of students. This school was a gain to the cause of medical education in that vicinity, and was one of the incentives to the subsequent establishment of a summer term in the Medical Department of Harvard. He likewise assisted in the formation of the Society of Natural History, and for years gave to it freely of his evening hours, and to the subjects of natural history much interest and research. To the department of ichthyology, especially, he contributed some valuable memoirs. In 1837 his scientific reputation was such that he received a state appointment to report upon the zoology and herpetology pertinent to the then closing State survey. In 1845 he contributed to the New Haven meeting of American Naturalists his standard synopsis of the fishes of North America, and later he brought out his illustrated quarto on the "Fishes of Massachusetts." He became a Visiting Physician to the General Hospital of the State in 1849, served for nearly a decade, and was then promoted to a Consultant's position, which he retained over thirty years. His membership in the Massachusetts Medical Society dates from 1829, and he was the Senior Fellow residing in Boston at the time of his decease. He delivered the annual discourse before the Society in 1851, taking for his subject "Medical Jurisprudence," and this was the same subject-matter that a few years later made a part of his chair in the Harvard Medical School. He was in his fiftieth year when he was chosen to succeed Dr. Walter Channing as Professor of the Theory and Practice of Obstetrics and Medical Jurisprudence. This chair was filled by him acceptably and eloquently from 1854 to 1868. His lectures were seldom shirked by the students, but on the contrary they added popularity to the college. He was dean of the school for nine years. In 1868 his active participation in college duties ceased by resignation. His interest in the American Medical Association was early enlisted, and he attended a majority of the meetings in the first decade of its history, being made one of the vice-presidents in 1855. The passing away of this estimable and honored physician and scientist, ripe in years and character, is a great loss to our profession. He was, at the time of his death, with one ex-

ception, the senior surviving president of the American Medical Association. He presided in 1866, being the immediate successor in office of the Nestor, Davis, who held the chair at the second Boston meeting in 1865. The convention over which Dr. Storer presided was held at Baltimore, the first Southern city to entertain the organization after the signature of peace and the healing up of internecine wounds had begun in good earnest. He was especially prominent in the proceedings at the Charleston Convention when the question of Dr. Ramsey's obstetrical statistics was made a cover for an attack upon the Association. He was at that time the chairman of the committee on obstetrics, the branch of medicine which, with the diseases of women, engaged his special attention. He was one of the few who were made honorary members of the American Gynecological Society, at its foundation in 1876. He was a forcible and clear speaker in the debates of his chosen societies, and he had a quick intuition as against measures and methods that opposed the progress and honor of the profession, but of late years he has been little known in the medico-literary world. Fifty years ago he was prominent in a committee on library in the State Medical Society, and some of the results of his committee's labors rest among the 10,000 medical volumes on the shelves of the Public Library of Boston. Within the past two years, however, his friends and former students have made it possible for the Medical Library Association of that city to place upon its walls an exceptionally fine portrait of this lover of books, of natural science and of the healing art. When he was seventy-nine years old he was troubled with vesical calculus, and was operated upon successfully by the late Dr. H. J. Bigelow. His retirement from professional activity had been gradually progressing before that operation, but after that it became more decisive. This retirement, however, left him with a mind well furnished for life's decline, and he sustained his long-time reputation for cordiality and geniality and a lively sympathy with the junior members of the profession.

STORER, Horatio Robinson, of Newport, R. I., son of Dr. D. Humphrey Storer, was born in Boston, February 27, 1830. His classical education was obtained at the Boston Latin School and at the Harvard University, whence he graduated A. B. in 1850, and A. M. in 1853; and his medical education was also at Harvard, graduating M. D. in 1853. He also, subsequently, for the purpose of perfecting himself in medical jurisprudence, went through the regular course of the Cambridge Law School in 1854. After receiving his medical diploma he visited Europe, where he remained two years, settling in Boston in 1855. In 1872 he again went to Europe, returning in 1877, having previously been admitted, in 1876, by vote of the Branch Council of England, to a place upon the Medical Register of Great Britain. His specialty is gynecology. He was formerly prize essayist and secretary of the American Medical Association (1865), and its vice-president in 1868; president of the Association of the American Medical Editors; Fellow of the American Academy of Arts and Sciences and one of the founders (1869); and later secretary and president of the Gynecological Society of Boston, and responsible editor of its journal; member of the

Massachusetts Medical Society; and Medico-Chirurgical and Obstetrical Societies of Edinburgh; and of the Rocky Mountain Medical Association; also, corresponding member of the Obstetrical Societies of Berlin and London, and New York Medico-Legal Society; honorary member of the Canadian Medical Association; Province of New Brunswick Medical Society; State Medical Society of California; Louisville Obstetrical Society; and Medical Society of Sorrento, Italy. He was formerly Professor of Obstetrics and Diseases of Women in the Berkshire Medical College; and Assistant in Obstetrics in Harvard University; Physician to the Boston Lying-in-Hospital; Surgeon to the New England Hospital for Women and Children; St. Joseph's Home; and to St. Elizabeth's Hospital for Women; and Consulting Surgeon to the Carney General Hospital. For several years he delivered in Boston a semi-annual course to medical graduates upon the surgical diseases of women, refusing to admit any applicant that was not in good standing in the American Medical Association. These lectures were attended by physicians from all parts of the country. In 1871, by special invitation of the California State Board of Health, he delivered a lecture in Sacramento, on "Female Hygiene." Dr. Storer has been a large contributor to medical journals, and the titles of his papers exceed 125 in number. In book form he has published, with Dr. W. O. Priestly: "The Obstetric Memoirs and Contributions of Sir James Y. Simpson," 1855; "Criminal Abortion in America," 1860; "Why Not? A Book for Every Woman," 1866; "Is it I? A Book for Every Man," 1867. With Franklin H. Heard: "Criminal Abortion; its Nature, its Evidence, and its Law," "On Nurses and Nursing with Special Reference to the Management of Sick Women," 1868; and "Southern Italy as a Health Station for Invalids," 1875. Since the return of Dr. Storer from Europe, in 1877, where he spent five years to regain his health, he has resided in Newport instead of Boston, his former home.

STURGIS, Frederic Russell, of New York City, N. Y., was born at Manila, in the Philippine Islands, on July 7, 1844, of English and American parentage. He was educated during his early life in England, and at the age of thirteen came to this country, entering the Private Latin School in Boston, Mass., and from there went to Harvard College. In 1862 he entered the Harvard Medical School, from which he received the degree of M. D. in July, 1867. In 1864 he became a member of the Boylston Medical Society, and was elected its vice-president in 1866. In 1867 he received the second prize of the Boylston Medical Society for an essay on "Human Cestoids." In 1865 he served for one year as House Physician at the City Hospital in Boston, Mass., and in 1866 was House-surgeon to the Massachusetts General Hospital for a term of one year, being attached to the division of Drs. J. Mason Warren, Samuel Cabot and Richard Hodges. In the latter part of 1867 he came to New York, where he has practiced his profession ever since. In 1868 he entered into partnership with the late Dr. Freeman J. Bumstead, of New York, being with him for six years, and has devoted himself entirely as a specialist to the treatment of venereal and genito-urinary diseases, with a fair degree of success. During his residence in Boston he

was a member of the Boston Society of Natural History, and since his residence in New York has been a life member of the American Geographical Society. From December, 1869, to October, 1876, he served as Assistant Surgeon to the Manhattan Eye and Ear Hospital, and in 1874 he was appointed Clinical Lecturer on Venereal Diseases in the Medical Department of the University of the City of New York. He held this office until 1880, when he was appointed Clinical Professor in the same department of the University. In 1861 he resigned his professorship and became Professor of Venereal and Genito-Urinary Diseases in the New York Post-Graduate Medical School and Hospital. He resigned this position in 1890. From 1882 to 1888 he was Secretary of the Faculty of the above named institution, and from 1887 to 1890 served on the Board of Directors. In June, 1876, he was appointed Sur-

J. R. Sturgis

geon in the department of venereal and skin diseases in the New York Dispensary, and held this office until 1880. On October 29, 1877, he was appointed House Physician at the last-named institution and held this position for nearly two years. Since 1883 he has been one of the Visiting Surgeons to the venereal and genito-urinary division in the City (formerly Charity) Hospital on Blackwell's Island, New York. He is a member of the Medical Society of the County of New York, being for several years a member of its Board of Censors and in 1882 its president. He is a Fellow of the New York Academy of Medicine, a member of the American Association of Genito-Urinary Surgeons, and is a permanent member of the Medical Society of the State of New York. Of the latter Society he

was chairman of the committee on legislation in 1883. Among his contributions to medical literature may be enumerated: "On the Etiology of Hereditary Syphilis," New York, D. Appleton & Co., 1873 (reprinted from the *New York Medical Journal*, July, 1871, and July, 1873); "On the Progress of Syphilis," *American Journal of the Medical Sciences*, 1873; "Scleritis Syphilitica," *Archives of Dermatology*, 1875; "Upon Some Points in the Etiology of Hereditary Syphilis," *Chicago Medical Journal and Examiner*, June, 1876 (read before the Medical Journal Association of the City of New York, May 26, 1876); "Relations of Syphilis to the Public Health," New York, Hiram Truss & Co., 1877 (read at the annual meeting of the American Public Health Association in Philadelphia, November 12, 1874, and printed in the Report of the Association, Vol. II, 1876); "On the Affections of the Middle Ear during the Early Stages of Syphilis," *The Boston Medical and Surgical Journal*, June 3, 1880; "The Students' Manual of Venereal Diseases" (being the University lectures delivered at Charity Hospital, Blackwell's Island, during the winter session of 1879-1880), New York, G. P. Putnam's Sons, 1880; "On the Virus of the Simple Venereal Ulcer (the Chancroid)," *The Specialist and Intelligencer*, December, 1880; "A Case of Gummous Infiltration of the Inguinal Glands, Followed by a Pustulo-Crustaceous Syphilide," *The Boston Medical and Surgical Journal*, February 3, 1881; "A Simple Venereal Ulcer or Chancroid," *The International Encyclopedia of Surgery*, New York, Wm. Wood & Company; "Hints and Suggestions for Reform in Medical Education," *Transactions of the Medical Society of the State of New York* for 1882; "A Question of Medical Ethics," *The Manhattan*, July, 1883; "A Treatise on Syphilis in New-born Children and Infants at the Breast," by P. Diday, American edition, with Notes and an Appendix, New York, William Wood & Company, 1883; "What Effect does Syphilis have upon the Duration of Life?" "Medical Topics," New York, William Wood & Company, 1885, containing: (1), "Hints and Suggestions for Reform in Medical Education" (read at a meeting of the Medical Society of the State of New York, February 7, 1882); (2), "A Plea for the State Regulation of Medicine and Surgery;" (3), "Medical Education; its Objects and Requirements;" "The Hygiene of Syphilis," *Hygiene and Public Health*, 1887, William Wood & Company; "Is there a Chancroidal Virus?" *Journal of Cutaneous and Genito-Urinary Diseases*, March, 1887; "Syphilitic and Genito-Urinary Diseases of Infants and Young Children," *Journal of Pediatrics*, 1888; "Diseases of the Testis, etc., in Infants and Young Children," *Encyclopedia of the Diseases of Children*, J. B. Lippincott Company, 1890. He revised and edited the fourth edition of "Gross on the Disorders of the Male Sexual Organs," Lee Bros. & Company, Philadelphia, 1890; "A Plea for Rapid Dilatation (Holt's operation) in the Treatment of Urethral Stricture," *International Clinics*, Vol. II, 1891, J. B. Lippincott Company; "Diagnostic Value of Albumen in the Urine," *International Medical Magazine*, Vol. I, 1892, J. B. Lippincott Company; "Hereditary Syphilis—A System of Genito-Urinary Diseases, Syphilology and Dermatology," D. Appleton & Company, 1893.

SUTCLIFFE, John A., of Indianapolis, Ind., was born in Fayette county, Ind., in 1845. His parents were Joseph M. and Cynthia Sutcliffe. He was educated at Brookville College and Asbury University, and graduated from the first-named institution in 1869. He afterward received the degree of Master of Arts from Moore's Hill College. His medical education was acquired at the Ohio Medical College, Cincinnati, and at Bellevue Hospital Medical College, New York, where he completed his course and received his medical degree in 1872. He was Assistant Surgeon in Bellevue Dispensary during the same year, an honor only conferred upon the most proficient graduates. On the expiration of his term of service in that capacity he began the general practice of his profession, but for the past six years he has confined himself exclusively to surgery and genito-urinary diseases. Since the date of his

John A. Sutcliffe.

graduation Dr. Sutcliffe has supplemented his education and training by taking two courses in surgery and genito-urinary diseases in Bellevue Hospital, and also two similar courses in the New York Polyclinic. In 1888 he went to Europe, visiting the large hospitals of London, Paris, Vienna, Berlin and Edinburgh, where he remained for nearly a year, taking additional courses in the same branches of his profession, in order to better prepare himself for the practice of his specialty. Dr. Sutcliffe has filled the chair of Anatomy and Genito-Urinary Diseases in the Central College of Physicians and Surgeons, Indianapolis, for several years, and for the past seven years, that of Principles and Practice of Surgery and Genito-Urinary Diseases in the same institution, and is treasurer of the Faculty. Dr. Sutcliffe is Surgeon to the Cincinnati, Hamilton &

Dayton, Railroad Consulting Surgeon to the City Dispensary, and Clinical Lecturer at the City Hospital and St. Vincent's Infirmary, Indianapolis. He is an active member of the Marion County Medical, the Indianapolis Surgical, and the Indiana State Medical Societies, and of the Mississippi Valley, and the American Medical Associations. Dr. Sutcliffe was a member of the Indianapolis Board of Health for four years, and president of the same for two years. He was married in 1876 to Miss Laura K. Jones.

SUTHERLIN, William Keener, of Mansfield, La., was born in DeSoto Parish, La., July 11, 1859. He is a son of the late Judge J. H. Sutherlin and Sarah (Keener) Sutherlin, and on his mother's side is of German descent. He received his early education at the male school at Mansfield, La., and at Thatcher's Institute at Shreveport, La. He studied medicine for a few months, while clerking in drug store in Mansfield, with Dr. A. J. Beall, of that place, and then became an *Interne* in the Shreveport (La.) Charity Hospital for eighteen months; then attended medical lectures at the University of Virginia during the session of 1878-79; graduated at the University of the City of New York in 1880, but on account of his not having arrived at the age of majority, the faculty refused to grant him his diploma until the following year. He attended the New York Polyclinic for four months during 1889-90. He has always taken more interest in surgery than any other of the branches in medicine. He has done a great many surgical operations which he rarely reports. He has practiced medicine in Mansfield since his graduation. He joined the Louisiana State Medical Society, 1883, and has been an active member ever since. He became a permanent member of American Medical Association in 1889. Being actively engaged in a large country practice, frequently his patients are twenty-five or thirty miles apart; he has but little time to contribute, and has contributed but little to medical literature, the only ones being "A Case of Simple Dislocation of the Metatarsal Bone of the Great Toe Upon the Dorsum of Foot, Caused by Indirect Violence," and "The Report of a Case of Peri-Nephritic Abscess."

SWERINGEN, Hiram V., of Fort Wayne, Ind., was born October 5, 1844, in Navarre, Starke county, Ohio. He is a descendant of the doughty Garrett Van Sweringen, of whom it is related in history, as well as by tradition, that upon the surrender of the Dutch colony in America to the English, he broke his sword across his knee and, throwing its fragments right and left, renounced all allegiance to the Dutch government. He was a notable man, the younger son of a noble family, born at Roensterdwan, Holland, in 1636, served the West India Company, and was supercargo of the "Prince Maurice," which sailed to the Dutch colony on the Delaware. Dr. H. V. Sweringen received but a common school education. He left his native place in 1861 for Fort Wayne, Ind., where he has since resided. Soon after his arrival there he enlisted in the Forty-fourth Indiana Regiment, but on account of his youth and stature, was not taken to the front. For some years he served in the capacity of a drug clerk and medical student with Dr. W. H. Myers as his preceptor. After the lapse of a few years thus

employed he began the preparation of a book on pharmacy, "A Pharmaceutical Lexicon," which was published by Messrs. Lindsay & Blakiston, Philadelphia, upon the recommendation of Prof. John M. Maisch, of that city, who examined the manuscript. A few years later he entered the Jefferson Medical College, Philadelphia, from which he graduated in March, 1876, with honor and credit to himself and *alma mater*. A few months later he was elected to the chair of *Materia Medica* and Therapeutics in the Medical College of Fort Wayne, a position he resigned a few years later. In 1883 Dr. Sweringen was honored by the Monmouth College, Illinois, with the degree of A. M., and in 1884 he was invited to accept the chair of *Materia Medica* and Therapeutics in the College of Physicians and Surgeons at Chicago, an honor he regarded very highly, but which circumstances not under his control forced him to decline. In June, 1885, he was appointed a member of the Board of

H. V. Sweringen

Examining Surgeons for the Pension Department. In 1890 he was appointed Physician and Surgeon to the Indiana School for Feeble-Minded Youth, a position he still holds, ably assisted by his son, Dr. Budd Van Sweringen, a graduate of the University of Pennsylvania. Dr. H. V. Sweringen is a member of the Allen County Medical Society, of which he has served a term as president; of the Indiana State Medical and of the American Medical Associations, and has served a number of terms successively as Physician to the Allen County Infirmary, and as a member of the staff of Physicians and Surgeons of Hope and St. Joseph Hospitals. He has been an acceptable contributor to various medical journals, many of his articles having been extensively quoted by others. While not devoting himself to any specialty in his profession, he has won particular distinction in the field of obstetrics and in that of the diseases of women and children. There are few cases of midwifery recorded

in the books that he has not successfully met. Dr. Sweringen has recently become interested in the study of psychic phenomena, hypnotism, telepathy and other occult subjects, having witnessed a number of remarkable, mysterious manifestations in his own home, which he reported to several secular papers. As a result of his investigations he was elected a member of the American Psychical Association. *The Progressive Thinker*, a prominent journal published in Chicago, under date of December 5, 1891, contains a six-column article from the Doctor's pen, bearing upon the above-named subjects.

SWETT, John Appleton, of New York City, was born in Boston, Mass., December 3, 1808, and died in the former city, September 18, 1854. Memoirs of this noted physician have been written by the late Dr. B. W. McCready and Dr. Austin Flint, from which liberal extracts have been made in the preparation of this sketch. Referring to his ancestry, and early personal history one of his biographers writes as follows: His father, a reputable merchant, and eminently an active, energetic business man, died in 1834. His mother was distinguished for her intelligence, and still more for her moral worth—a woman of unaffected piety. To the influence of her life, and reverence for her memory, may fairly be attributed in a great measure, under Providence, the formation of her son's character, in its moral and religious aspects. He was prepared for college at the Boston Grammar School, and graduated at Harvard University in 1828. He was not distinguished for great proficiency in collegiate studies, but held a fair rank in all, save mathematics, to which he had an invincible repugnance. His medical studies were pursued under the direction of Dr. Jacob Bigelow, of Boston, for many years, and up to a recent period, Professor of *Materia Medica* in the Medical Department of Harvard University. He obtained his degree of Doctor of Medicine in 1831, and soon afterward established himself as a practitioner in the city of New York. During the first few years of his professional life, his zeal in the pursuit of medical knowledge was manifested by the discharge of the duties of Physician to the City Dispensary, with which he soon became connected, and by his co-operation with his colleagues in forming a society for mutual improvement, by means of reports of interesting cases, and the discussion of medical subjects. Like most young physicians who are enthusiastic in their love of the profession, Dr. Swett was desirous of availing himself of the advantages which are offered by the hospitals, the museums and the teachers of the Old World. More favored in this regard than many who enter the profession, his pecuniary circumstances enabled him to gratify this desire. On the death of his father, in 1834, he inherited a moderate property. The year following he sailed for Europe, and was absent about seventeen months, spending the greater part of the time in Paris. Among the many distinguished medical teachers of the French metropolis, Louis inspired him with the greatest regard. He followed diligently the service of this eminent observer and philosopher, at the Hôpital La Pitié. Probably here he acquired a fondness for the particular branch of practical medicine, viz., the diagnosis of diseases of the chest, with which his name has become especially identi-

fied. His biographer, Dr. McCready, adduces evidence not only of his diligence when in Paris, but of the salutary effect of his example upon others, by a quotation from a touching letter addressed to Dr. Swett by the late Dr. Power, of Baltimore, on his death-bed. In this letter Dr. Power expresses his feelings of gratitude for the influence which he derived from their companionship, attributing to it all his subsequent success and usefulness as a medical practitioner. More precious such a testimonial than the most costly gifts! After his return to New York, in the spring of 1838, Dr. Swett first became known as a medical teacher. His lectures on the diseases of the chest were first delivered at the Broome Street School of Medicine, a voluntary association for medical instruction. They were repeated at the spring course of the College of Physicians and Surgeons, and published from stenographic notes in *The New York Lancet*. These lectures established his reputation as an accomplished diagnostician, in a class of affections which require for their discrimination certain special modes of investigation included under the name of physical exploration. From that time he was consulted by patients, far and wide, who were affected with thoracic disease, and the larger share of his private practice afterwards consisted of cases of this class. The lectures thus referred to formed the basis of an extensive work on Diseases of the Chest, which was published in 1852. This work has been received with favor by the medical profession, both at home and abroad, and will remain an enduring monument of the author's talents, industry and acquirements. Prior to his assuming the labors of a lecturer, he was for two years, in connection with Dr. John Watson, editor of a new quarterly, entitled *The New York Medical and Surgical Journal*. At the end of this time, the *Journal* was discontinued, in consequence of the pecuniary embarrassments of the publisher. During its continuance, many of its most able contributions were from the pen of Dr. Swett. From 1842 up to the time of his death, he was one of the Physicians of the New York Hospital. He persevered in his labors in this institution during the progress of his fatal illness, and relinquished them only when his physical powers were so much reduced as to be wholly unequal to the task. He added to clinical investigations, conducive alike to the welfare of patients and the advancement of science; instruction at the bedside, for the benefit of the students of medicine who were attracted to his wards; and he also delivered repeatedly courses of lectures at the hospital on diseases of the chest and of the kidney. To the latter, for several years preceding his death, he had given close study, and more particularly to the malady known as Bright's Disease, to which he himself fell a victim, adding thus another instance to the number in which physicians have died of the affections to which they had given special attention. These instances, says Flint, are so numerous as to imply something more than mere coincidence, and, in fact, perhaps, to warrant the conclusion that to concentrate the attention to a particular disease, and make it a special subject for study, is to run a greater liability to it than would otherwise exist. In 1853 Dr. Swett was elected Professor of the Theory and Practice of Physic in the Medical Department of the University of the City of

New York. To fill a position of this kind had been his aim from an early period in his professional life. He was now forty-four years of age, in the meridian of life; his intellectual faculties in full vigor; his mind stored with learning and the lessons of experience. A new career of distinction and usefulness was now open to him, on which he entered with alacrity, notwithstanding he had for several years suffered from the gradual advancement of a serious and exhausting disease. He completed his first course of lectures in the university during the winter of 1853-54, having discharged the duties of the chair greatly to the satisfaction of those who listened to his instructions. It was evident, however, to his friends that his first course would be his last. The probability of this must have been apparent to himself, for he was fully aware of the nature of his malady, and no one knew better than he that it almost invariably advances steadily onward to a fatal termination. For several years he had watched the gradual progress of his disease, finding temporary benefit, and even apparent restoration, by giving short periods to relaxation and traveling. In 1852 he made a brief visit to Europe, with reference mainly to the improvement of health; but during his sojourn in Paris, under these circumstances, unable to repress the gratification of his thirst for scientific knowledge, he attended diligently the lectures and demonstrations of the eminent microscopist and philosopher, M. Robin. His anxiety to prosecute microscopical researches in pathology continued even after his confinement to the bed with his fatal disease. A short time before his death, he exhibited delight at the reception of an elegant microscope, which he had ordered from London. Toward the latter part of May, 1854, his debility was so great as to compel him to relinquish further efforts to continue his hospital and private practice, which he never again attempted to resume. He endeavored once more to recruit, by resorting to change of scene and the invigorating air of the country, but without avail. Gradual but progressive failure of the powers of life continued, and he was released from the duties and sufferings of this world in the early autumn of the same year. A prominent feature in the life of Dr. Swett is the persistency with which he was devoted to scientific pursuits, and the practical duties of his profession, under obstacles incident to ill health, which would have discouraged most persons; and when, too, for several years, he must have felt morally certain that he was laboring under a fatal organic disease. This will doubtless appear surprising to many readers, and the more so because his circumstances as regards property were such as not to render his personal exertions necessary for the maintenance of his family. Great as was his love of the science and the art of medicine, it would be unjust to his character to suppose that this alone was the motive impelling him to persist in his labors, until compelled by physical weakness to forego them. An excessive enthusiasm, bordering on idolatry, which is oftener, perhaps, affected than real, was not with him a ruling passion, which it may be imagined continued strong in death. A fair estimation of his character leads to other and higher springs of action. In a firm conviction of duty, based on an abiding sense of the responsibility of life, lies the secret of that

tenacity of purpose which refused to stop in the path of exertion which Providence had ordained for him, until his course was arrested by the fiat of the Supreme Ruler of human events. Thus actuated and guided, his mind was enabled to struggle manfully and triumphantly with the discouragements of disease, while it was becoming to continue the conflict. And receiving support from a higher source than the fascination of science, he was the better prepared to derive aid and happiness from the latter. Reason, experience, and revelation teach us that it is best to work, so long as we possess the capacity of performing the labors incident to the position allotted to us. Better, far better, to die in the harness, than to await, timorous and inactive, the uncertain coming of the messenger of death. Such were the sentiments entertained by the subject of this memoir. At all events, his life affords evidence of their practical exemplification. Philanthropy and love of his profession were manifested by Dr. Swett in the disposition of his property. Leaving his family a moderate competence, he bequeathed a handsome legacy to the Society for the Benefit of the Widows and Orphans of Medical Men, which has been organized and supported by the medical profession of the city of New York. In summing up the moral and intellectual traits which distinguished the character of the eminent physician whose brief but honorable and useful professional career claims the respectful remembrance of the public, and whose example may be held up as worthy of the imitation of young men who are about to enter on the responsibilities belonging to the medical profession, Dr. McCready, whose intimate acquaintance enabled him to speak from a personal knowledge, says: Dr. Swett's understanding was clear and comprehensive, his judgment sound. He was a careful and patient observer, and a devoted and conscientious lover of truth. He was energetic and persevering in what he undertook, his passions were moderate and under the control of his reason, and he possessed, in a high degree, that almost instinctive recognition of truth and propriety, quite independent of the mere power of reasoning, to which we give the name of common sense. The soundness of his judgment and the moderation of his views were shown in the conduct of his ordinary affairs, as well as in his professional career. His love of truth, the care with which he guarded himself against all undue leaning or bias, was a marked feature in his character. It was not merely with him the instinct of the gentleman; the avoidance of the acted or spoken lie, but a principle which pervaded his whole life and influenced his conduct. In relating a case or giving an opinion, he would not only state what was true, or what he believed to be true, but he would disdain to round off with a phrase those points on which he was ignorant, or on which his observation had been imperfect. "Guard yourself against envy," he said to a friend; "it will not only impair your happiness, but it will distort your views; you will be unable to see things as they are, and it will spoil your whole moral character." He was fond of music, but had no skill in it. He had, too, a love of painting and sculpture, and his criticisms on the works of art he saw abroad, as contained in his journal, seem just and appreciative. With all this he

had little imagination, and no love of poetry. Byron was the only poet whom he read with pleasure. Another of his traits that must not be passed over in silence was his kindness of heart. His was not alone the ready charity which seeks the easiest mode to relieve itself from an unpleasant emotion, but a thoughtful and considerate kindness, which carried out deliberately plans deliberately formed. Perhaps of all his qualities, this the most endeared him to his friends and made him loved best by those who best knew him.

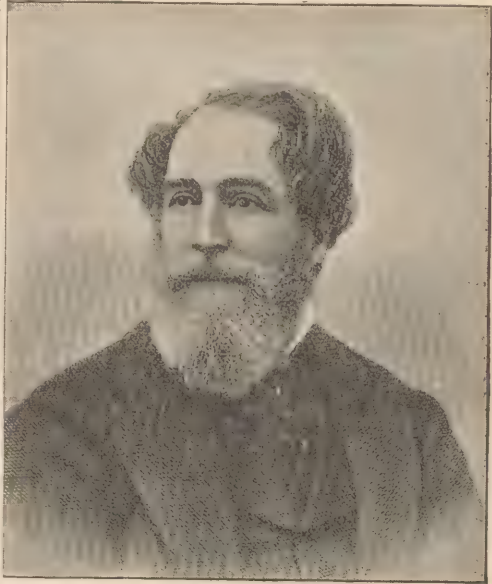

SWINBURNE, John, of Albany, N. Y., was born in Denmark, Lewis county, in the same State, May 30, 1820, and died in the former city, March 28, 1889. Left early an orphan, he was soon called upon to assist in supporting his mother and family, securing his education at district schools and neighboring academies, partly by his own exertions. He studied medicine under Professors Mather and J. H. Armsby, and Dr. Griffin Sweet, graduating in 1847 from Albany Medical College. After a short country practice he was called to fill the position of Demonstrator of Anatomy in Albany Medical College, and performed its duties for three years. During this period he prepared for the Anatomical Museum at Albany, the skeleton of the celebrated Dr. Edson, who for many years was exhibited on account of "his attenuated abnegation of flesh." Appointed Almshouse Physician, he attended eight hundred cases of ship fever in one year, with a mortality of only fifteen per cent. On the outbreak of the War of the Rebellion he was appointed Chief Medical Officer on the Staff of Gen. John F. Rathbone, and given charge of all the sick at the post in Albany, and during three months he treated nearly fifteen hundred patients. In May, 1862, he was appointed Medical Superintendent of wounded New York troops at the front. He served on the battle-field, and labored for the improvement of the appliances for treating and permanently curing the disabled soldiers, publishing the results of his observations in pamphlet form. For a time he was in charge of the United States Army Hospital at Savage's Station, Va., and five times was ordered to the field under special commission from the Governor of New York, four times as the State's representative. He was one of the eight surgeons who organized the hospital at White House. His services led to his appointment by Governor Morgan as Superintendent of the New York State troops. He was instrumental in the preparation of an asylum for 2,500 patients in Virginia, and after General McClellan's retreat to the banks of the James river, though offered freedom by the enemy, preferred to remain with his patients, and notwithstanding the scarcity of supplies succeeded in saving many lives. On his return he was complimented by the surgeon-general of the United States Army and the surgeon-general of the State, for his efficiency and patriotism. After the war he served for six years as Health Officer of the port of New York, at quarantine, being nominated by a Democratic Governor, and confirmed unanimously by the Senate. While in this position he suggested the establishment of large warehouses in the upper and lower bay, for the purpose of protecting the city against the introduction of yellow fever into the port, and lessening the period of quarantine, and secured the passage of a law

preventing "runners" from boarding vessels before their permits were delivered to the mayors of the cities adjacent to the bay. After the expiration of his service as health officer he went abroad, served with the French during the Franco-German War, organized the American Ambulance Corps in Paris, and was in charge of it during the siege. He received the Cross of the Legion of Honor for these services. In 1873 he returned to Albany; in 1882 was an independent candidate for mayor, claimed the election, and was awarded the office after eighteen months of litigation; in 1884 he was defeated for re-election; and the same year was elected to Congress from the Nineteenth New York District, on the Republican and Citizens' ticket. Since 1873 he had maintained a free dispensary in Albany, in which he treated more than one hundred thousand cases, chiefly surgical. He was Professor of Fractures and Dislocations and Clinical Surgery in Albany Medical College, and Consulting Surgeon to Albany Hospital. He was a member of the Medical Society of Albany County, and of the Medical Society of New York. Among his published writings are: "An Address Showing the Identity of the Various Forms of Erysipelas, Peritonitis, and Phlebitis," Transactions of Medical Society of New York, 1850; "Treatment of Fracture of the Femur by Simple Extension," 1859; "Introduction of Air into the Uterine Veins, during Criminal Abortion, with Flexible Catheter," pronounced by Dr. Dalton the only authentic case on record; "Two Cases of Extra-Uterine Pregnancy," Transactions of Medical Society of New York, 1860; "Compound and Comminuted Gunshot Fractures of the Thigh, and Means for their Transportation."

TAYLOR, Benjamin Walter, of Columbia, S. C., was born in that city February 28, 1834. He is a grandson of Col. Thomas Taylor of the Revolution. His education was received at the South Carolina College of Columbia, from which he was graduated in 1855, and he obtained his medical degree from the South Carolina Medical College at Charleston in 1858. He then settled in his native city, where he remained, except during the Rebellion. On the outbreak of the Civil War he was made Assistant Surgeon and assigned to Fort Moultrie, where he served until Fort Sumter surrendered. On the organization of the Hampton legion he was selected as Assistant Surgeon. He was afterward made Surgeon and assigned to the Second South Carolina Cavalry, Hampton's brigade. During the last year of the war he was promoted from Chief Surgeon of Division to Medical Director of Cavalry Corps, Army of Northern Virginia. He is a member of the South Carolina Medical Association, and was its vice-president in 1875, and was president of his County Medical Society in 1876, and was a delegate to the International Medical Congress held in Philadelphia the same year. Dr. Taylor has contributed important articles on various subjects to the Transactions of the State Medical Association of South Carolina. He is Medical Examiner of numerous life assurance companies, and is widely known as an accomplished physician and surgeon.

TAYLOR, Isaac E., of New York, was born in Philadelphia, April 25, 1812, and died in the former city October 30, 1889. He was a son of William and Mary Taylor, natives of Cam-

bridge, England, who settled in Philadelphia in 1797. He was educated at a private boarding school and at Rutgers College, New York, graduating from this institution in 1830. During his stay at Rutgers he was suspended for playing billiards, and during his suspension he attended lectures on anatomy, chemistry and midwifery, and after graduating A. B., entered the office of Samuel L. Southard, Esq., of Trenton, N. J., where he read law for two years, and then in 1832 entered the office of his brother, Dr. Othniel H. Taylor. He graduated M. D. at the University of Pennsylvania in 1834. In 1835 he entered into mercantile business with his father-in-law, Stuart Mollan, of New York, but returned to his profession in 1839, in the city of New York. In 1840 he visited Paris and entered the office of Prof. Cazeaux, studying his specialties of obstetrics and diseases of women and children; he also

Isaac E. Taylor

traveled extensively, attending hospitals and other places of interest. He returned in 1841, and associated himself with the City, Eastern, Northern and Demilt Dispensaries as Attending Physician, having charge, in each, of the diseases of females for seven years. In 1851 he was elected Physician to Bellevue Hospital, and immediately after commenced that series of improvements and reforms which brought about that renovation in the government, economy and police of its system, resulting in changes eminently beneficial and increasing the utility of the institution, in the uniting of the entire medical department of their government under one medical organization, and embracing Bellevue Hospital, the Penitentiary, Almshouse, Work-house, Island Hospital and Small-pox Hospital, and excepting only Randall's Island and the Lunatic Asylum, and established the Bellevue Hospital Medical College, in connection with the Bellevue Hospital, with the addition of an out-door depart-

ment. He was a permanent member of the American Medical Association, permanent member of the New York State Medical Society, and member of the New York County Medical Society, was its president in 1865, and vice-president in 1864 and 1877; Fellow of the New York Academy of Medicine, vice-president in 1867 and 1868, and elected trustee in 1872 for ten years; president of the obstetrical section of the Academy of Medicine, 1856, also in 1876 and 1877, and of the New York Journal Association (of which he was the founder) in 1868 and 1869; vice-president of the American Gynecological Society, corresponding member of the Obstetric Societies of Berlin, Boston, Philadelphia and Knoxville, Tenn. He was also honorary member of the Medical Society of Christiana, Norway. He was the author and editor, among others, of the following: In 1839, he, with Dr. James A. Washington, introduced to the American profession the hypodermic method of treatment by morphia, strychnine, in the New York Dispensary, sixteen years previous to Dr. Andrew Wood, of Edinburgh (see Bartholow, 1873); "Cases of Diseases Peculiar to Females and Nervous Diseases," 1841; "Dr. Evory Kennedy's Work on Auscultation," 1843; "On the Use of Liquor Hydr iodate of Arsenic and Mercury in Cutaneous and Uterine Diseases," 1843; "Rheumatism of the Uterus and Ovaries," "Report on Cases of Aphonia and Syphilitic Ulceration of the Larynx Treated with Sponge Probang and Nitrate of Silver," "Protrusion of the Eye," 1845; "Syphilitic Mucous Tubercles and Secondary Syphilitic Affections of the Os Uteri," 1853; "Sunburnt Appearance of the Skin," "Regurgitation of Stomach," "Labor with Anteversion of Uterus in that State," "Recto-Vaginal Fistula Cured by a New Operation," 1856; "Non-Shortening of the Supra and Infra-Vaginal Portion of Cervix Uteri," 1862; "Procidencia Uteri of Fifteen Years Cured by Simply Reinverting the Everted Cervix Uteri," 1864; "Placenta Previa," 1865; "Recto-Vaginal and Recto-Labial Fistula," 1866; "Mechanism of Spontaneous Action of Uterine Inversion," read before the Academy of Medicine, April, 1872; "Physiological Lengthening of the Cervix Uteri, Before, During and After Labor," 1875; "Treatment in Cases of Contracted Pelvis During Labor," 1875; "Is Craniotomy, Cephalotripsy or Cranioclastm Preferable to the Cesarean Section in Pelvis?" 1876. He was president in 1861 of the Bellevue Hospital Medical College, and was elected *Emeritus* Professor of Diseases of Women and Children therein in 1867. He held the position of Physician to Bellevue Hospital from 1852 to 1876, and had since been its Consulting Physician; was president of its medical board from 1868 to 1874; Consulting Physician to Charity Hospital in 1872; president of its medical board from 1861 to 1863, and Attending Physician from 1860 to 1872; Consulting Physician to the Infants' Hospital, Blackwell's Island, from 1868 to 1876, and president of its board for 1870; president of the Bureau of the Consulting Board of Medical and Surgical Relief, Bellevue Hospital, from 1866, and Consulting Physician to same; Consulting Physician to the New York State Women's Hospital, the Women's Infirmary and Examiner on Obstetrics; and Physician to the Maternity Hospital, Blackwell's Island.

During Dr. Taylor's career he was noted for the kindly feeling and sympathy which by his manner he had caused to exist between himself and his patients, the students who were under him, and the profession. The former has shown itself in expressions from them, and the second was especially noticeable in 1872 at a dinner given to Dr. Taylor by the profession previous to his departure for Europe.

TAYLOR, Matthew Addison, of Austin, Tex., was born at Columbus, O., November 12, 1828. He is of English and Irish descent. He was educated at the Columbus High School and Miami University. After studying medicine entered the Starling Medical College, and was graduated M. D. from that institution in 1849. Soon afterward he settled at Logan in his native State, where he was engaged in an active general practice, but being compelled by the severity of the winters to seek a milder climate, he removed to Texas in 1852, and since 1853 has been established in Austin, that State. While engaged in general practice, he has given special attention to surgery, particularly to the surgical treatment of women and children. In 1855 he was one of the founders of the first medical association in Texas, an organization that existed two years. In the same year he also assisted in founding the Travis County Medical Society, now the largest county medical society in the State. In 1874 he was a delegate to the American Medical Association, and in 1876 a delegate to the International Medical Congress, at Philadelphia. In 1859 he was appointed one of the Trustees of the State Mute Asylum, and served in that capacity two years. He was Physician to the State Blind Asylum, from 1872 to 1874, and was president of the Board of Trustees of the State Lunatic Asylum, in 1873 and 1874, and was also appointed a member and administrator of the board charged with the duty of founding a State university, and in that position he assisted in the organization of the Texas State Commercial and Agricultural College. Dr. Taylor is widely known as a skillful physician and surgeon, and is examiner of several leading life insurance companies. He has been active in elevating the standard of education in his adopted State.

THACHER, James, of Plymouth, Mass., was born at Barnstable, in the same State, February 14, 1754, and died May 26, 1844. For the interesting details concerning the life and achievements of this noted pioneer representative of the American medical profession the editor is indebted to memoirs written by the late Dr. Stephen Williams and the venerable Dr. N. S. Davis of Chicago. The latter biographer says: Whether viewed as a patriot faithfully serving his country in the darkest period of her history; as a man of science and extensive literary acquirements; or simply as an active and honorable member of a humane and noble profession, the subject of this sketch eminently deserves a prominent page in the historical annals of his country. Referring to his ancestry Dr. Williams, in his Medical Biography, says: Dr. Thacher's mother was the daughter of a Mr. Norton, of Marthas Vineyard, and granddaughter of ex-Governor Coggeshall, of Rhode Island. Paternally, he was descended from one of the most learned and useful families in the colony. In "The Magnalia," by Cotton Mather, we have the biography of Dr. Thomas Thacher, who is

represented to have been a learned physician and clergyman of Massachusetts; from whose pen emanated the first medical publication in that colony. Dr. J. B. Beck in his *History of American Medicine Before the Revolution*, referring to this tract or monograph entitled *A Brief Guide in the Small-Pox and Measles*, says it was published in the year 1677. Dr. Williams tells us that "no less than sixteen graduates of the name of Thacher appear in the triennial catalogue of Harvard University, from 1671 to 1832, nine of whom were clergymen." The name of the subject of this memoir, however, is not on the list, and we have no evidence that he ever enjoyed the advantages of a full collegiate education; although his writings abundantly show that his mind was early stored with, and disciplined by, the elementary branches of learning. At the early age of sixteen he manifested his predilection for the study of medicine, and soon after commenced his period of pupilage under Dr. Abner Hersey, a physician who then enjoyed a high reputation and extensive practice in his native town. Under the guidance of this highly esteemed preceptor, young Thacher enjoyed good advantages for acquiring medical knowledge, and improved them with a faithfulness amounting to enthusiasm. His period of pupilage closed in 1775, at the age of twenty-one years. It was just the time when the long-smothered fires of patriotism in the Colonies had broken forth into flames of open revolution. The blood which stained the fields of Lexington and Concord had not only severed the last tie that bound the people of the American Colonies to the mother country, but had also caused the clarion notes of war to vibrate over every hill and valley in the land. Stepping upon the stage of active life at such a moment, it is not strange that the heart of young Thacher was found beating in unison with the glorious spirit of the times, or that his feelings of patriotism and love of rational liberty should cause him to hazard his all in the cause of his country. Hence one of his first acts was to apply for a place in the medical department of the Continental Army. Taking a letter from Joseph Otis, of Barnstable, he proceeded to Watertown and made his application personally to James Warren, who was then President of the Provincial Congress. He was received by this eminent patriot with great cordiality and kindness on July 3, 1775. Within a week his name was added to the list of candidates for examination by a medical board consisting of Drs. Holton and Taylor. The examinations of this board seems to have been faithful and severe, for of the sixteen candidates examined, only ten were admitted as qualified for duty. Dr. Thacher, however, passed through this ordeal with credit, received from the Provincial Congress the appointment of Surgeon's Mate in the hospital at Cambridge, and entered upon the discharge of his duties July 15, 1775. At that time Dr. Benjamin Church was Director-General of the Hospital, and Dr. John Warren the Senior Attending Surgeon. The institution occupied several private houses in Cambridge, and was filled with the soldiers wounded in the battle on Breed's Hill, and so many sick with various diseases as to afford constant employment for the medical officers. In February, 1776, Dr. John Morgan, of Philadelphia, was appointed by Congress Director-General of Hospitals in

the place of Dr. Church, and Dr. Thacher, after undergoing another examination by him, was appointed Surgeon's Mate to Dr. David Townsend, in one of the regiments stationed on Prospect Hill. This regiment was commanded by Col. Asa Whitcomb, and was actively engaged in the laborious duty of fortifying the heights of Dorchester, where they were almost daily anticipating an attack from the whole British force stationed in Boston. After the British had evacuated the city and the American Army had taken possession, small-pox was found so prevalent that inoculation was very generally resorted to. The regiment to which Dr. Thacher was attached, consisting of five hundred men, were all subjected to the disease by inoculation, and he tells us in his journal that all recovered except one negro. When the soldiers were again fit for duty, this regiment, together with that of Colonel Sargent, was ordered to march to Ticonderoga, on Lake Champlain, where they arrived in the latter part of August, 1776. In April following, Colonel Whitcomb's regiment, having served out the period of time for which they were enlisted, returned home; but Dr. Thacher immediately received the appointment of Surgeon's Mate in the General Hospital, and remained on duty at Ticonderoga until that post was abandoned by our army. He accompanied the sick and wounded to Fort Edward, and subsequently to Albany. While on duty in that city, the final conflict took place between the Northern Division of the American Army under General Gates, and that of the British Army under General Burgoyne. The two hard-fought battles, which preceded the surrender of Burgoyne, took place only about thirty miles from the General Hospital, and many of the wounded officers and soldiers were immediately transferred thither. Six days after the surrender of General Burgoyne, Dr. Thacher made the following entry in his military journal, which is quoted for the purpose of showing the nature of his duties, and the faithful and humane manner in which he discharged them: "This hospital is now crowded with officers and soldiers from the fields of battle; those belonging to the British and Hessian troops are accommodated in the same hospital with our own men, and receive equal care and attention. The foreigners are under the care and management of their own surgeons. I have been present at some of their capital operations, and remarked that the English surgeons perform with skill and dexterity, but the Germans, with few exceptions, do no credit to their profession; some of them are the most clumsy and uncouth operators I ever witnessed, and appear to be destitute of all sympathy and tenderness towards the suffering patient. Not less than one thousand wounded and sick are now in the city; the Dutch church, and several private houses are occupied as hospitals. We have about thirty surgeons and mates; and all are constantly employed. I am obliged to devote the whole of my time, from eight o'clock in the morning to a late hour in the evening, to the care of our patients. Here is a fine field for professional improvement. Amputating limbs, trepanning fractured skulls, and dressing the most formidable wounds, have familiarized my mind to scenes of woe. A military hospital is peculiarly calculated to afford examples for profitable contemplation,

and to interest our sympathy and commiseration. If I turn from beholding mutilated bodies, mangled limbs, and bleeding, incurable wounds, a spectacle no less revolting is presented, of miserable objects languishing under afflicting diseases of every description; here are those in a state of mournful despair, exhibiting the awful harbingers of approaching dissolution; there are those with emaciated bodies and ghastly visage, who begin to triumph over grim disease, and just lift their feeble heads from the pillow of sorrow. No parent, wife, or sister to wipe the tear of anguish from their eyes, or to soothe the pillow of death, they look up to the physician as their only earthly friend and comforter, and trust the hands of a stranger to perform the last mournful duties. Frequently have I remarked their confidence in my friendship, as though I was endeared to them by brotherly ties. Viewing these unfortunate men as the faithful defenders of the liberties of our country, far separated from their dearest friends, who would be so lost to the duties of humanity, patriotism, and benevolence, as not to minister to their comfort, and pour into their wounds the healing balm of consolation? It is my lot to have twenty wounded men committed to my care, by Dr. Potts, our surgeon-general; one of whom, a young man, received a musket-ball through his cheeks, cutting its way through the teeth on each side, and the substance of the tongue; his sufferings have been great, but he now begins to articulate tolerably well. Another had the whole side of his face torn off by a cannon-ball, laying his mouth and throat open to view. A brave soldier received a musket-ball in his forehead; observing that it did not penetrate deep, it was imagined that the ball rebounded and fell out; but after several days, on examination, I detected the ball lying flat on the bone, and spread under the skin, which I removed. No one can doubt but he received his wound while facing the enemy; and it is fortunate for the brave fellow that his skull proved too thick for the ball to penetrate. But in another instance, a soldier's wound was not so honorable; he received a ball in the bottom of his foot, which could not have happened unless when in the act of running from the enemy. This poor fellow is held in derision by his comrades, and is made the subject of their wit for having the mark of a coward." In December following, was entered in his journal the following note: "The wounded soldiers committed to my care in October last have all recovered; and as a compliment for my assiduity and attention to my patients, I have received from Dr. Potts, our Surgeon-General, a generous and handsome present." Two years and a half now elapsed since young Thacher left his home and attached himself to the fortunes of the patriot army; and the duties of the hospital being greatly diminished, he asked, and readily obtained, a furlough, or leave of absence, for forty days. Though in the middle of winter, he made the journey from Albany to Boston and Barnstable on horseback; visited his friends, and returned to the hospital ready for duty two days before the expiration of his furlough. Early the following season, the hospital was removed to the Highlands, further down the Hudson, and Dr. Thacher continued on duty in it until he was advanced to the rank of Surgeon, when, at his

own solicitation, he was transferred from hospital service to that of Field Surgeon, and attached to a regiment chiefly from the South, under the command of Col. Gibson. At another period he was selected as the surgeon to a picked corps of light infantry, chosen from the several New England regiments, and under the immediate command of Col. Alexander Scammel. This corps "consisted of the most active and soldierly young men and officers," and was designed to march in advance of the main army, constantly prepared for the most active and hazardous duty. His selection as Surgeon to this corps was a high compliment, but not higher than his skill and faithful devotion to the duties of his station had entitled him to. From this time Dr. Thacher accompanied nearly all the more important movements of the Continental army to the end of the war. Whether in the camp or in the field—whether under a single tent amidst the snows of a Northern winter, or on the rapid march under the burning rays of a summer sun—he shared fully in all the privations, the toils, and the glories, that were endured and achieved by the defenders of our country during that eventful period of its history. Even in the last important conflict, the siege of Yorktown, he accompanied the corps sent forward in the darkness of the night to open the last entrenchment necessary to complete that siege. The great struggle of the Colonies for independence having been finally crowned with success, and the war actually closed, the following entry appears in his journal under the date of December 25, 1782. "It is with inexpressible reluctance that I contemplate a separation from the numerous friends with whom I have so long associated in the most harmonious and pleasing intercourse. Engaged in the same glorious and honorable cause, encountering together the same perils, suffering unparalleled hardships and privations, and participating in the most interesting scenes and events, our mutual and cherished attachments are no less ardent than the ties of brotherly affection. Friendships formed under such circumstances, and cemented by purity of sentiment, must prove as lasting as our days on earth; and we shall ever cherish a sincere interest in the welfare of the companions of our military career. It will be to me a source of infinite satisfaction, during the remainder of my days, that I have shared in the toils and perils of war, during seven and a half years, in defense of my country and its freedom; and that the mighty struggle terminates in peace, and the establishment of our national independence. This momentous event should be considered as a rich blessing which Providence bestows on us for the benefit of the present and many future generations. It is incumbent on me to express my unfeigned gratitude to the All-wise Author and Preserver of men, that he has been pleased to confer on me innumerable blessings, and preserved my life and health during a long period while exposed to the greatest hardships and imminent perils." Again, on January 1, 1783, he writes as follows: "This day I close my military career, and quit forever the toils and vicissitudes incident to the storms of war. To my military companions I bid a final adieu, and hope to enjoy in future the blessings which attend a virtuous course of domestic life. While I congratulate my country on the

momentous event by which we are about to be elevated to the rank of an independent nation, most cordially do I proffer my sympathy for the many lives of inestimable value which have been sacrificed during this ever-memorable contest." He retired with the most full and honorable testimonials to his punctuality, professional skill and faithful performance of duty in all the stations he had been called to fill. During his long connection with the army he enjoyed the confidence and society of its highest and most gifted officers, including General Washington himself. Nor was his attention entirely absorbed by his professional duties, for he found time to keep a record or journal of all the important events that transpired during the war. This journal was published by Dr. Thacher, with an appendix, containing brief biographical sketches of the principal officers of the American Army, in 1824. It was dedicated to his Excellency, John Brooks, then Governor of Massachusetts. A second edition was issued in 1826, and it was republished, with appropriate illustrations, in 1854, and was a most reliable and interesting historical work. On leaving the army, Dr. Thacher settled in Plymouth, Mass., and entered upon the ordinary practice of medicine and surgery. Having already the active sympathy and gratitude of the community, he soon became engaged in an extensive and laborious business. The practical duties of his profession, however, were not allowed to engross his attention to the exclusion of literary and scientific pursuits. On the contrary, his mind, released from the long-accustomed excitements and anxieties of his military career, seemed to turn with great energy and pleasure to the cultivation of science. In 1802 he communicated a paper, entitled "Observations on the Art of Making Salt from Sea-water," to the American Academy of Arts and Sciences, of which he was a member. The paper was well received, and published in the Transactions of the Society for that year. He soon after furnished to the Historical Society of Massachusetts a paper "On the Natural Production of Iron Ore, with a Description of Smelting Furnaces." This was published in the ninth volume of their Transactions. In 1810 he had completed and caused to be published his "New American Dispensatory," which soon became a standard work in the profession, and passed through four editions during the succeeding eleven years. In the same year he received the honorary degree of Doctor of Medicine from Harvard University. He next wrote a work entitled "Modern Practice of Physic," which was published in 1817, and a second edition of which was issued in 1821. In the latter year he also published a "Monograph on Hydrophobia," exhibiting much research, and containing many valuable facts. In 1822 he had ready for the press the "American Orchardist," a second edition of which was called for in 1825. In 1828, his work on "American Medical Biography" was published, in two volumes. This was the first attempt made in this country to perpetuate the memory of distinguished American physicians, by collected biographical memoirs. These volumes were exceedingly interesting and valuable, and a few years preceding the death of the author he was solicited by many to prepare a new edition with additions, but the infirmities of great age prevented him, and the work has been

suffered to pass entirely out of print. In 1829 he furnished his publishers with a "Practical Treatise on the Management of Bees," and two years after, a very curious and interesting volume on "Demonology, Ghosts, Apparitions and Popular Superstitions." The last work written by Dr. Thacher, worthy of special mention, was the "History of Plymouth," published in 1832. This was an interesting volume, and was received by the public with sufficient favor to call for a second edition in 1835. From the foregoing list of works, it will be seen that Dr. Thacher was not only a voluminous writer, but also that his studies embraced a wide range both in science and literature. He furnished a considerable number of valuable papers to the medical and other periodicals. He also devoted much attention to antiquarian researches, in which he felt an enthusiastic interest. He was an active member of the Pilgrim Society of Plymouth, and of the Massachusetts Medical Society. All the writings of Dr. Thacher bear the impress of a mind disciplined by careful study, sharpened by long-continued habits of observation, and well stored with facts. Hence they were anxiously sought for by the public, and generally read with profit. Throughout his whole life he maintained a private character above reproach. During his protracted connection with the army, his military journal affords abundant proof of his sterling integrity, his high sense of honor, and his constant readiness to applaud virtue and condemn vice. In mentioning a high sense of honor, we do not mean that false idea of honor which has led so many foolishly to hazard their lives in accordance with the *code duello*. This practice, which caused the loss of several valuable lives during the Revolutionary War, is alluded to, only to be condemned, in all the writings of Dr. Thacher. In conclusion his biographer, Dr. N. S. Davis, says: As a physician he ever exhibited that urbanity and kindness which so quickly win the confidence and esteem of the sick. As a citizen he was public-spirited, a patriotic lover as well as defender of his country, and a liberal supporter of the civil and religious institutions of the community in which he lived. He was small in stature and physical development, light and agile in his movements, fond of social intercourse, yet regular and studious in his habits. During a few of the last years of his life he was afflicted with a difficulty of breathing, which interfered much with his exercise and social enjoyments, but which he bore with patience and cheerfulness. He came to his death, serenely and peacefully, in May, 1844, in the ninety-first year of his age. As a patriot of tried integrity, as a learned and honorable physician, as an eminent contributor to the advancement of science and literature, and as an active defender of his country in the darkest days of her history, Dr. James Thacher, of Barnstable, Massachusetts, is worthy of grateful remembrance by the present and all future generations.

THOMAS, J. D., of Pittsburgh, Pa., was born in that city, May 8, 1843, and is of Welsh extraction. He first attended the public schools, then the Western University of Pennsylvania. During the last year of the war he served in the light artillery service as a private. After returning to his home he entered the office of the late Geo. McCook, M. D., as a student of

medicine. In 1869 Dr. Thomas graduated from Bellevue Hospital Medical College, but remained in the city of New York, and took the spring course before returning to his home; he also took a post-graduate course in New York City in 1888. After graduation, he began the practice of medicine in his native city, where he has continued ever since. He is a member of the American Medical Association, of the Pennsylvania Medical Society, of the Allegheny County Medical Society (one term its president), and others. He is one of the founders of the Western Pennsylvania Medical College (Medical Department of the Western University), in which institution he now holds, and has held since its organization, the chair of Genito-Urinary and Venereal Diseases; he is also one of the trustees of the institution.

J. D. Thomas.

He is one of the founders, and is Surgeon to, the South Side Hospital, of Pittsburgh, as well as a member of the Board of Trustees. He was elected by the councils of the city of Pittsburgh for four consecutive terms as a member of the Board of Health; he served this body at different times as its president and secretary. In 1887 he delivered the address on "Hygiene," before the Pennsylvania Medical Society, at its annual meeting, at Bedford, Pa. The following are some of the articles he has contributed to the medical journals, viz.: "A Case of Rupture of the Lower Segment of the Uterus;" "Paralysis of the Lower Extremities, Following the Use of the Obstetric Forceps;" "Sponge Grafting;" "Application of the Forceps when the Head Lies Too Far Forward;" "Leaves from my Obstetric Case-Book;" "Treatment of Stricture of the Male Urethra by Electrolysis;" "Reply to a Criticism of above Paper;" "An Improved Urethrotome;" "Report of a Case of Rupture of

the Male Urethra;" "Report of a Case of Late Syphilitic Epididymitis;" "A Case of Amputation at the Hip-joint, by Wyeth's Method," and "Acute Rheumatic Neuritis." He delivered the "Valedictory Address," before the Class of 1890, Western Pennsylvania Medical College, at the Grand Opera House. During the summer of 1890 he made a tour of Europe. After his return, his observations made abroad were embodied in book form, and entitled, *A Souvenir of Europe*. The publication was for private distribution only.

THOMAS, Theodore Gaillard, of New York City, N. Y., was born on Edisto Island, South Carolina, November 21, 1832. He was educated at the College of Charleston, and obtained his degree at the medical school of that city in 1852. Shortly after this he came north, and became Resident Physician in the Emigrant Refuge Hospital on Ward's Island. After finishing this course he settled in New York City, where, with Dr. Donaghy, he established, in connection with the University of New York, a "quiz class" in obstetrics, which became very successful, and attracted much attention. He succeeded Dr. Bedford as Lecturer in this institution. Dr. Thomas was equipped with what was considered, at that time, a very perfect and remarkable collection of diagrams and plates, as adjuncts to his lectures. It is an interesting and instructive, as well as encouraging fact (to those who have in later years admired his brilliant oratory and remarkable facility as a lecturer), that his first lecture was considered a complete failure by his friends. But it was his last failure, as we know, for, since then, none of his colleagues have addressed more delighted audiences, among which old visiting practitioners frequently crowded out, in their eagerness to hear and see the lecturer, those whose matriculation fee gave them the better right. Early in his career he attracted the attention of Dr. John T. Metcalfe, who, at that time, had his finger upon the pulse of fashionable New York. Dr. Thomas became his assistant. From this time his course was steadily upward and assured. His general practice became very large, but he devoted himself especially to obstetrics, and made his reputation first in this branch of medicine. He was appointed Professor of Obstetrics at the College of Physicians and Surgeons, and held that chair for a number of years. He was appointed on the first Board of Visiting Physicians to Roosevelt Hospital, but soon resigned. He has acted in the same capacity at Bellevue, St. Luke's, and Nursery and Child's Hospitals, and at St. Mary's Hospital in Brooklyn. When the Professorship of Diseases of Women was established at the College of Physicians and Surgeons, he resigned the chair of Obstetrics and accepted this. Not long afterward, he wrote and published his work on "Diseases of Women." This book found its place waiting for it, and attained an immense sale. It was the most complete work on this subject then in existence, and made for its author an immediate reputation as a gynecologist of the first rank. In 1863 he was appointed Physician to the out-patient department of the Women's Hospital, and four years later he became Consulting Physician, and finally, in 1873, he was appointed one of the Attending Surgeons to the same institution. This post he held until a few years ago, when he resigned, and was re-

quested by the board of governors to name his successor. As an obstetrician, his name is especially identified with the operation of *laparo-elytrotomy*, which he presented to the profession as a substitute for the then very dangerous operation of Cæsarian section, and still more dangerous one of craniotomy. He performed the operation a number of times with good results. As a gynecologist, he has devoted himself with special taste to laparotomy. In this branch of the specialty he soon acquired an immense experience and a world-wide reputation as a quick and skillful diag-

G. Gaillard Thomas.

nostician and operator. His quickness, coolness and skill in using the knife are the first things which impress the observer at his operations. Untiring energy, quickness of perception and great decision are to the impartial observer the leading traits in his character. He is a member of the leading obstetrical societies of this country and Europe. An excellent portrait of Dr. Thomas is presented with this sketch for the benefit of those who have only known him by his works, and the editor is indebted for both to the *New York Journal of Gynecology and Obstetrics*.

THOMPSON, James Edwin, of Galveston, Tex., was born in Northwich, England, in 1864, and was educated at the Owens College, Manchester, and obtained the scholarship and gold medal in anatomy at the London University, and the Bradley and the Dunville surgical scholarships in connection with the Manchester School of Medicine. He was admitted as a member of the Royal College of Surgeons in 1886, and a Fellow of the same college in 1888. Dr. Thompson obtained the degree of Bachelor of Medicine, and the degree of Bachelor of Surgery of the London University, in both of which examinations he was placed in the honors list. He has held the posts of House Surgeon to the Royal Infirmary, Manchester; House Surgeon to the Dudley Hospital, England, and lastly to the important post of Resident Surgeon to the Manchester

Royal Infirmary, where he obtained his experience in teaching. He studied on the continent six months in Vienna, and six months in Paris. From some dozen or more applicants Dr. Thompson was recently chosen by the regent of the University of Texas for the chair of Surgery in the Texas Medical College, at which time he presented the highest and most satisfactory credentials and testimonials from the most eminent surgeons and anatomists in England, France and Germany.

THOMPSON, William, of Philadelphia, Pa., was born in Chambersburg, January 28, 1833. His ancestors were Scotch on both sides, who came to this country before 1776. He was educated at the Chambersburg Academy, then a famous classical school, and by private tutors, until he entered the office of Dr. John C. Richards, of his native town, as a medical student. He spent six months in Philadelphia in the study of pharmacy, and finished his pupillage with his brother, Alexander Thomson, at Mt. Savage, Md. He entered the Jefferson Medical College and graduated in 1855. He then settled in Lower Merion, a few miles from Philadelphia, married Rebecca, daughter of William E. George, and was in full practice until 1861. Having passed an examination before a medical board, he entered the Regular Army, and was placed on duty before the battle of Bull's Run, with the Army of the Potomac, with which he served, either in the field or at its base in Washington, until it was disbanded at the conclusion of the war. Having been chosen by the medical director, Dr. Jonathan Letterman, during the peninsula campaign as his assistant, he was placed on duty at the headquarters of the army, and participated in the anxieties and responsibilities of that heroic period, when the organization of the medical department of that army, thanks to Dr. Letterman, became the model of all the others in the service, and inferior to none in the world. These improvements and reforms are described in the *Medical Recollections of the Army of the Potomac*, by Dr. Letterman, in which he also does full justice to the aid rendered by Dr. Thomson, especially at the battle of South Mountain, where, the army being obliged to advance, Dr. Thomson was left in sole charge of the field, and was obliged to find food, shelter, transportation and surgical aid for 2,500 wounded men, and give burial to the dead, both Union and Confederate, all of which was completed in seven days, and for which he was also complimented by President Lincoln. His experiences on the peninsula enabled Dr. Thomson, after the battle of Antietam, to propose and elaborate two reforms for overcoming the defects of the medical field service, one being a system of brigade supplies, to prevent the loss of medical stores, and the other a system of division hospitals, which fixed in order the position of every medical officer during and after an engagement, which were adopted by the medical director, and promulgated in orders from the commander-in-chief. These were reissued by the Secretary of War to all the armies in the service, and remained in use, with little or no alteration, until the end of the war. In 1863 he was placed in charge of the Douglas Hospital in Washington, which under his management became one of the models of the general hospital system, and conspicuous for the excellence of its administration. In 1864 he was

chosen by Medical Director Abbott as Medical Inspector of the Department of Washington, where he remained until the close of the war. During his service these hospitals contained over twenty-three thousand beds; and, in 1864 alone, provided for over one hundred and thirteen thousand patients. In 1866 he organized and had charge of a hospital for cholera, then epidemic, which was also the post hospital of Washington. Having received two brevets for distinguished services, he, in 1867, passed successfully his second examination before the army board, was promoted, and sent to Louisiana; when in 1868 he tendered his resignation, and returned to civil life. In 1861 he introduced the local use of carbolic acid, then issued as creosote, as a disinfectant in the treatment of wounds, and to prevent the attacks of flies and the annoyance from maggots; he wrote also a paper on hospital gangrene, and its treatment by bromine. He was warmly interested from its inception in that splendid monument of American surgery, the army medical museum, and has the distinction, in its published catalogue, of being its largest single contributor in specimens and papers, especially those on osteo-myelitis and pyemia, and wounds of the knee-joints. At the Douglas Hospital, in conjunction with Dr. William F. Norris, then in the army, he demonstrated to the surgeon-general the value of photography in preserving valuable surgical records, by sending to the office a series of prints of wounds and injuries made by them at the hospital. Having seen the establishment of the photographic bureau by the surgeon-general, Drs. Thomson and Norris then essayed to establish the value and possibility of preserving records of microscopic work by photography; and after months of effort, in May, 1864, they placed before the surgeon-general successful reproductions of the field of the microscope, in photographic prints made from negatives, confining themselves to the optical apparatus, the clinical microscope, furnished from the surgeon-general's office, and ranging in magnifying power from ten to three hundred diameters. This was the first successful effort to make practical use of the negative process of photography, by wet collodion, in microscopy, for high powers in the country, and it reflects great credit on the medical staff of the army, and led to the splendid developments afterwards in the hands of Drs. Woodward and Curtis, aided by the full resources of the Surgeon-General's office. He was warmly welcomed by the profession when he settled in Philadelphia, and was elected to their medical and scientific societies, and is now a Fellow of the College of Physicians and a member of the Pathological Society, Academy of Natural Sciences and its biological and microscopical section, County Medical Society and Philadelphia Ophthalmological Society. He also is a member of the American Medical Association, where he represented the United States Army as delegate, and of the State Medical Society; the Neurological Society of New York (honorary); the International Ophthalmological Congress; the American Ophthalmological and Otological Societies. He was a delegate to the International Medical Congress held in Philadelphia, 1876, and was elected vice-president of the Ophthalmological Section. In 1868 he was elected Physician to the Hospital of the Protestant Episcopal Church, and to the

Church Home for Children, but soon resigned these positions to give his exclusive attention to the diseases of the eye, for which his knowledge of optics especially qualified him. He was elected as Surgeon to the Wills Hospital for Diseases of the Eye, where he gave lectures for several years, and in 1877 was unanimously elected *Emeritus* Surgeon. In 1873 he was appointed Clinical Lecturer on Diseases of Eye and Ear at the Jefferson Medical College, and in 1877 Ophthalmic Surgeon to the Jefferson College Hospital, where he conducts a daily clinic, and gives, in the regular course, practical instruction on this branch to the hundreds of students who crowd the halls of this school. He has contributed largely, in reviews and papers, to the literature of his specialty, and made important additions to its art and science. Among these may be mentioned the following: Professor Gross, in preparing his late edition of his *System of Surgery*, placed the section on diseases and injuries of the eye in Dr. Thomson's hands for revision, and acknowledges his indebtedness to him for this and for the "valuable remarks on refraction and accommodation" in his Preface. He has offered to the profession a novel and practical method for the diagnosis and correction of ametropia, with a simple instrument, which has been placed on a supply-table of the army by the surgeon-general, is in general use by ophthalmic surgeons here and abroad; has been commended by Douders as accurate, novel, and time-saving, and is highly spoken of by Dr. Mitchell, as giving to the physician a prompt means of detecting optical defects in the treatment of nervous diseases. The late Professor Gross, in his paper on a "Century of American Surgery," mentioned this method, and the papers of Dr. Thomson, on the "Connection Between Astigmatism and Posterior Staphyloma" and the "Correction of Conical Cornea, by Cylindrical Glasses," and claimed them as evidences of American skill and originality. In connection with Dr. S. Weir Mitchell, Dr. Thomson has also published, in the *American Journal of Medical Sciences*, papers on the use of the ophthalmoscope, in diagnosis of intra-cranial tumors, and clinical reports of cases of severe and prolonged headache, dependent upon astigmatism, relieved by the correction of optical defects. The report of a case of hemiopia following gunshot wound of the brain, as published by Dr. Thomson and Dr. W. W. Keen, is accepted by Professor Flint, in his *Physiology*, as elucidating the question of the partial decussation of the optic nerve-fibres. A lecture, introductory to the summer course at Jefferson Medical College, on the relation of ophthalmology to practical medicine, was published by the class, and widely distributed. In 1880 Dr. Thomson was appointed Professor of Ophthalmology at the Jefferson College, Philadelphia, which chair he now holds. During the same year he was made Surgical Expert of the Pennsylvania Railroad, and later of the Reading Railroad, to carry out his method of examination for color blindness, acuteness of vision and hearing, which has been largely adopted by many other railroads. He was editor of the ophthalmological part of the annual of the *Medical Sciences* (1889) the first year of its publication. Professor Thomson is also the author of the article entitled, "Surgery of the Eye," in the new work, *An American Text-Book on Surgery*, by thirteen

eminent American surgeons; W. B. Saunders, Publisher, Philadelphia, 1892.

THORNBURY, Frank J., of Buffalo, N. Y., was born at Java, N. Y., March 14, 1867, and is of English ancestry. His preliminary education was received at Arcade Academy, in his native State. He then studied medicine under the preceptorship of Wm. Juddkins, M. D., and entered the Medical College of Ohio, Cincinnati, and was graduated from that institution in 1889. On the occasion of receiving his medical degree he was awarded the Dawson Gold Medal, and received "especial honorable mention" in general studies. He also obtained, by competitive examination, first place as Resident Physician in the Cincinnati Hospital, and was appointed Chief of Resident Medical Staff and Examiner in 1890. His medical education has been supplemented by an extended course of study in Europe, where he attended the Universities of Heidelberg, Vienna and Berlin; also clinical courses in the hospitals of London and Paris. Dr. Thornbury was Assistant in Kaposi's Clinics of Dermatology, and studied in Koch's Laboratory in 1891. He located in practice at Buffalo, in 1892 and devotes special attention to bacteriology. He has recently been appointed *Post-Mortem* Examiner of Erie county and Buffalo, and Supervising Microscopist of the Bureau of Animal Industry, United States Department of Agriculture. He has devised "A New Combination Sterilizer" for antiseptizing simultaneously water, instruments and dressings, which was described in the *New York Medical Journal*. In June, 1892, Dr. Thornbury was appointed Demonstrator of Bacteriology in the medical and dental departments of the University of Buffalo. He has made important contributions to medical literature which have been published in some of the leading periodicals. Among his more recent articles may be mentioned the following: "Influenza and the Latest Bacteriological Researches," "Advances in Aseptic Surgery," "The Bacteria of the Mouth," "The Present Status of Wound Treatment," "Septic Dangers of Hypodermic Injections," and "Death from Nitrous Oxid Gas." Dr. Thornbury is a member of the Central New York Medical Association; of the Erie County Medical Society; Fellow of the Buffalo Academy of Medicine, and the Buffalo Society of Natural Scientists.

THORNE, Walter Scott, of San Francisco, Cal., was born July 22, 1840, near Aurora, Cayuga county, N. Y. He is of English descent, his ancestry having settled at the close of the Revolutionary War along the Hudson river, and in the Mohawk valley. He was educated at the Petersburg Classical Institute, Petersburg, Va., and at the Santa Clara College (of the Society of Jesus), in Santa Clara, Cal. In 1857 he made a voyage from New York to San Francisco around Cape Horn. In 1863, while yet a student of medicine, he went to live in Humboldt county, Nevada Territory, inhabited at that time by a few rude whites and the Piute Indians, the latter of whom rose up the following year and mercilessly slaughtered the unprotected whites. After much delay a band of fifty whites was organized, of which he was elected surgeon, and as such served in several engagements. During the campaign he made, with very rough and imperfect instruments, a number of amputations on the field, and ligated some of the larger vessels. He after-

wards returned to California and then went to Mexico, where he followed the French army across the continent from the Pacific to the Atlantic, and on the defeat of the Imperialists, visited South America, exploring to some extent Peru, Ecuador, Chili and Bolivia, and the Isthmus of Panama, and Central America. He returned to California in 1867, and soon after left for New York, where he completed his medical education, receiving the degree of M. D. from Bellevue Hospital Medical College in 1869, and taking the first honors in a class of 135 graduates. He then established himself at San Jose, Cal., where he remained in active general practice for several years, and afterward removed to the city of his present residence. He has a decided taste for surgery, in which he has performed several of the major operations. He is a member of the American Medical Association; of the State Medical Society of California, and of the Santa Clara County Medical Society. Among his literary contributions to medicine is a paper on "Dislocations of the Elbow-Joint," 1871; a paper on "Fracture of the Femur," a paper on "Medical Journalism," 1872; an essay on "Dislocations of the Lumbar Vertebra," published in the Transactions of the California State Medical Society, for 1877; and a pamphlet on "Medical Experts and Investigation of Insanity by Juries."

THORNER, Max, of Cincinnati, O., was born in Geestemünde, Germany, April 2, 1859. His classical education was acquired at Oldenburg, and he pursued his medical education at the universities of Jena, Leipzig, Heidelberg and Munich. Early in 1884 he took the medical State examinations and graduated at the

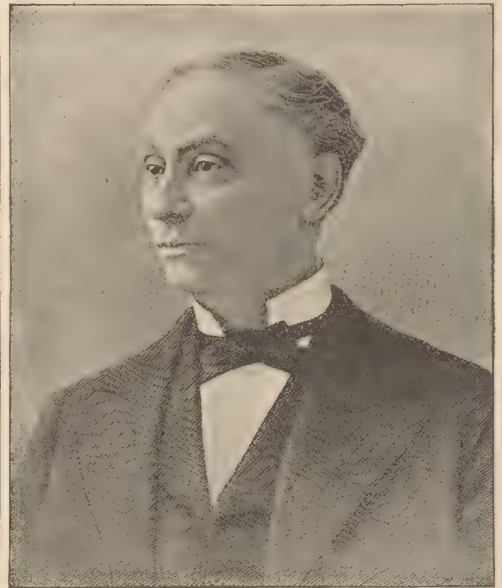

Max Thorner.

Royal University of Munich with the distinction *Summa cum Laude*. He has been *Interne* in the surgical and medical wards at Heidelberg and Leipzig, and was Clinical Assistant in the Lying-in-Hospital at Munich. He then took charge of the practice of a colleague, and attended during seven months to an extended country practice. During the winter of 1884-85

he visited the clinics and hospitals of Berlin, Vienna and Paris, where he devoted himself to the special study of diseases of the throat, nose and ear. He continued these studies in London under Sir Morell MacKenzie, at the Hospital for Diseases of the Throat and Chest, at which institution he served as Clinical Assistant during the summer of 1885. In the fall of 1885 he began to practice in Cincinnati, where he has since that time successfully devoted himself to the treatment of diseases of the ear, throat and nose. In 1888 he was elected Laryngologist and Aurist to the Jewish Hospital, and in 1892 Consulting Laryngologist to the Ophthalmic Hospital. In the same year he was appointed Professor of Clinical Laryngology and Otology in the Cincinnati College of Medicine and Surgery. He is a member of several medical and scientific societies; a Fellow of the Berlin Laryngological Society, and was from 1890 to 1891 president of the Cincinnati Medical Society. He was one of the honorary secretaries of the section on laryngology in the Tenth International Medical Congress at Berlin, 1890, and the secretary of the section on Otology in the First Pan-American Medical Congress in Washington, 1893. In 1887 he introduced the internal use of salol in acute affections of the throat (*Cincinnati Lancet-Clinic*, December 10, 1887). His contributions to medical literature refer generally to his specialty. He is also the author of a treatise on "Pneumonia Crouposa Congenita" (inaugural dissertation, Munich, 1884), and one of the contributors to Burnett's "System of Diseases of the Ear, Nose and Throat" (Philadelphia, 1893).

TODD, Robert Nathaniel, of Indianapolis, Ind., was born near Lexington, Ky., January 4, 1827, and died at his home, June 13, 1883. His father was Levi L. Todd, one of the early pioneers of Kentucky, and his mother was the daughter of Capt. Nathaniel Ashby, of Virginia, who served as an officer of the line throughout the War of the Revolution. His family moved to Indiana in 1834, when he was but seven years of age. His early advantages were indifferent—a common school education such as the country at that day afforded, with such a knowledge of Latin as he could pick up (unaided by a teacher) from an old grammar and reader and a copy of Esop's Fables, with the reading of a few volumes of history and travel. These constituted the stock of his literary furnishing. As a boy he was sprightly and energetic. He made rapid progress in his studies at school, showing more than ordinary aptness for figures. At home he was industrious—took to work as kindly as books—was ingenious and remarkably skillful in the use of tools in the common contrivances of boyhood. Though not averse to school, he was there, as at home, not easily controlled, and only by mild means. He was willful and impulsive—always ready to rebel against the least unjust or improper exercise of authority over him, or the infringement of his rights, and the school-teacher who attempted to reduce him to submission by violent means, always left the task unfinished. Physically, he was delicate, rather a sickly boy, and was always dyspeptic from a child. Gaining in strength and health, however, as he grew older, at the age of nineteen he began the study of law at South Bend, with Judge Liston, his brother-in-law, but at the expiration

of a year and a half returned to the farm, where he remained until, broken down by hard labor and sickness, he was compelled, at the end of two years, to abandon farm work entirely. After having remained at home for some months an invalid, and almost despaired of regaining his health, he visited Dr. David Todd, of Danville, Ind., by whom he was induced, after a little while, to commence the study of medicine, which he did more as a diversion from low spirits, not expecting ever to be well enough to turn it to practical account. His health, however, soon began to improve, and the next year he attended lectures at the old Indiana Central Medical College, which was organized about that time under the rule of Drs. Bobbs, Mears, Deming, Dunlap and others (the first of Indianapolis medical colleges), and the next year, 1851, he graduated, and settled in the following spring at Southport, Ind., where he remained until

R. N. Todd.

the breaking out of the war. A good portion of his time as a student had been passed with Dr. J. S. Bobbs, for whom he entertained great regard. He was ever faithful to the memory of his friend and preceptor, never failing to eulogize him in the highest terms when an opportunity offered, and would have accepted as a personal injury any word spoken slightly of him. In the year 1861, shortly after the breaking out of the War, he was appointed Surgeon of the Twenty-sixth Indiana Volunteers, and went soon after with his regiment to Missouri, where he remained on duty in camp and hospital for about twenty months, when he was called home on account of his wife, whom he found rapidly sinking with consumption, and who died in a short time, leaving him a family of five children, the two youngest but a few months old. Having resigned his position upon his return home, he soon after removed

to the city, and again entered the Government service as Surgeon at Camp Morton, where, associated with Dr. Kipp, of the Regular Army, and under the medical directorship of Dr. Bobbs, he continued until the close of the War. His health, for several years following his army service and the death of his wife, was very much impaired, during which time he had several hemorrhages from the lungs, a prolonged cough, and other grave symptoms of pulmonary consumption, from which he did not entirely recover for several years. There having been no medical college since the disbanding of the old one, which occurred in 1852, in the year 1869 the organization of the Indiana Medical College was effected, in which he was chosen as Teacher of Theory and Practice, in which he continued until the spring of 1874, when he resigned his chair, and shortly after, upon the organization of the College of Physicians and Surgeons (himself having been the originator), he was assigned the same department, and held it until the union of the two medical schools, in 1878, under the style of the Medical College of Indiana, when he was elected to the same chair he had occupied in the two other organizations, viz.: Principles and Practice of Medicine, and which he continued to hold until the time of his death. He was the first representative from his State upon the Judicial Council of the American Medical Association, which he held for several successive terms, and to which he was again elected, in his absence, at the meeting in 1883. He was president of the State Society in 1871; was an active worker for seven years upon the Provisional Board, created by the Legislature, and whose work was the erection and fitting up of a large building, occupied as the Female Department of the Hospital for the Insane; was one of the Physicians to the Deaf and Dumb Asylum for nearly eight years; he served a single term in the Legislature as Representative, in 1856-57, besides which he held no position disconnected with his profession, and to which most of his life's effort was faithfully given, never abating his interest in State or local society matters, and was a regular attendant of his county society as long as his health would allow. As a practitioner of medicine he was eminently successful. His notably quick perceptive faculties, his careful and systematic methods of examination, with a comprehensive knowledge of pathology, general and special, combined to make him skillful in the diagnosis of disease; whilst his ready resources and originality of thought in the application of means, left him entirely independent of routine therapeutics. Added to these his cheerful, pleasant manner in the sick room, his gentle touch and sympathizing words, made him always welcome; and there was about him that indescribable something that always inspired confidence. These and other qualities necessary to the successful physician, he possessed in an unusual degree, and they enabled him to bring to the bedside resources not surpassed by any man of his State and time; and the estimation in which he was held by his professional brethren throughout Indiana is well attested in the large consultation business he did for many years. As a teacher he was clear and explicit, easily understood, and well remembered; talked much of the specific nature of diseases and their laws of reproduction, and dwelt

largely upon the general principles of pathology and their application in special forms of diseases, frequently referring to them in the solution of minor questions. More popular perhaps with his classes in his lectures upon chest diseases, and especially upon the several affections of the heart, and their differential diagnosis, reducing the knowledge of a difficult and intricate subject to a basis readily understood and easily retained, as many a practitioner of the hundreds scattered through this and other States, who have had the benefits of his teaching, will testify. Though an extensive reader and collater of authorities, he used but few notes, relying mostly upon memory for the authorities, as well as for the arrangement of his subject, giving name of author and page with precision. He was averse to writing, and has left but few written articles, and these have less merit than his talks, public or private. As a lecturer, his manner was easy, dignified and not ungraceful; his words were well chosen, his language was plain but forcible, sometimes eloquent, and he always commanded the attention of his auditors. One of his colleagues, who was familiar with Sir Thomas Watson's methods of teaching, says Dr. Todd always reminded him of that worthy by the simplicity, clearness and force with which he presented a subject. Certainly it would not be claiming for him more than his due to say that in this regard he will compare very favorably with the best lecturers of the several institutions in which he was engaged, and upon the history of medical teaching in Indiana he has left a lasting impress. He had but little toleration for irregular medicine (so called) in any of its forms, and was opposed to all modern innovations upon the usages of the past in medical ethics; was an ardent and unconditional advocate of the code, and always gave his voice and influence to aid in maintaining the dignity of the profession. He was the friend of his brother physician, always ready to aid him in any difficulty when called upon, and to take his side in any controversy when consistent with his ideas of right; especially was this spirit manifested toward the younger members of the profession, who never looked to him in vain for aid, one of his last acts being to vindicate a young practitioner of this city from what he considered an unjust accusation by the Board of Health. On another occasion he very summarily dismissed from his office rooms a legal gentleman of standing, and a special friend, who was talking with some parties and proposing to take evidence prejudicial to a reputable physician in a neighboring country town, declaring with emphasis that no proceeding for the purpose of injuring a doctor should be instituted in his office. If in the conflict of life under circumstances so unfavorable and beset by so many difficulties he attained success where many would have endured defeat—if he succeeded in wrenching from Fortune's unwilling hand a prize worthy of the effort—if the end seems large when contrasted with the small means employed in the beginning—and if there is that to emulate in his example—the lesson it would teach is one of entire devotion to a single purpose in life, with all the force and energy of his nature directed in a single channel. Yet, whatever may be said of education and general advantages—their developing and concealing influences upon char-

acter—there is perhaps too little ascribed to inherent qualities that work their results inevitably as the laws of chemistry, and without external aids. Diamonds are not the product of human skill. "Poets are not made." Birds that sing or soar are not reared in cages. There are few *noticeable* things whose pattern is of human origin, and when the Almighty makes a *man*, he endows him with the means within himself of working out his destiny. Such souls "spring shelterless as grasses," and need not the protecting wing with which nature hovers her "cheaper broods." As is commonly the case with men of his cast, he was not financially successful. Though commanding a large and lucrative business for many years, he failed to improve the opportunities offered, which were ample, for the accumulation of a fortune. But he esteemed money only for its uses, and with a liberal hand he gave it to meet the wants of others, frequently, indeed, to his own injury. And no matter how often imposed upon in the matter of benevolence, he rarely failed to respond to the call of want or distress, and only those who were intimate with him knew how much of his time and of his best efforts in private practice were devoted to impecunious sufferers. It seemed as though the poverty and wretchedness of his patients were the cords which bound him more closely to them, securing for them his most persistent and unremitting efforts, and while he paid but little court to those whose wealth and station made them, as he thought, exacting in their demands for his professional services or respect, yet the charity patient, no matter how difficult or chronic the case, was never turned away unkindly. And the earnest and heartfelt regard he entertained for his suffering fellow-creatures is well attested in the love and gratitude of many who followed him with tears of sorrow to the grave. Truly and worthily might the lines have been written for his sake—

"How many a poor heart's blessing went
With thee beneath that low, green tent
Whose curtain never outward swings."

If it be esteemed a great end in life to be remembered when gone from this world, how much better to live in the warm light of love and sympathy, if it be but for a single generation, within a circle that personal recognition can compass, than to have a name in marble—read through curiosity rather than affection—and a heritage under the cold sky of fame, even though it be world-wide. Though impulsive and passionate in his nature, and possessed of a power of language that gave easy utterance to his mood in expressions of scorn, ridicule or abuse, it required but little acquaintance with him to know that the ebullition was only superficial above the quiet depths of kindness in his heart, and his severest tirades frequently had only the effect to make his victim smile, either in admiration for the keenness of his tongue, or the utter failure in his effort to be severe. Akin to this, or rather growing out of this exercise of good feeling, was an entire absence of vindictiveness, or a spirit of resentment toward those who had wronged him, if beyond the time of infliction of the injury. He had no word in his vocabulary which was expressive of hate, and was as free from malice as the Israelitish Nathaniel was from guile, as those who knew him best will testify. And through

all the conflicts of a stormy and eventful professional life, he never had an enemy to whose aid he would not have come in distress; and his anger toward his fellow-man was never so hot and fierce but that it might have died in forgiveness with the sunset of that day; and his generosity here, as elsewhere, overstepped the bounds of justice, and never stopped to question the extent of his injuries, in the unconditional forgiveness of those who had been his worst enemies. Still he had faults and frailties, his full human share, though for the most part springing from the same deep, generous soil of his nature, out of which grew virtues, one of which would overshadow a multitude. Whatever of bitter fruit was borne, it was to himself and not to others. Let the broad mantle of that charity his life so kindly and yet so justly claims, be thrown over his faults; but may the memory of his virtues shine out like stars in the night, to lighten the darkness that follows the setting of life's sun. His habits as a reader (or rather as a student of medicine, for such he was to the last days of his life) were in some respects more noticeable than worthy of example. His readings were not so general as exhaustive. Once having laid hands upon a book, or his attention having been directed to a subject, he forgot or neglected everything else, himself included, until that was disposed of, and to the best of his abilities. For years past, it was not uncommon for him, and especially during his lecture season, after his family were in bed, to spend the night through in close application upon some work or special subject, and that, too, perhaps, after a hard day's work. The theater, the concert, or the literary lecture, had no attractions for him that his love of medical science and the investigation of its many unsolved problems did not overmatch. He was ambitious and aspiring from the very commencement of his professional life, having declared, when a student, that he intended to be president of a medical college. And this crusader-like zeal with which he espoused his profession did not abate, nor did he suffer the rust to settle upon his harness to the close of his career. In practice, when in good working trim, the number of patients he could see in a given time, the rapidity and precision with which his examinations were made, and prescriptions written, was a matter of no little wonder to those well acquainted with him. As a matter of minor mention his immunity from contagious and infectious diseases was somewhat remarkable, having been subject to none of them. Even when a boy he had none of the eruptive fevers that are incident to childhood and youth, and though never successfully vaccinated he had an unusually large experience in the treatment of small-pox, having volunteered to take charge of a small-pox hospital while in the army, and continued to treat the disease, whenever called upon, to the close of his life. His tastes were simple, and geniality and kindness shown in all the smaller matters of life. He loved his pets. Next to his children his horse and dog came in for their full share of his regards. His health was always inconstant, having been subject to acute attacks throughout his adult life, and these increased upon him very notably in force and frequency of late years, his robust appearance and vigorous manner and movement being deceptive as to his real condition, and

from the indisposition that began in August, 1882, which was unusually prolonged and severe, he never recovered his accustomed tone, though filling most of his lecture course, and with the loss of vital resistance incident to his age and condition he sank at last under the effects of a casualty from which he could easily have recovered a few years earlier in life. Not old, it is true, in years, but relatively as life is really to be reckoned by its vicissitudes and hardships, he was much farther advanced. He is gone from the homes of men, his life has faded from the light of this world's day, his journey has ended, his work is done and his record made, whether for good or evil, and his ear is alike insensate to the praise or blame that may follow. Life to him was no holiday; its beginning was unpropitious, its brightest days were overhung with clouds of sorrow, and its close was invested with unusual sadness. Use the figure as you will—it was to him “a winter’s day,” “a battle,” a “toilsome journey full of weariness and pain,” “a voyage” over a stormy sea from the ceaseless unrest of whose waves and billows we trust his soul has found rest and peace at last in some quiet harbor. Covered with flowers, moistened with sympathetic tears, his remains were borne by friendly hands to a quiet spot far from the noise and tumult of the city’s ways and near to the scenes of his early labors, amidst woods and fields, where the sweet influences of nature which in life he had loved so well might brood over the place of his rest, and where the songs of birds and the hum of bees, and the perfume of flowers might come to him in the balmy air of summer and its gentle winds might lull his spirit to a sweet repose. Rarely has death stilled a hand that left more of the heart of humanity in its friendly grasp, or its palsying touch been laid upon a truer, a manlier or more loving heart.

TONER, Joseph Meredith, of Washington, D. C., was born in Pittsburgh, Pa., April 30, 1825. His academic education was received at the Western University, and at Mount Saint Mary’s College, Md. His medical studies were pursued in the Vermont Academy of Medicine in 1850, and at the Jefferson Medical College in 1853, from which he received the degree of M. D. He practiced, successively, at Summit and at Pittsburgh, Pa.; Harper’s Ferry, Va., and finally at Washington, D. C., establishing himself in the last named city in November, 1855. He is a member of the American Medical Association, was its president in 1873; of the Medical Association and Medical Society of the District of Columbia, having at various times filled the leading offices in both organizations; of the American Public Health Association, its president in 1874; a delegate to, and one of the vice-presidents of the International Medical Congress at Philadelphia in 1876; an honorary member of the New York and California State Medical Societies, and of the Boston Gynecological Society. He was also Vice-President and Registrar of the International Medical Congress in 1887. He was a founder of Providence Hospital, and of St. Ann’s Infant Asylum, to which he was visiting physician, and since 1856 has been the attending physician to St. Joseph’s Orphan Asylum. In consideration of the perishable character of much of the early medical literature of this country Dr. Toner devised a scheme for a repository of medical works that

should be under the control of that profession in the United States, and located at the National Capital. His resolution on that subject was adopted by the American Medical Association in 1868, and resulted in the establishment of the library of that organization. The collection is placed in the Smithsonian Institution, and has reached the number of several thousand volumes, including pamphlets. In 1871 he founded the Toner lectures by placing \$3,000 (which has since grown to nearly double that amount) in the hands of trustees who are charged with the duty of annually procuring two lectures that contain some new facts valuable to medical science; the interest on the fund, save ten per cent., which is added to the permanent fund, being paid to the authors of the essays. These lectures are included in the regular list of the publications of the Smithsonian Institution. It is the first attempt in this country to endow a course of lectures on such conditions. Dr. Toner has devoted much time and research to early medical literature, and has collected over a thousand treatises published before 1800, and besides publishing numerous monographs has in preparation a Biographical Dictionary of Deceased American Physicians, of which more than four thousand sketches are completed. He is an authority in the medical, biographical and local history of the District of Columbia, and has devised a system of symbols of geographical localities which has been adopted by the United States Post-Office Department. He is a member of numerous medical, historical and philosophical associations, and has published more than fifty papers and monographs upon subjects of interest to the medical profession. Of his more important publications may be mentioned: “Abortion in a Medical and Moral Aspect,” “Arrest of Development of the Cranial Bones—Epilepsy,” 1861; “Maternal Instinct of Love,” 1864; “Propriety and Necessity of Compelling Vaccination,” “History of Inoculation in Pennsylvania,” 1865; “Anniversary Oration before the Medical Society of the District of Columbia,” “The Portability of Cholera and Necessity for Quarantine,” 1866—joint paper with Charles A. Lee, M. D.; “History of Inoculation in Massachusetts,” “Medical Register of the District of Columbia,” 1867; “Address at Dedication of Medical Hall, Washington,” 1869; “Statistics of Representation in the American Medical Association,” “Necrology of the Physicians of the Late War,” 1870; prepared “Medical Register of the United States,” 1871; “A Sketch of the Life of Dr. Charles A. Lee,” “Facts of Vital Statistics in the United States, with Diagrams,” 1872; “Statistics of the Boards of Health in United States,” “Free Parks, Camping Grounds, or Sanitariums for Sick Children of the Poor in Cities,” “Statistical Sketch of the Medical Profession of the United States,” “Statistics of the Medical Associations and Hospitals of the United States,” 1873; “Address as President before the American Medical Association,” 1874; “Dictionary of Elevations and Climatic Register,” “Annals of Medical Progress and Education in America,” “Contributions to the Study of Yellow Fever in the United States—Its Distribution with Weather Maps,” 1874; “Annual Oration before the Medical and Chirurgical Faculty of Maryland,” 1875; “Address as

President of the American Public Health Association," 1875; "Biographical Sketch of Dr. John D. Jackson," "Medical Men of the Revolution—an Address before the Alumni of the Jefferson Medical College," 1876; "Sketch of the life of Dr. T. M. Logan," "Biography of Dr. John Morgan, of Philadelphia," "Address on Biography before the International Medical Congress," 1876; "Water Supplying of Cities—Public Health Association," "Notes on the Burning of Theaters and Public Halls," "Rocky Mountain Medical Association," and a "Memorial Volume with a Biography of its Members," 1877; also addresses before various societies and colleges. In 1874 he placed a gold medal, struck at the United States mint and bearing his likeness, at the disposal of the faculty of Jefferson Medical College to be awarded annually to the student producing the best thesis based upon original research. In the same year he established a medal to be granted annually by the faculty of the University of Georgetown, D. C., to the student who should collect and name the greatest number of specimens in any department of the natural sciences. In 1882 he gave his entire library, including manuscripts, to the United States Government. It consisted of 28,000 books and 18,000 pamphlets.

TONEY, Luther Clark, of Omaha, Neb., was born in St. Louis, Mo., May 25, 1858. He graduated at Missouri Medical College in 1881, and at Bellevue Hospital Medical College in 1882. He was appointed, after special medical examination, as Assistant Physician on the medical staff of officers in the New York City Lunatic Asylum, Blackwell's Island, and served until November 15, 1883, when he left by voluntary resignation. In December of the same year he was appointed Surgeon on board the *Leerdam*, of the Netherlands Steamship Navigation Company, between New York and Amsterdam, Holland. The death of a brother, T. N. Toney, midshipman in the United States Navy, took him to Illinois, where his father, Dr. E. C. Toney, lives, and where he remained in practice with his father and served in the capacity of Surgeon for the Ohio & Mississippi Railroad, at Trenton, that State. In 1885 he was Agency Physician for the Indians in Chehalis county, Washington, and afterward established himself in Omaha, where he remained in general practice until 1888, when he was appointed Acting Assistant Surgeon United States Army and was ordered to Los Angeles, Cal., and has since served at Fort Lowell and Fort Grant, Arizona. Dr. Toney has been a member of numerous medical societies, including the Illinois State Medical Society and the American Public Health Association. Among his contributions to medical literature may be mentioned those entitled as follows: "Cystic Sarcoma," "Hour-glass Contraction of Uterus," "Effects of High Altitude upon Heart and Lung Diseases," and "The Use of the Stomach-tube for the Insane."

TUCKER, Willis Gaylord, of Albany, N. Y., was born in Albany, on October 31, 1849. His father, the late Luther Tucker, was a well-known editor and writer upon agriculture. From childhood he evinced a taste for the natural sciences, and especially for chemistry, and at the Albany Academy, where eight years were spent, he came under the instruction of teachers whose influence was in every way most beneficial. Under the guidance of

the late Dr. Jacob S. Mosher, he devoted himself assiduously to the study of chemistry, and graduating from the academy in 1866, he became Dr. Mosher's assistant in the laboratory of the medical college, which position he had occupied for some time before leaving the academy. A year later he entered the office of the late Prof. James H. Armsby and began the study of medicine, but he still continued to devote much of his time to the study of chemistry and other branches of natural science. From the medical college he was graduated in 1870, and during the succeeding year he was appointed Assistant Professor of Chemistry in the Medical College, and in 1874 Lecturer on *Materia Medica* as well. On the reorganization of the Faculty in 1876 he was made Professor of Inorganic and Analytical Chemistry, and in 1887 the department of toxicology was also assigned to him. During these years he has conducted the laboratory classes in practical chemistry, in connection with the lectures given, and, as a teacher, has been most successful in kindling new ardor and love for science and the methods of scientific inquiry in the pupils who have come under his instruction. In this capacity his relations with the college are still continued, but Dr. Tucker's work as an instructor has not been confined to the Albany Medical College alone. Since 1874 he has been Lecturer on Chemistry at St. Agnes School, and at different times he has been Professor of Chemistry at the Albany Academy, the Albany Female Academy, and from 1876 to 1887, at the Albany High School. Largely through his instrumentality, in 1881, was founded the Albany College of Pharmacy, created by the board of governors as a department of Union University. From the outset he has been Professor of Chemistry in this new school, and for several years was its secretary, and is now the president of its Faculty. From a small beginning, he has seen this school grow into one of the most successful of its kind in the land. The State Board of Health was created in 1880, and the following year Dr. Tucker was appointed one of the analysts to the board, a position which he continued to hold until 1891, when the entire chemical work of the board was put under his charge as Director of the State Laboratory. During these years he has investigated and reported upon many of the public water supplies of the State, examined thousands of samples of drugs, and made special study of matters pertaining to sanitary science, especially in the direction of food and drug adulteration. For many years he has given much attention to water analysis, and from the outset opposed the plan afterwards adopted, of taking the city supply from the Hudson river. As chemist to the special water commission, and afterward to the board of water commissioners, he has examined the various sources of water supply proposed for the city of Albany, and a few years since he analyzed for the City Board of Health the waters of the public wells, and recommended the greater part of them to be closed. As an expert in medico-legal cases his services as a toxicologist have frequently been rendered in court; and he is a witness not easily discredited. In 1882 Dr. Tucker was chosen Registrar of the Albany Medical College, and he was one of the originators of its alumni association, and since its organization in 1874, has

been its secretary. As president of the Faculty of the College of Pharmacy he is an *ex-officio* member of the board of governors of Union University. He is a Fellow of the Chemical Society (London); of the American Association for the Advancement of Science; a member of the American Chemical Society; of the New York State Medical Society, and of various other scientific societies throughout the country. As a writer Dr. Tucker has been a frequent contributor to scientific journals, particularly on chemical subjects. For several years he was one of the editors of the *Albany Medical Annals*, and contributed to its pages many original articles of his own. He is a great lover of books and has collected a large library in which most of the great masters in literature are represented as well as a working library well stocked with the latest authorities and works of reference in science. The honorary degree of Ph. G. was conferred on him by the Albany College of Pharmacy in 1882, and the same year he received the degree of Ph. D. from Union College.

TURNBULL, Charles Smith, of Philadelphia, Pa., was born in that city, November 10, 1847. He is the son of the following Dr. Laurence Turnbull and was graduated at the Philadelphia Central High School A. B. in 1868, and A. M. in 1873; and studied medicine in the Medical Department of the University of Pennsylvania, from which he graduated in 1871. In 1871 and 1872 he was Surgeon to the United States Geological Survey of the Territories of Wyoming and Montana. In 1873 and 1874 he was Resident Assistant Surgeon to the New York Ophthalmic and Aural Institute. In 1874 and 1875 he was a student in the Ophthalmic and Aural Departments of the Imperial General Hospital, Vienna, under Arlt, Jäger, Politzer and Gruber, since which time he has been practicing ophthalmology and otology in Philadelphia. He is a member of the Franklin Institute, and is Chief of the Aural Department of Jefferson Medical College, and Ophthalmic and Aural Surgeon to the Howard, St. Christopher, German and Jewish Hospitals, as well as the Home for Incurables. He is a member of the Philadelphia County and Pennsylvania State Medical Societies, of the American Medical Association, and other national organizations, also a Fellow of the Philadelphia College of Physicians, and the associate editor in charge of the Department of Otology in the "Annual of the Universal Medical Sciences." He has translated from the German Gruber's "Tenotomy of the Tensor Tympani Muscle;" Brunner's treatise "On the Methods of Connections of the Ossicles;" and Arlt's "Injuries of the Eye Considered Medico-Legally."

TURNBULL, Laurence, of Philadelphia, Pa., was born September 10, 1821, in Scotland, and came to this country when he was twelve years of age. After receiving an academical education he entered the drug and chemical establishment of Mr. John Bringham, and about the same time the Philadelphia College of Pharmacy, from which he graduated, taking as his thesis, "Salacine," which he discovered in the *populus tremuloides*, which was afterwards published by the faculty of the college in the *Journal of Pharmacy*. Subsequently entering the establishment of the late Frederick Brown, Esq., he took charge of the chemical department, preparing many of the new preparations

of the day, and while thus engaged received an award of merit from the Franklin Institute for his success and skill in preparing citrate of iron, and other pharmaceutical remedies. He subsequently made the discovery that biborate of soda had the property of bleaching ordinary colored ointments. While yet giving a portion of his time to chemistry and pharmacy, he entered as a student the office of the late Prof. John K. Mitchell, and subsequently graduated from the Jefferson Medical College in 1845. Owing to his failing health he relinquished his chemical and pharmaceutical studies. Soon after his graduation he accepted the position of Resident Physician at the Philadelphia Hospital, Blockley, afterwards that of out-door Physician of the poor for the Department of Moyamensing, and subsequently that of Vaccine Physician, which he held for a number of years. For some time he was a Lecturer at the Franklin Institute, on Chemistry Applied to the Arts, giving particular attention to electricity, in its various manifestations and applications, especially to telegraphy, his lectures being subsequently published in the journal of the institute and in book form, while a second edition was published by Abraham Hart. In 1857 he was elected one of the Physicians to the Department of Diseases of the Eye and Ear in the Western Clinical Infirmary (now Howard Hospital), and served in that capacity until 1887. In 1859 he visited Europe, where he studied the practice of the Irish, Scotch, English, Dutch, and French physicians in diseases of the eye and ear. Returning to this country, he published a work (the first of its kind in the United States), on the mode of using the ophthalmoscope. At an early period in his professional life, he began the special study of aural surgery, and he was the first in United States to perform perforation of the mastoid cells for diseases in that region, which operation he has successfully repeated with the most gratifying results. After the second battle of Bull Run he offered his services to the United States Government, serving in Emory Hospital and Fortress Monroe. He is a Fellow of the American Association for the Advancement of Science; a member of the American Medical Association; Medical Society of the State of Pennsylvania, of which he was vice-president; Philadelphia County Medical Society; and was a delegate to the recent International Medical Congress, in 1876, where he was elected president of the Section on Otology, which he declined in favor of a gentleman from abroad. Besides holding membership in various medical societies, he presided over the Section in Otology of the American Medical Association in 1880, and of the British Medical Association in 1881, and he was chosen a delegate to the Section in Otology of the British Medical Association in 1888, and to the Congress of Otology that convened in Brussels, Belgium, during the same year. In 1878 Dr. Turnbull was elected Aural Surgeon to Jefferson Medical College Hospital. Among his contributions to medical literature are: "A Biographical Sketch of Prof. John K. Mitchell;" "The Electro-Magnetic Telegraph, with an Historical Account of its Rise, Progress, and Present Condition;" "Whooping-Cough;" "Hints and Observations on Military Hygiene, with the Best Means of Treating the Medical and Surgical Diseases of the Army;" "Defective and Impaired Vision, with the

Clinical Use of the Ophthalmoscope in their Diagnosis and Treatment;" "The Nature, Causes, and Treatment of Nervous Deafness, with an Additional Translation from the French of Duchenne;" "A Manual of Diseases of the Ear;" "A Brochure on Tinnitus Aurium," second edition; and, "Clinical Observations on the Relief of Pain in Acute Affections of the Ear." He is also the author of "A Clinical Manual of Disease of the Ear," 1881, "A Manual of Anesthetic Agents, and their Employment in the Treatment of Disease," 1885, and has since made other important contributions to medical literature.

TURNER, Henry E., of Newport, R. I., was born in Warwick, R. I., June 16, 1816. He was educated at the schools of Newport and Portsmouth, and received the degree of M. D. from the University of Pennsylvania in 1836. He was appointed an Acting Assistant Surgeon United States Army in 1862, and was stationed at Fort Adams and Newport Harbor. He has contributed many valuable papers to medical and scientific literature, and also to history. His standing as an anatomist is exceptionally high. He is the oldest of the Newport physicians, and is one of the most respected in his State. He is City Physician, and one of the Attending Physicians in Newport Hospital, one of the Medical Examiners of the district, president of the State Board of Health, and a prominent officer of the Society of Cincinnati.

TYSON, James, of Philadelphia, Pa., born in that city October 26, 1841, descended from Cornelius Tyson, who emigrated to Germantown, Philadelphia, from Crefeld, on the lower Rhine, between 1683 and 1703. Cornelius Tyson died at Germantown, in 1716, at the age of sixty-six, and is buried in Axes graveyard. Over him was placed by Pastorius a tombstone, still in good state of preservation, which is said to be the oldest existing tombstone erected to the memory of a German in Pennsylvania. Dr. James Tyson received his preliminary education at Haverford College, Pennsylvania, whence he was graduated A. B. in 1860, and A. M. in 1864. He studied medicine under the direction of his father, the late Dr. Henry Tyson, of Reading, Pa., Dr. John B. Brooke, of Reading, Pa., and the late Dr. John Neill, of Philadelphia. He was graduated from the Medical School of the University of Pennsylvania, in 1863. During the last year of his student life was an acting medical cadet in the military hospitals of Philadelphia, and shortly after graduation was appointed an Acting Assistant Surgeon in the United States Army, serving during the summer in Philadelphia and Harrisburg. In July, 1863, he was elected a Resident Physician in the Pennsylvania Hospital, where he served until the following April, when he again entered the service of the government, and continued until the close of the War of the Rebellion, in 1865, serving in Philadelphia and for a time at Winchester, Va. He commenced practice in Philadelphia in 1864, and continues to reside there at the present time. He began also teaching medicine to private classes of students in the University of Pennsylvania with the session of 1864-5. He was appointed Lecturer on Microscopy there in 1868, and on Urinary Chemistry in 1870. From 1870 till 1878 he was Professor of Physiology and Microscopy in the Pennsylvania College of Dental Surgery. On the organization of the new Hospital of the Uni-

versity of Pennsylvania, in 1874, he was made Lecturer on Pathological Anatomy and Histology. In 1876 he was elected Professor of General Pathology and Morbid Anatomy in the Medical Department of the University, and in 1889 was transferred to the Chair of Clinical Medicine, which he now holds. He was Secretary of the Faculty of Medicine from 1877 to 1888, and Dean of the Faculty from 1888 to 1892. He was one of the visiting physicians of St. Joseph's Hospital, Philadelphia, 1871-2. He was appointed Microscopist to the Philadelphia Hospital in 1866, Pathologist in 1870, and Visiting Physician from 1872 to 1890, and President of the Medical Board in 1886. He is also *ex-officio* one of the physicians to the Hospital of the University, and was one of the Board of Managers from 1874 to 1878, and was again made a manager in 1891. He is one of the Visiting Physicians to the Rush Hospital, for consumption and allied diseases, in Philadelphia (1892), Consulting Physician to the Kensington Hospital for Women (1891.) In 1871 and 1872 he assisted in editing the Philadelphia Medical Times, and he also edited four volumes of the publications of the Pathological Society of Philadelphia (1871 to 1877.) In addition to numerous papers on histology and pathology, and clinical lectures, he has published "The Cell Doctrine: Its History and Present State" (Philadelphia, 1870), second edition, 1878; "An Introduction to Practical Histology" (1873); "Practical Examination of the Urine" (1875), eighth edition, 1893; "A Treatise on Bright's Disease and Diabetes" (1881), and a hand-book on "Physical Diagnosis" (1891). Dr. Tyson is a member of the College of Physicians of Philadelphia (1866); a member of the Pathological Society (1863), and was recorder from 1869 to 1877, vice-president from 1871 to 1882, president from 1882 to 1884, member of the Philadelphia County Medical Society (1874), and a life member of its Mutual Aid Association; of the Medical Society of the State of Pennsylvania (1875), and of the American Medical Association (1872). He was recorder of the Biological and Microscopical Section of the Academy of Natural Sciences from 1868 to 1872, vice-director from 1872 to 1877; one of the original members of the Obstetrical Society of Philadelphia, 1869; is an original member of the Association of American Physicians' Institutes, and since 1887 a member of the American Philosophical Society.

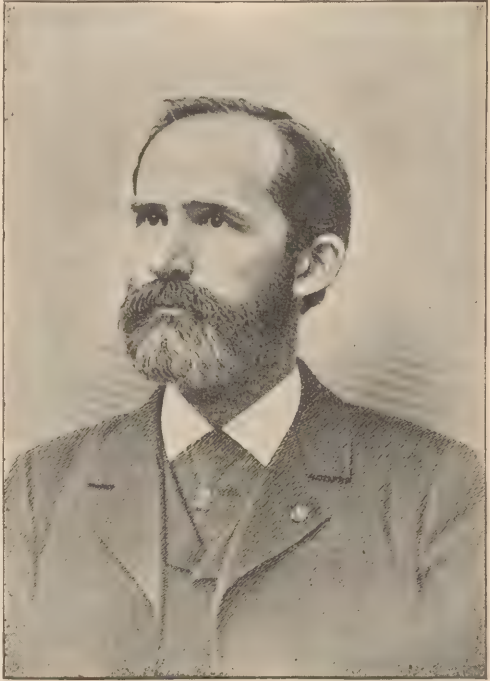

ULRICH, William B., of Chester, Pa., was born in Philadelphia, May 4, 1829. After receiving an academic education in the common schools of Chester and at a high school at Unionville, in his native State, he studied medicine and entered the Philadelphia College of Medicine, and subsequently the New Orleans School of Medicine, graduating from the former institution in 1850, and from the latter in 1866. Dr. Ulrich established himself in practice at Fairview, La., in 1851, where he remained engaged in the active duties of his profession until 1867, when he removed to Galveston, Tex., but near the close of the latter year settled in the city of his present residence. He was a member of the Galveston Medical Society, and is ex-president of the Delaware County (Pa.) Medical Society, and is an active member of the Medical Society of the State of Pennsylvania, and of the Ameri-

can Medical Association. He has served as Surgeon to the Pennsylvania Military Academy at Chester, and has taken an active interest in educational affairs, both at Chester and at Fairview, La., where he has held the position of School director.

VAN BUREN, William H., of New York City, was born in Philadelphia, Pa., April 5, 1819, and died in the former city March 25, 1883. He was a great grandson of Abraham Van Buren, who studied medicine under Boerhaave at Leyden, and who in 1700 came from Holland to New York. He was in his day a prominent physician of that city. The subject of this sketch was a student at Yale of the class of 1838 for two years, and was subsequently graduated at that institution. On leaving college he studied medicine at the University of Pennsylvania. He received his medical degree from that institution in 1840, and supplemented his professional education by attendance at the hospitals of Paris. Soon after graduating he was commissioned Assistant Surgeon in the United States Army, and served five years in that capacity. In December, 1845, he went to New York to assist his father-in-law, the late Dr. Valentine Mott, in his surgical clinic connection with the medical department of the University of New York. Dr. Van Buren attained eminence as a teacher and demonstrator of anatomy and surgery, as well as an operative surgeon and a skillful physician. On the organization of Bellevue Hospital in 1847 he was appointed one of the surgeons. In 1849 he became Surgeon to St. Vincent Hospital, and in 1852 he was elected Professor of Anatomy in the New York University Medical College. He became Visiting Surgeon during the same year to New York Hospital, and held that position for sixteen years, and was then Consulting Surgeon. He was also Consulting Surgeon to Bellevue and Charity Hospitals. He was one of the founders of the United States Sanitary Commission in 1861, and served as the medical member of its executive committee throughout the Rebellion, declining the appointment of Surgeon-General of the United States Army. He resigned his chair in the University Medical College in 1866, on being elected Professor of Surgery for the newly-established Department of Diseases of the Genito-Urinary System in the Bellevue Hospital Medical College. In 1868 this chair was combined with that of the Principles and Practice of Surgery, and from 1871 to 1873, also, he acted as Professor of Clinical Surgery. He was vice-president of the New York Academy of Medicine, president of the New York Pathological Society, and a corresponding member of the Paris Surgical Society. Yale conferred on him the degree of LL.D. in 1879. Dr. Van Buren amputated at the hip-joint, tied the internal and external iliac, and the subclavian arteries, as well as executed many other difficult and important surgical operations. He placed more reliance than surgeons generally in the reparative processes of nature. He devoted much study to hereditary taints and constitutional tendencies, and in later life, though still noted for his skill in general surgery, devoted his attention mainly to diseases of the genito-urinary organs. He published, with Dr. C. E. Isaacs, a translation of "Bernard and Huettes' Manual of Operative Surgery and Medical Anatomy," 1855; a translation of Charles Morel's "Compendium of Hu-

man Histology," 1861; "Contributions to Practical Surgery," 1865; "Lectures on Diseases of the Rectum," 1870, and, with his pupil, Dr. E. L. Keyes, a "Text-book on Diseases of the Genito-Urinary Organs, with Syphilis," 1874. In addition to his contributions to medical literature in book form, he was also the author of numerous important articles of professional interest in the leading journals of this country.

VANDER VEER, Albert, of Albany, N. Y., was born in Montgomery county, New York, July 10, 1841. He is a son of Abram H. VanderVeer, farmer, merchant, mechanic, and comes from good old Holland stock, a race which has done so much in the interest of colonization, civilization and the development of moral and intellectual powers. He was sent, when young, to the Union Free School, at Palatine, afterward to the Canajoharie

Albert VanderVeer

Academy, where he became a diligent and successful student, laying the foundation of a substantial intellectual fabric. His inclinations in the direction of medicine were so strong that when a mere boy he found great interest and satisfaction in dissecting birds and various small animals. At the age of eighteen he commenced the study of medicine in the office of Dr. Simeon Snow, of Root, N. Y., where for a year he studied the various medical text-books with all the enthusiasm and devotion of a genuine student; then, desiring to continue his education in a larger sphere, he went to Albany and entered the office of Dr. John Swinburne, the well-known surgeon, attending lectures at the Albany Medical College. In 1861, when the Civil War was begin-

ning, the call for surgeons as well as soldiers was so urgently made that, filled with ardor for his professional work, he desired to go to the front. He first served at the Ira Harris Hospital as a State Medical Cadet, and in May, 1862, was one of the original "one hundred" commissioned as a United States Medical Cadet, and ordered to report for duty at Columbia College Hospital, at Washington. While at this post he attended a course of lectures at the National Medical College, graduating in the session of 1862. He was then examined and commissioned by Surgeon-General S. O. VanderPoel as Assistant Surgeon of the Sixty-sixth Regiment of New York Volunteers, and in the following year was advanced to the grade of surgeon, with the rank of major. He served with this regiment until the close of the war and was mustered out September, 1865, having served in several important positions in the First Division Hospital, Second Army Corps. To perfect as far as possible his attainments in medical science, he attended a full course of lectures in the autumn of 1865 and 1866 at the College of Physicians and Surgeons in New York City. In the spring of 1866 he returned to Albany and established himself in the general practice of his profession. In the summer of 1869 Dr. VanderVeer was appointed to the chair of General and Special Anatomy in the Albany Medical College, from which, about this time, he received the honorary title of M. D. He now became Attending Surgeon in the Albany Hospital, and in 1874 was appointed to the same position in St. Peter's Hospital. He visited Europe in the fall of 1874 and the winter of 1875, finding much to gratify his special taste and to further enrich his stores of medical learning. On the re-organization of the Albany Medical College, in 1876, he accepted the professorship of the Principles and Practice of Surgery, and now holds the position of Professor of Didactic, Abdominal and Clinical Surgery. In 1882 Williams College gave him the degree of A. M., and in 1883 Hamilton and Union Colleges that of Ph. D. In 1884 he again visited Europe, where great kindness was shown him by Mr. Lawson Tait, F. R. C. S. He also read a paper before the International Medical Congress at Copenhagen. Outside of his own profession it may be here stated that the Doctor is a great lover of the fine arts, and studies with absorbing interest and delight the works of the great masters in sculpture, painting and engraving. Dr. VanderVeer is a member, and has been president of both the Albany County and New York State Medical Societies. He is moreover a member of the Boston Gynecological Society; the British Medical Association; the International Medical Congress, held at Copenhagen in 1884; the British Gynecological Society; the American Surgical Association; the Holland Society of New York, of which he is now vice-president for the Albany District; the American Medical Association; the New York Medico-Legal Society; the Albany Institute; the American Association of Obstetricians and Gynecologists, and President of the latter Association in 1892. Dr. VanderVeer has written much on surgical subjects, of which the following are among the principal contributions: "The Operation for Stone as Observed in Some of the London Hospitals, Together with a Report of Cases from Private

Practice;" "Report of Eight Cases of Uterine Fibroids;" "Report of Three Cases of Incision of the Rectum;" "Some Personal Observations on the Work of Lawson Tait, Together with a Report of Five Cases of Abdominal Section;" "Case of Sub-Cutaneous Section of Femur Above Trochanter Major;" "Cleft Palate and Hare-Lip," for Wood's Reference Hand-Book of the Medical Sciences; "History of Abdominal Section in Albany;" "The Relation of the Abdominal Surgeon to the Obstetrician and Gynecologist;" "To What Extent Can We Classify Versical Calculi for Operation;" "Water Supply of Cities and Villages," the anniversary address before the Medical Society of the State of New York, delivered at Albany, February 3, 1886; "Report of a Case of Hematophilia, or a Family of Bleeders;" "Appendicitis—The Relation of the Physician and Surgeon in the Care of Cases;" "Retro-Peritoneal Tumors—Their Anatomical Relations, Pathology, Diagnosis and Treatment;" "Report of Cases of Cholecystotomy, with Special Reference to the Treatment of Calculus Lodging in the Common Duct;" "Hystero-Epilepsy, with Report of Cases;" "The Management of Cancer of the Uterus, Complicated with Pregnancy, with Report of a Case." We may state here that the Doctor is paying the strictest attention to abdominal surgery and surgical diseases of women.

VANDERVORT, Franklin Cady, of Bloomington, Illinois, was born August 5, 1858, near Peru, in the same State. He comes of Knickerbocker stock, his father being of Dutch descent and his mother English. After receiving a high school education he attended literary college at Butler University, Irvington, Ind. He took up the study of medicine with his father, Dr. Ira A. Vandervort, and in the year 1881 graduated at the Rush Medical College, Chicago, being chairman of the executive committee of his class, which consisted of 185 members. He immediately commenced the practice of medicine at Tonica, his old home in Illinois, where he soon gained a large practice. In 1888 he moved to Bloomington, and is at present in partnership with Dr. J. L. White, and Assistant Surgeon of the Chicago & Alton Railroad. He is a member of the North Central Illinois Medical Society, of which he was president in 1888. He is also a member of the McLean County Society, of which he was also president. He was the first Medical Health Officer of the city of Bloomington, and has been County Physician of McLean county. He is a good writer, and has contributed many valuable papers to the different medical journals. He was married to Hattie E. Morehouse, of Bloomington, September 3, 1884.

VARICK, Theodore Romeyn, of Jersey City, N. J., was born in Dutchess county, N. Y., June 24, 1825, and died November 23, 1887. He descended from Dutch ancestry, who came to this country about 1680. His professional education was received at the University of New York, where he was graduated M. D. in 1846. During the following two or three years he practiced in the City of New York, and was Attending Physician to the New York Dispensary. In the latter part of 1848 he finally established himself in Jersey City, where he resided until his death. He was an active member of numerous local, State and national medical organizations; was president of the New Jersey and the New York State Medical

Societies, and was Surgeon-General of New Jersey. He was also Surgeon to St. Francis Hospital and the Jersey City Charity Hospital, and also a member of the New Jersey State Board of Health, and Director of the Morris Plains Hospital for the Insane. Dr. Varick made important contributions to professional knowledge, and his skill as a surgeon was widely known. He was the first to demonstrate the value of cocaine in capital amputations, and he introduced into this country Trendelenberg's method of amputating at the hip-joint. "Being dissatisfied with the results of the Lister method of dressing open wounds, he perfected a system for the employment of hot water in surgery, and thereby secured the largest percentage of successful amputations known, but three deaths resulting from fifty-four capital amputations. He was also the first to use hot water to control oozing in laparotomy." Of his professional publications may be mentioned: "Use of Nitrate of Silver in Acute Laryngitis;" "Subperiosteal Resection of the Clavicle;" "Distal Compression in Inguinal Aneurism;" "The Causes of Death After Operations and Grave Injuries;" "The Use of Hot Water in Surgery," and "The Protective Treatment of Open Wounds."

VERNON, George W., of Indianapolis, Ind., was born near Zanesville, Muskingum county, Ohio, April 20, 1857. He is a son of Noah Vernon and Mary (Morgan) Vernon. His father's family were Scotch-English, and among the

Geo. W. Vernon.

first settlers in Muskingum county, O. His mother was born in Virginia, of German parentage. His father died in December, 1863, leaving him the oldest of three children, which his mother kept together until the fall of 1865, when she sold all her property and moved (with her parents and family) to Sidney, Champaign county, Illinois. From the spring of 1866 to the fall of 1874, he worked upon a

farm, attending school when the weather was too disagreeable to work, and kept up with his classes by night study. From the fall of 1874 to the spring of 1880, he taught school—the last year was principal of the graded school at Sidney, his home. In the spring of 1880 he entered the drug business, receiving a certificate of Pharmacy from the Illinois State Board of Pharmacy, October, 1881, after which he worked in one of the leading drug stores in Champaign, and spent all leisure time in the study of pharmacy and medicine. In the fall of 1883 he entered the office of Dr. Joseph Eastman, Indianapolis, Ind., with whom he studied medicine, and attended three courses of lectures at the Central College of Physicians and Surgeons, Indianapolis, from which school he graduated in March, 1886. Upon receiving his degree he entered the competitive examination for positions in Indianapolis City Hospital and Dispensary; was successful, and served in City Dispensary for one year, when he commenced private practice, doing general practice until the summer of 1892, when he limited his practice to diseases of children and dermatology. He has been on the medical staff of the Indianapolis Orphan Asylum, also Consulting Physician to City Hospital and Dispensary since January, 1889. He is a member of the Marion County, the Indiana State, and the Mississippi Valley Medical Societies, and the American Medical Association. His principal contributions to current medical literature are: "The Causes and Pathology of Broncho-Pneumonia of Childhood," Transactions of Indiana State Medical Society, 1889; "Vulvo-Vaginitis in Children," same society, 1891; "Constipation in Childhood Following Diarrhea," read before the Mississippi Valley Medical Association, at Evansville, Ind., October, 1889, and printed in several medical journals. He is now engaged on a work in his special line of practice.

WAGNER, Theodore A., of Indianapolis, Ind., was born in Grevenmacher on the Moselle river in the Grand Duchy of Luxembourg, February 25, 1849. He received his education at the Royal (Grand Ducal) Athenaeum of Luxembourg, and came to the United States in December, 1865, entering on a mercantile career which he pursued for five years. In 1870 he began the study of medicine under Drs. F. S. Newcomer and John Chambers, and graduated from the Indiana Medical College in February, 1876, when he immediately entered upon the practice of his profession in Indianapolis. The following year he was appointed Physician at the City Dispensary, which post he occupied for four years; during two years of this time he was also Surgical Attendant at the police station and county jail. In 1878 Dr. Wagner was one of the three Indianapolis physicians in charge of the expedition for the relief of the yellow fever sufferers at Memphis, Tenn. In September, 1879, he married Sarah Hill Fletcher, daughter of Calvin Fletcher, of Indianapolis. From 1882 to 1885 he was Consulting Physician to the Marion County Infirmary. In addition to the practice of his profession, Dr. Wagner has taken a deep interest in municipal affairs, and has twice been elected Coroner. In 1884, while attending a case of small-pox, then epidemic, Dr. Wagner contracted the disease, and voluntarily went to the pest-house. After his recovery, with an abundance of clinical ma-

ferial about him, he devoted some time to the study of small-pox and its complications; and

Theodore A. Wagner

at subsequent meetings of the County and State Societies presented a resume of his investigations that attracted attention, and brought to him many letters from prominent physicians in various parts of the country. Among his other contributions to medical literature are: "Puerperal Septicemia;" "Varieties of Croup and Treatment;" "Complications of Diphtheria." Dr. Wagner is on the consulting staff of the City Dispensary. He is a member of the County, State and American Medical Associations.

WALKER, Edwin, of Evansville, Ind., was born in that city May 6, 1853. His ancestors for several generations were natives of the United States. On his father's side they were of Irish-English descent, and lived in Delaware and Pennsylvania. On his mother's side (Burtis), they were of Scotch and Dutch descent, and lived in New York. His paternal grandmother and his maternal grandfather were Quakers. Both families came west early in the twenties, and, after a short residence in Cincinnati, moved to Evansville, and have taken prominent parts in the affairs of their adopted city. Dr. Walker was educated in the schools of his native city and in Hanover (Ind.), College. He began the study of medicine with his uncle, Dr. George B. Walker, and, after attending three courses of lectures at the Evansville Medical College, graduated in 1874. In 1877 he attended a course in New York, and, in 1879, graduated at the University of that city. Subsequently he attended a course at the Policlinic, and has every year or two spent a month or more in study in New York City. In 1885-6 he spent a year in

Europe, studying at Berlin, Vienna, London and Edinburgh, devoting his time to gynecology and abdominal surgery. He has resided in Evansville all his life, and all his practice has been at that place. Dr. Walker has been gradually limiting his work to gynecology and abdominal surgery, and, while not yet entirely a specialist, the probabilities are that he will be in a few years. He has already done much work in this department. He has had two successful operations for extra-uterine pregnancy. He has done eight operations for appendicitis, and has also had more than fifty laparotomies. During the existence of the Evansville Medical College he filled successfully the chairs of Anatomy, Nervous Diseases, and Diseases of Women. He was one of the founders of the Evansville Hospital and also of the Training School for Nurses, both of which are now in prosperous condition. He has been Gynecological and Abdominal Surgeon of the Hospital since its beginning (1882). Dr. Walker is a member of the local and State Medical Societies and of the American Medical Society, also of the Mississippi Valley Medical Society, the American Association of Obstetricians and Gynecologists, and the Southern Gynecological and Surgical Association. In 1891 he was unanimously elected president of the Indiana State Medical Society, and was the youngest man ever chosen for that office. He has been an active practitioner, having very soon acquired a very large clientele, and has, therefore, found little time for writing. Among his contributions to the literature of the profession may be mentioned: "Report of Two Cases of Extra-Uterine Pregnancy," *American Journal of Obstetrics*; "Remarks on One Phase of Puerperal Sepsis," advocating early operation

Edwin Walker

in purulent collections after labor, with report of cases, *Medical Mirror*, also "Office Gyneco-

logical Practice," *Medical Mirror*. In 1880 he married Capitola, daughter of George P. Huds-peth. In 1888 the trustees of Hanover Col-lege conferred upon him the degree of Ph. D. as a recognition of his professional merit.

WALKER, John C., of Indianapolis, Ind., was born in Shelbyville, near that city, February 11, 1828, and died April 14, 1883. His ancestry were of Scotch-Irish stock, and emigrated to Penn-sylvania early in the Seventeenth Century. Benjamin Walker, a veteran soldier in the Revolution, at the close of the war returned to his home on the Susquehanna, near Harris-burg. In some trouble with the Indians, his father was captured, and, it was said, burned at the stake. Peace having been restored, a band of Indians encamped near the town, and one night two of them were overheard by Ben-jamin Walker relating the circumstances of the murder of his father. When the Indians de-parted he and his brother followed, overtook them, and after a desperate encounter killed both. The fight began near a high bank, over-looking the river, Benjamin and his adversary rolling in the water below, where he succeeded in drowning the latter. This affair having oc-curred in time of peace, Benjamin Walker was outlawed by proclamation of the Governor, and, with his wife and several small children, embarked in canoes on the Ohio river and ul-timately reached Dearborn county, Ind. At his home on Laughery creek he was frequently visited by Daniel Boone, the celebrated hunter. One of his sons, John C. Walker, a prominent citizen and member of the State Senate, re-moved to Shelbyville, where his son, the sub-ject of this sketch, was born. Dr. Walker was educated by his brother-in-law, Prof. E. P. Cummins, an eminent teacher and minister. Young Walker possessed a strong and active intellect, was a good student and diligent reader, and soon acquired a large store of information and varied accomplishments. Early in his career he purchased the *La Porte Times*, which, as editor and proprietor, he made the most influential paper in Northern Indiana. Its editor was soon re-cognized as a man of mark. He was elected to the Legislature of 1853, and took a high rank in that body. In 1855 he became a joint owner of the *Indianapolis Sentinel*, which he made a powerful party organ. In 1856 he was nomi-nated for Lieutenant-Governor, on the ticket with the eloquent A. P. Willard, but being under the constitutional age he was obliged to withdraw. A. A. Hammond, who was sub-stituted, became Governor by the untimely death of Governor Willard. Dr. Walker was chosen, in 1858, to make the race for Congress against Schuyler Colfax, but was defeated. Being a War Democrat during the Rebellion, he took the first opportunity to enter the Union army, and was elected to command the Thirty-fifth Indiana Volunteers, and served in that capacity for the period of one year. He then went to Europe, where he remained until 1872. In London he studied medicine at King's Col-lege, and married Miss Laura Seymour, daugh-ter of an officer in the British Navy. After his return to this country he continued his studies at the Indiana Medical College, from which he obtained his medical degree. He settled in his native town, and there success-fully practiced his profession until 1879, when he was appointed Assistant Physician in the Indiana Hospital for the Insane. In that in-

stitution he died of quick consumption, super-induced by diabetes, with which he had suffered for more than a year. Dr. Walker was a man of most noble nature, chivalrous in his devo-tion to principle and friends, fair and not im-placable to his enemies. His intellectual abil-ity was of high order. He was thoroughly well informed, a pleasant conversationalist, a de-lightful companion, full of reminiscences of great men and stirring times. He possessed a decided literary gift, was a facile and vigorous political writer, and sometimes practiced his pen in poetry. He was an accomplished phy-sician and a many-sided man, endowed by nature with noble and delightful talents.

WARREN, John, of Boston, was born in Roxbury, Mass., July 27, 1753, and died April 4, 1815. "Among those whom, in the history of our country, posterity will learn to regard as their most devoted benefactors, none will be placed in a more elevated position or be considered as entitled to a more grateful re-membrance, than the earlier teachers and prac-titioners of scientific medicine. Surrounded by almost insuperable obstacles, both to the attainment of instruction in those acquire-ments which in this noble pursuit can alone lead to extensive usefulness, yet having over-come them all, they certainly most richly merit the gratitude of succeeding generations who have placed the cultivation of this science upon a firm and enduring foundation. When, in addition, we have the memory of the purest, most disinterested and most active patriotism, sacrificing the dearest of human ties and in-terests for the general good, then, indeed, we have a combination which the pages of a na-tion's history are but rarely called upon to record. It is of such a man that the following pages are commemorative. Justice demands no more truthful exemplification of such a career than is found in the public life and services of Dr. John Warren." From a me-moir written by Dr. Buckminster Brown, of Boston, and published in the *American Medi-cal Biography*, the editor has derived the fol-lowing interesting details concerning the life and professional achievements of this eminent physician and surgeon: He was the son of Joseph Warren, whose chief interest and occu-pation consisted in cultivating his land, and particularly in raising fruit, and his enthusiasm in producing and bringing to maturity a cer-tain variety of apple, to which he had given much attention, may, indeed, be said to have cost him his life. This was the apple now called the Warren russeting. While walking through his orchard one morning he observed, near the top of one of his favorite trees, a very beautiful specimen of this fruit. The sun gilded its rosy side, and it had a very tempt-ing appearance. Determined to obtain so valuable a sample, he climbed the tree, and just as he had plucked it, the branch upon which he stood gave way, he fell to the ground and was instantly killed. The mother of Dr. Warren was one of those truly noble-minded women who always leave an impression; an impression which is felt, however unacknowl-edged, from one generation to another, and which is extended in constantly widening cir-cles, like the eddy formed by the stone upon the lake, with increasing radii, until the shore upon each side is touched by its gentle undula-tions. That biography must indeed be im-perfect, which omits all reference to the youth

of the great and good, or to those early influences and teachings that planted the seed, which in its maturity yielded such beneficent fruit. The virtues of the mother of Washington will ever form a part of his country's history, and the simple instructions and example, the disinterested courage and devotion of Mrs. Warren, will be felt so long as the names of her sons and the memory of Bunker Hill shall hold a place among its annals. Left at an early age a widow, with four young boys to educate, most faithfully did she perform the double duty which devolved upon her, and in her daily life they witnessed the exemplification of those virtues, which in after years they so signally imitated. A writer who knew her well, in describing her character, says: "But not only as a mother was she estimated, for she practiced the virtue of benevolence in the fullest sense of the word. To her neighbors she was kind and hospitable; to the poor her house was always open." The name of Dr. Warren's eldest brother, Dr. Joseph Warren, will ever be remembered, as that of one of the earliest martyrs in the cause of his country's freedom. Gen. Warren was also a physician, and previous to the Revolution enjoyed an extensive and lucrative practice in Boston. The eminence to which Dr. Joseph Warren had attained in the New England States, as a medical practitioner, may become shaded, and perhaps even overlooked, in the interest which his bright career and early death have awakened in the hearts of his countrymen. But this can never be without doing injustice to his memory, and to the medical profession, of which he was an earnest member, and in whose ranks he was proud to enroll himself. Dr. Joseph Warren was the medical instructor of his youngest brother, Dr. John Warren. He is, therefore, doubly entitled to consideration in a work of this character, both as having himself been distinguished as a medical man, and as having kindled the flame of professional enthusiasm which burned so long and with such results in the heart of his ready pupil. Dr. John Warren was educated at Harvard University. He entered college at the age of fourteen, and was entirely dependent upon his own exertions for maintenance while pursuing his education. Even at this early age, he exhibited a taste for the study of anatomy, and by his efforts an association of students was formed for the purpose of cultivating it. He took the degree of Bachelor of Arts in 1771; and having, under the tuition of his brother, completed his preparation for the practice of medicine, he settled in Salem, in 1773, being then only twenty years of age. He had previously made himself thoroughly acquainted with the Dutch language, with the intention of pursuing the practice of his profession at Surinam. The disturbed state of his native land, however, and his unwillingness to leave home while trouble was impending, prevented the execution of this design. While pursuing his medical studies he was initiated by his brother into the principles on which the patriots of that time grounded their opposition to the pretensions of the British government; and imbibed his ardor in supporting the rights of his country. He early became a political writer, and engaged heart and soul in the sacred cause of freedom, and in animating his friends and his often desponding fellow-citizens to encounter with

fortitude the difficulties of the contest. He endeavored to impress upon them his own sentiments: "that being engaged in a cause that was just it was their duty to persevere, and to be discouraged neither by present danger nor by the certain prospect of death." In Salem, Dr. Holyoke soon became one of his warmest friends. To all who are acquainted with the medical history of our country the name of this distinguished physician is familiar. Universally respected and beloved, he was alike honored for his practical science, his extensive attainments and accurate judgment, and for those noble qualities of mind and heart which attached all who were personally acquainted with him, and left a memorial in their hearts which the lapse of years has had no influence in effacing. Aided by so influential a patron, and winning his own way by his agreeable manners and evident ability, the practice of Dr. Warren rapidly extended, and soon became second only to that of his distinguished friend. In the mind of Dr. Warren, however, personal and individual considerations were of minor importance when the welfare of his country was in jeopardy. It was evident that love for his native land was paramount to all other interests. He was present when the first blood was shed in that eventful conflict which severed the American Colonies from the mother country. News being received of the intended attack on the military stores at Concord, he immediately joined Colonel Pickering's regiment, as a volunteer, and marched to the defense of this most important post, and was present when the two hostile forces encountered at Lexington, where the first battle took place. Two of Dr. Warren's brothers were also present in this action, and each of them took an active part in the skirmish. The reports of the conflict and the rumbling of the cannon of the ever to be remembered 17th of June, again called Dr. Warren from his professional duties. He armed himself, and hastened on foot, guided by the flames of Charlestown, to join the army at Cambridge. His mind was overwhelmed with anxiety for his brother's safety. He well knew that that brother's enthusiasm in the cause would lead him into the thickest of the fight, and he felt his own heart burning with eagerness to engage in the glorious struggle. Various and contradictory reports reached him on the road. By some he was informed that General Warren was taken prisoner; by others, that he had been slain on the field of battle. During this period of suspense, Dr. Warren suffered great distress. After some days the certainty of his brother's death was established, and the excitement caused by this event, added to his previous deep interest in the cause, determined him at once to relinquish his brilliant professional prospects, and to engage as a volunteer in the capacity of a private soldier. The intense agitation and emotions of resentment which burned in his breast against the instigators of those outrages which had brought such evils upon his country, may be best gathered from some fragments of his private journal which have recently been discovered, extracts from which have been published. A few sentences are cited to show his feelings at this exciting period: "Some told me that my brother was undoubtedly alive and well; and others that he was wounded; and others that he fell

on the field. Thus perplexed almost to distraction, I went on inquiring with a solicitude, which was such a mixture of hope and fear as none but such as have felt can form any conception. In this manner I passed several days, every day's information decreasing the probability of his safety. Oh, ye bloodthirsty wretches! who planned the dreadful scene which you are now forcing your bloodhounds to execute, did you but feel the pangs of heart-felt pungent grief for the cruel wounds you inflict upon the tenderest part of the public, as well as upon individuals, you would excrete those diabolical measures which, by your counsels, have been adopted, and which have precipitated us into all the horrors of a civil war! Go home, and tell your bloodthirsty master your pitiful tale, and tell him, too, that the laurel which once decorated the English soldier, has withered on his brow on the American shore. Tell him that British honor and fame have received a mortal stab from the brave conduct of Americans. Tell him that even your conquests have but served to inspire the sufferers with fresh courage, and more determined resolution, and let him know that since that accursed day, when first the hostile forces of Britain planted their foot on the American shore, your conduct has been such as has resulted in a continued series of disgraceful incidents, and in operations replete with ignorance and folly." The deep grief of Mrs. Warren at the loss of her eldest son, and the anguish she experienced at the thought of another being equally exposed, at last prevailed upon Dr. Warren to alter his resolution. He decided to serve his country by performing the more useful and equally arduous duties of hospital surgeon. To this office he was appointed by General Washington, during the siege of Boston. Important and honorable as this siege was to America, the Regular Army of Great Britain being shut up by an undisciplined militia for nearly a year, it was not fertile in military events. In March, 1776, however, there was a prospect of a bloody and desperate engagement. The Americans, by a masterly maneuver of their general, had taken possession of Dorchester Heights, and the British commander had the alternative of driving them from their position or of evacuating the city. He determined to make the attempt to storm the Heights, and at the same time attack the American force at Roxbury. General Washington, ever on the alert, and not willing to act simply on the defensive, ordered a select body of four thousand men to cross Charles river in boats, and at the same moment to attack Boston. Dr. Warren was of this party, and sympathized with the hopes and animation which filled the breasts of this patriotic band. It is a matter of history that the English general did not carry out his intention, but finally abandoned the city. Dr. Warren was one of the detachment ordered to take possession of Boston on its evacuation by the British troops. It was on this occasion that he, with Dr. Daniel Scott, made the discovery of a most ignoble and fiendish trap which had been set for their destruction by the enemy, viz., the poisoning of a large quantity of medicines that had been left by the English in the workhouse. This building had been used by them as a hospital, and in it were found large stores of capital and important articles. Upon examining these,

Dr. Warren found that large quantities of white and yellow arsenic had been mixed with them. By this timely discovery, undoubtedly, many lives were saved. Dr. Warren, in his private journal, very accurately describes the appearance of the city as it was left by the British, and the redoubts and fortifications upon Beacon, Copp's and Fort Hill, together with the cannon, ammunition, horses, wheat, hay and other articles which were found in various parts of the city. Although this sketch is intended chiefly as a biography of Dr. Warren as a medical man, yet we can not forbear making one further extract from this journal, to show more fully by what influences he was surrounded on his entrance into professional life, leaving the reader to judge how far these stirring events, which aroused the deepest feelings of an acutely sensitive nature, may have assisted in moulding his character in after life. His first visit to the spot where his brother was slain is thus mentioned: "This day I visited Charlestown, and a most melancholy heap of ruins it is; scarcely the vestiges of those beautiful buildings remain. The hill which was the theater upon which the bloody tragedy of the 17th of June was acted, commands the most affecting view I ever saw. The walls of magnificent buildings tottering to the earth below; above, a great number of rude hillocks, under which are deposited the remains in clusters of those deathless heroes who fell on the field of battle. The scene was inexpressibly solemn. When I considered myself as walking over the bones of many of my worthy fellow-countrymen, who jeopardized and sacrificed their lives in these high places; when I considered that perhaps, while I was musing on the objects around me, I might be standing over the remains of a dear brother, whose blood had stained these hallowed walks; with what veneration did this inspire me! how many endearing scenes of fraternal friendships, now past and gone forever, presented themselves to my view! But it is enough; oh, may our arms be strengthened to fight the battles of our God!" Dr. Warren was attached to the main army under the immediate command of General Washington. In the disastrous battle of Long Island, his professional skill was called into full operation, and he continued in active service throughout the gloomy and disheartening winter of 1776 and 1777. He, however, never for one moment was discouraged. Notwithstanding that the fate of the army seemed almost inevitable, as he constantly saw it diminishing in numbers day by day; although he beheld the suffering of the troops from the want of provisions and clothing, and retreated with the remnant as they were pursued from spot to spot, in this, the most dark and trying period of our eventful contest, yet his faith in the integrity of the cause, and the firmness of his conviction that the result would be the happiness and liberty of his country, prevented him from ever yielding to the pressure of the circumstances by which he was surrounded, but enabled him to sustain and strengthen the sinking hearts of his fellow-sufferers. The successes on that eventful Christmas Eve at Trenton, and on the brilliant morning of the ensuing 3d of January at Princeton, confirmed his prognostications. At the former place, he and the entire medical staff were very near being taken prisoners.

This was in consequence of the celerity and secrecy of General Washington's movements. Following up his advantages with a rapidity and decision which constantly took the English by surprise, and which so strikingly displayed the talents of a great military commander, he marched during the night to the attack upon the British at Princeton. The breaking up of the encampment took place so quietly that the medical officers were not aware of the event until in the morning they beheld upon the other side of a small stream the advance of the enemy upon them, while their own army was not anywhere visible. Mounting their horses, they with some difficulty discovered traces of the route taken by the American forces, and arrived in time to succor the wounded at Princeton. Soon after this Dr. Warren was seized with a fever which nearly proved fatal. Brighter prospects began now to dawn upon our country, and having been with the army through the most dangerous and discouraging periods of the Revolution, he was removed to another department, and returned to Boston to superintend the establishment of a military hospital in that place. He there continued in public service until the peace. This situation was favorable to the advancement of the anatomical studies which he had commenced when in college, and which he had occasionally pursued to the present time. His proficiency in this branch, together with the skill in surgery which he thus acquired, gained him a distinguished reputation, and soon raised him to the rank of the most eminent surgical practitioner in the New England States; a rank which he maintained for nearly forty years. While with the army at Philadelphia, Dr. Warren had frequently met, at his general's table, Miss Abby Collins, the daughter of Governor Collins, of Newport, R. I. This young lady was on a visit to the wife of General Mifflin, and formed one of the family party at headquarters, at General Washington's table. She was a favorite *protégé* of the great commander. Before the encampment at this place was broken up Dr. Warren became engaged to Miss Collins, and soon after his settlement in Boston he went to Newport to claim his bride. During the early part of his married life the expenses of a family were a source of anxiety. They exceeded his means, particularly as he was, at this time, under the necessity of liquidating a debt incurred for his education. Pecuniary embarrassments, however, could no more damp his ardor than political adversity; and, triumphing over all difficulties, he led the advance guard in the corps of medicine and surgery. His anatomical acquirements excited the interest and inquiries of his friends, and he gave for their instruction a few private demonstrations. These were so well received that the Boston Medical Association invited him to deliver a regular course of lectures. Dr. Warren's opportunities for attending lectures upon any subject connected with his profession had been very few. Those whom he was now called upon to instruct had some of them been educated in foreign medical schools, and had heard the first lectures of the age; they held the medical practice of Boston and its vicinity. Dr. Warren and his immediate contemporaries in the profession, when pursuing their studies, had been prevented from quitting home by the dangers which menaced their

country, and the importance of their services at home at that juncture. Before such an audience it was somewhat of a severe ordeal to present himself as an instructor. An early biographer, however, states "that all deficiencies were supplied by talents and resolution," and another writer says that he "gained much reputation from his accuracy in demonstrating and his facility in describing." In 1780 he gave a course of dissections to his colleagues with success. To them the opportunity was so novel and so desirable that they seized upon it with zeal, and none of them ever forgot the impression received from his lectures. These lectures were delivered in the Military Hospital, which was situated in a pasture, in the rear of the present Massachusetts General Hospital, at the corner of Milton and Spring Streets. It is well known that, at the time referred to, and in truth for many years later, there existed a strong popular prejudice against dissections. On this account the lectures were conducted with great secrecy. In the following year they were more public, and the students of Harvard University were permitted to attend. It was this season, and at the place above referred to, that Dr. Warren performed the operation for the removal of an arm at the shoulder-joint, with complete success. Already, by bequests previously made, there existed, at the university, foundations for professorships of anatomy and surgery. No person had as yet appeared whose talents and acquirements in these branches were such as to entitle him to fill these important chairs. President Willard perceived how much the interests of the university might be promoted by the talents of Dr. Warren. A correspondence was entered into, which terminated in the establishment of the first medical institution in New England. The courses were opened in 1783. Dr. Warren filled the chair of anatomy and surgery for more than thirty years. For twenty-six years his lectures were delivered in Cambridge without any assistance. The difficulties with which he successfully contended in the performance of these duties, arising from the circumstances of the times, from the public opinion in respect to dissections, and other causes, can not now be thoroughly understood. Add to these the delays and uncertainties of a tedious ferry, which had daily to be crossed, with the occupation and embarrassments of an extensive medical and surgical practice, and we may indeed consider this undertaking, and its attendant labors, as almost Herculean. At times, in the winter, the accumulation of ice would render the ferry impassable. To disappoint his class, or take a long drive through Roxbury and Brookline were the alternatives—a circuit of at least twenty miles. The latter was universally his choice—going and returning on the same morning by this circuitous route, after performing his dissections for demonstration to his students, and delivering a lecture sometimes three hours in length. Soon after commencing these exhausting labors, Dr. Warren was attacked with a violent fever, from which he was not expected to recover, and more than once were his overtaken powers on the point of sinking under these accumulated duties. Becoming fully aware that such exertions were rapidly undermining his constitution, he twice unsuccessfully tendered his resignation of the professorship. His

services as a physician were zealously rendered to the poor, as well as to those whose pecuniary circumstances enabled them to remunerate, so far as money can remunerate, the attentions of a faithful physician. With what fidelity these duties were performed, with what devoted attentions their various calls were answered, there are many in all classes of society yet living to attest, by their words, still breathing the warmest affection, and by their grateful remembrance. In 1784 Dr. Warren, in concert with several other medical gentlemen, established a small-pox hospital at Point Shirley, near Boston, and in 1792 he inoculated more than fifteen hundred persons. At the time of the yellow fever epidemic in Boston, in 1798, he interested himself deeply in the study of this disease, both in its symptoms and treatment during life, and in the morbid appearances presented after death. He examined the bodies of a large number who had died of this disease, and at the time, when the belief in its contagious nature was universal, he answered all calls, and showed his fearless devotion to the welfare of his patients, by inhaling their breath, in order to ascertain whether the calomel administered had had its specific effect. His experience in this disease convinced him that it was non-contagious. At this period Dr. Warren again became embarrassed in his pecuniary circumstances. He was induced to become responsible for the debts of a medical gentleman, and a former student, who had made extensive purchases of lands in the State of Maine. The lands were held in security. The gentleman failed to redeem his notes, and the property, reverting to Dr. Warren, was the source of large loss, of great annoyance and vexation, and finally involved a large portion of his property. In 1783 he took part in the formation of the Massachusetts Medical Society; and in 1804, after having been an active member, and most of the time an officer in that society, he was appointed president, an office to which he was annually re-elected until his death. Between the society and the medical school there had unfortunately been some misunderstanding, and at times even severe collisions. From his prominent position in both institutions, he was enabled to create harmony, and final co-operation in the furtherance of those great objects for which they had each been instituted. In 1810, by the efforts of Dr. Warren and his colleagues, the medical branch of the University was located in Boston. This step has served greatly to increase its prosperity and usefulness. A remarkable advance in the state of American medical science dates from this period. These changes were observed to have originated in Boston, and to have spread from thence throughout the country. A few years previous to this event, Dr. Warren had been elected president to the Massachusetts Humane and Agricultural Societies. He was also at this time Grand Master of the Massachusetts Lodge of Free Masons. In an eloquent eulogy, glowing with words fresh and warm from one of the noblest hearts and most gifted intellects of the profession, we find the following mention of the amount of work performed by Dr. Warren during these years of incessant toil. We refer to an address on the subject of this memoir, delivered at the request of the citizens of Boston, by Dr. James Jackson, who, universally

beloved and honored, was then engaged in the beneficent work to which his life had been devoted, and exhibited a noble example of the true physician, the brightest star in the medical galaxy of New England. His words are as follows: "From the year 1777, when Dr. Warren took charge of the army hospitals in this place, he became engaged in private practice. How extensive this has been, almost from the first moment, scarcely needs to be stated in an assembly of his townsmen. Probably no man in America has gone through so much business—I will not say in the same number of years, but even with the longest life. Certainly, for thirty years, one would think he scarcely retained time enough at his own command for the common purposes of sleep and refreshment. Yet we find that during this period he always had time to do good in his fullest proportion, as to those concerns which are common to all men. The interests of humanity were always his, and from her call he could never turn away his ear. We learn from the respectable fraternity of Masons, that he was among their greatest favorites; and, following his brother, he attained, at the age of thirty, to the highest distinctions which they could confer. In the Humane Society he was one of the earliest and most valuable members, and for many years was justly placed at their head. What, in short, is the institution, designed for the promotion of human happiness among us, in which he has not taken an active part? When a useful object was proposed, who has not felt assured that Dr. Warren might be counted among those who would give his efficient support?" Dr. Warren's mental attributes were of a high order. He may truly be considered a man of genius, although this was tempered and rendered doubly useful to mankind by a most rare combination with clear, far-sighted judgment, keen common sense, and extensive general literary attainments. His reasoning faculties were acute and powerful. He was gifted with a vivid imagination, which, in the practice of his profession, was of great service, both in enabling him to arrive at a more true and sympathizing appreciation of the sufferings of his patients than could otherwise be attained, and also in varying and adapting his treatment to the peculiarities and exigencies of the occasion. With a thorough knowledge of his art, he possessed a peculiar tact for the accurate observation of disease, and in rapidly arriving at conclusions, which another would only prove to be sound after a prolonged investigation. This quickness of perception, and the extraordinary rapidity with which thoughts succeeded each other in his mind, bringing him almost instantaneously to a correct judgment, constantly excited the astonishment and admiration of those with whom he was brought in contact. The rapidity of his bodily movement was equally remarkable. To this physical quality may in part be attributed the power which he acquired of performing an amount of work in a short time, and of accomplishing in a comparatively short life what, under other circumstances would have been utterly impossible. His intellectual activity and celerity of motion were manifested in all his habits of life. It was his custom to drive through the streets, when visiting his patients, often with his mind concentrated upon some important case, and with a speed which frequently set the laws of gravity

at defiance, and at his own imminent risk. It has been related by those who have accompanied him in his gig, that, considering the danger as always great, they have been in the habit of placing one foot upon the step, in readiness for a spring to the ground in case of accident. An incident may, with propriety, be here mentioned, at once exemplifying the universal respect with which his person was regarded by all classes of his fellow-citizens, and the qualities, mental and physical, above referred to. A military company being one day on parade through the streets of Boston, Dr. Warren was observed approaching them, driving with his customary speed, absorbed in thought, and evidently unconscious of their presence. At the word of their commander the soldiers, in true military style, opened to the right and left, and it was not until Dr. Warren had passed several of the foremost ranks that he realized this token of respect, and cordially acknowledged it with his usual courtesy. His experience of the toil and anxieties indissolubly connected with the medical profession, both in their effect on the practitioner himself and upon those connected with him in the family relation, and their intrenchment upon those hours of domestic enjoyment, which to him were peculiarly dear, led him to express a decided opinion adverse to any of his descendants entering upon the same path, or forming any connection by which they would be liable to suffer from this cause, as he and his had suffered. But the father can not mark out his children's destiny. His eldest son, the late Prof. J. C. Warren, whose career of elevated usefulness and distinguished professional renown has also terminated, early exhibited a taste for the studies and pursuits in which his father was so deeply interested. When his collegiate education was finished this inclination assumed a decided character. His father's opposition was equally decided, and for several months the young man remained at home in comparative idleness, prevented from following his natural bias by his desire to conform to the paternal wishes, while at the same time he found it impossible to interest himself in any other pursuit. But it was of no avail; the decision of the father was forced to yield to the enthusiastic ardor of the son. And it was well that it was so. Another of his sons, Dr. E. Warren, of Newton, Mass., likewise became a medical practitioner, and two of his daughters were united in marriage to members of the same profession; the eldest to John Gorham, M. D., late Professor of Chemistry in Harvard University, and another to John B. Brown, M. D., of Boston. As an orator Dr. Warren was gifted with peculiar power. His contemporaries unite in attributing to his eloquence a charm and interest which fascinated and riveted the attention of his audience. Time passed unheeded in listening to his flowing speeches, and after three hours had thus elapsed, which length of time was not unusual, they heard the closing words with regret. One who knew the subject of this memoir intimately, and to whose address we have previously referred, thus speaks of this endowment: "Amidst the various incidents and characteristics of his life which crowd upon my mind, I have not yet noticed his rare eloquence as a lecturer, nor do I know how to do so in adequate terms.

To those who have been accustomed to its charms I can not appear to do it justice. His voice was most harmoniously sonorous, his utterance distinct and full, his language perspicuous and well chosen. But its more peculiar charms were derived from the animation of delivery, from the interest he displayed in the subject of his discourse, and from his solicitude that every auditor should be satisfied both by his demonstrations and explanations." In a private communication to the writer, the same distinguished authority says: "His voice was fine, sonorous and mellow, and in the sick-room it was beautifully tender, expressing the kindliness of his heart and the warmth of his sympathy." The first time this gentleman met Dr. Warren was in the chamber of a young college friend, who was taken ill in Cambridge, far away from his home; and the warmth and tenderness of his manner at that time made an impression which, after the lapse of more than sixty years, remained still fresh in his memory. Another, in referring to these traits which so prominently marked his character, and which alone can account for that deep affection which was felt towards him by all who knew him, and which is cherished for his memory in the hearts of those who yet survive, thus writes: "Nor was his fame limited to a narrow circle of admirers; it was extended through our State and country; it was known, and honorably, in that from which we sprang. Much may not be said, but it is impossible to be wholly silent, on his wonderful assiduity in the practice, as well as diligence in the study of his profession. No call was unanswered; no hours or seasons were reserved. Wherever there was pain to be assuaged, or infirmity to be supported, or anguish to be relieved, there, at the first summons, was this ready minister of the healing art. The poor, who could give nothing but gratitude, the wretched, who scarce dared ask his attention, found in him a good Samaritan, not only binding up their wounds, but imparting, too, oil and wine for their comfort. To all his patients the manner of his attendance enhanced the value of his skill, and rendered him not only a celebrated but a beloved physician." "Not diligence alone, in the pursuit and communication of knowledge, and the discharge of those duties to which he had peculiarly pledged himself, but ardor of soul in all that he thought or did, emphatically characterized him. Who so active in business as he? Who more fervent in spirit? What could have carried him through such a course of duty, especially with his slender habit of health, but an eagerness which nothing could repress, a zeal which nothing could abate, a resolution which nothing could impede? His liberality was not confined to professional services; he cheerfully gave pecuniary aid to those he found in want; and all enterprises of a public or charitable nature found in him a ready contributor, both of money and of time." Ardent, energetic, enthusiastic, and generous in his temperament, Dr. Warren's mind and heart were in harmony with these qualities. Disinterested and unselfish almost to a fault, his whole soul was absorbed in fulfilling his duty towards those who were entrusted to his care; leaving no possible means for their relief un essayed; elevating, ennobling, and extending the usefulness of the medical profession, and benefiting the community of which he formed

a part. His nature was acutely sensitive, and his feelings keenly susceptible. He declined no responsibility which it seemed right he should assume. He exacted from himself the performance of duty to its utmost limit; and his shrinking from the fear of subsequent self-reproach caused him often to extend these limits far beyond the reality, and beyond his own powers of physical endurance. If an unusually important or doubtful case, or one which especially interested his feelings, was to be considered, his anxiety overcame all personal considerations, and the long hours of the night were passed in pacing his room, tasking his brain for some untried measure yet remaining to be employed, or by prolonged thought seeking to assure himself that no expedient which science or thoughtful consideration could suggest had been neglected. Keenly alive to the sufferings of others, the feebleness of his own constitution and his own liability to attacks of diseases, to which he was for many years subject, were immediately overlooked when others called upon him for aid. It was his custom to ride much upon horseback, as being the most expeditious means of visiting his patients, and especially when summoned in the night. His own complaints were most frequently relieved by an emetic, combined with the sudorific effect which usually accompanies their administration. He could not, however, even while under the influence of this remedy, be prevailed upon to refuse to bestow upon others the required attention; and frequently, after having retired for the night under these circumstances, he would rise and, in the severest weather, jump upon his horse and hasten to the bedside of the sufferer. It was undoubtedly such exposures, united to other causes already referred to, that undermined his constitution and shortened his life. As an almost necessary accompaniment of this extreme sensibility, Dr. Warren was subject, at times, to great depression of spirits. The hopes and aspirations of a strong and firm religious conviction had, however, taken deep root in his mind. Faith in the supreme goodness of a superintending Providence, and in a nobler state of existence, cheered him in his most desponding moments. To a firm conviction of the truth of the Christian revelation he had arrived, as the result of personal examination. Referring to this subject, Dr. Thacher, in his Medical Biography, says: "He was a Christian from conviction as well as feeling. He had examined for himself the evidences of our religion, and was satisfied of their conclusiveness; and the fruits of his belief were shown in a life spent in doing good, and in diffusing religious sentiments where he had influence. Although he visited many patients on Sunday morning, he devoted the rest of the day to religious duties, to attending on public worship, to reading on religious subjects, and instructing his family in the great truths of Christian doctrine. The foundations of this practice were laid by the instructions of an excellent and pious mother whom he zealously cherished while he lived, and deeply mourned on her death." All biography is comparatively worthless, which, in describing the public actions of a man, does not at the same time weave into the history of a sketch, minute so far as possible, of the distinguishing traits in his character in private life, one from which the

reader may be enabled to trace, in a clear, well-defined, and unique form, the entire man. No apology, therefore, is required for having entered into these details. It is in such, chiefly, that the biography of one distinguished man differs from that of another in the same walk of life; otherwise there would be a tendency to wearisome sameness. It is a narrative of the mental and moral qualities which can alone respond to the interest in the private history of an individual which his public career has awakened. From the sketch which we have thus far endeavored to trace, the true characteristics of Dr. Warren, in his domestic relation, will be readily understood. The ever flowing tenderness of affection with which he regarded those of his own household, and which awakened an endearing and peculiar strength of filial love and reverence in return, need find no memorial here. It requires no more living remembrance than that which it has found in the hearts and lives of those to whom he was thus united, and affords ample proof—if proof were required—that the career of the man of science, of one even the most completely absorbed in the active duties of life, is not inconsistent with the cultivation of the higher and nobler qualities; that such a life does not, of necessity, exclude the growth of those finer sentiments of the heart upon which, more than upon all else, true happiness depends. In his intercourse with his patients, the same susceptibility was conspicuous, and was the means of acquiring their affection. "He entered readily and warmly into their feelings. He affected no interest in their troubles that was not sincere. If they were in pain he knew what their sufferings were, and it would have been abhorrent to his nature to have treated them with indifference. In all the anxieties of those who were connected with the sufferers, by the relations of domestic life, he warmly sympathized, for no one had felt them more deeply than he. His virtues were heightened by an unaffected modesty, which the place he held in the estimation of his fellow-citizens never diminished. With the qualities we have described, he could not fail to possess that true politeness, which has its foundation in a benevolent heart." The esteem in which he was held often caused him to be called upon by those whose wish it was to advance some important political or social measure, and who were desirous that his influence should be exerted in its favor. His biographer has been informed by contemporaries of Dr. Warren that this influence was considered as almost a guide to public opinion. The peculiarity of the connection which, in those days, existed between the beloved physician and the families under his charge, will account in part for the power he possessed, to control or move the public mind. His interest in political affairs continued unabated through life, and when thus called upon, if the measure was one which met with his approbation, and one which he believed would advance the welfare of his country, or of his adopted city, he entered into it with his whole heart, and endeavored to secure its success by every means in his power. It was his custom, on such occasions, to acquaint himself thoroughly with the subject in debate, and, previous to the meeting, to write an address, in which his own views, with the course of reasoning which had

convinced him of their correctness, were clearly stated. Dr. Warren's published writings are not numerous. It certainly is remarkable, under the circumstances in which he was placed, that he found any time for the cultivation of general literature. Those important branches of knowledge, the daily acquisition of which is so indispensable in the progress of every well-balanced mind, were, however, never neglected. He delivered the oration on the first celebration of our National Independence, July 4, 1783. This oration affords abundant proof of extensive historical reading, of familiarity with the political affairs of the day, and of a wise and thoughtful consideration of their influence on the present and future welfare of the country. Orations and addresses on various other occasions of public interest have been published, viz., one before the Massachusetts Humane Society; one on the Hon. Thomas Russel, president of that Society, and an address to the Masonic Lodge of Massachusetts. He likewise contributed a number of valuable articles for the Communications of the Massachusetts Medical Society; others to the *New England Journal of Medicine and Surgery*, and the *Memoirs of the American Academy of Arts and Sciences*. The *Boston Magazine*, which was instituted in 1783, also contains in its pages articles from his pen, on some of the various miscellaneous subjects of general interest. A dissertation read before the Massachusetts Medical Society, entitled "A View of the Mercurial Practice in Febrile Diseases," contains a minute analysis of the effects of this remedy in the class of diseases in which it has been considered most efficacious. The results of an extensive practice, and of many years of careful observation, are here impartially narrated. The influence exerted by the remedy, as modified in many instances by the peculiar type of the prevailing disease, is minutely investigated, together with the circumstances in which it may be regarded as beneficial or injurious. In regard to various diseases in which calomel had previously been universally resorted to, Dr. Warren offers opinions in advance of the received authorities of the age, and in some instances strikingly coincident with those which prevail at the present time. Hydrocephalus, for example, is even yet considered by a large majority of English and American practitioners to be properly treated only by a resort to large and frequently repeated exhibitions of that remedy. In 1813, however, Dr. Warren wrote: "Calomel has for a long time been thought to be almost the only medicine affording any prospect of success. Whether it has ever effected a cure in real hydrocephalus internus, may, perhaps without imputation of skepticism, be doubted." His pathological investigations were unwearied, and the recorded results of these researches have afforded assistance in the diagnosis of disease at a later period, and their effects may often be traced in the established and universally received opinions of the present day. The work alluded to is, perhaps, the most concise and extended examination into the influence which this powerful remedy has upon many of those diseases with which we have most frequently to deal, and is a *résumé* of the knowledge and experience of the period, tempered and biased, of course, by the prevailing ideas and theories upon the subject to which it relates. Dr. War-

ren's chief, and perhaps only recreation, consisted in the indulgence, during the middle and latter periods of his life, of his taste for horticulture. His love for the country and for rural pursuits had always been strong, and had only been kept in abeyance by his more absorbing and sterner interests and duties. At no period could the gratification of this refined taste be considered as more than a passing and momentary relaxation. It was his custom, in the afternoon of a long summer day, to jump into his gig, and, accompanied by one of his family, drive with speed to his estate on Jamaica Plain, in Roxbury. There he would pass an hour, more or less, as circumstances would permit, in laying out his land, planting, trimming and grafting his fruit trees, and in noting their growth, and the development and progress of his various experiments and improvements. These hours afforded him the purest and most unmixed enjoyment, and they were those which his companions on such occasions recalled in after years as among the happiest in their lives. His keen delight in the beauties and wonderful provisions of nature, rendered him at these times peculiarly communicative and interesting in his conversation. His allotted time having expired, again he was in the city, and immersed in the anxieties and fatigues of professional business. Dr. Thacher, a contemporary, describes Dr. Warren's personal characteristics and hygienic habits in the following manner: "The personal appearance of Dr. Warren was most prepossessing. He was of about middling stature and well formed; his deportment was agreeable; his manners, formed in a military school and polished by intercourse with the officers of the French army, were those of an accomplished gentleman. An elevated forehead, black eyes, aquiline nose, and hair turned up from his forehead, gave him an air of dignity which became a person of his profession and character. Temperance was as agreeable to his wishes as it was necessary to his health. He rose and breakfasted early, afterwards did business at home, either professional or promiscuous, for about two hours, rarely leaving home till nine in the morning in summer, and ten in winter. He dined at two, ate heartily, but drank no wine and usually nothing but water,—for wine and the stronger stimulant drinks were poisonous to him through life. The afternoon and part of the evening were passed, like the morning, in visiting patients, and the evening terminated in visiting, or in consultation of such works as were necessary to the labors of the time, or in performing the duties incident to his position in the many societies with which he had become connected by his active and beneficent disposition. "Dr. Warren made his visits very short. He wasted no time in conversation, but immediately applied his mind to the case, and succeeded in possessing himself of it in a few minutes, in such a manner as perfectly to satisfy the patient and his friends; so that, though they often complained that his visits were short, and wished that they could have more of his company, they were deeply attached to him. This is not, however, to be attributed solely to their confidence in his skill, but to the warm and affectionate manner which with him was constitutional. In surgery, his pre-eminence was unrivaled during the greater

part of his career. The soundness of his judgment saved him from erroneous conclusions in a practice more within the cognizance of the public than that of medicine. Although compelled to trust to his own resources, and for the most part destitute of any aid from consultation in this division of his duties, his success was uniform, so far as the nature of the diseases he treated would allow. Hence he was resorted to from all parts of New England for surgical advice and operation. His manner of operating was perfectly cool, composed and decided. Though sympathizing in the suffering he was called upon to inflict, he did not allow that sympathy to influence him, or to hurry one step of his operation, or to omit any detail which could contribute to its success. Before its conclusion he always satisfied himself and those about him that everything had been done that ought to be done, and that no relic of disease had been suffered to escape his vigilance. At a very early period, and long before it was practiced on the continent of Europe, he introduced the healing of wounds by the first intention; thus shortening prodigiously the cure and sufferings connected with it. Among other difficulties he had to surmount was the want of an individual to whom he could resort for making, improving and repairing surgical instruments. No such person existed in Boston during the principal part of his time, and he was compelled to find a substitute in some itinerant razor-grinder, or in the labors of his pupils or his own hands."—*Thacher's Medical Biography*. Dr. Warren's collegiate education included a knowledge of the Greek, Latin, and to some extent of the Hebrew languages. He afterwards studied also the Dutch. Still later in life, being desirous of becoming acquainted with the French medical and anatomical works, he acquired that language; and thus a new field of industry and improvement was opened to himself, and an opportunity of transplanting to American soil the results of the investigations and discoveries of the French literati. Dr. Warren never possessed a robust constitution. Throughout the early and middle period of his life, he had been subject to frequent attacks of sick headache, which were accompanied by great depression of spirits. In his fifty-first year, he experienced complete relief from this affection. From the age of thirty he also suffered from uneasiness and pain in his chest and side. In 1811, while demonstrating a brain which had been immersed in alcohol and muriatic acid, and which he held and handled for a long time, in a very cold state, he was suddenly seized with a paralytic affection of the right arm, from which he never completely recovered. From this time the affection of the chest increased in severity, and recurred with still greater frequency. The pain came on in paroxysms and generally in the night. He was often obliged to take considerable doses of opium for its relief, and at times even this remedy failed. He would then rise and bleed himself. This last resort generally mitigated his sufferings. During the last winter of his life these attacks became alarming. They were attended by a sensation as if of a cord drawn across the chest and consequent dread of suffocation, producing great agitation and distress. In February and March, 1815, he underwent great anxiety, exposure and fatigue.

His friend, Governor Brooks, had been dangerously ill, and Dr. Warren had been obliged to visit him once and sometimes twice a day at Medford, five miles from Boston. About the same time, one evening, on returning home, he received a letter informing him that his brother at Foxboro', twenty-five miles distant, had dislocated his shoulder, and that the physician of the place had been unable to reduce it. Exhausted as he was in body and mind, and laboring under disease, Dr. Warren immediately ordered a carriage and started for his relief. On his arrival he at once commenced operations, and made several unsuccessful attempts to reduce the dislocation. He finally deferred further efforts until morning. He obtained no rest, but passed the night in walking the room. Before morning he again roused the family, and made renewed, and this time successful, efforts to restore the joint. Sinking from exhaustion, he got into his sleigh and returned home, and resumed his usual routine of visits. On the night of the 22d of March he had a paroxysm of dyspnea, with fever. Three days after he again visited some patients, and in the afternoon attended to business at home. In the night he had an alarming attack of his complaint. From this time the disease increased in severity, accompanied by fixed pain in the right side, and laborious respiration, with occasional cough. The remedies made use of alleviated the most distressing and urgent symptoms, but debility and general derangement of the functions of all the organs supervened. The pulsations of the heart became irregular and intermittent; the circulation in the left arm became peculiarly disordered, and the functions of the brain impaired. On the third day of April a distressing paroxysm of pain and dyspnea occurred, so severe that he requested an opening might be made in the side, probably under the impression that pus or water might be discharged. The pain was relieved by the application of hot tincture of cantharides and a moderate dose of opium. At seven in the morning of the fourth, he inquired the hour; then remained quiet; in a few moments he began to breathe more slowly, and almost imperceptibly expired without a struggle or a groan. A dissection of the body revealed extensive disease of the aorta. The following is the account given of the pathological appearances: "The affection of the aorta was of that sort which terminates in ossification. The extent of the morbid changes was from the orifice of the vessel, including the valves to as far down the thorax as the sixth dorsal vertebra, and probably much further. On the right side of the thorax, the lungs adhered in all the upper part. This adhesion was evidently of long standing. The lower part of the lung on both sides, but mostly on the right side, was greatly inflamed. The pleura on this part was high-colored, and was covered by a recent effusion of coagulable lymph. The lungs were heavy and very firm, not crepitating. When the inflamed parts were divided very few air bubbles issued; but from some portions there was discharged much thin purulent fluid. In nearly one-third of the whole lungs the air-cells were compressed by the effusion of coagulable lymph into the cellular membrane." The grief felt at the death of Dr. John Warren was great and widely extended. His fellow-citizens united to do honor to his

memory. His remains were deposited in a tomb, erected for the purpose by his family, in the cemetery under St. Paul's Church in Boston, in the same sepulcher, where also were laid the relics of his brother, who was killed at Bunker Hill. A eulogy was pronounced at the interment by his friend and former colleague, Prof. James Jackson. A funeral sermon was preached at the church where the deceased had attended public worship, and the Hon. Josiah Bartlett delivered a funeral oration at the request of the Grand Lodge of Massachusetts.

WARREN, John Collins, of Boston, Mass., was born in that city August 1, 1778, and died there May 4, 1856. He was a son of the preceding Dr. John Warren, and when but eight years of age entered the public Latin school of his native city. "At this period of his life, he is described as a boy of great sedateness, remarkable for his scrupulous neatness of person, and for his love of order, as shown in his room, his library and his clothes. He was also distinguished as a child for a high tone of moral feeling, but was cold, reserved and silent even at that age. Notwithstanding this external coldness, however, he was naturally of a warm, ardent and even impetuous temperament. His disposition was affectionate, and his mother often mentioned the devoted and patient attention which he displayed in watching by her sick-bed, when he was nine years of age. He had a strong natural taste for music, and could easily catch a tune upon once hearing it. As an illustration of this, it may be mentioned, that though in after life he never indulged the taste, yet he states in his diary that he perfectly retains, after the lapse of fifty years, the air of a Greek song, which he learned from one of Napoleon's officers, with whom he boarded in Paris." Dr. Edward Warren, of Massachusetts, his biographer, writes as follows: "At the first distribution of the Franklin medals, at the Latin School, his name stood at the head of the list. He left school for Harvard College in 1793. He was then at the head of his class, and delivered a valedictory address, on the 13th of July, in this year, in laudation of public school education, before the 'venerable fathers of the town.' This address, a copy of which is extant, partly in his handwriting, consists of grave advice to those who were to remain in the school to avail themselves to the utmost of the advantages which they enjoyed—advantages which were greater because shared equally between the poor and the rich, so that a feeling of cowardly depression was not cultivated in the former, or undue consciousness of superiority in the latter. Two of his surviving classmates, the Rev. Dr. Jenks, of Boston, and Judge White, of Salem, testify to his honorable standing in college, both as a scholar and a young gentleman. They state that he always held in view the rank obtained by his uncle, General Joseph Warren, as well as the high standing his father had obtained, and his ambition was continually stimulated by these examples. He was graduated in 1797. It was his father's wish that he should not enter a profession which he had found so laborious, and in many respects so full of care and anxiety as his own; but that he should adopt the more immediately lucrative employment of a merchant. John does not appear, at that time, to have had any

decided bias for his father's profession, and he spent the first year after he was graduated in studying the French language, as a useful preparation for whatever occupation he might adopt. The troubled state of Europe had, at that time, deranged mercantile affairs so seriously that, upon inquiry, it was found impossible to obtain such a situation in a counting-room as his father thought entirely suitable, and he was permitted, therefore, to indulge the preference which he felt for a profession. He commenced the study of medicine, and remained one year with his father. That his taste for this pursuit was not naturally very strong, seems to be shown by his speaking in his letters of this period as a year lost in the 'pretended' study of medicine. At the end of a year his strong desire to visit Europe, and avail himself of the advantages afforded by foreign hospitals, induced him to embark for London. He sailed on the 16th of June, 1799, two years after he had taken his Bachelor's degree, and arrived in London in twenty-four days. His passage, though less rapid than those made in these days, had more objects of interest. Despite of the assistance which France had rendered America, difficulties had arisen, and a war—which, by the testimony of even a Frenchman, Las Cases, was brought on by the vexatious and insolent conduct of the French—ensued. It was not possible, at that exciting period of our history, for the nephew of General Warren, and the son of one of the most ardent and unselfish patriots who ever lived, to behold public events with indifference. He had previously taken a deep interest in politics, and on the breaking out of the French war, took an active part in military affairs, and in the organization of companies. This interest in military matters, and his connection with a company, latterly as surgeon, continued through life. He describes his employments on board ship as of a warlike character. He and the other passengers were appointed to the charge of the great guns, and they soon became so expert in the management of these heavy pieces, that, he says, the oldest seaman could not outdo them. The captain inclining to prove their alacrity, once gave the alarm at midnight, when they were all buried in sound sleep. 'In five minutes we were all at our stations, and had every gun prepared for action.' They had many real alarms, and were forced to pass many nights in their clothes. Friends and enemies were almost equally disagreeable to meet. They were driven within pistol-shot of the French coast. 'After chasing a privateer, quarreling furiously with a British cruiser, and receiving very polite treatment from others, we landed at Deal, on the 10th of July.' Having arrived at London, seen the wonders, delivered his letters, and received the consequences thereof, he commenced at once the attendance of the hospitals. 'There are,' he says, 'two kinds of students in the hospitals; the one called dressers, and the other walkers. The first have the advantage of practicing on all the simple surgical cases, and dressing all wounds themselves; the others merely see what is done. Of course the former have vastly the greatest opportunities, but the expenses are likewise double, as the walker pays twenty-five pounds, the dresser fifty pounds. Though I do not like to pay so much money for one object, I believe I shall

enter as dresser; for, as I intend to become a surgeon, I think the acquiring a facility and standing in manual operations of the utmost importance." Our American student was fortunate in having opportunity to enjoy the instruction of the immediate pupils of the celebrated John Hunter, of Guy's Hospital. From them he acquired the taste and the facility of making anatomical preparations, which he always pursued with interest, and gradually formed the collection which he gave to the Massachusetts Medical College, and which is designated as the Warren Museum. He engaged lodgings near the hospitals, comfortably situated, three stories from the earth. His chambers were of sufficient size to require two steps from one side to the other. The "master," with whom he engaged was at first absent from London, and he availed himself of four weeks' leisure, for a tour in the Isle of Wight, and a large part of the south of England. On the surgeon's return, in August, he entered his name, and became senior dresser to William Cooper, "one of the best of men, and most eminent surgeons in London." Astley Cooper was afterwards connected with his uncle, and Dr. Warren always took delight in speaking of him as his "master," a word that has become nearly obsolete with us. Mr. Warren speaks in the highest terms of Astley, also. Though both were of high standing, their opinions, he states, were in many respects diametrically opposite. Thus, William Cooper would say that the opening of an abscess was effected much more kindly and safely by nature than it could be done by art. Astley maintained that an early incision, by relieving the tension of the parts, aided nature and saved much suffering. Here he devoted himself one year especially to hospital practice, and to the study of anatomy, surgery, and midwifery. His time was fully occupied. He went only from his room to the hospital, where he was obliged to sleep during his week to attend accidents, which came in very fast. He had from thirty to forty patients particularly under his care, at once. "I had, among others, a very fine simple fracture of the leg, which I think will do well. In fact, without the least previous notice, I am pitched into a surgeon. Obligated to do things of which I never saw a case, nor had an idea of, and I think I do very well." He writes to his mother, September 27, 1799: "I am the luckiest dog in life. I was called away at the end of the last period to a dislocated shoulder, which I have reduced in very handsome style. Within three days of my week, I have had one fractured leg, and another that we thought was fractured at first; one fractured rib, and this dislocation, besides two or three trifling accidents. I have been exceedingly fortunate every way, and I really begin to think I shall be famous." In September, 1800, he left London, and went by way of the lakes to Edinburgh, with the special view of studying medicine and chemistry, not, however, losing sight of anatomy and surgery. He remained in Edinburgh until June 4, 1801, having diligently attended the lectures which closed for the season about this time. Traveling through Holland on account of the war, he reached Paris in July, and entered, with M. Antonie Dubois, afterwards Baron Dubois, at the Hospice de l'Ecole de Medecine for one year. Here he studied anatomy, clinical surgery, midwifery, chemistry, and botany, with

Dubois, Vauquelin, Dupuytren, Chaussier, and Desfontaines. Through the aid of his banker, he obtained a place in the family of Dubois, a situation attended with very great advantages. In the family of Dubois were two of Napoleon's officers, from whom he received much attention and valuable information. He had laid the foundation of a thorough knowledge of chemistry in Edinburgh, by six months' attendance upon the lectures of Dr. Hope, then the best chemical teacher in Europe. In Paris, he attended the lectures of Vauquelin, whom he describes as the best chemist in France, though certainly not the best lecturer. This course was two hours a day for seven or eight months. His attention to anatomy and surgery was, of course, never remitted. After the conclusion of the winter course, he attended the lectures at the Jardin des Plantes. Here were Fourcroy, whom he describes as a great orator; Cuvier, afterwards so distinguished, and Desfontaines. Shortly before he left Paris, he received an invitation from, or by the order of Napoleon, to join the French army, which was then organizing in Italy. It would have been gladly accepted, but his father was anxious for his return, to see him established in medical practice before his own health, which was feeble, should fail, and the business be taken by others. Dr. John C. Warren returned home in the latter part of the year of 1802, and speedily began to aid his father in his practice. At that period there were comparatively few physicians in Boston, and those of much note were of advanced age. Though well acquainted with the principles of the art of healing, he was little familiar with the details of private practice, or the proportioning doses of medicine; details which, however important to the welfare of a novice's first patients, are too apt to be left to be acquired by supposed intuition. Many cases of midwifery came under his charge. In the course of the succeeding summer he was left with the whole practice, medical, surgical and obstetrical. At this period he sometimes made fifty visits a day. The remarkable tact possessed by his father, in taking in at a glance the patient's case, has been noticed by Dr. Jackson. As some children possess in arithmetic the remarkable faculty of arriving at results without apparently going through the previous steps, so did the elder Dr. Warren perceive, by an apparent intuition, the exact condition of his patient; he rode rapidly, almost furiously, and made very rapid visits. From his father, and from his own rule adopted very early in life, of never wasting a moment, he undoubtedly acquired the power of doing a great deal of business in a very short time. His attention having, as a matter of necessity, been occupied with the study of the theory and science of medicine, he underwent many severe trials, both from want of his habit of prescribing, and from the unwillingness of many to confide in so young a physician. Dr. Warren did not adopt the recommendation of old Panton to Dr. Percy, in "Patronage," to provide himself with a wig; he satisfied himself with keeping his queue and white top boots for some time after they had begun to be abandoned by the young and fashionable. He was much more at home in the dissections, which he undertook to prepare for the lectures in Cambridge. This, however, interfered, he complains, with a more important affair which

he then had on hand. In about a year after his return from Europe, he was married to the daughter of the Hon. Jonathan Mason. Engaged as he was in active business, he found time for other pursuits. In 1803 he became a member of a Society for the Study of Natural Philosophy, of which Mr. John Lowell, John Quincy Adams, Rev. Dr. Kirkland, Josiah Quincy, Dr. Jackson, William Emerson and others were members. He also became a joint editor of the *Monthly Anthology*, one of the earliest and ablest monthly periodicals in Boston. The ablest literary men, among whom was the highly-gifted Buckminster, whose early death was so deeply lamented, contributed to support this work. Rev. Mr. Gardiner, William Emerson, William S. Shaw, Buckminster, Tuckerman, Dr. Jackson and others formed the Anthology Society. In 1806, the Society took into consideration the establishment of a reading room in the town, and from this small beginning arose the Boston Athenæum. Dr. Warren, at this time, also formed a private medical society, with Drs. Jackson, Dixwell, Coffin, Bullard and Howard. The earnest zeal of Dr. John Warren for the extension of anatomical knowledge had introduced demonstrations upon the real body, instead of wax figures, at Cambridge. A medical school was soon formed there in connection with the college. It was a matter of novelty; and it is now difficult to conceive the interest and delighted attention with which a class of students, who were eager to improve in knowledge of anatomy, and whom privation had taught the value of the privilege, listened during an extempore lecture, two hours long. Those who enjoyed the privilege describe the elder Warren as very eloquent. In October, 1805, Dr. J. C. Warren removed to No. 2 Park street, where he continued to reside for the rest of his life, a period of more than fifty years. During this year he took a room over the apothecary store of Mr. White, in Washington street or Marlborough street, as it then was. Here he gave public demonstrations in anatomy. The same was used, for many years after, for lectures upon subjects connected with medicine. In 1806 he was chosen Adjunct Professor in Anatomy and Surgery with his father. This office he held until the death of Dr. John Warren, in 1815, when he was chosen to fill his place. Dr. John Warren, while surgeon of a military hospital in Boston, in 1780, had commenced the first course of anatomical lectures ever delivered in New England; and the following year they were attended by the students of Harvard College. He furnished a plan for a medical school, which was adopted by the corporation. In 1783 he was chosen Professor of Anatomy and Surgery, and Dr. Benjamin Waterhouse Professor of the Theory and Practice of Physic. It being found exceedingly inconvenient to the professors, who resided in Boston, and the medical students in general, to attend the lectures in Cambridge, the plan of transferring the school to Boston was proposed, and carried through in the year 1810, though not without great opposition. In the year 1809 Dr. Warren published a paper on "Organic Diseases of the Heart," a subject which had not before received attention in this country. In 1810 he began to make exertions, in conjunction with Dr. Jackson and other medical gentlemen of Boston, for the establishment of a hospital, for

the double purpose of relieving persons too destitute to be taken care of at their own homes, and of affording an opportunity for students to acquire a practical knowledge of medicine. The succeeding year he united with Drs. Jackson, Gorham, Bigelow and Channing, in the establishment and editorship of the *New England Journal of Medicine and Surgery*. This journal was conducted with great ability, and continued to flourish until the year 1828, when it was united with another, under the charge of the same editors, and took the name of the *Boston Medical and Surgical Journal*. On the death of Dr. John Warren, in 1815, Dr. Warren took the principal part of his father's business, in addition to what he had previously acquired. He was chosen Professor of Anatomy and Surgery. He also gave lectures upon midwifery and physiology. In this year the Massachusetts Medical College was built, the funds for which had been obtained principally by the exertions of Dr. Jackson and Dr. Warren. It was opened the succeeding year. But in addition to this unwearying industry, Dr. Warren possessed that temperament, that faculty of throwing himself into his subject, seeing it in the strongest light, and feeling it vividly as a matter of personal interest; that faculty, in short, in which talent and genius consists. This gave him his power as a clear and able writer, and an interesting and successful lecturer. Seeing clearly and full of his subject, but using as few words as possible, he was lucid and intelligible. By those who wished to depreciate his skill, but could not deny his success, it was sometimes said that he was a mere skillful operator, but destitute of the other qualities of a surgeon. They knew him only from what they saw in public, in the operating room. The fact was widely different. He did not value himself upon his dexterity as an operator, at least if celerity is a proof of dexterity. On the occasion of a physician from a distance taking out his watch, when Dr. Warren commenced an operation at the hospital: "You may put up your watch, Dr. —," said the surgeon; "I do not operate by time." That he was a skillful and dexterous operator there is abundant proof, but he possessed a much higher skill—that of distinguishing disease at a glance, and treating it in the most skillful manner, both before and after an operation, if an operation was necessary, and instantaneously seeing any change for the worse. It was said some years ago, by an American physician resident in Paris, that if he was compelled to undergo a surgical operation he would come to Boston, because he had much more confidence in the after-treatment. Other Americans felt the same. Recognizing the truth of the maxim that operations are the opprobrium of surgery, Dr. Warren never made up his mind to perform an operation until all other probable means of cure had been fully tried. The patient, therefore, might always feel full confidence that he would not advise or perform an operation unless it was absolutely necessary. Having determined to operate, he prepared himself deliberately for it, by reflecting in his own mind upon the method required, writing a list of the contingencies that might occur in the course of it, and of every instrument or article of apparatus that might be called for. In important cases, he resorted to authorities, and often practiced the operation upon the

dead subject. Thus, every operation was with him a matter of study, greater or less, according to its importance. He took pains also to avoid everything which might interfere with the steadiness of his hand, or the delicacy of his manual tact, or that might produce mental excitement in a temperament which, though kept under rigid control as it was, was always excitable. He proceeded to the operation with the greatest deliberation and caution, taking care to assure himself of the nature of every part or texture before he divided it, and to ascertain at every step that he knew exactly where he was. The operation performed, he proceeded with equal care to the bandaging, which with him was also a science. Perhaps one of the greatest improvements which he adopted was in the little use made of the needle and ligature in closing wounds. By the judicious use of adhesive straps and bandages, these were often dispensed with, and the unpleasant necessity avoided of making additional painful wounds, and leaving a foreign substance to increase the irritation. Thus it may be seen to the satisfaction of every one that the position which he now occupied was obtained and held, in the first place, by his diligent and earnest preparation in the study of his profession, and by his availing himself to the utmost, of the very great advantages which he enjoyed abroad, and secondly, by his continued and unremitting efforts, not only to keep his ground, but to improve himself and his science. If there were any who supposed that he fell easily and naturally into his father's place, with little exertion of his own, or that he held his position without both talents of a high order and unwearied and exclusive devotion to his profession, they were utterly ignorant of his labors. In 1820 Dr. Warren joined the religious society of Episcopalians, which had then recently erected St. Paul's Church in Boston. In this year the Massachusetts General Hospital was opened. It differed from other institutions of this nature in the comparative elegance of its accommodations. There were not at the time great numbers that required its advantages. The native population were generally well off, and had comfortable homes. However poor, they preferred to be taken care of at their own homes, and felt a prejudice against entering a hospital. The accommodations, therefore, were intended to give to a few, in a superior style, everything which their comfort or well-doing demanded. The poor patient who entered was sure of receiving all the care and attention, and of having everything done which would promote his cure, equally with the man of wealth. In 1828, the *Boston Medical Journal* was commenced. The *New England Journal*, before mentioned, had sustained its character from its foundation; but the professors whose aid had rendered it so valuable had now become fully engaged in private practice, and were less able to contribute freely to a work of this character, or to take an active part in its conduct. It was thought also that a weekly publication, somewhat of the character of the London *Lancet*, would be more acceptable. A weekly paper, *The Medical Intelligencer*, had been in existence for some time, established or conducted by Dr. Coffin, and had a very good list of subscribers. The proprietorship was purchased, and the two journals were united; Dr. Warren taking charge of the

editorship. He threw himself into this new labor with his usual energy, and exerted himself heart and soul to raise the work to the highest point of excellence. He caused the surgical records at the hospital to be kept more fully than before; and his selections from these formed a most valuable part of the new journal. It is difficult to understand how he could devote the time which he did to this work, which might seem to afford almost sufficient occupation for one who had no other business. Dr. Warren was now in the zenith of his medical career. He had an extensive private practice, medical as well as surgical; he was the leading surgical operator in New England. His labors in the temperance cause had recently commenced. The affairs of St. Paul's Church had a great share of his attention, beside other affairs. He rose in winter and breakfasted by candlelight; and went out directly to visit his patients, until one o'clock, when he received patients at his house, until two. He devoted about ten minutes to his dinner; but after this meal he rested for an hour or more. In the latter part of the afternoon he visited such patients as required a second visit; took tea at seven; after which he wrote and worked upon the subjects above alluded to, often until two o'clock, A. M. The greater part of this time was devoted to the *Medical Journal*. He prepared the hospital records; selected the extracts from foreign journals, and prepared original articles. The late hours which he kept at this time, doubtless, did serious injury to his eyesight. A temperance society had been formed in Boston in 1813, and the elder Dr. Warren was vice-president. It, however, accomplished very little, and was in a languishing condition in 1827, when Dr. J. C. Warren was chosen president. He engaged earnestly in the cause. He prepared a series of resolutions, which were heartily adopted, and produced great effect upon the community. It was thought, at the time, that men could not work without their regular supply of ardent spirits; and that their use was requisite to the health. The resolutions declared the contrary of this. Their influence was gradual; but, with the continued labors of Dr. Warren and the society, a total reform in this respect was effected. The sale of intoxicating liquors upon the common on public days, which had hitherto been days of riot and drunkenness, was prohibited, in consequence of a petition to the city government, headed by Dr. Warren. The next step was to place greater restrictions upon the retailing of liquors, especially of those to be drank on the premises; for grogshops were abundant in every street, and were places of riot and excess. In all these labors Dr. Warren was a prominent mover. He worked with so much zeal that he was sometimes accused of intemperance in the temperance cause; and yet, he never advised extreme measures. His efforts were directed, at first, against the most prominent abuses, and against the habitual use of distilled liquors. The compounding of medicine had always received a large share of his attention. Dr. Warren now devoted himself to the substitution of other forms of medicines for the tinctures. These had always been freely used by both sexes. Many ladies thought they required their daily dose of "tincture of bark" or "Stoughton's elixir;" and men who were ashamed to resort to

brandy or rum, took these substitutes. It was Dr. Warren's opinion that their use occasioned an imaginary necessity for their continuance, and led eventually to the employment of spirits, and this to intemperance. His efforts so far succeeded that, in the course of a few years, an eminent apothecary declared that whereas prior to the commencement of the society's labors, his rows of bottles of tinctures were regularly filled every morning, they now were almost untouched, and hardly required filling once a month. Dr. Warren always paid great attention to the subject of diet. In his younger days he once recommended custard; and the lady, whose daughter was sick, requested directions as to the ingredients. It was Dr. Warren's maxim never to appear in doubt. "O," said he, "take some flour and eggs and milk and stir them together, and put in a little sugar." The lady knew how to make custards, but she had wanted directions how to make them in this particular case. Dr. Warren probably was never caught in a similar blunder. He paid great attention to articles of diet and their composition; and the skillful management of these, enabled him to dispense with a great deal of medicine. The Graham bread, or bread of unbolted flour, and cracked wheat were introduced, upon his recommendation, as substitutes for cathartic drugs. He bestowed great attention also to the rendering medicines acceptable to the palate, and introduced many very elegant preparations. He was not inclined to assert that wholesome medicine is beneficial in precise proportion as it is nauseous. He acted upon the opposite principle, that, the less disagreeable to the palate, the better will be its effects. Dr. Warren's caution in preparing himself to perform an operation has already been recorded. He introduced many new operations, which had not hitherto been performed in this country. His father had done successfully a great number of amputations, extirpations, and other operations, and had removed many cataracts; thus being successful in restoring sight to the blind, by an operation oftener done than done with success. He had also repeatedly performed the operation of lithotomy; and on one occasion amputated at the shoulder joint, with complete success. Dr. J. C. Warren first operated for strangulated hernia, and met with great opposition from the friends of the patient, and other medical men. Subsequently he performed it so often as to do it with very little anxiety, and he lost very few patients. He introduced the operation for aneurism, and performed it in numerous cases, all of which but two were successful. In one of these two, the patient had delirium tremens, and fell a victim to his imprudence. In one case he extirpated the clavicle. The patient did well the first fortnight; but some imprudence caused his death. He performed the operation of removing the upper and lower jaw. One case of this is given in the first volume of the *Boston Medical and Surgical Journal*. Keeping his attention always on the alert, he introduced from abroad every new operation which was likely to be useful. He says: "I have always considered it as my mission to introduce the as yet unknown science of Europe, rather than to attempt originality. Still, however, I believe no one has been more ready to propose and execute new and difficult operations, required by peculiar cases." In 1837 he published his

"Surgical Observations on Tumors," a thick octavo volume, with plates, giving principally the results of his own practice. He intended it, not as a complete and elaborate treatise, but rather as a collection of cases, intended to illustrate the distinctions between different tumors. He published this work on the eve of his departure for Europe, with his family. He sailed for Liverpool June 12, 1837, leaving his son, Dr. J. Mason Warren, in charge of his practice. While abroad he neglected no opportunity in acquiring new information. He visited every hospital or other medical institution in places where he stopped in journeying; and he states that he rarely failed to derive something valuable from every one he visited. One main object of this labor was to acquire knowledge to be communicated in his lectures. In Paris he went through a regular course of dissection, with a French surgeon. On his return from Europe, Dr. Warren resumed his usual duties, his daily visits, hospital attendance, and lectures. As his son advanced in experience, and in the public confidence, Dr. Warren was able to devote more and more time to other objects of public usefulness. He had engaged a friend to purchase an estate in Brookline, six miles from Boston, during his absence, and he found it ready for occupancy in the summer after his return. He became an active member of the Agricultural Society, and interested himself in the importation of foreign stock, to improve the breed of milch cows and cattle; also, in encouraging efforts to improve the breed of horses. He became an earnest member of the Society of Natural History, of which he was chosen president. Comparative anatomy had always been with him a favorite science, and from this he was led to the study of fossil remains. In 1845 it was his good fortune to obtain the most perfect skeleton of the mastodon which exists. His work on the subject—first printed for private circulation, in an elegant quarto volume—but recently published, must be too well known to need description. Dr. Warren, having given his valuable museum of morbid anatomy to the Massachusetts Medical College, soon filled his house with a rare collection of fossil remains. In 1854 he published a small work on Fossil Impressions; and in 1855 an interesting account of the "Great Elm Tree on Boston Common." In October, 1846, the introduction of ether gave a new impulse to operative surgery. He gives this account of its first introduction: "The amount of what I know may be comprised in a few words. Dr. Charles T. Jackson suggested the use of ether to Dr. Morton, and Dr. Morton first employed it to prevent pain from the extraction of teeth, and at his request I first used it in a surgical operation. Dr. Jackson has also stated to me that he advised Dr. Morton to apply to me to use it in a surgical operation." Dr. Warren, with his usual circumspection, wished to pursue its use further, and give it a fair trial before making the discovery public. He was, however, anticipated. But fully convinced of its value, he gave it his sanction, and his well-known high reputation, both at home and abroad, insured it a fair trial. It was speedily adopted in the English hospitals, and Professor Simpson, of Edinburgh, entering warmly in its favor, made experiments with a view of discovering some other substance which might answer the ends, but be free from the disagreeable odor of ether.

This he found in chloroform, and its quick operation and pleasant odor and effects insured it rapid success. Deaths, however, occurred from its use, and Dr. Warren set himself to ascertain if something might not be found superior to ether, but safer than chloroform. After many experiments with chloric ether, he adopted this preparation, and continued to use it in his operations." In 1848 he published a small volume or tract on "Etherization;" and the subsequent year one upon the "Effects of Chloroform and Strong Chloric Ether as Narcotic Agents." He strongly opposed the use of chloroform. Dr. Warren continued to contribute frequently to the *Boston Medical Journal* and the *American Journal of Medical Sciences*, and also to supply verbal or written communications to the Natural History Society, the American Academy of Arts and Sciences, and the Medico-Chirurgical Transactions of London. Dr. Warren's first wife died in May, 1841, leaving six children, most of whom were married, and his house was left solitary. He was married again, October, 1843, to the daughter of Gov. Thomas L. Winthrop. She died December 17, 1850. The last paper, probably, which Dr. Warren contributed to any periodical, appeared in the *Boston Medical Journal* for May, 1855. In the fall and winter of this year, though his health for some time past had been seriously impaired, he still continued to practice; kept his usual hours for his various employments; visited a few patients, and even operated. He was now seventy-seven years of age. He devoted himself more than formerly to social enjoyment, and seemed to delight in collecting his family around him on such evenings as his other engagements did not prevent. His health, however, rapidly declined during the last three months of his life. Dr. Jackson, who has given an account of his last illness, thought that an autopsy would be very unlikely to show that the immediate cause of death was any local affection. He considered that distress of mind had accelerated his death. The loss of his first wife had been deeply felt, and that of his second, when he was older and feeble, still more so. The ill health of his son in Europe also occasioned him great distress and anxiety. Dr. Warren left ample materials for an extended memoir, which he directed by will to be prepared for publication within two years after death. It subsequently appeared, in two octavo volumes.

WARREN, Joseph, of Boston, was born at Roxbury, Mass., June 11, 1741, and died on the battle field of Bunker Hill, June 17, 1776. "He graduated at Harvard University, Cambridge, Mass., in 1759, and immediately commenced the study of medicine. Having completed the usual course, he established himself as a physician at Boston, where he soon acquired an extensive practice, and arrived at the highest eminence in the profession. Had he been desirous of wealth, or ambitious only of eminence in his profession, his opportunities were such as might have gratified his highest wishes." Dr. Perkins, a Tory, is quoted as saying of him: "If Warren were not a Whig he might soon be independent and ride in his chariot." But the oppressive acts of the English Government had excited an alarm, and Dr. Warren took too deep an interest in the affairs of his country, and felt too strongly the dangers that threatened it,

to suffer himself to be engrossed by private business, when his exertions might be of some use to the public. After the passing of the Stamp Act, he undertook a serious examination of the right of Parliament to tax the Colonies, and as time was not at his command during the day, his nights were spent in this investigation. When he had satisfied himself that no such right existed, he was indefatigable in his exertions to produce the same convictions in the minds of others. He devoted himself to the common cause with a zeal extremely prejudicial to his private interests. While he was engaged in disseminating the great truths he had learned, his pecuniary affairs were neglected and became greatly deranged. Young and ardent, with a fine person, engaging manners, and a kind and generous disposition, he enjoyed the affection and confidence of all classes, and was thus enabled to exert an influence extremely beneficial to the cause he had espoused. By his writings in the newspapers, his public speeches and orations, he labored to infuse his own ardor into the breast of his fellow-citizens. Probably no man did more to excite and sustain the spirit of opposition to British tyranny for which Boston was so early distinguished. During his short but eventful life, Dr. Joseph Warren was appointed by his fellow-citizens to various high offices within their gift. He was elected first a delegate, and then president of the Provincial Congress, and chairman of the Committee on Public Safety. "By virtue of these places he united in his person the chief responsibility for the conduct of the whole civil and military affairs of the new commonwealth, and became a sort of popular dictator." He twice delivered the annual oration commemorative of the Boston Massacre of the 5th of March, 1770, viz., in 1772 and 1775. The latter was delivered at the point of the bayonet. It is an historical fact that some of General Gage's officers had declared that no one should publicly refer to the event of which the day was commemorative, and escape with life. It was on account of these threats of assassination that Dr. Warren, at his own request, was appointed orator on the occasion, as it is stated that there were not many equally willing to brave the indignation of the military. The pulpit in which he stood was filled with British officers, and the orator was obliged to make his entrance by a ladder at the pulpit window. The oration was as warm, earnest, powerful and stirring an invective against English oppression and tyranny as any which had ever been pronounced, and the bloody scene in State street, with the series of wrongs which had preceded, were vividly portrayed. While in the midst of one of the most exciting periods, an officer standing upon the steps leading to the desk, being unable longer to endure the stinging words, drew and cocked his pistol and pointed it at the head of the orator. Dr. Warren saw the movement, and without a moment's hesitation in his speech, unblenched and unmoved, took from his desk his white pocket-handkerchief and quietly dropped it upon the upturned muzzle. The sensation produced among the populace below warned the officers of their danger and prevented the execution of their implied threat. At the battle of Lexington, the first conflict of our Revolution, Dr. Warren took a prominent part. In Mr. Alexander H. Everett's account of the

engagement, he says: "For the vigor and determination which marked the conduct of the people on this occasion, it is not too much to say that the country is mainly indebted to the vigilance, activity and energy of Warren." On the approach of the British, he armed himself, and went out in company with General Heath to meet them. On this occasion he displayed his usual fearlessness by exposing his person very freely to the fire of the enemy, and a bullet passed so near his head as to carry away one of the long, close, horizontal curls, which, agreeably to the fashion of the day, he wore above his ears. Previous to receiving his appointment as Major-General, Dr. Warren had been requested to accept the office of Surgeon-General to the Army. But this office suited less with the ardor of his temperament than to be an active participator in the hazards and triumphs, the adversities or successes of the glorious struggle. We are told, however, that his aid and advice were sought in the medical department, and were of great service to them in their organization and arrangements. Dr. Warren was prepared by a thorough course of military study and observation for the elevated rank to which he was appointed in the army. He did not live to see the grand object of his life achieved. In the official account of the battle of Bunker Hill by the Massachusetts Congress, his death is thus noticed: "Among the dead was Major-General Joseph Warren, a man whose memory will be endeared to his country and to the worthy in every part and age of the world, so long as virtue and valor shall be esteemed among mankind."

WATKINS, Thomas James, of Chicago, Ill., was born at Steuben, Oneida county, N. Y., July 6, 1863, of Welsh parentage. He attended the Steuben District School from 1868 to 1879, and then the Holland Patent Academy for one year. During the following two years he was a student at the Adams Collegiate Institute for the fall and spring courses, and taught the Steuben District School in the winter. In 1883 he commenced the study of medicine with Dr. D. A. Crane, of Holland Patent, and in the fall of the same year entered the Medical Department of the University of Michigan, where he attended lectures for two years, taking special courses in embryology and pathology, and spending the summers in Utica, N. Y., where he studied with Dr. J. H. Glass. He was also Resident Physician at the Utica City Hospital, and in charge of the City Dispensary. In the fall of 1885 he entered the third year class at Bellevue Hospital Medical College, and was graduated April 13, 1886. He obtained, by competitive examination, the first position at St. Peter's Hospital, Brooklyn, where he served as *Interne* for eighteen months. In 1887 he competed for and obtained first position in the Woman's Hospital in the State of New York, and there remained eighteen months as *Interne*. In the spring of 1889 he removed to Chicago. His practice is chiefly gynecological. In the fall of 1889 he was appointed Assistant to the chair of Gynecology in Chicago Medical College, and Instructor in Gynecology at the Chicago Polyclinic. A year later he resigned his position at the Polyclinic and became Adjunct Professor of Gynecology at the Chicago Post-Graduate School, and Gynecologist of the Dispensary, St. Luke's Hospital. He is a member of

the Chicago Medical Society, and vice-president of the Chicago Gynecology Society. He has contributed to medical journals articles as follows: "Concentrated Solution of Magnesium Sulphate as an Enema, With Some Points Relative to the Physiology of the Abdominal

Thomas J. Watkins.

Circulation;" "After-Treatment of Laparotomy;" "Laceration of the Anterior Vaginal Wall and Its Repair;" and has also written for Hare's System of Therapeutics, the section entitled "Diseases of the Vulva and Vagina (Non-Venereal) Leucorrhoea."

WAXHAM, Frank E., of Denver, Col., was born near La Porte, Ind., in 1853. A life sketch, by H. L. Conard, published in a recent number of the *Magazine of Western History*, says: His ancestry is English, although his father, Zachariah Waxham, came to this country when a boy, and was raised in the United States. The elder Waxham was a farmer, and in one of the country schools of La Porte county his son received such education as he had been able to pick up until he was twelve years old. In 1865 Farmer Waxham removed to Illinois, and purchased land just outside of the little city of Rockford, where his son began attending the city schools. In 1871 the latter graduated at the Rockford High School, and soon after commenced teaching school. After following that pursuit two years he went to California in 1873, and remained there two years. At the end of that time he returned to Rockford, and began the study of medicine under the preceptorship of Dr. Lucius Clark, of that city. In the fall of 1875 he entered the Chicago Medical College. After attending one course of lectures he found it necessary to devote another year to teaching school in order to obtain sufficient funds to enable him to complete his medical education. He returned to the medical college in 1877, and graduated in the class of 1878. The pio-

neer physicians of Chicago, broad-minded and public-spirited men that they were as a rule, while striving for professional eminence themselves, were not unmindful of the fact that in the years to come their burdens must be shifted to other shoulders, and that they were in a measure responsible for the proper education and qualification of their successors. It was these pioneers that laid the foundations of the great medical educational institutions which have since become renowned throughout the country, and a few of the founders have lived to see those who have received their professional training in these schools distinguished both at home and abroad for their contributions to medical science. The immediate successors of the pioneers have themselves grown gray in the service, and the public is beginning to cast about among the young men of the profession for those who have the broadest and most comprehensive knowledge of the healing art. Critical in a sense, and at the same time quick to appreciate genuine talent and real skill, either in the treatment of diseases in general, or particular forms of disease, the public does not withhold the meed of praise from deserving practitioners of medicine, waiting for them to attain a certain age. And so it happens, particularly in Western cities, that some of the younger members of the profession are among those best known to the general public. What is true of any other Western city, is true of Chicago in this respect. The profession has reason to be proud of the pioneers, satisfied with the attainments and general high character of their immediate successors, and sanguine as to what will be accomplished by these younger members of the medical fraternity, who have demonstrated that they have a genius for the practice of medicine. To this younger class of physicians, Dr. Frank E. Waxham belongs. Immediately after his graduation he entered a competitive examination for the position of House Physician at Mercy Hospital. As a result of the examination he received the desired appointment, and devoted a year to hospital practice, which gave him an exceedingly valuable experience and served to more thoroughly qualify him for the general practice of his profession. After the expiration of his term of service as Hospital Physician, he opened an office in the city, and his close application to professional business, his evident thorough preparation for the practice of medicine, and his manifest deep interest in the welfare of patients, soon brought to him a much larger clientèle than usually falls to the lot of a young physician. At the end of three years of active general practice, he had acquired local distinction for his successful treatment of diphtheria and the various diseases of children. His professional friends were not slow to recognize the fact that he had given this branch of practice careful and intelligent consideration, and in 1882 he was invited to become a member of the Faculty of the College of Physicians and Surgeons as Professor of Diseases of Children. This position he retained until 1888, when his treatment of another class of diseases, and his skillful operations in connection therewith, attracted widespread attention among medical men, and led to his being transferred to a chair in the college dealing especially with diseases of the throat and nose. This chair, which is tech-

nically known as the chair of Laryngology and Rhinology, he still retains, while he has been further complimented by being called to a corresponding professorship in the Chicago Ophthalmic College, and the Post-Graduates Medical School of Chicago. In the spring of 1885 Dr. Waxham became prominently identified with the operation of intubation, an operation which he has perhaps performed a greater number of times than any other physician. In treating diseases of the throat Dr. Waxham had frequent occasion to resort to the generally approved operation of tracheotomy, but the results were so far from satisfactory he determined to adopt a substitute for that procedure. Instead of attempting to keep his patient alive by making an incision in the windpipe and inserting a tube to breathe, when respiration by any other means became impossible, Dr. Waxham began trying the experiment of inserting the respiratory tube through the mouth and throat of the patient. It is this operation, generally recognized by the profession as vastly preferable to tracheotomy, which has become known as intubation, and with which Dr. Waxham, of Chicago, and Dr. J. C. O'Dwyer, of New York, have been more prominently identified than any other American physicians. The Chicago physician has himself, in something less than five years, performed the operation about three hundred times, and in thirty-four per cent. of the cases the lives of the patients have been saved. When the fact is taken into consideration that the operation is what is always looked upon as the last resort for saving the life of the patient, the percentage of cases in which it has proved successful in Dr. Waxham's practice, demonstrates the value of this discovery to the medical profession, and at the same time proves conclusively the fact that he has acquired rare skill in the performance of the operation. His contributions to the medical journals, and papers read before the various medical societies and associations with which he is connected, concerning diseases of the throat and nose, have for several years been read and listened to with much interest by members of the profession, and all exhibit careful study and painstaking research. In 1888, while attending the session of the British Medical Society, held at Glasgow, as delegate from the American Medical Association, he read before that Society a paper on "Intubation" and the treatment of those diseases to which he has given special attention, which was warmly commended by the distinguished members of that organization. After attending the above-mentioned meeting of the British Medical Society, he remained abroad several months, spending the greater part of his time in London and Berlin, where he made use of all the advantages afforded by the hospitals and medical institutions of those cities, to add to his professional attainments. Since his return from Europe, five years ago, he has devoted himself to the treatment of diseases of the throat and nose, with a degree of success which has given him a national reputation. He has been prominently identified with the State and local medical societies, and is an active member of the American Medical Association. He was a delegate to the International Medical Congress, which met in Washington, D. C., and was a member of the

Executive Committee of that Congress. A paper, which he read before that distinguished body of physicians and surgeons, gathered from all parts of the world, bearing upon the important operative procedures with which his name has become so closely associated, was listened to with no less interest than the one on the same subject had elicited before the British Medical Society a few months earlier. Dr. Waxham is a member of the Board of Directors of the Oakwood Springs Sanitarium of Lake Geneva, a member of the Laboratory of Experimental Research, of Chicago, and Surgeon-in-Chief of the Throat and Nose Department of the West Side Free Dispensary, and also a member of the Directory of Chicago Charitable Hospital. Since he became a member of the medical profession, Dr. Waxham has made it a point to give his whole time and attention to that avocation, and the success which he has achieved, somewhat remarkable, when the fact that he has not yet reached middle life is taken into consideration, is largely due to exceptionally studious habits and untiring industry. In 1893, and since writing this sketch, Dr. Waxham was elected Professor of Laryngology and Clinical Medicine in the Gross Medical College, Denver, Colorado.

WEBER, Samuel L., of Chicago, Illinois, was born in Kaschan, Hungary, August 1, 1861. His parents emigrated to this country when he was yet a child. He received his elementary and high-school education in Chicago. After being in business six years he entered the University of Chicago. Soon this university went out of existence, and the subject of this sketch went to Harvard University. Here he devoted himself mainly to biology, chemistry and physics. He left Harvard before graduating, and began the study of medicine. He took his first year at Rush Medical College, of Chicago, and the second and third year at the College of Physicians and Surgeons, of New York City. He graduated from the latter school in May, 1888, being an honor and prize man in his class. He entered immediately as interne in the surgical service of Mount Sinai Hospital, of New York City, in which he served two and one-half years,—two terms as house-surgeon. Such was the confidence of the surgical and gynecological visiting surgeons and gynecologists in him that they allowed him to do over five hundred major operations during his two terms as house-surgeon. During the second of these terms he very frequently gave the regular clinics in place of Professors Wyeth, Mundé, and Fluhrer. He resigned from Mount Sinai Hospital, and went to Europe for further study. Abroad he served as *voluntär arzt* at the *Königliche Frauenklinik* in Dresden; also took surgical, gynecological and pathological work in Berlin and Vienna. He began private practice in Chicago in the fall of 1891. He gives courses of lectures on surgery at the Post-Graduate Medical School; is attending surgeon to the out patient department of Michael Reese Hospital, and lecturer on *materia medica* and therapeutics at Rush Medical College. He has contributed, frequently, papers on surgical and gynecological subjects to the journals.

WEED, Theodore Arthur, of Cleveland, Ohio, son of John H. and Jane (Jones) Weed, was born at Cleveland, Ohio, on December 27, 1855, and received his literary education in the public schools of that city. In 1873,

when 17 years of age, he began the study of medicine in the Medical Department of the University of Wooster, located at Cleveland, and soon after entered the office of Prof. G. C. E. Weber, as a private student. In the early spring of 1876 he was appointed assistant home physician at Charity Hospital, and in February, 1877, he graduated from the Medical Department of the University of Wooster, and began the practice of medicine. One year later he went abroad to perfect himself especially in the study of diseases of the internal organs. He located in London, England, where he held appointments as clinical clerk, surgical dresser and substitute house-surgeon in the London Hospital, during which he had unusual advantages in the study of diseases of the stomach, liver and kidneys. On December 19, 1878, he graduated from the Royal Society of Apothecaries of London, which is the

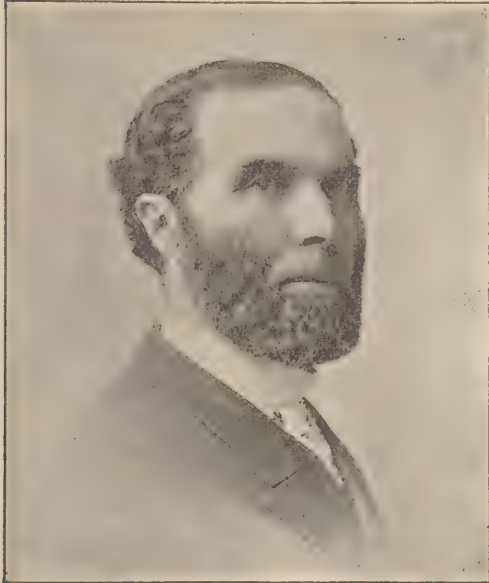

Theo. A. Weed

oldest examining body for physicians in Great Britain, having been chartered by King George III. In the spring of 1879 Dr. Weed was appointed a member of the house staff of the City of London Hospital for Diseases of the Heart and Lungs, resigning ten months later to accept an appointment as member of house staff of the East London Hospital for Children. After six months' service he resigned in order to follow the study of diseases of the liver and stomach, under Dr. Murchison, at St. Thomas Hospital. Early in 1880 he went to Edinburgh, Scotland, and in February he passed the necessary examinations and obtained diplomas from both the Royal College of Surgeons and Royal College of Physicians, the latter also conferring on him a special degree of obstetrics. He returned to London, and passed the examination for and obtained the diploma of the Royal College of Physicians of London. While in hospital

work Dr. Weed enjoyed the advantage of the strong personal friendship of the late eminent writer and clinician, Dr. J. Milner Fothergill, to whom he was indebted for much practical knowledge in diseases of the heart and lungs. Later in the year, 1880, he returned to his native city, and again began the practice of his profession. In the early part of 1882 he was appointed Professor of Diseases of the Heart and Lungs and Physical Diagnosis in the Medical Department of the University of Wooster, which he resigned in June, 1885, being at that time appointed one of the United States Examining Surgeons for pensioners. On August 25, 1884, he was married to Miss Tasia Farnan, of Cleveland, Ohio. Dr. Weed is consulting physician to both St. Alexis' and St. John's Hospitals, and is a member of the Ohio State Medical Society. The special training he received while abroad laid the foundation for the wide reputation which he now enjoys in the treatment of internal diseases.

WEEKS, Stephen Holmes, of Portland, Me., son of John and Mehitabel (Holmes) Weeks, was born in Cornish, York county, Maine, October 6, 1835. His ancestors came from Somer-

S. H. Weeks

set county, England. He married, March, 1864, Mary A., daughter of Rev. Paul C. Richmond, of Fryeburg, Me. He was educated at Fryeburg Academy, and received the honorary degree of A. M. from Bowdoin College in 1889. He studied medicine at the Portland School for Medical Instruction; attended lectures at the Medical School of Maine (Bowdoin College), and at the medical department of the University of Pennsylvania, receiving his degree of M. D. from the latter institution in March, 1864. Upon graduating he established himself in Portland, Me., where he has since remained. In 1880 he spent ten months in Europe visiting hospitals and medical schools, mainly in Edinburgh, London, Paris, Berlin

and Vienna. In 1890 he again visited Berlin as a delegate to the Tenth International Medical Congress. For twenty years he has been Surgeon to the Maine General Hospital. He is a member of the Maine Medical Association; was appointed Orator in 1885; the subject of the annual oration was "How to Promote the Advancement of Medical Education;" and in 1888 was elected its president. Among the more important contributions to that society were papers on "Hip-Joint Disease;" "Intestinal Obstruction;" "Penetrating Wounds of the Abdomen," and "Tracheotomy in Diphtheria." He is a member of the American Medical Association, and was a delegate to the Ninth International Medical Congress held in Washington, D. C., 1887. At this meeting he presented a paper on "Pregnancy Complicated by Uterine Fibroids." He is a Fellow of the American Surgical Association. At the time of his admission to this society he presented a paper on the subject of "Drainage and Drainage Tubes in their Application to the Treatment of Wounds." He was the first surgeon to prepare drainage tubes from arteries. Some of these artery drainage tubes may be found in the Army Medical Museum in Washington, D. C. He also presented these tubes to the surgical section of the Tenth International Medical Congress at Berlin in 1890. In 1877 he was appointed Professor of Anatomy in the Medical School of Maine, Bowdoin College, which chair he held until 1881. Upon the death of Prof. William Warren Greene he was transferred to the chair of Surgery, which position he still holds, 1893. His surgical work has extended over a period of twenty years, and has covered the entire field of operative surgery.

WEIR, Robert Fulton, of New York, was born in that city, February 16, 1838, and was the son of James and Mary Anne (Shapter) Weir. He was educated at the New York Free Academy (now the College of the City of New York), and received the degree of A. B. in 1854, and A. M. 1857. His medical education was pursued at the College of Physicians and Surgeons, New York, from which he graduated in 1859, and of which he was also prize medalist the same year. He settled in New York City, turning his attention especially to surgery and to genito-urinary diseases. During the war he held the position of Assistant Surgeon Twelfth Regiment New York State Militia (April to August, 1861); Assistant Surgeon United States Army, from August, 1861, to March, 1865, and was in charge of the United States Army General Hospital, Frederick, Md., from 1862 to 1865. He married, October 8, 1863, Maria Washington, daughter of Robert G. McPherson, Esq., of Virginia. She is a lineal descendant of Samuel Washington, eldest brother of President George Washington. He is a member of the New York County Medical Society; of the New York Pathological Society, of which he was vice-president in 1876; of the New York Medical and Surgical Society, acting as secretary of this for the same year; was president of the Laryngological Society of that city in 1875, and vice-president of the New York Medical Journal Association. He has contributed largely to medical literature. From 1868 to 1875 he was Aural Surgeon of the New York Eye and Ear Infirmary; from 1866 to 1870, Physician to the Nursery and Child's Hospital, New York; Surgeon to St. Luke's

Hospital from 1865 to 1875; Surgeon to Roosevelt Hospital in 1871; to the New York Hospital in 1876; Professor of Surgery in Woman's Medical College from 1868 to 1870, and in 1874 he was chosen Lecturer at the College of Physicians on Genito-Urinary Diseases.

WELCH, William Henry, of Baltimore, Md., was born in Norfolk, Conn., April 8, 1850. His grandfather, father and four uncles were physicians in the northwestern part of Connecticut and the adjacent part of Massachusetts. He was graduated as A. B. at Yale College, in 1870, and in medicine at the College of Physicians and Surgeons, New York, in 1875. He spent a year and a half as *Interne* in Bellevue Hospital, New York, and subsequently two years and a half in foreign universities, including Strasburg, Leipsic, Berlin, Breslau, Vienna, Munich and Göttingen, his time being devoted chiefly to the study of pathology and bacteriology. He was demonstrator of anatomy and professor of pathological anatomy in Bellevue Hospital Medical College, New York, from 1879 to 1883, and since 1884 has been Professor of Pathology in the Johns Hopkins University, Baltimore, and has been pathologist to the Johns Hopkins Hospital since it was opened. He is Fellow of the New York Academy of Medicine; Associate Fellow of the College of Physicians, Philadelphia, and member of the Association of American Physicians. In 1891-2 he was president of the Medical and Chirurgical Faculty of Maryland. His principal contributions to medical literature are: "Zur Pathologie des Lungenödems;" The General Pathological and Pathological Anatomical parts of Flint's Practice of Medicine, fifth and sixth editions; "Articles on Organic Diseases of the Stomach in Pepper's System of Medicine by American Authors," (Vol. II); "Zur Histiophysik der Roten Blutkörperchen," (with Meltzer); "An Experimental Study of Glomerulo-Nephritis;" "Hemorrhagic Infarction;" "The Cartwright Lectures on the General Pathology of Fever;" "The Structure of White Thrombi;" "Modes of Infection;" "Considerations Concerning some External Sources of Infection;" "Hydrophobia;" "Conditions Underlying the Infection of Wounds;" "Some Considerations Concerning Antiseptic Surgery;" "Pathology in its Relations to General Biology;" "Rudolf Virchow, Pathologist;" "Some of the Advantages of the Union of Medical School and University;" "Hog Cholera;" "Etiology of Diphtheria (with Abbott);" "Histological Lesions of Experimental Diphtheria (with Abbott);" "The Micrococcus Lanceolatus;" "Sanitation in Relation to the Poor;" "A Gas-producing Bacillus (*Bacillus Aerogenes Capsulatus*), capable of rapid development in the blood-vessels after death (with Nuttall);" "Bacterium Coli Commune."

WELLS, Charles Leonard, of Minneapolis, Minn., was born in Onondaga county, New York, October 13, 1842. He is directly descended from Sir Thomas Wells, one of the Colonial Governors of Connecticut. His academical studies were commenced at the Manlius Academy, and finished at the Seneca Falls Academy, N. Y., in 1861. He entered Hobart College in 1861, and received his degree of A. B. in 1865. During his college course he was awarded the Second Sophomore Prize for declamation and the First Junior Rhetorical Prize. Some years later the degree of A. M.

was conferred upon him by his *Alma Mater*. In the fall of 1865 he was appointed teacher of Latin and Greek in Burlington College, New Jersey. At the close of the college year he resigned this position and entered the office of Prof. H. N. Eastman as a medical student, and took his first course of medical lectures at the Geneva Medical College. Upon the completion of this course of lectures he was appointed head teacher in the Geneva High School, which position he held until November, 1868, having charge of all the Latin and Greek, and part of the mathematics. During this period, in addition to the arduous school duties, he continued his medical studies, and graduated in 1869 at the Geneva Medical College. Soon after his graduation he was appointed Second Assistant Physician to the Willard Asylum for Insane, and a year later was promoted to the First Assistantcy. This position he held until December, 1873, when he resigned for the purpose of engaging in private practice. The winter of 1874-75 was given to studies in the hospitals and dispensaries of New York. During the whole period of his academic, college and medical studies the expenses incurred were defrayed by his own earnings. In September, 1875, Dr. Wells removed to Minneapolis, where he has been engaged in the practice of medicine up to the present time. At the opening of the Minnesota College Hospital he was appointed Professor of Diseases of Children, which position he now holds in the University of Minnesota. Dr. Wells is a member of the Minnesota Academy of Medicine; the Hennepin County and State Medical Societies; has contributed a number of papers to each organization; has held all the offices in the Hennepin County Medical Society; and in October, 1892, was elected president of the Minnesota Academy of Medicine. He now holds the position of Attending Physician to Asbury Hospital, Home for Children and Aged Women, and Consulting Physician to Northwestern Hospital for Women.

WESCOTT, Cassius Douglas, of Chicago, Ill., was born May 25, 1861, in the little town of Salisbury Center, Herkimer county, State of New York. He is of English and Scotch descent, his mother being a lineal descendant of Sir Andrew Murray of Scotland. His father was a physician, and practiced medicine in New York State until the subject of this sketch was seven years of age, at which time he moved west, locating in Chicago. Young Wescott entered the Old Central High School at the age of fifteen, taking the scientific course, but was unable to finish the third year on account of poor health. When nineteen years of age he entered Rush Medical College as a faculty student, and graduated in the spring of 1883. Dr. Wescott was immediately appointed demonstrator of chemistry under Professor Walter S. Haines, and held that position for a year, during which time he practiced with his father. In the spring of 1884 he obtained an appointment as assistant physician at the Illinois Eastern Hospital for the Insane, at Kankakee, Ill., under Dr. Richard Dewey, serving a little over two years. He then returned to Chicago, where he has been in general practice since. He took a post-graduate course in diseases of the eye, at the Chicago Polyclinic, in 1886. In the spring of 1887 he was appointed assist-

ant surgeon in the ear department of the Illinois Charitable Eye and Ear Infirmary, but resigned the position in order to take charge of the eye and ear clinic at the Central Free Dispensary, connected with the Rush Medical College. In the spring of 1888 he was appointed lecturer of anatomy in Rush Medical College, but gave up the chair at the end of one year because of failing health. In 1891 he was appointed oculist and aurist to the Cook County Hospital, and has been re-appointed to the same position this year. Dr. Wescott is a member of the American Medical Association, the Chicago Medical Society, the Illinois State Medical Society, the Chicago Academy of Medicine, the Chicago Medico-Legal Society, the Chicago Ophthalmological Society, the Practitioners' Club, and is president of the Chicago Pathological Society. His practice is not limited to diseases of the eye, and should his health continue as good as at present, he hopes to continue in general practice as long as possible. He has frequently contributed clinical reports to the local societies and medical journals.

WEST, Hamilton Atcheson, of Galveston, Tex., was born March 30, 1849, at Russell's Cave, Fayette county, Ky., and is of Scotch-Irish ancestry. He was graduated in medicine from the Medical Department University of Louisville, Ky., 1872, taking highest honor in a graduating class of ninety-eight. In April of the same year he was elected by competitive examination one of the House-Surgeons of the Louisville City Hospital. He moved to Texas in 1873, and was elected in the autumn of that year Professor of Materia Medica and Therapeutics in the Texas Medical College. He was appointed House-Surgeon of the Galveston City Hospital, in the spring of 1874, and was re-appointed to the same position in 1877. At the reorganization of the Texas Medical College, in 1888, he was elected Professor of Theory and Practice of Medicine. He was elected Fellow of the American Association of Gynecologists and Obstetricians in 1889, and was elected Secretary of the State Medical Association of Texas, in April, 1891, and in June of the same year he was elected to the chair of Theory and Practice of Medicine and Clinical Medicine in the School of Medicine, University of Texas, the position he now holds.

WEST, William Beverley, of Fort Worth, Texas., was born at Westland, Louisa county, Va., January 30, 1860. His parents were Francis Thornton West and Addie Childs, daughter of Susan Randolph West and Fendol Childs. His ancestors were among the earlier settlers of Virginia. His family are descendants of Thomas West, Lord Delaware, Governor of Virginia. He was educated at Hawkw-ood, a private school in his county, and Randolph Macon College, Virginia. He studied medicine at the Medical College of Virginia, and the College of Physicians and Surgeons of Baltimore, Md., from which he received his diploma in 1884. Before graduating he read medicine under Hunter McGuire, M. D., LL. D., Richmond, Va. He was House-Surgeon in Dr. McGuire's private hospital, St. Luke's Home for the Sick, two years. From there he moved to his native county and practiced at Apple Grove, Va., for eighteen months. He removed from there to Frankfort, Ky., where he had charge of the medical department of Messrs. Mason, Gooch, Hoge & Co.,

the largest railroad contractors in the South. In that position he had a large field for surgery, for which he had early shown great talent, while under the instructions of his illustrious teacher, Hunter McGuire. Here he soon made a large reputation as a cool-headed operator; and his opinion was much sought in cases of surgery. In the spring of 1889 he moved to Fort Worth, Tex.; in the following year he was elected City Physician and Health Officer over nine other competing physicians, which office he held for two terms. This office placed him in the position to be able to bring himself before the profession, and in a very short time he had gained the reputation of one of the brightest young surgeons in Texas. He

W. Beverley West

has never written much, contributing occasionally to local medical journals, such as report of cases, etc. His large and laborious practice leaves him but little time for writing. He has performed gastrotomy twice in the past year for foreign body, with one recovery. In his laparotomy cases he has had wonderful success. He is Surgeon for Houston & Texas Central railroad, and examiner for twelve life insurance companies. He is a member of National Association of Railway Surgeons; also Virginia Medical Society; active member Texas State Medical Association, and has served on some of its most important committees. His career has been a remarkable one, and his success such as rarely falls to the lot of the most deserving and most energetic.

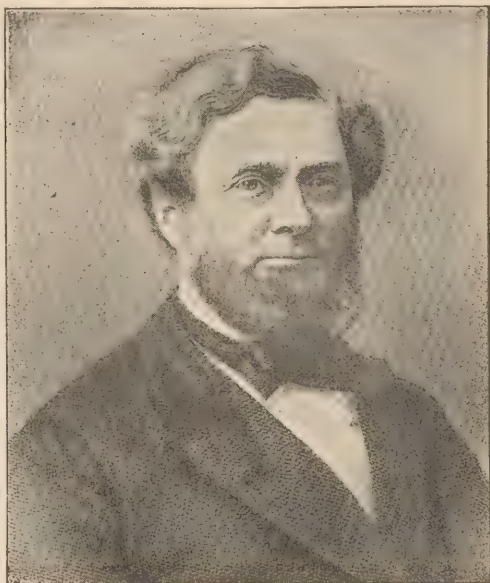

WHELPLEY, Henry Milton, of St. Louis, Mo., was born at Battle Creek, Mich., May 24, 1861. His father is a physician and his mother of a literary family. Both parents are of English descent. His education was received in Michigan and Illinois High Schools. After

serving a pharmacy apprenticeship in these States he entered the St. Louis College of Pharmacy, October 10, 1881. He stood at the head of the junior class in examinations and made the best general average in the senior class the following year, for which he was awarded the alumni gold medal. Having contributed regularly to newspapers, he naturally became a writer for the pharmaceutical press, and took charge of the scientific department of the *National Druggist* (then *St. Louis Druggist*) early in 1884. The next year he became editor-in-chief of the journal, and continued until the close of 1887. Dr. Whelpley next took charge of the *Meyer Brothers Druggist*, and has continued this work ever since. He is also on the editorial staff of the *Medical Fortnightly*, and a frequent contributor to medical and pharmaceutical literature of the day. Dr. Whelpley studied medicine under the preceptorship of Prof. Justin Steer; commenced a three-years' course at the Missouri Medical College in 1887, and graduated in 1890, with very high honors, in a class of 113. This was accomplished in face of having continued all his other duties as editor and teacher while at medical college. The Doctor began teaching private classes while a schoolboy, and has continued to give instructions ever since. At the present time he is Professor of Microscopy, Director of the Microscopical Laboratory and Quiz-master of Pharmacology in the St. Louis College of Pharmacy, Professor of Physiology and Histology, Director of the Histological Laboratory and secretary of the Faculty of the Missouri Medical College, Professor of Microscopy and secretary of the Faculty of the St. Louis Post-Graduate School of Medicine. He is a member of and fills important offices in local, State and national pharmaceutical, medical and microscopical societies. The Doctor is also honorary member of several State pharmaceutical associations, among them Illinois, Kansas, Nebraska, Texas and Arkansas. Dr. Whelpley has practiced in St. Louis ever since graduation, and confined his work to office patients. He is a close student, and continues to attend clinics at the colleges with which he is connected. Dr. Whelpley finds time for collateral science, and often gives public lectures on popular subjects. These are always free and for the good of education.

WHITE, Frank Sprague, of Austin, Tex., was born in Wise county, Tex., May 22, 1859. He is the son of J. D. White, of Illinois, and Permelia Preston, a native of Kentucky. He received his literary education in the common schools of the country; began the study of medicine in 1880, under Dr. W. L. Carpenter, of Decatur, and, after attending two courses of lectures at the Central College of Physicians and Surgeons, Indianapolis, Ind., he graduated in 1884. He was awarded the Faculty prize for the highest general average in all branches. Dr. White located in Decatur, in March, 1884, and in July, 1885, received the appointment of Assistant Physician at the North Texas Hospital for the Insane. He filled this position until January, 1891, when, upon the death of Dr. W. W. Reeves, he was appointed by Governor Hogg, Superintendent of the State Lunatic Asylum, at Austin, Tex., and in February, 1893, he was re-appointed by the governor to the same position, which he now holds. Dr. White married Miss Willie F. Daniel, a niece of Governor Ireland, February 10, 1887,

and they have one son. Dr. White is a member of the Association of Medical Superintendents of American Institutions for the Insane, the State Medical Association, the Terrell Medical Society, and the Austin District Medical Society. He has contributed several valuable papers on his specialty to medical literature.

WHITE, James Platt, of Buffalo, N. Y., was born in Austerlitz, Columbia county, N. Y., March 14, 1811; died September 28, 1881. His father and grandfather served as soldiers in the early war with Great Britain, the former in the War of 1812, and the latter in the Revolutionary struggle. Through them he was a descendant of Peregrine White, the first male born in the Mayflower colony. He pursued his classical studies under the Rev. John C. Lord, and at Middlebury Academy; attended lectures at Fairfield Medical College from 1831 to 1833, and at the Jefferson Medical College,

James P. White

Philadelphia, graduating from the latter in March, 1834. Previous to his graduation, in 1832 and 1833, he had attended a number of patients during the cholera seasons in those years at Black Rock, but commenced professional practice immediately after graduating in 1834, in Buffalo. In 1846, assisted by Drs. Austin Flint and Frank H. Hamilton, he procured a charter for the University of Buffalo, and organized a medical department therein. While his success as a general practitioner was very great, he made obstetrics and the diseases of women his leading practice, and was the first in his State and one of the first in this country (1850) to teach midwifery clinically, a movement which at first met with great opposition, but from its intrinsic value and his determination he carried through to success. During the winter of 1870-71, by invitation of the faculty, he delivered the lectures in his de-

partment at the Bellevue Hospital Medical College, for Prof. George T. Elliott (at his own expense, giving all the fees to his sick fellow-professor) which the faculty resolved "were characterized by great learning, the practical knowledge derived from large experience, zealous exertions to render his instructions as useful as possible, and an efficiency showing peculiar ability and qualifications as a public teacher." In 1856 he reduced an inversion of the uterus of eight days, and in 1858 reduced a chronic inversion of six months, and was the pioneer in taking the ground that chronic inversion can always be reduced. He had altogether reduced twelve cases and performed more than one hundred operations for ovariectomy, being successful in seven cases in ten. He was a member of the American Medical Association, its first vice-president in 1877; of the New York State Medical Society, its president in 1870; honorary corresponding member of the New York Academy of Medicine, and honorary member of the Rhode Island State Medical Society; was twice president of the Erie County Medical Society, and the Buffalo Medical Association; and was one of the vice-presidents of the International Medical Congress, held in Philadelphia in 1876. His contributions to medical literature are on various subjects, and have appeared in the *Buffalo Medical Journal* during the last thirty years. Besides these he contributed numerous papers to the Proceedings of the State Medical Society, and in July, 1858, published a full account of chronic inversion of the uterus, with plates, in the *American Journal of Medical Sciences*. He was the author of the articles on "Pregnancy," in Beck's Medical Jurisprudence, edited by the late Professor Gilman, and of the "Life of Dr. Samuel Bard," in the American Medical Biography, edited by Prof. Gross. During the war he visited Memphis and inspected the hospitals there, and after the battle of Seven Oaks, went to the Peninsula, to assist in caring for the sick and wounded. In neither of these visits was he in an official capacity, his expenses being borne by himself. He was a prominent member of the Episcopal Church, and was chiefly instrumental in organizing St. John's Parish, Buffalo, and in procuring funds for the erection of its church. He also rendered valuable aid in establishing the Protestant Episcopal Church of the city of Buffalo. He was married to Mary Elizabeth Penfield, in 1854. Their union was in all respects a happy one. Soon after his marriage he met with an accident that left its mark upon him through all his after life. In traveling in a stage coach over a rough road, his head was jolted upward against the top of the coach with such force as to fracture the atlas. By some good fortune there was no displacement of the fractured portion of the bone. He was, however, obliged to keep his bed for a long time. He recovered, with permanent loss of the power of rotation of the head upon the neck. "It has been the general rule that speedy progress at the beginning of the practice of medicine is premature, and not likely to lead to permanent success, but Dr. White's career as a practitioner was an exception to this. He not only speedily acquired an extensive practice and outstripped his competitors of equal age, but his seniors as well. For more than forty years his practice was only limited by his power of endurance

and his willingness to work. His physical capability, energy, promptness and self-confidence were remarkable, and these qualities, added to his real ability as a practitioner, secured and maintained for him a degree of success to which but few attain. He resolved at the outset to succeed, and with him, to resolve was to persevere and to spare no efforts to accomplish this result. That Dr. White stood at the head of his profession was understood, not only by the public, but was conceded by his fellow-physicians, who delighted to do him honor and took pride in his fame. There was much in his life that could be profitably commented on at length, but only the salient points in his character and record can be presented in this connection. An ample sketch of his life would be a history of the medical profession in Buffalo for the last half century—nay, almost a history of the city itself, for there have been but few important public questions or enterprises since the corporation was established in which he did not become more or less interested. Soon after he established himself in Buffalo, he began to leave his impress upon the life around him. The foundation of the medical school of that city was very largely due to his exertions. It was necessary to overcome opposition from some of the older and most influential members of the medical profession. At that time the school at Geneva, N. Y., had large classes and an able faculty. Most of the members of the faculty were led to accept appointments in the Buffalo school, in view of its geographical and clinical advantages. Public interest was aroused sufficiently to obtain the funds needed for a substantial building. The continued prosperity of the school has not only been a source of proper pride to the city in which it is located, but the institution has become a grand monument to the men who created it. Dr. White was the Professor of Obstetrics and Gynecology, in which relation he continued until his death. As a teacher he was direct, forcible, and practical. He did not aim at rhetorical or oratorical display, but he kept in mind a purpose of sound teaching, and sent forth that which could be put to practical use in the exigencies of the profession. During the last twenty years of his life he devoted much attention to ovariectomy and his reputation in this direction was such that he was called to various parts of the country. As a speaker and debater he was ready, cogent and courteous. He participated largely in oral discussions at the meetings of the different associations with which he was connected. What he said was always to the point, and always commanded respectful consideration. His opinions on scientific questions, and those of polity, well formed and well maintained, never failed to have much influence upon the minds of others." Dr. White co-operated actively in the establishment of the Buffalo Hospital of the Sisters of Charity; the Maternity, and Foundling Hospitals, and the Providence Asylum for the Insane. He was also largely instrumental in the creation of the State Lunatic Asylum and its location at Buffalo. He was one of the managers from the first, and was its president until his health, towards the close of his life, compelled him to relinquish that position. He was also ever ready to do all in his power for the public good. He was one of the found-

ers of the Young Men's Association, of the Academy of Fine Arts, and of the Historical Society. He worked in many ways favoring all movements that would aid his city in a physical or moral sense, that would add to its healthfulness, or that would make it more beautiful. He was active in his efforts to secure for Buffalo its magnificent public park, and in the erection of the finest business block in the city, he at once attested his public spirit and business sagacity, and also left an enduring monument to his own name. He was generous and hospitable, and his qualities endeared him to the hearts of those who knew him, and his professional skill was sought by those in physical danger or pain. Referring to his personality, the late Dr. Austin Flint has said: "The salient points of his character show superior intellectual endowments and attainments united with fixedness of purpose, perseverance, good judgment, tact, unusual executive ability and rectitude—mental qualities which insure success and usefulness in this world. These qualities of the mind, to which were added vigorous health and physical endurance, could not fail to secure success in medical practice, as regards not only obtaining and retaining patients, but in the management of cases of disease." He investigated cases carefully, but reached conclusions with promptness and decision. He had no confidence in an intuitive ability to judge of diseases. "In the care of patients he was not unduly affected by unfavorable possibilities or probabilities. His attention was more directed to those which were favorable. He was always hopeful for the best, and as long as there was any ground for hope he never relaxed his efforts. He acted under a deep sense of responsibility to his patients. No one ever accused him of indifference or neglect. These professional traits secured the fullest confidence on the part of patients. Extraneous methods to possess their confidence were to him not needed. These he held in contempt. In his bearing toward his patients he was independent. He was not a suppliant for confidence. He demanded it as a condition for assuming the responsibilities connected with the management of cases of disease. As an operator, he was conservative, yet bold, and with a fertility of resource which enabled him to meet emergencies as they arose." In all his social and domestic relations, Dr. White was the true man and the Christian gentleman. He lived to a good old age, and when the summons came it found him ready. His power of mind and body were remarkably well preserved. His final illness was brief and unattended with much suffering. His mind was unclouded to the last, and when the end came he met it as befits one who leaves a useful life behind him and who looks forward to a sure hope of a higher, nobler life in the world to come.

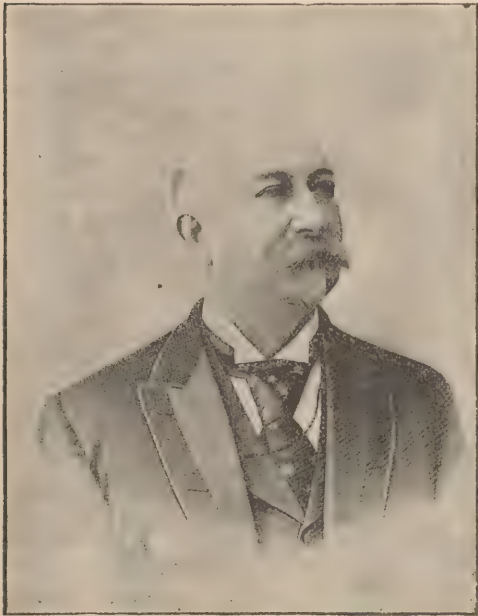

WHITE, J. William, of Philadelphia, was born in 1850. Dr. White is descended from Mr. Henry White, who settled in Virginia about the year 1645. His son, Henry White, Jr., who was born in 1630, settled in the neighborhood of what is now Elizabeth City, North Carolina, from whence his great-grandson, James White, removed to Tuckerton, New Jersey. The latter's eldest son, William Rose White, married Mary, daughter of Samuel Stockton, a highly respected citizen of Bur-

lington, N. J., and a direct descendant of Richard Stockton, the founder of the distinguished New Jersey family of that name, who settled at Flushing, L. I., some time prior to the year 1656, afterwards removing to Springfield township, Burlington county, N. J. One of his great-grandsons was the Honorable Richard Stockton, of Princeton, one of the signers of the Declaration of Independence. William Rose and Mary (Stockton) White had two sons, the late Samuel Stockton White and Dr. James William White, the father of the present J. William White. Dr. White, the father, was well known in Philadelphia, not only as a prominent and successful business man, but as an active worker during war times in the Sanitary Fair, and again as manager of the People's Literary Institute during the period before the war when he brought before the people of Philadelphia the prominent anti-slavery lecturers of the country; as the founder of the Maternity Hospital, Philadelphia, and as the first president of the Board of Charities and Corrections of that city. J. William White was educated at the University of Pennsylvania; his preceptor was Prof. Horatio C. Wood; he graduated in 1871, in medicine, and at the end of that year took the degree of Doctor of Philosophy, receiving the full vote of each examiner and standing at the head of his class in competitive examination. He subsequently was appointed upon the personal staff of Prof. Agassiz in the celebrated Hassler expedition to South America, and was absent for thirteen months; he then resided for a year in the Philadelphia Hospital as *Interne*; for three years was medical officer to the Eastern Penitentiary, to which institution he was subsequently made inspector by the appointment of the Governor of Pennsylvania. He has been in the practice of surgery in Philadelphia all his professional life. Dr. White, after beginning as quiz-master, first on anatomy and then on surgery, has successively occupied the positions of Assistant Demonstrator of Anatomy and Surgery; Demonstrator of Surgery; Clinical Professor of Genito-Urinary Surgery; Surgeon to the Philadelphia University and German Hospitals; Consulting Surgeon to the Maternity and Samaritan Hospitals, and Professor of Clinical Surgery at the University of Pennsylvania. He has made a number of contributions to medical literature, among which the following may be mentioned: Article on "Urethritis," in the *National Encyclopedia of Surgery*; on "Hereditary Syphilis," in *American System of Medicine*; on "Urethral Stricture," in *Appleton's Encyclopedia of Genito-Urinary Diseases*; and papers on "Dislocation of the Tendon of the Long Head of the Biceps Muscle;" "Iodide of Potassium in Syphilis;" "The Surgery of the Spine;" "The Present Position of Antiseptic Surgery;" "The Supposed Curative Effect of Operations *Per Se*;" "The Technique of Perineal Section;" "The Modern Treatment of Vesical Calculus in Male Children;" "The Treatment of Glandular Tumors of the Neck, and of Tumors of the Female Breast;" "The Abortive Treatment of Syphilis," and "The Diagnosis of Urethral Stricture."

WHITEHEAD, William Riddick, of Denver, Colo., was born at Suffolk, Va., December 15, 1831. For the details concerning the ancestry, the life, and the professional achievements of

this noted surgeon the editor is indebted to an interesting sketch in a recent number of the *Magazine of Western History*: His father, Col. William B. Whitehead, a native of Virginia, was of English descent. It is said that three brothers by the name of Whitehead came to the colony of Virginia during the reign of Cromwell. They came in company with the Spotswoods and Fitzhughs. A Spotswood was Colonial Governor of Virginia, and a Whitehead was in the House of Burgesses. Hugh Blair Grigsby, a connection by marriage of the Whitehead family, and a man of great learning, and formerly president of the Historical Society of Virginia, has traced the relationship of this family to William Whitehead, the poet laureate of England. The three brothers above mentioned settled upon the eastern shore of Virginia. One of these brothers,

was a devout member. He often remarked on the scholarly discourses and dignified deportment of the Episcopal clergy, and thought the forms and ceremonial of that church added dignity to and inspired respect for religion. He acquired wealth by marriage, and increased it many fold by mercantile pursuits by land and by sea. Dr. Whitehead is his oldest and sole surviving son; several sons, together with a daughter, died in infancy. One son, Robert, a bright, brave, noble lad about twenty years old, during the war, died at Bermuda of yellow fever. He was wounded in one of the battles near Richmond, and afterwards was a signal sergeant in Lee's army, but at the time of his death was the signal officer of a blockade runner. Another son, Joseph, was a physician, and died at Norfolk, Va., a few months after his father's death, and a remaining son, Richard, died some years later. Dr. Whitehead's father was a large sugar planter in Louisiana. At the close of the war he failed, and was voluntarily released unconditionally by his creditors on the payment of fifty cents on the dollar. He mentally resolved, however, not to accept this settlement, and resumed his sugar planting, and in a few years, by successful management, paid the full amount of his original indebtedness. In 1877, at about the age of seventy years, he died at New Orleans, leaving a large estate, most of it to his grandchildren. He, like some of his ancestors, had the virtues of antique Romans; that which he most feared for himself, or for those he loved, was a "wounded name." To the last moment of his life he was resolute in his noble purposes to be always just, kind, and charitable; his good deeds live after him; truly he was "the noblest Roman of them all." Dr. Whitehead's mother, Emeline F. Whitehead, *née* Riddick, became an orphan at an early age, and an heiress in the care of her aunt, Mrs. Mary A. Charlton, the wife of Captain Francis D. Charlton, of Suffolk, Va. She was a descendant of Colonel Willis Riddick, who was in the Revolutionary War, and commanded a small force of Continental militia, at the burning of Suffolk by the British, May 13, 1777. She died in 1875. A notable event occurred at Suffolk during her early life: In 1826, Lafayette, on his second visit to America, accepted an invitation to visit this place. This old town which has always been celebrated for its hospitality, on this particular occasion, pre-eminently distinguished itself for its open-handed liberality, and for its cordial expression of happiness at the high honor accorded to its citizens by the visit of the marquis. Foremost among the entertainers was her uncle, Captain Charlton, who, with his company of Suffolk Columbians, one of the finest military organizations of Virginia, received the distinguished visitor and escorted him to the Castle Inn, where the noble guest was entertained by the citizens of Suffolk in the most approved manner of that period. Dr. Whitehead married a daughter of Col. Thomas G. Benton, a native of North Carolina, and cousin of the former United States Senator from Missouri, Thomas H. Benton. She is a descendant of Major Jesse Benton, a Continental officer, who was killed at the battle of Camden. Dr. Whitehead graduated in 1851 at the Virginia Military Institute, at Lexington, Va.; after which he studied medicine for one year

W. R. Whitehead.

from whom the subject of this sketch is descended, finally settled on the south side of the James river, and his offspring helped to people Surry, Isle of Wight, Nansemond, and Norfolk counties. A large and influential family of this name in Georgia are also related to this branch. His father was an old line Whig; he despised Democracy because it abolished in Virginia the slight property qualification for voting, which previously existed, and he believed it had a leveling tendency inimical to a pure and respected form of government. He was a man of sterling worth of character, inflexible in his ideas of right and wrong, and in his pursuit of duty. He was courteous, kind and warm-hearted, but generally formal, punctilious in dress and manner, and self-respecting to a degree that caused him to be thought proud by those who did not know him well. He was never familiar with friends or others. He was a supporter of the Episcopal Church, of which his wife

at the University of Virginia, and graduated in medicine the following year at the University of Pennsylvania. Visiting Paris, he continued the study of medicine there; but devoted his time mostly during one year to improve his knowledge of French and to acquire a correct pronunciation. He endeavored to learn to speak the language without any foreign accent, and studied, as if this were the sole purpose of his life; and to this end often visited the same play at the theater ten or a dozen times successively, read much aloud to competent listeners, and avoided all English speaking persons. He succeeded so well that he could converse for hours without any English accent being detected by educated native Frenchmen. Money was plentifully furnished to him by his father, who was wealthy, and who was always liberal with him. He was never much disposed to frivolous amusements, but generally inclined to books and to rational enjoyment. Remaining in Paris a year, he then visited Vienna; and after a few months' sojourn there, one morning, presented himself before Prince Gortchakoff, the Russian Ambassador to the Austrian Court at Vienna, told him who he was, and solicited as a young American surgeon, an active position in the Russian Army, then fighting the battles of Russia against the allied armies of France, England, Sardinia and Turkey. He was most graciously received. The Prince took his American passport, and afterwards ordered a Russian passport to be issued to him, which, with other Russian papers, Dr. Whitehead still retains as souvenirs. At a second interview, arranged for him by the Prince, and of which he was notified by a messenger, he was received still more graciously, and this time addressed in excellent English, instead of in French, as on the previous occasion. He then appeared to be a man of about sixty-five years of age, of very genial and engaging manners, and had a courtly grace and dignity that at once commanded esteem and respect. At the close of their interview he impressively lifted his hands above the young surgeon's head, said, "God bless you!" and dismissed him with kind words, and with letters to his cousin, Prince Gortchakoff, the commander-in-chief of the armies of Southern Russia. Dr. Whitehead's big and impressive-looking American medical diploma was sent to St. Petersburg, and he received the appointment of staff surgeon. After presenting his letters to Prince Gortchakoff, the General commanding, he was ordered to Odessa, where he had nothing to do for several months but to enjoy a round of festivities and amusements, having the *entrée* of the most distinguished and fashionable society of this gayest of gay cities of Southern Russia. French was universally spoken by the educated classes, and his fluent command of the French language procured for him many social attentions that otherwise he should have missed. However, it was not for this purpose that he visited Russia, and he tired of fashionable dinners and balls, and finally made an earnest appeal to be ordered to the seat of war at Sevastopol. He reached this partially besieged city after a tedious journey and many novel and interesting incidents of travel, and found an American, Dr. Turnipseed, of South Carolina, ill with typhus fever, and in the same room with him the dead body of a Dr. Draper, of New York, who had just died

of the same disease, and at whose burial he was present the next day. He had Dr. Turnipseed removed to better quarters, and he recovered after a tedious convalescence. At Sevastopol he was under the supervision and kindly guidance of Pirogoff, the great Russian surgeon, and received many kindly attentions from Count Osten Sacken, the military commandant of the city, and also from his staff officers. During the following summer considerable cholera prevailed, and a Dr. McMillan, of Mississippi, died of this disease and was buried the next day. Dr. Whitehead was then very young and quite inexperienced as a surgeon, but Pirogoff always took a friendly interest in him, and as most of the Russian surgeons and officers of good birth spoke French well, he soon won their confidence by his frankness and earnest desire to acquire a practical experience of gunshot surgery. Pirogoff marked off for him with pen and ink, on a wounded soldier's foot, the outlines of his celebrated operation, which the subject of this sketch then performed under his eye and personal supervision, and which he has often since successfully repeated, indeed recently, at the Arapahoe County Hospital at Denver, to which he is at present Consulting Surgeon. Through the recommendation of Pirogoff, he received, toward the close of the war, by order of the Emperor, the cross of Knight of the Imperial Russian Order of St. Stanislaus. Just before the treaty of peace was signed, he received an honorable discharge from the Russian service; and about the same time receiving through an English banking house, from his father, a remittance for a thousand pounds sterling, he returned to Paris, determined to study carefully his profession in the dissecting room and at the bed-sides of the Paris hospitals; and was registered as an *élève de l'École de Médecine de Paris*. At this time Judge John Y. Mason, a friend of his father, and a native of Southampton county, Va., was the United States Minister to France. The Judge presented him to the Emperor, Louis Napoleon, at one of his grand court receptions and balls. A gorgeous court costume was absolutely *de rigueur*; and the grandeur and magnificence of the occasion exceeded anything he ever witnessed. The *Cent Gardes*, men of the most perfect physical development of all the soldiers of France, were stationed with their drawn sabres, like grand statues along the majestic halls and approaches to the reception rooms, and parlors of the Palais of the Tuileries. "On being presented to his majesty, his reflections were, looking at him from an anatomical point of view, what short legs and long body the Emperor has, and that he should always hold his receptions, like his military reviews, on horseback. He almost feared that he saw him looking at his legs, and read his thoughts. He afterwards heard it said in Paris that the Emperor seemed conscious of this great personal defect. After the reception the ball opened with a cotillion set, in which were the Empress and English Minister, the Emperor and Princess Clotilde, and others. This ball passed off, as all such grand festivities do, with great *éclat*, and was participated in by hundreds of people, including dignitaries of the army, foreign persons of rank and wealth, grave professors from the *Sorbonne*, wearing awkwardly fitting court costumes, and embar-

passing swords, side by side with *élèves* from the *école Polytechnique*, the embodiment of neatness and military precision." Dr. Whitehead having passed with more or less distinction all of his examinations, and his thesis for the doctorate, in 1860 he received the degree of *Docteur en Médecine de la Faculté de Paris*. Soon afterward he returned to the United States and settled in New York City; and was elected Professor of Clinical Medicine in the New York Medical College, and was the colleague of Doremus, Jacobi, Chas. Budd, and others. After the fall of Fort Sumter he returned to his native State, Virginia. On account of his military education, Mr. Jefferson Davis appointed him a first lieutenant in the battalion, which was intended as a nucleus for the regular Confederate army, but the organization of which was never completed; and subsequently Mr. Davis, at the request of the colonel and some of the officers of the Forty-fourth Virginia Infantry, appointed him surgeon to that regiment, with which he served about two years. He was successively regimental surgeon, senior surgeon of brigade, and acting surgeon of division, and during the last year of the war president of an examining board in South Carolina, for the examination of conscripts and disabled soldiers. At the battle of Chancellorsville, he had General "Stonewall" Jackson, after he was wounded, placed in an ambulance and sent to the rear. This ambulance was already occupied by his chief of artillery, Lieutenant-Colonel Crutchfield, wounded in the right thigh. After the battle of Gettysburg, an order came directing him to take charge of all the wounded of Jackson's old corps, who could not be removed; and four or five surgeons were ordered to remain, and report to him; but only Surgeon Tanny, of a Louisiana regiment, remained, together with about twenty nurses. After the retreat of the Confederate army the Federals took possession of their camp of wounded, but permitted him to remain in charge, and liberally furnished supplies for the wounded. About a month after the battle, Dr. Tanny and Dr. Whitehead, with other Confederate surgeons, were sent to Baltimore, and instead of being exchanged, as expected, they were detained as prisoners of war, and shut up in an inclosure adjoining Fort McHenry. In the meantime Dr. Whitehead's pretty little cousin, to whom he was engaged, and afterward married, had, on account of her ill health, gained permission from Mr. Stanton, the United States Secretary of War, to cross the lines into Virginia. Aware of this, he plotted to free himself from the uninteresting life of a prison barrack and camp. One dark night he made his escape in citizen's attire, leaving his Confederate uniform, top boots and big spurs behind as souvenirs; having scaled the formidable brick wall which was erected across the peninsular, on the point of which Fort McHenry is located. This escape was attended with some interesting incidents, which space will not permit to relate. The following night after his farewell to Fort McHenry he appeared before his much astonished future father-in-law in Brooklyn, and the next morning left on the Hudson River railroad for Canada. He stopped a week or ten days at the Clifton House, opposite Niagara Falls, visited Toronto, Montreal and Quebec. He went down the St. Lawrence river, through the Gut of Canso to

Halifax, stopped there ten days, became acquainted with some of the officers of the garrison and fleet stationed there, met his old friend and fellow schoolmate of the Virginia Military Institute, Ben Ficklin, and took passage with him on the Cunard steamer Alpha, for St. Georges, Bermuda. After remaining in Bermuda three weeks, Major Walker, of Petersburg, Va., the Confederate quartermaster, stationed there to look after the coaling and other interests connected with the blockade runners, gave him passage on a fine steamer about to leave for Wilmington. The purser of this ship was a Mr. Taylor, relative of General Taylor of the Confederate army, and a friend and neighboring sugar planter in Louisiana of his father. He shared with Mr. Taylor his large and comfortable state room. On their arrival off the entrance to Cape Fear river, during the small dark hours of the morning, they got aground, and the Federal cruisers watching for them were quite near, but they got afloat again without discovery, and at daylight they saw that they were steaming up Cape Fear river, under the guns of the Confederate forts, and that their signal officer aboard was signaling their arrival. It was said that their steamer was one of the fleetest blockade runners afloat. She was like most of them, painted of a lead color. Her hull, smoke stack, masts, spars and most everything about her was painted of this color. The object of this was to make her less visible at sea, anthracite coal was used, which gave no smoke, and during the day a man with a good field glass was constantly at the mast head on the lookout, as well as two men on the forward deck, each with good field glasses. The one who first espied a sail of any kind received a reward. Their steamer carried no lights at night and so timed the run of about three and a half days from St. Georges to the mouth of Cape Fear river, as to arrive there when there was no moon. The little colored lights which the Federal cruisers carried near the water line, to keep from running into each other, were really an advantage in discerning to a blockade runner the location of the blockading squadron. The approach was always made with full steam up; if discovered before passing the little colored lights, the blockade runner depended on its speed, taking the chances of shot and shell to enter the harbor, or to make its escape at sea, much depending on the courage, cool-headed behavior and judgment of the captain. On his arrival at Richmond, Surgeon-General Moore took some interest in his adventure, and gave him twenty days' leave of absence, during which time he was married to his little cousin, and at the expiration of his leave the Surgeon-General extended it, and finally appointed him president of the Examining Board in South Carolina, for the examination of conscripts and disabled soldiers. At the close of the war he returned to New York, devoted himself assiduously to the practice of his profession, principally surgery, became an active working member of several medical societies, performed many difficult surgical operations, and contributed much and frequently to the best medical journals, by the report of interesting and instructive cases. In 1872, on account of the ill-health of his wife and of the fear of losing their son Charles, also in ill-health, they removed to Denver.

With the exception of a visit to Europe, with his family and an occasional visit East, or a vacation passed at their summer residence in Estes Park, they have remained at Denver since their first arrival there. Two sons and a daughter are living—Charles, Frank and Florence. About the year 1874 Dr. Whitehead was elected a member of the city council of Denver; and was the chairman of the committee on health, and served the city zealously and faithfully. About this time, at the request of Mr. William N. Byers, then editor of the *Rocky Mountain News*, he prepared two lengthy articles for his paper on the subject of "Sewerage for Denver;" and these articles were the initial steps towards the establishment of the present system of sewerage in that city. He has always taken an active part in his profession in Colorado, and was president of the local medical society at Denver, and also president of the State Medical Society of Colorado. He was one of the founders of two medical schools in that State, the University of Denver and the University of Colorado, and in each of them was the Professor of Anatomy. While connected with these schools, it was his ambition to show anatomy should be taught, not as a dry, uninteresting study, but as an attractive application of the knowledge of the human body, to the relief of medical and surgical ailments. But the time for such thorough work is too short in most American medical schools. Referring to this question, Dr. Whitehead says: "As our convictions, when sustained by proper reasons and arguments, form the best part of our mental life, it is eminently pertinent to the subject of this sketch that I should state one of my well-established convictions concerning the subject of medical education in this country, and which conviction is in keeping with my expressions and acts, and also in harmony with the sentiment of every competent, earnest and hard-working physician in the United States. My objection to most of the medical schools of this country is that the time allotted to the whole study of medicine is not as much as should be devoted to anatomy alone. The preliminary requirements exacted, often none at all, and time given to the study of medicine, are totally inadequate to the acquirement of a proper medical education. The general government should, as a matter of public safety, take away the licensing power of the medical diploma from every college, and vest this power in medical examining boards, at least equal to those for the examination of Surgeons to the United States Army and Navy. The government owes quite as much to its people as to its soldiers. This is the position which some of the best and most worthy members of the medical profession think that the government should assume, and I believe it the only way in which extremely ignorant and incompetent persons can be excluded from so sacred and important a trust as that held by the physician. The remarkable ambition to be a professor in a little medical school, or the support afforded by the students' fees in the large colleges, having only a two-years course of study, are generally the motives for the continuance of the dishonorably low standard of medical education in this country. We find professors of recognized merit who prostitute their good names, and their abilities, to defend the mis-

erable two-years course; they allege specious reasons, and proffer flattering compliments about the vivacity of the young American mind over the sluggish intellect of the European youth. I hope the day will come when an intelligent public sentiment will condemn all such nonsense, and will recognize that it takes time and labor to learn anything that requires the highest exercise of the intellectual faculties. To this end the American Medical Congress is destined to exert an influence of the greatest interest to this country. The congress is composed of associated medical organizations, which meet jointly at Washington once every three years; while each year the separate organizations meet at such places as each association designates. It is of this congress and one of these associations (the American Orthopedic Association) that I am an active member. In this manner much earnest and valuable scientific work is accomplished; and in this way the young physician is shown the need of higher qualifications for the duties of his profession." As that which one publishes forms an essential part of a life's history, it is proper to cite a list of some of Dr. Whitehead's contributions to medical literature, which have appeared in the *New York Medical Journal*, *Medical Record*, *American Journal of Medical Science*, and other leading periodicals at home and abroad. The articles are as follows: "On Excision of the Superior Maxilla: Report of a Case with Remarks on Certain Tumors of This Bone," illustrated, 1866; "Extirpation of an Osseous Tumor of the Upper Jaw;" "The Prevention of Fatal Anesthesia from Chloroform, by the Previous Use of Alcoholic Stimulants," read before the New York Medical Journal Association; "Delirium Tremens Successfully Treated with Coffee;" "Perineal Urethrotomy: Relation of a Case Suggestive of Remarks on the Treatment of Stricture of the Urethra," 1867; "Case of Muco-Periosteal Uranoplasty;" "Account of a New and Very Successful Operation for the Worst Forms of Cleft of the Hard and Soft Palate," illustrated with seventeen figures and a brief analysis of fifty-five cases; "Ancient Specula, and the Conical or Cylindrical Speculum of the Moderns," illustrated, 1868; "Surgical Treatment of Cleft of Hard Palate, with an Illustrative Case," colored illustrations; "Report of the Best Methods of Treatment of Different Forms of Cleft Palate," read before American Medical Association, Transactions American Medical Association, 1869, expensively illustrated with colored illustrations by the Association; "Remarks on the Physiological Action of the Interossei Muscles of the Hand, with an Easy Method of Strengthening the Fourth Finger of the Pianist," illustrated; "Cases of Rare Cystic Tumors," 1869; "Results of the Operation for Cleft of the Hard and Soft Palate, with a Tabular Statement of Cases;" "Remarks on the Reproduction of Bone," read before New York County Medical Society, March 21, 1870; "The Effects on the Cerebral Circulation of Large Doses of Bromide of Potassium," 1870; "Blood-letting as a Means of Prompt Relief, in some Cases of Penetrating Wounds of the Chest;" "Remarks on a Case of Extensive Cleft of the Hard and Soft Palate, closed at a Single Operation"—thirteen wood-cuts; "Cases of Fibrous Stricture of the Rectum, Relieved by Incisions and Elastic Pressure," illustrated, with remarks, 1871; "Cases of Cleft of the Hard and

Soft Palate, Closed by Operation;" "Reproduction of Bone in the Palatine Vault;" "Cases of Stricture of the Rectum Treated by Different Methods—one of them by Electrolysis," 1872—copied by *Braithwaite's Retrospect*; "Remarks on the Management of the Inner-Maxillary Bone in Double Hare-Lip," three cases, *Transactions Colorado Territorial Medical Society* for 1873; "Successful Case of Ovariectomy, with Remarks," operation March 14, 1872; "Remarkable Mode of Union in a Case of Cleft Palate," *Transactions Colorado State Medical Society*, June, 1877; "Absence of the Uterus, with a Previous History of Chronic Inversion of this Organ, which was mistaken for Polypus, and Removed with Ligature, with Remarks," *American Journal of Medical Sciences*, January, 1877; "The Use of the Midwifery Forceps in Contraction of the Conjugate Diameter of the Pelvis—or Disproportionate Size of Fetal Head," *Transactions of Colorado State Medical Society*, 1878; "A Series of Lectures Delivered at the Denver Medical College, on Diseases of the Genito-Urinary System," published in the *Rocky Mountains Medical Times*, from January to June, 1882; "Inaugural Address as President of Colorado State Medical Society," *Transactions Colorado State Medical Society*, 1884 (The subject of this address was "The Elevation of the Standard of Medical Education"); "Rupture of Posterior Tibial Muscle," also, "A Description of a New Apparatus for Making Extension and Counter-Extension at the Ankle Joint, in Diseases of this Joint," 1885; "The Closure of Cleft of the Hard and Soft Palate, at a Single Operation, with a Brief Report of a Recent Case;" "Notes of some Recent Cases of Hip-Joint Disease, Including two Cases of Excision and one of *Brisement Forcé*, with Remarks on some others," ten illustrations, 1886; "Report on Orthopedic Surgery to the Colorado State Medical Society," illustrated, *Transactions Colorado State Medical Society*, 1887; "Remarks on Stricture of the Rectum;" "New Methods of Applying the Plaster of Paris Jacket to Obtain Extension," with illustrative cases, 1887; "Surgical Drainage," 1888; "The Operative and Mechanical Treatment of some Joint Diseases and Injuries, with special reference to Hip, Knee, and Elbow Joints," with illustrative cases, *Medical News*, Philadelphia, and *Transactions American Orthopedic Association*, 1889; "Conservative Treatment of Compound Fractures," illustrated, published in 1889, in *Transactions Colorado State Medical Society*.

WILLCOX, James Carter, of Darlington C. H., South Carolina, was born in Marion county, S. C., November 21, 1857. His father, John Willcox, was twice married; first to Miss Wayne, who died, leaving two sons, and the second time to Miss Sarah Clarke, he being the eldest living of five brothers of this union. The origin of his family name is "Wild-chough," or a black raven with red legs, found in Southern England, and his family coat of arms is a design of said bird perched upon a ledge of rock. The first of the family known in America was Thomas Willcox, of England, who married Elizabeth Cole, of Ireland, and who came to this country about the year 1727 and settled at Ivy Mills, Delaware county, Pa., where he established the first paper mill of this continent, and it enjoys the enviable distinction of being the oldest business in America where the

ownership has since borne continuously the family name, it being still at this writing in active operation. John Willcox, the first son of Thomas, married Rebecca Butler, of Philadelphia, Pa., and removed to North Carolina. He and a friend, Husbands by name, were the leaders in the battle of Alamance county, N. C. This being one of the first battles of the Revolutionary War, it was for this rebellion against Governor Tryon, of North Carolina (Tory Governor), that the English government offered a considerable sum for his head. He therefore returned to Philadelphia, and took an active part in suppressing the whisky insurrection, and subsequently returned to North Carolina, where he died, leaving four sons and four daughters. George, the fourth son, was twice married; first to Elizabeth Tyson, who was of German descent, and who was the

John Willcox

grandmother of the subject of this sketch. Their second son, John, removed to Marion, S. C., after spending his early life on his father's plantation, and engaged in the mercantile business, about the year 1838, where he lived until his death, which occurred May 1, 1890. He was a successful business man and amassed a considerable fortune, but having ardently espoused the Confederate side, the result of the war found him a poor man. His son, Dr. Willcox, a mere boy at the time, received his early education at the Marion Academy, and at the age of sixteen left his father's roof and removed to Darlington, S. C., where he still lives. He began the study of medicine by first devoting seven years of his life to qualifying himself in pharmacy and chemistry, as he considered these branches of more importance to the physician than is generally

believed. He entered the University of Maryland in 1878, and afterwards the University of the City of New York, from whence he graduated in 1881. He at once began the practice of medicine, and his practice has been eminently successful, from a financial as well as a professional standpoint, his reputation having extended over his entire State as a physician and surgeon. He married Miss Annie L. Milling, of Darlington, S. C., and the result of their union has been three boys and one daughter. He was active in creating the law establishing the State Board of Medical Examiners, and was a member of said board during its whole existence of four years until it was repealed in 1891 by the political faction which came into power at that time, and for no other reason than that higher professional education was not favorably considered by them. While he has always eschewed politics, he was prevailed upon to accept the office of Mayor of Darlington, mainly for the purpose of improving its sanitary environments, and during the four years of his administration he had the satisfaction of seeing his town grow to a city, and to-day second to none in South Carolina as to pluck, enterprise and health. He is a member of all local medical societies, including the State Medical Association, and to them he has presented many papers upon various subjects. Some of his principal surgical operations of importance for the past few years have been: Removal of a nine and one-half ounce tumor from the rectum, attachment eight inches from the margin of anus, without cutting, April 14, 1884, patient sixty-five years old; Ligation and extirpation of vermiform appendix with two lemon seed impacted, patient aged nineteen years, June 5, 1887; Tracheotomy for foreign body impacted in right bronchi, one-fourth inch from bifurcation, and extraction of same, child three and one-half years old, December 17, 1890. All these cases were successful and recovered. Out of several hundred surgical operations, his only case lost was one where laparotomy was performed for gun-shot wound, and out of 1,037 obstetrical and gynecological cases, his record shows three deaths. Being of English, Scotch, Irish and German descent, he seems to be endowed with above characteristic qualities, which suit his profession. He is ingenious; never tires; always willing to assume responsibilities; is bold, yet exercises good judgment, and will continue and pursue a forlorn hope as long as any human being can—so much so that he is known as a "natural-born fighter." Mentally, he is scientific, and never accepts anything on faith, unless it can stand the test of investigation. He is practical to a rare degree, and understands how to make his profession pay, thereby differing from most of his medical brethren.

WILE, William Conrad, of Danbury, Conn., was born in Pleasant Valley, Dutchess county, N. Y., January 23, 1847. He was the only son of the Rev. B. F. and Elizabeth (Bulkly) Wile. He received his early education under C. P. Roe, who at that time was a prominent teacher, and afterward obtained the degree of A. M. At the commencement of the Civil War he enlisted in Company G, One Hundred and Fifth New York Volunteers, and served two years and eight months as a private, during which time he "marched to the sea" with Sherman, and is now a member and Surgeon-General of the G. A. R., and for-

merly Medical Director, Department of Connecticut. After the war he began his medical studies, and in 1870 received the degree of M. D. from the medical department of the University of New York. He practiced for a short length of time at New Brunswick, N. J., and Highland, N. Y., but removed to Newton, Conn., where he remained for some years. While there he started the publication of the *New England Medical Monthly*, which is one of the foremost medical journals in the country. In 1887 he was offered the Lectureship of Nervous Diseases in the Medico-Chirurgical College of Philadelphia, which he accepted, but becoming tired of city life he resigned and removed to Danbury, Conn., where he still resides. Surgery has always received much attention from him; his great success in abdominal surgery has added much to his reputation. He holds the position of Medical Ex-

William C. Wile.

aminer of Danbury, and Surgeon for both the Housatonic and New York and New England railroads. Among the offices held by him are those of vice-president of the American Medical Association; president of the American Medical Editors' Association; president of the Fairfield County Medical Society; president of the Danbury Medical Society; secretary of the Section of Anatomy of the Ninth International Medical Congress; also corresponding member of the British Medical Association; member of the Medico-Legal Society, and of the Connecticut State Medical Society. In addition to surgical work, Dr. Wile still edits the *New England Medical Monthly*, and an excellent journal devoted to practical therapeutics entitled *The Prescription*, and is a frequent contributor of very valuable papers to other medical publications and societies. On account of his great energy, perseverance and unquestionable high standing in his profession, he is widely known throughout the country; while his pleasing address and genial dis-

position are traits of character which have secured for him many warm personal friends. In 1887 the honorary degree of A. M. was conferred upon him by Center College, Danville, Ky.

WILL, Otho Boyd, of Peoria, Ill., son of William Will and Elizabeth (Baxter) Will, was born in Mercersburg, Franklin county, Pa., June 27, 1846. Ten years later he removed with his parents to Canton, Ill., where he received his preliminary education in the public high school, and in higher scientific branches by night study. Subsequently he entered the office of Dr. W. M. Swisher, a surgeon of considerable local repute, and received the degree of M. D. from the Rush Medical College, Chicago, in 1869, having received the special public commendation of his teacher, Prof. R. L.

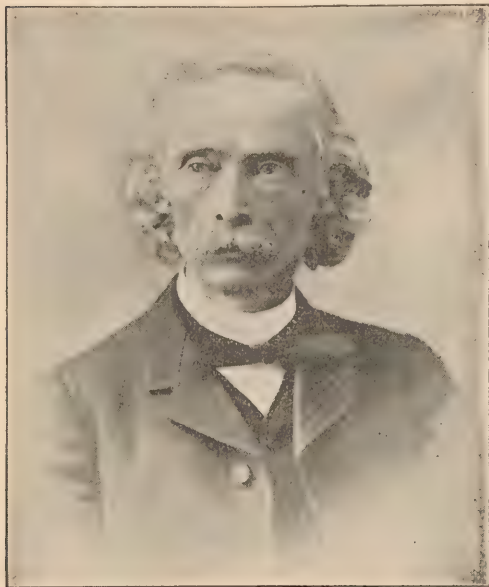

O. B. Will

Rea, for his proficiency in anatomy. He at once located successively in the suburban villages of Kickapoo and Dunlap, and subsequently settled in the city of Peoria, where he has for over ten years devoted his attention exclusively to the practice of gynecology, including abdominal and pelvic surgery. In 1870 he was married to Miss Elizabeth Grant, of Brimfield, Ill., daughter of Kenneth and Isabella Grant. Dr. Will's medical education has been supplemented by special work, such as assistant to Prof. H. J. Garrigues, of New York, and courses at the post-graduate medical schools, as well as observations in the hospitals of London, Paris and Berlin, at which last place he was a delegate to the International Medical Congress of 1890. Dr. Will is a member of the American Medical Association, and of the Illinois State Medical Society, in which he has occupied various official positions up to that of president. He has been president of the Military Tract District Medical Society; of the Rush College Alumni Association, and was one of the founders of the

Cottage Hospital, a model institution of his city, and to which he is the attending gynecologist. He has recently made somewhat of a specialty of catheterizing the fallopian tubes, and has met with greater success in that direction, perhaps, than any other surgeon of the country. He has contributed frequently to current medical literature. Dr. Will has for years been deeply interested in the collateral sciences of biology and bacteriology, and his lectures, entitled "The Popularization of Scientific Method," "The Blood and its Circulation," "The Work of Koch and Pasteur," and "A Lesson in Biology," have been published in connection with the transactions of the Peoria Scientific Association, of which he is an active member and vice-president.

WILLARD, Andrew Jackson, of Burlington, Vt., was born in Harvard, Mass., March 19, 1832, being of English and Welsh descent, and having on the paternal side such ancestors as Maj. Willard of colonial reputation, and President Willard, of Harvard, of educational; and on the maternal a long line of Emersons, the best known among whom is probably the Concord philosopher, Ralph Waldo. Willard fitted for college in Worcester, Mass., and entered Yale in August, 1849, graduating with honors in what is generally known as the "famous class of '53." His position in this class was a prominent one, both in scholarship and other respects, for he was the "first president" of Linonia in his class, and consequent orator at their annual "Statement of Facts," in what was at the time a heated controversy with the rival Brothers in Unity, at which time he was associated with the late ex-Senator Gibson, and the Hon. Wayne McVeagh. He also took various prizes, one in English composition, together with the Townsend premium; also the first prize in the Bishop Prize Debate of Linonia. He was a member of the various secret societies in college, such as the well-known Psi Upsilon, Phi Beta Kappa, and the somewhat mysterious "Skull and Bones." After spending three years in the study of theology at Yale and Andover, and some thirteen years as a congregational clergyman at Upton, Mass., and Essex, Vt., and one year as superintendent of public schools in Burlington, Vt., he was obliged, by failure of health, to change his profession, and entered upon the study of medicine at the University of Vermont, Burlington, Dr. Walter Carpenter being his medical preceptor. He graduated from the university in 1877, at which time he received the prize for the best thesis, the subject being "Medical Chemistry." After nearly a year spent in special study in New York City, and a brief practice of his profession in the city of Burlington, he was appointed Instructor in Chemistry in the Medical Department of the University of Vermont, which chair he held until he resigned in 1889, on account of his increasing duties in connection with his specialty, the treatment of nervous disease. Since that time he has held the position of Adjunct Professor of Chemistry in that institution. From 1880 to 1886, he was Superintendent and Resident Physician of Mary Fletcher Hospital, being appointed to that office when the institution was in its infancy, and consequently being in a position to do considerable towards bringing it to its present prosperous condition. In December, 1886, he left the hospital, and entered at once upon a plan

which for some time had been maturing, of founding an institution devoted exclusively to

A. B. Willard

treatment of diseases of the nervous system. To this purpose he had been led by the conviction formed while connected with the general hospital, that adequate provision was not made there or elsewhere for the special need of the nervous invalid. This institution proved a success from the very outset. Though laboring under great disadvantages, having no building at first for the reception of patients, it has achieved a success which, to say the least, is exceptional. For two years Dr. Willard was obliged to find boarding places for his patients in the city, but such was the efficiency of his helpers, and his own untiring energy, as well as faith in the fact that his institution filled a desideratum in the community, that at no time was it without patients that should attest to its value. In December, 1888, he had finished the erection of his building, and at once entered upon a new career of prosperity. Situated upon College Hill, on a street well named Prospect, from its commanding views of Lake Champlain and the Adirondack and Green Mountains, in the quietest part of the city; this is an ideal place for rest and recuperation, where a nervous and irritable invalid can feel that he has all the comforts of home without its cares. Here, for five years, this institution variously known as "The Nervine," "The Rest Cure," and "The Willard Home," has met with a phenomenal success. Patients have applied for admission from all parts of the Union and from Canada, only a small number of whom could be received and treated, owing to limited accommodations. The necessity of enlargement has been considerably agitated, and will probably be entered upon in the near future. A very popular and successful sort of

annex has been established for convalescents during the summer, in a beautiful place upon the shore of Lake Champlain, in the midst of a pine and birch grove, and which is extensively known as "The White Birches." This is a rural and romantic spot, in every respect suited for the special purpose to which it is put. Altogether it is generally conceded in the community in which Dr. Willard lives and his institution exists, that a good work is being done among nervous invalids by this enterprise, such as reflects not a little credit upon the sagacity of its founder, as well as his ability in carrying out so completely his first formed conception for the special treatment of nervous diseases.

WILLARD, DeForest, of Philadelphia, Pa., was born in Newington, Conn., March 23, 1846. He is a descendant of Puritan stock. His preliminary education was received from Hartford High School. He studied medicine under the preceptorship of Dr. Jacob F. Holt, and was graduated at the University of Pennsylvania in 1867. He has received the honorary degree of A. M. from Lafayette College. He also received the degree of Ph. D. from the University of Pennsylvania in 1870. After receiving his medical degree he settled in Philadelphia to practice, and has remained in that city ever since, devoting special attention to general and orthopedic surgery. During the Civil War he was in the medical service at City Point and at Petersburg, Va., under the auspices of the United States Sanitary Commission. He was abroad in 1890 attending the schools and hospitals of Europe. Dr. Willard has devoted especial attention to comparative anatomy. He has done a large amount of major operative work, and acquired an excellent reputation in surgical practice. He has instituted some interesting experi-

De Forest Willard

ments in bronchotomy through the chest walls which have been reported in the Transactions

of the American Surgical Association (1891), and has reported "Experiments in Pneumnectomy and Pneumonotomy." (See Transactions of the College of Physicians, Philadelphia.) He has devised many special surgical appliances. He was Surgeon to Howard Hospital from 1876 to 1881, and to the Presbyterian Hospital from 1881 to the present time, and is Consulting Surgeon to many institutions of Philadelphia. He was Lecturer on Orthopedic Surgery in the University of Pennsylvania from 1876 to 1889, when he was elected Clinical Professor of Orthopedic Surgery in this institution, which position he still holds. In 1893 he was appointed Mütter Lecturer on Surgical Pathology, and is President of the Society of the Alumni Auxiliary Department of the University of Pennsylvania, and of the Philadelphia County Medical Society. He was also President of the American Orthopedic Association in 1890. He is a member of the American Surgical Association, American Orthopedic Association, Philadelphia College of Physicians, Philadelphia County Medical Society, the Pathological Society of Philadelphia and of numerous other medical and scientific organizations. He has made numerous and important contributions to medical literature, among which may be mentioned: "Operative Treatment of Spinal Caries;" "Operative Treatment of Hip Disease;" "Operative Treatment of Club Foot;" "Open Urachus;" "Anesthesia and Anesthetics;" "Nephrectomies for Gunshot Wounds;" "Osteotomy for External Tibial Caries;" and "Osteotomy for Knock Knees;" "Supra-Pubic Cystotomy;" "Foreign Bodies in Urethra;" "Surgical Treatment of Infantile and Cerebral Paralysis." Dr. Willard has also written an interesting biography of the late Prof. D. Hayes Agnew.

WILLIAMS, Arthur U., of Hot Springs, Ark., was born in Marion county, Mo., June, 1855, and is of Welsh descent. His father, W. F. Williams, was born in Virginia. He attended Rensselaer Academy at Rensselaer, Mo., Lagrange College in 1873-74, afterwards finishing his literary course at Louisiana Baptist College, Louisiana, Mo. He read medicine under Dr. Thomas Proctor, now of Monroe City, Mo., and graduated at Missouri Medical College, in 1878; At the age of twenty-two years he was selected, after a competitive examination, to fill the position of Assistant Physician at St. Louis City Hospital, which position he held for one year. During the summer when the yellow fever was so bad in Memphis, the St. Louis authorities established a quarantine station below Jefferson Barrack. The fever broke out among the employes, several of them dying; among the number Dr. Davis. The Health Commissioner called for volunteers to go to quarantine. Dr. Williams promptly responded, was accepted, and sent to the Quarantine Hospital, where he remained until the disappearance of the fever. His term of appointment at the hospital having expired in April following, he located in Sullivan, Ill., and engaged in active practice for five and a half years. During this time he was appointed Surgeon of the Eighth Regiment I. N. G., and Assistant Surgeon of Wabash and P., D. & E. Railways. These he resigned at the time of his removal to Hot Springs in 1885. Dr. Williams has, by close attention to business and affable manners, made a host of friends all over the country, and has succeeded in building up a

lucrative practice. He is now Examining Physician for the Imperial Life Insurance Company, of Detroit, Mich.; Travelers of Hartford, Conn.; Western Commercial Travelers' Asso-

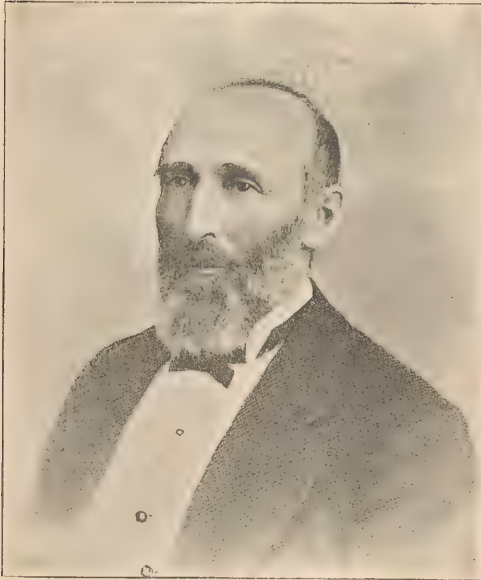

A. U. Williams.

ciation, and Physician to the Actors' Fund of America. The Doctor takes some interest in sporting matters, and is president of the Arkansas Gun Club.

WILLIAMS, Elkanah, of Cincinnati, O., son of Isaac Williams, a captain in the United States Army in the War of 1812, and one of the earliest settlers of Indiana, was born in Lawrence county, Ind., December 19, 1822, and died in Hazlewood, Pa., October 5, 1888. Having received his early education at the Bedford Seminary, in his native county, he entered the State University at Bloomington, in 1843, and after nearly four years of study he left this institution in February, 1847, for the Asbury University, at Greencastle, at that time under the presidency of Rev. Mathew Simpson, now Bishop of the Methodist Church, whence he graduated in July, 1847. The degree of M. A. was conferred upon him a few years thereafter. Returning to his home he began the study of medicine with Isaac Denson, M. D., of Bedford, Ind. In the fall of 1848 he entered the Medical Department of the University of Louisville, being the private student of Dr. T. G. Richardson. In the spring of 1850 he received the degree of M. D. During the ensuing two years he was engaged in a large and successful practice in Indiana. Not satisfied with his professional knowledge, he returned to Louisville and attended a third course of lectures, enjoying the benefits of private instruction from Prof. S. D. Gross. In the spring of 1852 he settled in Cincinnati. In November of the same year he embarked for Europe, with especial reference to the study of ophthalmology. Foreighteen months he was a constant attendant at the clinics of Desmarres, Nelaton, Roux and others in Paris.

In the spring of 1853 he crossed to London, and was for a number of months almost the only student at the great Moorfields ophthalmic hospital. He was very cordially received by the distinguished surgeons of this great charity, including Bowman, Dixon, Wordsworth, Critchett and others. The ophthalmoscope had but recently been discovered, and was practically unknown to these London celebrities till Dr. Williams introduced it to their notice and made numerous examinations for them, an account of which he published in the *Medical Times and Gazette* of London, in 1854. The remainder of that year he spent in Prague, under Prof. Arlt, in Vienna, with Prof. Rosaz, Stelwag, von Carion and Jaeger, and in Berlin with A. von Graefe. His zeal and attainments in all these great cities secured for him the

E. Williams

cordial friendship of his distinguished teachers. In the spring of 1855 he returned to Cincinnati, and commenced practice as an exclusive specialist in diseases of the eye and the ear. He was the first regularly accredited physician in America who confined his practice strictly to these branches. He was soon associated in clinical teaching with the Miami Medical College. In 1860, in advance of all other American colleges, a chair of ophthalmology was established in this institution and tendered to Dr. Williams, which he accepted and held for many years. There was indeed no one else who could have occupied it but himself. It may then be said that to him is mainly due the establishment of ophthalmology upon a sure, scientific foundation in the United States. In 1861 he was made Ophthalmic Surgeon to the Commercial Hospital, now the great Cincinnati Hospital, a position which

he held for over eleven years, resigning in 1872. Early in the War of the Rebellion he was appointed Assistant Surgeon to the Marine United States Hospital in Cincinnati, a position which he filled till after the restoration of peace. In 1862 he revisited Europe and assisted in the International Ophthalmological Congress held in Paris, reading before that body a paper entitled: "Plusieurs Questions de Therapeutique Oculaire;" (several questions of ocular therapeutics). These included inoculation in pannus; treatment of entropium; obliteration of the tear sac; partial ablation of the eye; and will be found in the *Compte-Rendu*, 1862. In the summer of 1866 Dr. Williams again visited Europe to meet with the congress at Vienna, but the occurrence of the Austrian and Italian War prevented the assemblage at that time. Again, in the summer of 1872, Dr. Williams met with the congress in London, and read a paper: "Practical Observations on Different Subjects," including iritis; granulated eyelids; neuro-paralytic conjunctivitis; atropine; Graefe's cataract operation; and anomalies of refraction. These were published with the reports of the Fourth International Ophthalmological Congress, 1872. Out of deference to him and many other ophthalmologists from America, it was then decided that the next congress should meet in New York in 1876. At the New York meeting, held in September, 1876, he was elected president of the congress. By appointment of the committee of arrangements, Dr. Williams read a paper before the ophthalmological department of the International Medical Congress at their meeting in Philadelphia in September, 1876, on "Pulsating Tumors of the Orbit." This paper was published in the Transactions of that organization. In June, 1875, Dr. Williams was elected president of the Ohio State Medical Society at Put-in-Bay, and read a paper on "Penetrating Wounds of the Eye." Dr. Williams was a member of the International Ophthalmological Congress; of the American Ophthalmological Society; of the International Otolological Society; of the American Medical Association; of the Ohio State Medical Society; of the Cincinnati Academy of Medicine (being one of its founders), and of the Cincinnati Medical Society. Besides the articles already mentioned he was the author of numerous papers treating of his specialty, published in this country and in Europe. In 1865 he read a paper before the American Medical Association at Boston, on "Paracentesis of the Cornea; Treatment of Stricture of the Nasal Duct; The Brown Citrine Ointment and its Extensive Value." To the *Cincinnati Lancet and Observer*, from 1856 to near the time of his death, he had been a frequent and valued contributor, being for several years editor of the ophthalmological department. In the *Medical Record*, of New York, March 18, 1868, will be found a very important paper from Dr. Williams on cases of "Tumor of the Brain with Optic Neuritis," with details of *post-mortem* sections. In the same journal, in the following month, will be found the report of a case of aneurism of the orbit, in which, at his request, Dr. H. E. Foote tied both carotids, thirty days apart, with a successful result. The investigations of the retinal circulation before and after these operations, as seen by the ophthalmoscope, formed

a most interesting part of this paper. In the *Archives of Ophthalmology and Otology* for 1869 is a paper on "Stricture of the Nasal Duct," in which a new and important modification in the treatment was advocated. Dr. Williams had long cherished the intention of embodying his vast experience in a treatise on ophthalmology.

WIRT, William Edgar, of Cleveland, Ohio, was born near Mendota, Ill., December 19, 1862. His great-great-grandfather, John Harris, fought with the "New Jersey Continental Line" in the Revolution. John Harris, Sr., lived in Scotland. From the age of five to eleven Edgar lived with his parents in Missouri. For the next six years he lived with his uncle, Dr. N. S. Everhard, of Wadsworth, Ohio, where he attended the public schools, graduating from the high school in 1880. In May, 1880, he passed first in the examination held at Elyria, Ohio, for appointment as Cadet-Midshipman at the United States Naval Academy, Annapolis, Md., twenty-two students competing. He graduated at Annapolis June, 1884. Midshipman Wirt, United States Navy, was then ordered to the United States Steamship "Tennessee" for duty. In December, 1884, he was ordered to the United States Steamship "Marion," on which ship he visited the ports of the Mediterranean Sea, the Suez Canal, Red Sea, Suakem, Aden, Arabia, Ceylon, Singapore, and all the principal ports of China and Japan, remaining in those waters for about a year. In the spring of 1886 he was ordered to Annapolis, via San Francisco and across the United States, thus completing the circuit of the globe. He passed his final examination at Annapolis in June, 1886, and retired from the government service July 1, 1886, immediately taking up the study of medicine under his uncle, Dr. N. S. Everhard, of Wadsworth, Ohio. He took three courses of lectures at the College of Physicians and Surgeons (Medical Department Columbia), New York City, graduating in June, 1889. He also attended the summer course (1888) at Medical Department University of Wooster, Cleveland, Ohio, taking his degree (M. D.) at its close. Along with his medical work he took a non-resident course of post-graduate work in biology and chemistry with the University of Wooster, receiving the degree of A. M. in 1889. The Ohio University conferred Ph. D. on Dr. Wirt in 1891 for post-graduate work. During the summer and fall of 1889 Dr. Wirt served in Demilt Dispensary (New York), having charge of the medical clinic; also in the Medical Division of the "Vanderbilt Clinic" of physicians and surgeons (New York). Later in the fall he entered the Hospital for Ruptured and Crippled for a year's service, acting in the capacity of Junior, Senior and House Surgeon, at the termination of which he received a hospital graduate's diploma. While in the hospital Dr. Wirt did original work in the way of determining "The Tension on the Tendo Achilles in Supporting the Body on Tip-Toe." He made his deductions from experiments and measurements on the house staff (Drs. Fitzhugh, Logue, De Pass and Wirt), and by the use of trigonometry, logarithms, determined that the tension on the tendon is 2.2 times the weight of the body if deep muscles are ignored; but when all muscles are considered the tension is $1\frac{1}{2}$ times the weight of the body. By invitation the paper was read before the Orthopedic Section

of New York Academy of Medicine March 21, 1890, and was published in the *New York Medical Record* June 28, 1890. While yet in the hospital Dr. Wirt received an invitation to go to Cleveland and take the chair of Orthopedic Surgery in the Medical Department of the University of Wooster. In January of the next year (1891) he accepted the chair as Lecturer, and in September, 1892, he was elected to the Professorship, which he now holds. Dr. Wirt confines his practice to orthopedic surgery, including the diseases of bones and joints. Besides holding the above-named chair he is Visiting Surgeon to University Hospital; Orthopedic Surgeon to Cleveland Hospital for Women and Children; chairman of Committee on Defective Classes of Ohio State Association of Charities and Correction; honorary member of Northern Ohio District Medical Association; member of the American Orthopedic Association; Fellow of the American Academy of Medicine; also member of the American, State, and several local medical societies. Dr. Wirt's contributions to medical literature are as follows: "Action and Tension of the Tendo Achilles in Supporting the Body on Tip-toe" (mentioned above); "Discussion on the Radical Cure of Hernia," published in the Transactions of Ohio State Medical Society, June, 1891; "Congenital Dislocation of the Hip," Published in *Cleveland Medical Gazette* (1891); "Pott's Disease," read before the Cuyahoga County Medical Society, published in *Cleveland Medical Gazette*, November, 1891; "Case of Double Club-foot, Double Club-hand and Multiple Deformities," read before American Orthopedic Association, September, 1891, published in *Medical News* (Philadelphia), November 7, 1891; "A New Traction Splint," read before American Orthopedic Association, September, 1891, published in Transactions of Association; "Hip Disease—Operative Treatment in Old and Neglected Cases," published in Columbus (O.) *Medical Journal*, March, 1892; "Treatment of Certain Forms of Club-foot," read before Ohio State Medical Society, May 5, 1892, published in *Cincinnati Lancet-Clinic*, July 23, 1892; "Rickets and the Treatment Resulting of Deformities," read in Section of Diseases of Children of American Medical Association, June 7, 1892, published in Journal of American Medical Association; "The Conservative Treatment of Joint Diseases," read before Northern Ohio District Medical Society, December, 1892, published in *Annals of Gynecology and Pediatrics*, August, 1893; "Treatment of Hernia in Children," read before Section of Diseases of Children of American Medical Association, June, 1893, published in *International Medical Magazine*; "Initial Treatment of Club-Foot," read before Ohio State Medical Society, June, 1893, published in *Practice* (Richmond, Va.); "Treatment of Old Cases of Hip Disease," read before Mississippi Valley Medical Association, October, 1893.

WISHARD, William H., of Indianapolis, Ind., eldest son of John and Agnes H. Wishard, was born in Nicholas county, Ky., January 17, 1816. His biographer, Dr. A. W. Brayton, referring to his ancestry, writes as follows: The Wishard or Wishart family were Scotch dissenters, and when the persecution occurred the family moved to the North of Ireland, and later to the American Colonies, settling in Delaware. Dr. Wishard's grand-

father was a soldier in the war of the Revolution, taking part in the memorable battle of Brandywine. The family subsequently settled in Pennsylvania, and in 1793 removed to Kentucky. The father of the subject of this sketch emigrated to Indiana, settling on the "Bluff" road, ten miles south of Indianapolis, where his family pitched their camp on the evening of October 26, 1825. Only one year before this date the seat of State government had been transferred from Corydon to Indianapolis. The wolves still howled about the settler's camp. The embryo doctor was then in his tenth year, and, being the eldest son, took a man's part in pioneer work. On one occasion, returning from mill late at night alone in the darkness of the dense forest, he came upon a pack of wolves snarling over a wounded deer. He made a wide detour through the brushwood, reaching home in

William H. Wishard.

safety. Many a night he spent at the old Bayou mill, or at Patterson's or Bacon's, waiting for his grist to be ground. His educational advantages were limited to a few months of winter school in a log school-house. The teachers were usually possessed of meager attainments, but men of vigorous intellect and aspiring ambition. Teaching with them was not an end, but a means. The spring and summer seasons were spent in attending to the crops and helping to clear the land. Dr. Wishard saw the last of the Indians in this region. In 1826 the widow and family of Tecumseh, and the prophet who commanded the Indians at Tippecanoe, camped for two days and nights west of Greenwood, on their way to what is now Kansas. Ten years passed in the comings and goings of early Indiana farm life—a life of monotony and hardship,

but not without its pleasures and its sterling educational advantages. There is no better school than a pioneer farm to develop the sturdy physical, intellectual and moral characters of an individual, only provided that the home and social environment is pure and wholesome. A half century ago there were fewer books in farm houses than now, but they were representative of the best that had been said and thought in the world; they were more thoroughly read and understood. In those days the Bible, then as now the fountain-head alike of moral precept and of terse, vigorous English speech, was the common reading book in home, school and church. The current of thought was less turbulent, but it was deeper and purer than now. The seclusion of farm life led to introspection and independence of character. The Scotch-Irish people in this country, as well as at home, have developed a natural genius for both education and religion. Life has never been regarded by them as either pain or pleasure, but as serious business; a period of education and preparation for a world to come. They have been neither pessimists nor optimists, but have cultivated and maintained an even intellectual and moral balance. Duty has ever been their guide and watchword. Such a people are not suppressed by the hardships of pioneer life; indeed, from such a stock, under such apparently obscure surroundings, has developed the best elements of American civilization. Having passed the early years of manhood in building up the fortunes of his family, Dr. Wishard, at the age of twenty-two years, commenced the study of medicine with Dr. Benjamin S. Noble (a brother of the late Governor Noble, of Indiana), of Greenwood, Johnson county, and entered into partnership with him on the 22d day of April, 1840, and so continued till 1852, when Dr. Noble removed to Iowa. Dr. Wishard attended his first course of lectures at the Ohio Medical College, Cincinnati, in 1843, and was graduated at the Indiana Medical College, at La Porte, Ind., in 1848. He again attended the Ohio Medical College in 1852, and received an *Ad Eundem* degree from the Medical College of Indiana, at Indianapolis, in 1877. In the first twenty-five years that had passed since the emigration from Kentucky the county had greatly increased in wealth and population. The Ohio river was still the great channel of communication with the East, but in the fall of 1847 the first through train from Madison passed through Greenwood to Indianapolis. Dr. Wishard was one of the passengers. Upon its return in the afternoon of that notable October day he occupied a seat with the Rev. Henry Ward Beecher, who had resigned his pastorate of the Second Presbyterian Church of Indianapolis, and was on his way to take charge of Plymouth Church, Brooklyn. During the war of the Rebellion Dr. Wishard served parts of four years as volunteer surgeon—from 1862 to 1865—in all, two years. One incident of this service is too important, because of the great good it accomplished to our sick and wounded volunteers, to allow it to pass into oblivion. It was evident after the surrender of Vicksburg that there were no adequate provisions for care on the field, or means of transportation to northern hospitals of the disabled, suffering and homesick soldiers. By request of Gen. A. Stone, Quartermaster-General of the

State of Indiana, Dr. Wishard collected all the facts as to the number of sick and wounded troops in the department of the Mississippi after the surrender of Vicksburg, and also determined the absolute inadequacy of transportation facilities for their removal to northern hospitals. This accurate report enabled the famous war Governor of Indiana, the Hon. O. P. Morton, to obtain, through the War Department, backed and urged by President Lincoln, the celebrated order to remove all sick and wounded troops from the front to the northern hospitals. The report made by Dr. Wishard, through Gen. Stone to Governor Morton, did not vary three per cent. from the reports made to Surgeon-General Barnes through the customary channels. The sick and wounded troops now took precedence; hospital boats were equipped and the movement north at once began. Dr. Wishard made the first trip himself with the steamer *Sunnyside* from Vicksburg and Natchez to Cairo, and thence to the Hospital and Soldiers' Home at Indianapolis. His intense and unselfish loyalty is manifested by the fact that he never accepted any remuneration whatever, not even for his uniform, while in the service of the government. In October, 1876, Dr. Wishard was elected Coroner of Marion county, and removed from Southport to Indianapolis, where he has remained ever since. After serving four years as Coroner he continued the practice of medicine, which, however, he had not entirely given up. The space of this biography does not permit any retrospect of the immense progress in medicine, or of the history of epidemic diseases, or of the change in the type of diseases, such as malaria and typhoid fever, incident to the development of a new country, and of which Dr. Wishard has been eye-witness and an active participant through the fifty-four years of his active practice. Dr. Wishard has given a vivid portrayal of these features in his presidential address before the Indiana State Medical Society, May 1, 1889. It is published in the *Transactions* of that year, and also in the *Indiana Medical Journal* of June, 1889. From a glance at this interesting portrayal we learn that fifty years ago the practice of obstetrics was in the hands of females, and that a physician was called only when the skill of the midwife was baffled. The neighbors of both sexes were assembled; the parturient sat upon her husband's lap, after the manner described as the "Ohio" or "Virginia" position by Dr. Englemann, in his book, *Postures in Labor*, while the accoucheur sat upon a stool or half-bushel measure in front. Dr. Wishard relates that after a total inversion of the uterus in this position he refused ever after to deliver a woman except in bed, and was therefore thought by many of his patrons to be an innovator and extremist. In the early forties, the old medical "aunt," who was a strange compound of superstition, ignorance and wisdom, exerted a marked influence. In that day certain diseases, notably tuberculosis, diphtheria and cerebro-spinal meningitis, were very uncommon. The open fire, abundant oxygen, out-door life, abundant and wholesome diet and sparse settlement, warded off tuberculosis. Patients did not consult doctors when first taken ill; to do so was an anomaly in medicine, and regarded as a waste of time and money. Four-fifths of the cases were second-

hand, but the doctor was held responsible, as he had the last chance. Remittent fevers were treated as follows: "Ten and ten" was given as a purgative—ten grains of calomel and ten of jalap—every six hours. When purgation was secured, the dose was lessened, but continued till ptialism occurred. Tartar emetic to reduce the fever; if watery stools were produced, these were controlled by opium. To reduce the fever, nitre or potash was also given. Cold water was prohibited. The tonics were Peruvian bark, Huxham's tincture or an infusion of quassia. Quinine was considered uncertain and unsafe. It was first used in Dr. Wishard's family in 1828. The "chills" would not yield, and the embryo doctor was sent to Indianapolis and received from Dr. Mothershead, a very intelligent practitioner, a compound of thirty grains of quinine, ten drops of sulphuric acid and six ounces of water; the dose a teaspoonful four times a day to be taken, and the results observed "with great care." Blood-letting was employed in certain intermittent and congestive fevers, with good results, and was the sheet-anchor in pleurisy and pneumonia. In the hands of intelligent practitioners, blood-letting no doubt saved many lives. The thumb-lancet was an heirloom in the family; "one had descended through four generations, and had drawn more blood than was spilt by some regiments in the late war." Some persons would be bled every spring. In 1841 a prize essay on the treatment of fevers, by Dr. Lunsford P. Yandell, of Louisville, was published in the *Western Medical Journal*, of that city. Dr. Wishard read and re-read this article, and, with the younger men, followed its well-grounded precepts, although the elders regarded it a dangerous innovation. Dr. Yandell aborted "bilious" fever by the use of a cathartic and an emeto-cathartic and the free use of water internally, and by sponging during the hot stage. Quinine and Dover's powder were used during the remission. This soon became the accepted treatment, and in Dr. Wishard's judgment no single essay was more productive of good than this effort of Dr. Yandell's. The medical man of Dr. Wishard's boyhood started on his morning rounds with full pill bags and especially abundant supplies of salts, oil and senna. Fifty to sixty patients were to be seen; the round was forty to fifty miles, and took from twelve to twenty-four hours. The road was a bridle path through dense forests from one hamlet to another, across swamps and ponds of water. The creeks now dry were always full; the water level of the country was ten to twelve feet higher than it now is. A frequent change of horses was necessary, and these were stationed in different neighborhoods. Three or four horses were worn out in one sickly season. The dysentery of 1850-51 was a notable and deadly epidemic. Children and old people were the victims. It was at its height in July and August, and was followed in September by typhoid fever. Dr. Wishard recalls that during that summer he was called to see six infants that were dead when he reached the settlement, usually four to twelve hours after the call was sent. He tired out four horses, slept in his saddle, and for two weeks, only removed his clothing to make a necessary change! And yet, in spite of the summer and autumnal epidemics, the popula-

tion increased steadily. "The good dame of those days pointed with pride to her ten or twelve sons and daughters, the joy of her home, the pride of her heart, and the hope of her old age; while now, alas! we have presented too often to us one child, the future hope of a blighted household." Dr. Wishard continues: "Let not our young men debase their calling for filthy lucre, but keep the professional robe unsullied from this offense against the laws of God and man." It is unnecessary to go farther. Enough is told to indicate the thorny road traversed by Dr. Wishard and his comrades. Some of those brave compeers are preserved to memory dear in a paper on "Medical Men and Medical Practice in the Early Days of Indianapolis," read by Dr. Wishard before the Marion County Medical Society, December 6, 1892, and published in the *Indiana Medical Journal* for January, 1893, and ordered published in the Transactions of the Indiana State Medical Society during the same year. Here are preserved for all time, and as perfect as insects in amber, the truthful sketches of Drs. S. G. Mitchell, Isaac Coe, Livingston Dunlap, Jonathan Cool, Caleb Scudder, Wm. H. Lilly, Henry Ross, John L. Mothershead, John H. Sanders, Geo. W. Mears and Dr. J. L. Richmond. These names cover the period from 1821 to 1836 of Indianapolis practitioners. All have now joined the great majority. Following them, from 1836 to 1840, came an influx of men of ability and professional standing, such as Drs. John S. Bobbs, Charles Parry, A. A. Ackley, and others whose names are only memories, but whose good deeds live after them. It is to be hoped that Dr. Wishard will rehabilitate these and other names in early practice from the abundant storehouse of his memory, for his memoirs of medical men are more worthy and lasting than tablets of brass and monuments of marble. Dr. Wishard has always taken an active part in medical organization. There was no State society when he entered the practice. Indianapolis had a local society, and in May, 1849, issued a call for a State medical convention the following month. June 6, 1849, the society was organized in Wesley Chapel, southwest corner of Circle and Meridian streets, with Dr. John Sanders, chairman, *pro tem.*, and Dr. John S. Bobbs, secretary. There were twenty-eight members, sixteen from Indianapolis. Of the charter members only four remain—Drs. John M. Gaston, W. C. Thompson, P. H. Jameson, and the subject of this biography. Dr. Wishard has been a member of the American Medical Association almost from the time of its organization. He attended it as early as 1860, at New Haven, Conn., and has been a delegate at numerous meetings since. He was president of the Indiana State Medical Society in 1889, and at that time made the remarkable address, "A Retrospect of Fifty Years' Practice," from which this sketch has already been enriched. In religion Dr. Wishard is and has been a Presbyterian of liberal and progressive type. His house has always been the headquarters of both home and foreign missionary movements in this city. He has been an elder of the church for forty-eight years, and has represented the Indianapolis Presbytery at New York, Philadelphia, Pittsburg, Cincinnati, and finally at Portland, Ore., in 1892. In most of

these travels he has been accompanied by his devoted wife, who has been his constant companion and sympathizer during his entire professional life. Dr. Wishard's long career as husband and father, citizen and soldier, public and church officer, and active practitioner of medicine in the pioneer regions of Indiana, and with equal facility and success in her capital city for a period of fifteen years, has been here briefly portrayed. He never went to school outside of a log-cabin. He had for teacher only a good father and mother, a backwoods farm, a few good secular books, and the Holy Scriptures. He was resident for over fifty years in a church community, which for twenty-five years had one pastor continuously in its service. The people educated each other. The church was an educator. We know not the subtle influence to the youthful mind of the four thousand sermons which fell twice a week from the lips of that fearless and God-serving pastor, the Rev. P. S. Clellan. Mr. Garfield once said: "A pile of bricks and a catalogue do not make a college. When I sit at one end of an oak puncheon and Mark Hopkins at the other, then we have a college." The thing in education after all is the result and not the means. At any rate, the log cabin home, the simple country church, the few months' winter schooling, and the ups and downs of a pioneer farm are the institutions which educated the best men of the present century; the men who were at the front in the late war, and who have taken the lead in the arts of peace. To these opportunities Dr. Wishard added a prime essential—never failing good health, and descent from a long lived family. His father's family averaged eighty-five to ninety years, and Dr. Wishard gives promise of a yet long lease of life in the practice of his chosen profession. William H. Wishard, M. D., the subject of this sketch, has been continuously engaged in the practice of medicine in Marion and Johnson counties for fifty-four years. Of those who were his associates in practice a half century ago in the counties of Marion, Shelby, Hancock, Morgan, Johnson and Hamilton not one is now living. Dr. Corydon Richmond, now of Kokomo, Ind., is the only companion of these early days, and he has long since given up the practice. But Dr. W. H. Wishard, now just rounding out his seventy-eighth year, is hale and hearty, and is in the active practice of his profession. He is to-day the best known professional figure on the streets of Indianapolis. He drives his own horse; he makes frequent night visits; he is a faithful attendant of the Marion County Medical Society; he takes an active part in church work; he wields a ready and trenchant pen; he is a logical and convincing discussant and a most charming conversationalist. Age has not withered nor custom staled his infinite variety, and to-day his natural force is not abated. Dr. Wishard would have graced the pulpit, or been an ornament of the bar; or brought dignity and virtue into political life, had his desires led him along any one of these pursuits, rather than to the practice of medicine. In 1840 Dr. Wishard was married to Harriet N. Moreland, daughter of the Rev. John R. Moreland, the second Pastor of the First Presbyterian Church of Indianapolis. Nine children were born to them—four sons and five daughters. The first four, one son and three

daughters, died in infancy and childhood. The others are living. One of his sons, Dr. Wm. N. Wishard, was for seven years the Superintendent of the City Hospital. Under his superintendency the hospital was rebuilt and organized upon a modern basis, the Flower Mission Training School was established, and the hospital took first rank with similar charities. Another son, Albert W., is a well-known attorney of the city and a member of the State Senate, session of 1892-3. A third son, Dr. George W., practiced medicine for a time with his father in Indianapolis, and is now engaged in real estate business in St. Paul, Minn. Of the daughters, Harriet J. has been an active worker in the woman's charities of the city, and is now State Secretary of the Young People's Society of Christian Endeavor. Elizabeth M., the youngest daughter, is now located in New York, as secretary of the Young People's Department of the Home Missionary Society of the Presbyterian Church. Indeed, Dr. W. H. Wishard has built up about him a family active in every good work. They are a recognized element in the business, church and social life, as well as in the charities of their city.

WISHARD, William Niles, of Indianapolis, Ind., son of the preceding, Dr. William H. Wishard and Harriet (Moreland) Wishard, was born in Greenwood, Johnson county, Ind., October 10, 1851; he was educated at the Southport High School and at Wabash College. He graduated in medicine at Indiana Medical College, in February, 1874. He began the practice of his profession at Southport, but in a short time became a student at Miami Medical College, Cincinnati, from which he also graduated in March, 1876. He resumed the practice at Southport, but in November, 1876, he removed to Indianapolis, and was in active practice until July 1, 1879, when he was elected Superintendent of the City Hospital, and accepted the place. During the time he was in the practice of his profession in Indianapolis, he served as deputy coroner of Marion county, and made most of the *post-mortem* examinations with which the coroner was charged. He remained superintendent of the City Hospital until January 1, 1887, when he declined a re-election, that he might devote himself to the active practice of his profession. It was during Dr. Wishard's superintendency that the present elegant and commodious hospital buildings were erected, and it was mainly by his influence and untiring energy that the great work was completed. He secured the necessary appropriations, located and spaced every room, and superintended the construction of the new buildings. For years he devoted himself to it, and it will stand as a memorial of his unselfish labors when he shall be no more. Dr. Wishard was chiefly instrumental in securing financial assistance from the city for the Flower Mission Training School for Nurses, which was established in 1883, and which has since done the nursing for the Indianapolis City Hospital. The late Rev. Oscar McCulloch stated before his death that without Dr. Wishard's assistance, the Training School for Nurses could not have been established. Dr. Wishard first introduced trained nurses into the wards of the City Hospital, and secured recognition for them from the medical profession, and not until after their introduction in the City Hospital were they

ever employed by physicians in private practice in Indianapolis. Dr. Wishard has been honored by the Medical College of Indiana as assistant to the chair of Principles and Practice of Medicine, Lecturer of Clinical Medicine, and Professor of Genito-Urinary and Venereal Diseases, which latter position he still holds. He was one of the organizers, and the first president of the Indianapolis Surgical Society and was elected first vice-president of the Mississippi Valley Medical Society, at Cincinnati in 1892. He was also elected vice-president of the Marion County Medical Society in January, 1893. He is a member of the American Association of Genito-Urinary Surgeons; of the American Medical Association; the Indiana State Medical Society; the Marion County Medical Society, and of various other societies. On leaving the City Hospital,

W. N. Wishard.

Dr. Wishard was appointed Consulting Surgeon in that institution, in the department of genito-urinary and venereal diseases, and the same position was given him in the City Dispensary. Soon after leaving the hospital, he took a course in the Post-Graduate Medical College and Polyclinic in New York. He then resumed the general practice of medicine in Indianapolis, but in a few months abandoned it, and since then has devoted his entire time to the practice of his specialty, that of genito-urinary surgery. In 1890, Dr. Wishard went to Europe for the purpose of better qualifying himself to practice his specialty. He attended the World's Medical Congress, held at Berlin, and afterwards visited the hospitals in Berlin,

Vienna and London. He saw and conversed with most of the leading specialists in his line of practice in these cities. Dr. Wishard is a member of the Presbyterian Church, having united with it in 1873. He has served as ruling elder, and is influential in church councils. May 20, 1880, Dr. Wishard married Alice, daughter of Mr. William Wesley Woollen, of Indianapolis. His wife was a most brilliant and charming woman, but she was not long spared to bless his home. She died December 9, 1880, and since then Dr. Wishard has remained a widower. Dr. Wishard is of commanding appearance. He is six feet two inches high, without surplus flesh, and has blue eyes and brown hair. Should he live to the allotted age of man, he promises to become one of the most eminent men in his specialty. He is well read, and has mingled much with the brightest men of the present time, both in and out of his profession.

WISTAR, Caspar, of Philadelphia, Pa., was born in that city September 13, 1761, and died there January 18, 1818. Referring to the environments, family history and other circumstances which influenced the life and professional achievements of this famous physician, surgeon and teacher of medical science his biographer, the late Dr. Caspar Morris, writes as follows: There has been no period in the annals of Pennsylvania in which the inhabitants have not been blessed by the presence of medical men whose names were household words during their respective lives, and whose memory has been transmitted from generation to generation by grateful recipients of their kindness and appreciators of their skill. The names of Owen, Kearsley, Kuhn, Morgan, Jones, Redman, and Rush, as well as those of the Cadwaladers, the Shippens, and the Bonds, illustrious predecessors of Wistar, may well challenge still for their descendants the homage which succeeding generations are always ready to pay to the merit of the past; and the knowledge of their honor doubtless had its due weight in determining his career. During Wistar's early life Philadelphia was without a rival, the acknowledged principal city of the British Colonies in North America; and the period was one which gave more than usual eminence to all those whose lot was to become actors in the great events which were then just beginning to assume the position which have given them unrivalled importance, and made their influence to be felt throughout the civilized world. It was not only by their resistance to unrepresented taxation that the colonists were at this time asserting their rights as British freemen, but their claim to that interest in the management of the government which could only be exercised by the recognition of their independence of the mother country. An indication of this growth of nationality, not only very significant in itself, but especially germane to our present subject, is afforded by the fact that just at this time, only four years subsequent to the birth of Wistar, a school of medicine was commenced in Philadelphia. It was thus a conjuncture which demanded for our science men home born and bred upon the soil, who should be able to seize the lamp as it should be ready to fall from the hands of the first runners in the race, and carry it with steady and increasing power of illumination to be delivered to another generation. To this Caspar

Wistar was admirably adapted. He was the son of parents of great respectability, and in affluent circumstances. His paternal ancestry was German. His grandfather, who bore the same name, had emigrated from Hillsbach, near Heidelberg, in the year 1717, and had married, at Germantown, Pa., Catherine Jansen, whose parents were also German. It is interesting to trace the germs of the same character which was afterwards displayed by the grandson, in his first progenitor in this country. Having a brother younger than himself and several sisters, he abandoned the Fatherland and arrived in Philadelphia with a pistareen in his pocket and a handsomely-mounted double-barreled revolving gun on his shoulder, "to carve for himself a fortune in the New World." (This fowling-piece was, a few years ago, still in the hands of one of his descendants.) The legends of the family prove how zealously and honorably he applied himself to the accomplishment of this object, and his efforts certainly were crowned with success. Residing in Philadelphia, he established in New Jersey, near Salem, what is believed to have been the first glass factory in the Colonies, an enterprise in which his son, the father of Dr. Wistar, was, in due time, associated with him. The peculiar characteristics which displayed themselves in the person of Dr. Wistar in the wider sphere which he adorned, were equally strongly marked in his father and grandfather. These were strict integrity, great industry, quick conscientiousness and enlarged benevolence. His maternal ancestry was English, Bartholomew Wyatt, the father of his mother, having accompanied the earliest settlers of West Jersey, under the auspices of William Penn. These worthy people on both sides were "Friends," commonly called "Quakers," a fact which alone is sufficient to indicate their possession of an earnest and religious character; since at that period the views which are peculiar to this sect were held, with perhaps a few exceptions, only by such as were willing to sacrifice all personal and temporal advantages for conscience sake. Under the influence of such parents, and with such ancestral traditions, Caspar Wistar was trained to the practice of every virtue and the avoidance of every vice. Among the earliest efforts for the permanent benefit of the colony they had established, William Penn and his "Friends" appropriated their means freely to the endowment of schools of learning, in which their children and descendants should receive the advantages of a liberal education under the purest and wisest moral control. It was in a school thus endowed, and in a building which exhibited the generous and enlarged views of those by whom it was erected, and which stood until the middle of the present century, on Fourth street below Chestnut, in what was in the day in which it was built, the healthy western suburb of the growing city, young Wistar received the best classical education the New World could afford. The devoted and constant friend of his maturer years, and the loving eulogist of his memory, Chief Justice Tilghman has said of this period: "I have been able to discover nothing very uncommon in his juvenile character. In quickness he was surpassed by several of his companions; but what he undertook he never failed to accomplish by perseverance." He certainly at this time and in this school laid the foundation

of an education which enabled him, when soon after he repaired to the schools of Europe for further advantage, to assume at once a position, which proves that he was at least the equal of his compeers, and through life he associated on a footing of ease with the most learned and scientific men of his day, as well in Europe as in this country. He was able to converse fluently and correctly in Latin, had the usual command of French, and an intimate acquaintance with the German language. The political excitement which marked the period at which he was born, steadily increased in the several colonies, and it was while he was a boy, pursuing his studies in the academy in Fourth street, that the Congress of Delegates met to consider their grievances and devise means for their redress, in Carpenter's Hall, which stood immediately adjacent to the school. What were then his sympathies and emotions we are not told. We may, however, justly infer from the views on such questions which he held strongly in mature life, that the ardor of youthful feelings would lead him to adopt that side which asserted the liberties of the people, and their right to resist, passively at least, all encroachment on their privileges; and with an intelligent appreciation of the blessings of that freedom which had been the heritage of their ancestors from the earliest period of history, to transmit to their posterity a noble patrimony which can only be maintained in its integrity by the resistance of each generation to those invasion which are ever being attempted on the one or the other side. It was not long till the determined resistance to encroachment culminated in open strife. The importance of Philadelphia, then the largest city on the continent and the seat of the American Government, caused its vicinity to be soon the seat of war; and the battle of Germantown presented to the peace-loving inhabitants the sad opportunity to witness "the wicked wastrie of life in war." While the religious principles of the Wistar family prevented most of its members from any active participation in the bloodshed of battle, there were others nearly allied to them who were foremost in the conflict; and every feeling and principle by which their lives were governed, called those who were non-combatants to minister to the relief of the wounded. It was asserted by Chief Justice Tilghman, whose authority is beyond doubt, that Caspar Wistar, then but sixteen years old, was active in assisting those who were prompt in rendering the services required by the wounded. "His benevolent heart was affected by the sufferings of the wounded soldiers; and so deeply was he struck with the happy effects of the medical art that he determined to devote his life to a profession formed to alleviate the miseries of Mankind." Such was the fountain-head of the stream which, as it ran onward, ever spread wider and grew stronger, dispensing blessings as it flowed. When he had completed his scholastic education, young Wistar devoted himself to the study of medical science under the direction of Dr. John Redman, one of the most eminent medical practitioners of Philadelphia, and President of the College of Physicians, instituted at that early period for the promotion of the culture of medical science, and the regulation of those ethical relations which should exist among those who pursue so noble a calling. The

Medical School of Philadelphia, then still in its infancy, was the first established in the British Colonies. Commenced under the auspices of men of highly cultivated minds and lofty aspirations, it had been founded solely with a view to the benefit of those colonies. While pursuing their own studies in the schools of Europe, two of the sons of Philadelphia, Dr. Wm. Shippen, Jr., and John Morgan, conferred together on the need of such an institution, and determined to accomplish the great undertaking of providing one for those who were unable to seek foreign instruction, but who yet were endowed with ability to apply to the public benefit such medical knowledge as should be placed within their reach. Dr. Shippen, reaching home before Dr. Morgan, commenced by giving private lectures on anatomy only. In April, 1765, Dr. John Morgan presented to the Trustees of the College of Philadelphia a letter from the Hon. John Penn, proprietor of the Province, giving his approbation to the effort; and being appointed by the trustees Professor of the Practice of Medicine, delivered and published an address on the subject of medical schools under their auspices. In September of the same year Dr. Shippen was, by the same board, appointed Professor of Surgery and Anatomy. These two gentlemen, in conjunction with Dr. Shippen, Sr., the two Drs. Bond, Dr. Cadwalader, Dr. Redman, and the Rev. Dr. Smith, the learned and judicious Provost of the College, prepared a plan for conducting medical education and conferring degrees, which was adopted, and the Faculty was enlarged by the addition of Dr. Adam Kuhn, as Professor of *Materia Medica* and Botany, and in the following year by Dr. Benjamin Rush, of Chemistry. The starting point of the school was eminent; its tone was dignified; its ambition lofty. It aimed at the establishment of a system of instruction, which should present to the commonwealth men duly prepared to deserve the confidence they should seek, when they asked that the lives and health of the community should be intrusted to their care. The first commencement was held June 21, 1768, after a public examination of the candidates for the honors of the College. This fact is thus noticed in the minutes of that venerable institution: "This day, which may be considered the birthday of medical honors in America, the Trustees being met at 9½ o'clock in the forenoon, and the several professors and medical candidates in their proper habits, proceeded from the apparatus room to the public hall, where a polite assembly of their fellow-citizens was convened to honor the solemnity." A Latin oration was delivered by Mr. Lawrence. A disputation was held between two of the candidates on "The Seat of Vision," and another between two other candidates on the question, "*Num Detur Fluidum Nervosum.*" Ten young gentlemen received the degree of Bachelor of Medicine. Such was the noble beginning of the Medical School of Philadelphia. The college with which it was connected was, however, doomed to participate with all other humane institutions in the ruin caused by war. During the heat of the civil strife in the year 1779 an unfounded jealousy led to the confiscation of its estates, and the transfer of its property and position to a new organization incorporated under the title of the University of Pennsylvania. Possessed of the

funds of the old college, and favored by the patronage of the dominant party, for a time the new organization was paramount, and it was in this school that Caspar Wistar attended the lectures, and from it he received his degree of Bachelor of Medicine in the year 1782, just before the war with Great Britain was brought to a close by the acknowledgment of the independence of the American Colonies. The examination of the candidates for degrees was then conducted publicly, in presence of the trustees and any citizens who might be disposed to witness it. Conflicting theories met with the support of rival teachers among the Faculty, and Judge Tilghman says, doubtless on authority beyond question, "Each professor examined with an eye to his own system. Of this Wistar was aware, and had the address to answer each to his satisfaction in his own way, with such uncommon promptness and precision as excited the surprise and commanded the admiration of all who heard him." Not content with the amount of knowledge thus acquired, nor with the honor thus achieved, and panting with an honorable and laudable desire to render himself thoroughly qualified for the performance of the high and responsible duties of the profession to which he had dedicated himself with entire devotion of all his faculties, the youthful graduate repaired to Edinburgh, at that time the center from which the light of medical science was diffused over the entire British Empire. As the students of the preceding generation had repaired from Philadelphia as well as from London, to Leyden to learn from Boerhaave and Albinus, so, at this time, they flocked to Scotland for the instruction of Cullen and the Monroes. On the way to Edinburgh, young Wistar spent a year in the vicinity of London, and though, by the death of his father, he had been left to the unchecked control of his own pursuits, and had become possessed of an ample estate, he not only resisted the temptations to vicious indulgence by which so many are betrayed under such circumstances, but gave himself entirely to the diligent prosecution of the purpose for which he had crossed the Atlantic; thus early affording evidence of the possession of those principles which in after life enabled him to reach the eminence to which he attained. From London he repaired to Edinburgh, and the assiduity with which he there devoted himself to his studies is amply demonstrated not only by the ripe fruits of his after life, but by the friendships he formed and the honors conferred upon him. Thus, for two successive years he was elected by his fellow-students one of the presidents of the Royal Medical Society of Edinburgh, and also president of a "Society for the Further Investigation of Natural History." We may, without hesitation, adopt and reiterate the expressions of Chief Justice Tilghman, who, in recounting these evidences of the esteem which Wistar had acquired, remarks: "These honors, conferred by a great, a learned, and a proud nation, on a youth, a stranger, and one whose country had but just risen into existence, are the surest testimonies of uncommon merit. We contemplate them not only with pleasure, but with pride. Their lustre is reflected from the man to the country which gave him birth." Nor must we forget, while estimating their value, that it was at a time when the fratricidal struggle which had given independence to our coun-

try was but recently terminated, and the heart-burnings and jealousies of civil war had not yet died away. The course of life pursued by Dr. Wistar was singularly consistent. Chosen calmly and deliberately, though at an early period, it was steadily pursued to the end. Thus, diligent as he was in the study of those branches of knowledge which are more strictly professional, we find him, even while preparing for the examination for his doctorate, turning his attention also to those collateral branches, the cultivation of which adds so much to the resources of the intelligent physician, and in which he ever after manifested an increasing interest. It was not the mere caprice of the youthful mind, wandering lawlessly around the fields of observation, and returning with the empty recompense of dissipated powers; his was the careful, accurate investigation which seized and made profitable all knowledge which came within his reach. Dr. David Hosack, in the eulogy pronounced by him before the medical classes attending upon his lectures in the city of New York, ere the cold clay of Wistar had been consigned to its repose in the grave, thus records his testimony to the character he had won for himself while pursuing his studies at Edinburgh: "He was distinguished for the same assiduity, correct moral deportment, and retiring, modest demeanor, that characterized him in every period of his life, and which, young gentlemen, permit me to add, you will ever find to be the sure and never-failing passport to distinction and usefulness. Such, too, was the impression made at that early period of his life upon his friends in the university, that his name was ever afterwards mentioned in terms of the warmest regard and respect. The impression which was thus made on my mind by the affectionate language in which he was spoken of by the late celebrated divine Dr. Erskine, the present eminent physician of that city Dr. Charles Stuart, and by the elder Professor Duncan, in all whose families he had been domesticated, can never be erased." To those thus enumerated, he added on the list of friends who ever watched his career with the interest which had been begotten by his character as a student, the celebrated Cullen himself, Sir James McIntosh, Mr. Emmet, and Professor Jeffrey, men whose friendship was not lightly bestowed, and never without reflecting honor on the merit of the recipient. After three years thus honorably and profitably spent, he took his degree of Doctor of Physic in 1786. Nothing could more perfectly exhibit the character of the mind of Dr. Wistar than the subject selected for his inaugural thesis, "*De Animo Demisso*." Dedicated to Cullen, the great luminary of the medical world, and Franklin, the philosopher of both the Old and New, it is devoted to the investigation of the nature, causes, and treatment of one of the most distressing maladies to which our nature is subject. In Latin which does ample credit to his knowledge of that language, he discusses the relations between mind and matter, deducting his illustrations from the stores of medical literature, classic authors, and modern poets and philosophers, with a judicious liberality proving his acquaintance with them all, yet falling short of pedantic display, as well as of the mere quotation to furnish matter, so frequent in such productions; and he closes the essay with a tribute

of grateful affection to his preceptors, Dr. Redman, of Philadelphia; Dr. Jones, of New York, and his friend, Dr. Charles Stuart, of Edinburgh. In the family of the latter gentleman he had been domesticated during the two years of his residence. In the year 1787 he reached his native city. The earnest student was the germ of the anxious, diligent, and faithful practitioner. The social position of his family and connections, with the comparatively limited population of the city of Philadelphia, placed him at once in a position which forbade mediocrity. His fellow-citizens manifested their respect for him in every proper mode, and ample was the return he made in the honor which, gathering around his own brow, was transferred to the city of his birth and the home of his affections. He was immediately appointed one of the physicians to the Philadelphia Dispensary, then recently established; and one of his preceptors, Dr. Jones, took every opportunity to promote his advancement, by manifesting his own confidence in his ability. It is related of him that having requested the young surgeon to assist him in a critical operation, when the patient was prepared, he handed the scalpel to Dr. Wistar, pleading the failure of his own vision as an apology for transferring the responsibility to him. The College of Physicians, which was then a very exclusive body, having few members, and they the oldest and most distinguished medical men of the city, elected him one of its Fellows; while the American Philosophical Society, under the auspices of Franklin and Rittenhouse and Jefferson, called him to a participation in their labors for the investigation of knowledge, to which he devoted himself with an alacrity the offspring of earnest interest. On both he conferred by his subsequent career, honor more than a recompense for that thus early bestowed. The College of Philadelphia, to which the returning sense of justice on the part of the government of the new State of Pennsylvania had restored its charter and endowments, placed him immediately among the trustees to whom was committed the duty of resuscitating that venerable institution, and a few months afterwards appointed him Professor of Chemistry and the Institutes of Medicine. He devoted himself with untiring energy to the work of accomplishing a junction of the two institutions, convinced that more injury would result from the jealousy of rivalry in so narrow a sphere, than good from any honorable competition. It was chiefly through his instrumentality that this happy result was accomplished in the year 1791. At that period the chair of anatomy was held by the one incumbent teaching the classes of both schools. The attendants on his lectures numbered one hundred and four, of whom fifty-five were attendants also on the lectures of the other professors of the University of Pennsylvania, while the larger number were matriculates of the college. The new institution thus formed took the name of the University of Pennsylvania, and the Medical School that, by which it has become so widely known, of The Medical Department of the University of Pennsylvania. The high reputation of Dr. William Shippen, Jr., as a teacher of anatomy, of whom it was said by competent judges he had no superior, had caused him to hold that chair in both schools,

and he was now placed in the same position in the new arrangement, while Dr. Wistar was appointed Adjunct Professor of Anatomy and Midwifery. We thus find Dr. Wistar, in his thirtieth year, fairly started on that course in which he achieved for himself a distinction than which no greater has been attained by any competitor. He did not propose to himself to seek for fame. The honorable ambition to win the esteem and to acquire the confidence of his fellow-men was no stranger to his bosom, which responded promptly and warmly to such appeals. This was the goal at which he aimed; and, in the faithful discharge of duty to which this desire stimulated him, he acquired a reputation unexcelled by any of the many noted medical men of his time. The medical department of the University of Pennsylvania thus organized from the junction of the two schools, soon assumed in the western continent the position of the great center to which all who sought instruction in the art of healing flocked, from every part in which the English language is spoken; and, though the eloquence of Rush was a strong attraction, the sound wisdom of Wistar was not less celebrated. He was an able, instructive and attractive teacher. Dr. Hosack says: "He at once evinced those great qualifications by which he was afterwards distinguished. The same fluency of utterance, the unaffected ease and simplicity of manner, the perspicuity of expression, the animation and earnestness arising from the conviction of the truths he was delivering, as well as from the desire to impress them upon the minds of the pupils, and the readiness with which he summoned and applied the numerous and varied resources of his mind, which many of you now in my hearing have had an opportunity of witnessing, Dr. Wistar displayed in a most remarkable manner, in the first lectures he delivered. Such were his fascinating powers of description, that even upon those subjects that are usually considered as an uninviting part of a course of Anatomical lectures, the attention of his hearers was ever awakened and unremitting. Even in the demonstration of a muscle or a bone, his views were those of the philosopher as well as the anatomist." The manner of Dr. Wistar in the anatomical theater, surrounded by his pupils, was such as at once to command not only their confidence in his powers as a teacher, but their love and veneration for him as a man. Courteous and gentle, yet dignified, he never stooped to seek the passing favor of the moment by pandering to a vicious taste, or indulging in jesting or levity. His whole demeanor was that of one who felt himself the accredited minister of a holy service. With a countenance which changed with every passing shade of thought and feeling, and a heart which responded to the gentlest influences which touched it, none ventured on familiarity; yet the only awe he inspired was that with which a kind and loving parent attracts to himself, rather than repels the children of his affection. His intercourse with the students who frequented his lectures was marked by one peculiarity, which was indicative of that greatness of mind which depends on entire truthfulness of character. So soon as the lecture closed, he allowed them to throng the area in which he stood, and he never closed the door to his private apartment, to which they were freely ad-

mitted, and he would prolong the lecture by conversation, during the time he was preparing to retire, and often remained talking to them and answering their numerous questions, not only without reluctance, but with a cheerful and happy tone of voice and expression of face, which, while it gratified the youthful aspirants to his favor, convinced them that he considered their interests paramount to his own convenience. He thus more than compensated his class for the few minutes by which he often trespassed upon their patience, through a want of absolute punctuality to his hours, which with him was almost unavoidable. Universally known and respected, his daily course through the streets was interrupted by persons of every grade in life, who were permitted to stop him by the way to consult him about their ailments, or to testify their gratitude for the benefits received from his skill. His courtesy to all was unbounded; the poorest equally with the richest were received with kindness, and their cases treated with respectful consideration. His walks were almost an ovation, and childhood as well as manhood rejoiced at the beaming look and pleasant nod which gave evidence of his recognition of each token of respect. It was the habit of Dr. Wistar to invite the students in small numbers to his house, repeatedly during their attendance on his lectures. On these occasions his urbane manner and happy faculty of engaging them in conversation relieved the frigid formality which usually settles on such assemblages. The students of that day were generally from the rural districts, having enjoyed but few opportunities for social intercourse or familiarity with the usages of city life. Great embarrassment was therefore naturally a serious alloy to the enjoyment of such associations. No sooner would Dr. Wistar enter the room, around the wall of which some twenty or thirty young men but little acquainted with each other were arranged in awful expectancy, and take his seat in their midst, than he would address, first to one and then another, some question as to the local peculiarities of the section of country from which they came, so worded as to prove the possession on his part already of some knowledge of themselves personally, and the subject about which he made inquiry, and thus would he draw them into conversation and give freedom to their powers, pent up not so much by ignorance as by timidity. It was not in the company of students of medicine only that he thus sought to place those around him at ease by drawing them into conversation on those subjects with which they were familiar, while adding at the same time to his own stock of knowledge. This delicacy of perception, and consideration for the feelings of others, marked his general intercourse with his patients and society, and gave an especial charm to the literary and scientific soirées which he gathered weekly at his house, when he collected there not only the best-informed and most intellectual citizens, but also all strangers who were supposed capable of giving or receiving pleasure at such meetings. It is asserted by the Abbé Correa da Serra, that these parties at Dr. Wistar's house were the first which were held in this country on the plan of the European conversations. Nor was his hospitality confined to those meetings only, which were the origin of the Wistar parties, so-called,

of the present day. Under the auspices of Dr. Wistar, these scientific and literary parties were strictly such; the refreshments being limited to the simple tea and coffee, and similar light articles, which were handed to the company, instead of the luxurious suppers which now form so prominent a feature of these entertainments. On suitable occasions, however, his table was spread as a generous board; and few strangers of any mark visited Philadelphia without partaking of the pleasures which clustered there. Warm and quick in his feelings, generosity was an especial characteristic of his heart, and by its promptings influenced his mind. This led him to pay but little attention to the pecuniary obligations of his patients, to whom he gladly rendered gratuitous services, even when the recipient had no special claim on his consideration; while to those, who, with straitened circumstances were struggling to sustain a respectable position, his sympathies were ever open. As a practitioner of the healing art, Dr. Wistar occupied a position no less eminent than that we have seen he possessed as a cultivated teacher of the science. Endowed by nature with a determined will rather than a quick perception, those who know him best speak of him as less rapid in his mental action than many who have yet not attained to the same eminence. As a corrective he combined with this an earnestness of purpose, and highly wrought moral sensibility, and an exalted benevolence, which stimulated him to action and sustained him in effort. The examination of each individual case was, therefore, made with the most minute scrutiny of all its features, and a patient attention to the complaints of the sufferers, which assured them of the interest he felt, and his desire to attain that intimate knowledge of the disease which would enable him to administer his remedies understandingly. The Abbé Correa da Serra remarks: "He was scrupulously attentive in the examination into the nature of disease, and gentle and kind in the treatment of his patients. It was his object to assist nature. Hazardous treatment did not enter into his plan of healing. This system is but little understood by those among whom he lived, but was the natural product of his own character." The estimation in which he was held as a surgeon is proved by the Minutes of the managers of the Pennsylvania Hospital, in which they speak of his resignation as "unexpected and very much regretted by the managers, who would gladly have embraced an opportunity of giving to a long-trying, experienced, and faithful practitioner a further proof of their confidence in his skill and abilities, by re-electing him to the office he had filled more than sixteen years with great reputation, had he not prevented them by declining to serve any longer." His biographer, Dr. Morris, referring to the lasting impression made by him on his boyish imagination, and the deep hold upon his affections which was established by Dr. Wistar, as the medical attendant in his father's family, writes as follows: "The countenance beaming with affectionate interest in the suffering of the patient—the gentle tones of endearment with which he soothed the anxieties and quieted the alarm of childhood—the patient investigation of the symptoms, and the earnest effort to adapt his remedies so as to offend as little as possible the irritability of a sick and perverted

taste, then much more difficult than now, will never be forgotten, and are as vividly present as when, more than forty years ago, they determined the adoption of his own course of life. These traits of character were natural. He was sincere and truthful; and the patient in the hospital, in the wards of which he was a faithful attendant during seventeen years, or the poor sufferer in an alley, received from him the same delicacy of attention as the proudest citizen who claimed his services for a fee. Indeed his disregard of the pecuniary recompense for his services was so great, that it not only prevented the accumulation of wealth for his family, but, whilst it gave a higher elevation to the esteem of the community for the philanthropy of the profession, it was open to the censure of leading them to expect from others, who are more dependent on their own exertions for their support, the same self-sacrificing devotion to their interests as he had displayed." We have seen that, from the commencement, Dr. Wistar was accustomed to give wide scope to the action of his mind. Chemistry, botany, and mineralogy were all studied with care, but anatomy, as the subject on which it became his duty to teach others, claimed his special attention. He published, for the benefit of his class, a work on human anatomy, which, for clearness and conciseness of description, was unrivalled, and which retained its position as the text-book of all our medical schools, until the advances made in the modes of investigation and classification, and the changes in the modes of teaching, which have characterized later years, required another. The discovery made by him of the mode of development of the cells of the sphenoid bone, and their attachment in the early period of life to the ethmoid, was one which conferred honor on him as an investigator and discoverer, and in which he took unalloyed and great satisfaction. With the exception of the work on anatomy, he committed but little to the press. He sometimes wrote anonymous essays, and occasionally communicated his views over his own signature, through the daily papers, and the Transactions of the College of Physicians, and American Philosophical Society. Of this body he was always a zealous member, and was one of the vice-presidents from the year 1795; he was elected to the presidency on the resignation of his intimate friend, Thomas Jefferson, in 1815. He maintained a constant correspondence with men of eminence in science in other countries, as well as at home, and in every mode in his power labored to promote the cultivation of general knowledge. In the natural history of our own continent he was deeply interested, and was especially so in the investigation of those fossil remains which were then first claiming the attention of scientific men. The fifth volume of the new series of Transactions of the American Philosophical Society, published after his death, contains an article from his pen on this subject, which he was the first to investigate in a scientific manner, and to which it was his intention to devote the leisure of his remaining years. He was interested, also, in the history of our own nation, and it was at his suggestion, and through his influence, that a committee of the American Philosophical Society was appointed for the purpose of collecting and preserving the scattered fragments which are essential to the perpetuation of our knowl-

edge of the transactions of the past. The meetings of this committee he attended regularly, and one of his colleagues remarks that it was the custom, after having dispatched the business of the evening, to gather round the hearth and enter into general and unrestrained conversation, in which he ever took the lead without intending it, and by his just remarks and interesting anecdotes, he would beguile the time, until warned by the unwelcome tolling of the midnight hour that they were entering on another day. Dr. Wistar's literary taste was good and elevated. Poetry had a charm for his maturer years as well as for his youth; but works of fiction he disregarded in his more earnest seeking for solid truth. His opinions on government were in strong contrast with those of his family and friends, and the social circle in which he moved. He embraced fully and decidedly the views of Mr. Jefferson. Yet he lived in harmony with those who differed from him on these subjects, at a time when party divisions were more violent and rancorous than even now; and those of both parties entertained for him that profound respect and warm affection which was equally creditable to him and them. His warmest friends, most devoted patients, and nearest relatives, were zealous advocates of the views of the Federal party. His sense of propriety taught him, as a medical practitioner, to avoid the obtrusion of his views upon others; and he was well aware of the incompatibility of political and medical studies and pursuits. He therefore never took any part in the former, beyond the expression of his views when occasion demanded it; and then in such manner as was least offensive. His well-known popularity at one time induced the leaders of the Democratic party in Philadelphia to endeavor to persuade him to allow them to put him in nomination as their representative in Congress; this he positively refused. Soon after his return from Europe, he was united in matrimony to Miss Isabella Marshall. Within two years he was called to mourn her loss, with no child to perpetuate the alliance and solace his grief. It was not till after the lapse of eight years that he again married, Miss Elizabeth, daughter of George Mifflin, and niece of Thomas Mifflin, widely known as one of the Governors of Pennsylvania. This estimable lady cheered the subsequent years of his life by her sympathy, and long survived him. Two sons and a daughter were the fruits of this union. His delight in nature was as simple as that of a child, and furnished him unbounded gratification. A modest but beautiful country residence afforded him a retreat from the toil and cares of his profession during the summer months, and it was here that he delighted to gather around him his family and friends. He was fond of children, whom he caressed, and thus disarmed their fears. He never indulged, either while visiting his patients or elsewhere, in idle gossip about character, and when it was attempted in his presence, would check it by an apt quotation from that noblest sentence of uninspired morality:

"He that filches from me my good name,
Robs me of that which not enriches him,
And makes me poor indeed."

The religious views of Dr. Wistar were those of the Society of Friends, modified by his large intercourse with the world. When his

professional duties permitted, he ever joined with them in their meetings for worship once, at least, on the Lord's day, and he enjoined the same habit on his children, not as appropriate to their childhood only, but as the privilege and duty of man through life, and requested they would ever continue it. He urged upon his sons that, even should they adopt the medical profession, they would never allow their duty to their patients to furnish an apology for the neglect of this duty to God. Among the latest acts of his life was the postponement of other engagements to join in a religious meeting held at his own house by some traveling ministers of the Society of Friends. It was also his custom to take with him in his carriage and read as he traveled, either for pleasure or professional calls, a copy of the word of God which he especially valued, as the present of his early friend, Dr. Charles Stuart, of Edinburgh, and on such occasions, he commended the sacred teachings of the Gospel to the affectionate regard of his children, whom he frequently carried with him on short journeys. His philanthropy was quiet and sincere, manifested not only in the discharge of his duty as a physician, but by a ready response to the call for aid in every mode by which want is accustomed to appeal for relief. His sympathy for the weak and oppressed found vent in his kind interest in the sad remnant of the Indian tribes, which, at that day, still lingered in wretchedness amid our frontier settlers, and frequently visited our great cities; while, in common with Franklin and Rush, and every enlightened citizen of Pennsylvania, and many of the leading men of more southern states, he took a lively interest in the abolition of negro slavery, and desired to promote the diffusion of those views which would lead to its extinction elsewhere as there, by the voluntary act of the masters themselves. Having thus briefly described the character of Dr. Wistar, and narrated the principal events of his life, it only remains to record the circumstances of its close. During many years he had suffered more or less from symptoms which indicated an organic affection of the heart, which occasionally gave rise to attacks of dyspnea. On this account he strove as much as possible to reduce the number of his patients and diminish the amount of his professional labor. He, however, entered on the duties of his professorship in the winter of 1818 with his usual energy. But about the middle of January he was seized with a fever which soon manifested those indications of prostration which gave rise to alarm. Dr. Horner, then his affectionate pupil, and subsequently the successor of Dr. Physick in the chair of anatomy, records: "So long as reason maintained her seat I heard him say, 'Well, to-morrow I shall certainly be able to meet my class;'" and it was only by the watchful care of his friends he was prevented from the attempt. The last sentence he was heard to pronounce was, "I wish well to all mankind." Dr. Wistar died in the maturity of his intellectual force, and at the highest point to which earthly ambition can aspire. Beloved, respected, honored by all who knew him, his virtues had secured him the affections of his friends; his talents and industry the respect and esteem of the community in which he lived, and a reputation of no ordi-

nary character in a wider circle; and, in the struggle of life there had been personal jealousies and heart-burnings, they died with the individuals who were affected by them, leaving only a crown of honor placed on his brow by a grateful posterity which cherishes his memory as that of one who, by the diligent discharge of duty in his generation, established his claim to be "held in everlasting remembrance."

WOOD, George B., of Philadelphia, was born in Greenwich, Cumberland county, N. J., March 13, 1797, and died in the former city March 30, 1879. His parents were members of the Society of Friends. He received his early education in the City of New York, and completed it at the University of Pennsylvania, where he graduated A. B. in 1815, and studied medicine in the medical department of the same institution, receiving his degree of M. D. in 1818. He was the author of a number of works which rank high in medical literature. Among these are: "The Dispensatory of the United States," written in conjunction with Dr. Franklin Bache, in 1833. This work was thoroughly exhaustive in its description of many medicinal agents peculiar to American practice, indicating minutely their various properties and effects. Of this work 150,000 copies were sold during Dr. Wood's lifetime, the royalty to the authors being about \$155,000. In 1847 he published "A Treatise on the Practice of Medicine." This work has gone through six editions, the last being in 1867. In 1856 he published "A Treatise on Therapeutics and Pharmacology, or Materia Medica," of which three editions have been issued, the last in 1868; and a volume containing twelve lectures, six addresses on medical subjects, and two biographical memoirs, in 1859, chiefly delivered before the medical classes of the University of Pennsylvania. He was also author of the "History of the Pennsylvania Hospital;" "History of the University of Pennsylvania," and "Biographical Memoirs of Franklin Bache." These, together with the "History of Christianity in India," of "The British Indian Empire," and of "Girard College," were collected into a volume, entitled "Memoirs, Essays and Addresses." He was Professor of Chemistry in the Philadelphia College of Pharmacy from 1822 to 1831, of Materia Medica in the same institution from 1831 to 1835; Professor of Materia Medica in the University of Pennsylvania from 1835 to 1850; of the Theory and Practice of Medicine in the same institution from 1850 to 1860; and Physician to the Pennsylvania Hospital from 1835 to 1859. He was president of the American Philosophical Society in 1859, and was for many years president of the College of Physicians of Philadelphia. He, in 1865, endowed the auxiliary faculty of medicine in the University of Pennsylvania, consisting of five chairs: one of Zoölogy and Comparative Anatomy; one of Botany; one of Geology and Mineralogy; one of Hygiene; and one of Medical Jurisprudence; all of these to be especially considered in their relation to medicine. The pathology of diseases as laid down by Dr. Wood in his Treatise on the Practice of Medicine excelled that to be found in any other work in this country. He was eminently successful as a lecturer, and while in the chair of Materia Medica exhibited to the student many specimens of rare

living tropical plants and other exotics, which he had secured at great expense, and of which he had occasion to treat in his lectures. As an author and teacher of various departments of medicine he was recognized as pre-eminent, and at the time of his death was perhaps the oldest and most widely known member of his profession in Philadelphia.

WOOD, Horatio C., of Philadelphia, Pa., was born in that city January 13, 1841. His professional education was received in the University of Pennsylvania, whence he was graduated M. D. in 1862. After serving in various civil and military hospitals, he established himself in Philadelphia in 1865, making specialties of therapeutics and nervous diseases. He is a member of the Philadelphia County Medical Society; of the College of Physicians; of the Academy of the Natural Sciences, of which he was formerly Recording Secretary; of the New York Lyceum of Natural History; of the American Philosophical Society, and American Medical Association. From 1866 to 1876 he was Professor of Botany in the Auxiliary Medical Faculty of the University of Pennsylvania, and since the latter date has been Clinical Professor of Nervous Diseases and Professor of Therapeutics in the medical department proper of that institution, which position he still holds. In 1879 he was elected to the National Academy of Sciences. He was Visiting Physician to the Philadelphia Hospital from 1872 till 1887, and to St. Agnes Hospital since 1886, and has held the same relation to the University Hospital since 1870. Of his numerous professional publications may be mentioned: "On the Influence of Section of the Cervical Pneumo-gastrics upon the Action of Emetics and Cathartics;" "Acetic Ether as an Anesthetic;" "Physiological Action of Atropia;" "Experimental Researches on the Physiological Action of Nitrite of Amyl" (Warren prize essay); "The Vaso-Motor Action of Ergot;" "On the Oxytocic Action of Quinine;" "An Investigation into the Action of Veratrum Viride;" "A Study of the Nature and Mechanism of Fever" (Toner lecture), Smithsonian miscellaneous collection, 1875; "Thermic Fever, or Sunstroke" (Boylston prize essay); "A Study of Convulsants;" "Case of Leucinosis, or Yellow Atrophy of the Liver;" "On Acute Dropsy, Scarlatinal and Idiopathic;" "Therapeutic Value of Nitrite of Amyl;" "On the Relations of Leucocythemia and Pseudo-Leukemia;" "A Treatise on Therapeutics," J. B. Lippincott & Co., 1875 (seventh edition, 1888); also edited United States Dispensatory (fourteenth edition, 1883). Dr. Wood edited *New Remedies* from 1870 to 1873; the *Philadelphia Medical Times* from 1873 till 1880, and in 1884 he became editor of the *Therapeutic Gazette*. His more recent publications are: "Brain Work and Over Work," 1879, and "Nervous Diseases and Their Diagnosis," 1886. He has for a number of years been a zealous investigator, and constant and voluminous writer in the domain of natural history.

WOOD, James Rushmore, of New York, was born in that city September 14, 1816, and died there May 4, 1882. He studied medicine under Dr. Tulley, of New Haven, and Dr. David L. Rogers, of New York, and also at the Castleton (Vt.) Medical College, graduating in 1846. In 1847 he became associated with Dr. Wilson, Resident Physician of Bellevue Hos-

pital, in connection with that institution, which at that time was a receptacle for lunatics, paupers, criminals, and all the diseased of a depraved and vitiated life, where the hygienic laws and ventilation were almost entirely neglected, and the attendance and nursing inefficient and untrustworthy, and with the assistance of Dr. Drake and Moses Franklin, president of the then Board of Aldermen, so successfully endeavored to modify the existing evils that an effective change came over the hospital, as proved by the saving annually of six hundred lives. During the era of Dr. Wilson he made all the *post-mortem* examinations in the establishment, which numbered many hundreds. He also established Saturday surgical clinics, and founded the Wood prize for the best anatomical dissection. He successfully established beyond dispute the fact of the second growth of bone by the separation of the periosteum from necrosed bone, and carefully enucleating it, specimens in the anatomical and pathological museum which he founded, showing the reproduction of almost every bone in the human body. As early as 1847, Dr. Wood began to collect material with the intention of founding a museum, and this collection, together with the accumulated specimens of twenty years' practice, he presented, in 1856, to the Commissioners of Public Charities and Corrections. This, with the later additions, constitutes the "Wood Museum," which Dr. Willard Parker has styled "the grandest monument ever erected to any surgeon in this country." He was chiefly instrumental in procuring the passage of the "Dissecting Bill," by which the bodies of all unclaimed vagrants are given to the institutions of medicine and surgery for dissection. It took four years to secure the enactment of this law, and so great was the public prejudice against it that it finally passed in 1857 by only one majority. In 1861, together with many of the leading physicians, and under the auspices of the Almshouse Commissioners, he founded Bellevue Hospital Medical College. Among the operations performed by him was the removal of the whole lower jaw for phosphor-necrosis (in a patient who died subsequently, and to whose skull a second jaw had attached itself). He tied both carotids in the same patient for malignant disease of the antrum, placed the ligature on the subclavian on several occasions, and tied the external iliac several times. He was a member of the New York Academy of Medicine; of the American Medical Association; of the New York Pathological Society, of which he had been twice president; of the New York Medical and Surgical Society; of the New York Society for the Relief of Widows and Orphans of Medical Men; the Medical Journal Association of the City of New York; of the New York Physicians' Mutual Aid Association; honorary member of the New York and Massachusetts State Medical Societies, and corresponding member of the Historical Society of Yale College. He was the author of "The Growth of Bone," an address delivered before the New York Academy of Medicine; of pamphlets on "Removal of the Entire Lower Jaw," "Ligature of External Iliac Artery," "Spontaneous Dislocation of the Head of the Femur Into the Ischiatic Notch, Occurring in Morbus Coxarius," and also "Early History of the Operation of Ligature of the Primitive Carotid Ar-

tery." In 1846 he was appointed Demonstrator of Anatomy at Castleton Medical College; was Surgeon to St. Vincent's Hospital and New York Ophthalmological Dispensary; also Consulting Surgeon of the New York Academy of Medicine. In 1861 he was called to the Chair of Operative Surgery and Surgical Pathology in Bellevue Hospital College, and was *Emeritus* Professor of Surgery therein at the time of his death.

WOODBURGE, Luther Dana, of Williamstown, Mass., was born December 27, 1850, at Perth Amboy, N. J. He is descended from Rev. John Woodbridge, who came from Great Britain to New England in 1634. The subject of this sketch was educated at Williams College, having graduated at that institution in 1872, and then became a teacher in Robert College, Constantinople, during 1872-73. He began the study of medicine under the preceptorship of Dr. N. H. Babbitt, of North Adams, Mass., received his medical degree from the College of Physicians and Surgeons, New York City, in 1877, and was awarded a diploma of special examination honors. He served as House Physician to Roosevelt Hospital during 1878-9, and was assistant in the out-patient department of Columbus Street Hospital, New York City. He then pursued special studies in ophthalmology, otology, gynecology, obstetrics, pediatrics, surgery, venereal, and skin diseases in the University of Vienna during 1879 and 1880. He afterward went to the British metropolis, and served as "*Interne*" at the London Hospital. He then engaged in the general practice of his profession in New York City, in association with Dr. T. H. Burchard, from 1881 to 1884, and during this time he became an Assistant to the Ophthalmic Department of Manhattan Eye and Ear Hospital in connection with the service of the late Dr. C. R. Agnew. He was also Lecturer on First Aid to Injured, under the auspices of the New York State Charities Aid Association. During 1884 he was called to the chair of Anatomy and Physiology in Williams College, Williamstown, Mass., and has since practiced medicine there in connection with college duties. He is a member and ex-president of the North Berkshire Medical Association, member and vice-president of the Berkshire Medical Society; member and Councilor of the Massachusetts Medical Society; and also a member of the American Medical Association and the American Academy of Medicine. Dr. Woodbridge is the author of a "*Syllabus of Lectures on Anatomy and Physiology*," and has made important contributions to the literature of his profession, among which may be mentioned articles on "*Abortive Treatment of Typhoid Fever*," and "*Antiseptic Medication*."

WOODBURY, Frank, of Philadelphia, Pa., was born in that city December 9, 1848, and is of New England parentage and of English descent. He received his preliminary education at the Philadelphia High School, and under private teachers. His medical education was continued under the preceptorship of Professor James Aitken Meigs, and he was graduated in medicine at the Jefferson Medical College in March, 1873. The honorary A. M. degree was conferred upon him by Lafayette College in 1888. He was Resident Physician of Pennsylvania Hospital from 1873 to 1874, and was its librarian and officer of hygiene

from 1874 to 1875. He was librarian of the Philadelphia College of Physicians from 1875 to 1879; also Attending Physician to German Hospital for six years, and Attending Physician to Medico-Chirurgical Hospital four years. He was Professor of Therapeutics and Materia Medica in the Medico-Chirurgical College of Philadelphia four years; afterwards and at present Professor of Clinical Medicine in this medical college. He was second vice-president of the American Medical Association at its meeting held at Newport, R. I.; and chairman of the Section of Materia Medica and Pharmacy, American Medical Association in 1890, 1891 and 1892. He was president of the American Medical Editors' Association at the Detroit meeting in 1892. Dr. Woodbury was formerly reporting secretary of the Philadelphia County Medical Society for five years, and the editor of the *Philadelphia Medical Times* from 1883 to 1888. He has also been the Philadelphia editorial representative for the *Boston Medical and Surgical Journal* since 1887, and the Philadelphia correspondent for the *Journal of the American Medical Association* since 1891. He is a member of the Philadelphia Academy of Science and New England Society. In the Ninth International Medical Congress held at Washington, September, 1887, he was secretary of Section on Therapeutics and Materia Medica, and has been a writer of numerous contributions to medical journals. In 1873, in the *American Journal of Medical Sciences*, he was the first to suggest digital compression of the iliac artery in hip amputation, afterwards carried out by Davy, of London. He is the author of a monograph on *Disordered Digestion and Dyspepsia* (Detroit, 1889, George S. Davis publisher); and is the American editor of Farquharson's *Therapeutics*; Murrell's *Notes on Poisons*; Tillbury Fox's *Epitome of Skin Diseases*; Hall's *Differential Diagnosis*, and other important medical publications. Dr. Woodbury was formerly stenographic reporter to the clinics of Professors S. D. Gross, Joseph Pancoast, and J. M. Da Costa; also to the American Laryngological Association, and American Dermatological Association.

WOODWARD, Joseph Janvier, of Washington, D. C., was born in Philadelphia, Pa., about 1832, and died near that city August 17, 1884. He was educated at the Philadelphia Central high school, from which he received the degree of A. B. in 1850, and that of A. M. in 1855, acting as the valedictorian of his class. After receiving the first-mentioned degree he began the study of medicine, and graduated from the University of Pennsylvania in the spring of 1853. For a short time thereafter he practiced medicine in Philadelphia, acting during that period as examiner and teacher upon microscopical and pathological anatomy; he entered the army, wherein he rose rapidly, and became chief assistant in the surgeon-general's bureau at Washington, D. C., with the rank of Lieutenant-Colonel. His professional labors have been of distinguished character, none more so than his comprehensive series of experiments in microscopic photography, by which the profession has been placed in possession of records of the highest value and usefulness. Among his publications, which number about one hundred single papers, are: "*Address on Medical Staff of United States Army*;" "*Remarks on Croup and Diphtheria*;" "*Typho-Malarial Fever: Is it a Special*

Type of Fever?" Transactions of International Medical Congress, 1876; "Remarks on Photographic Micrometry," Transactions American Medical Association, 1876; "Application of Photograph to Micrometry, with Special Reference to the Micrometry of Blood in Criminal Cases;" report on "Medical Literature;" report on "Causes and Pathology of Septicæmia." He was also author of "Outlines of the Chief Camp Diseases of the United States Armies," 1863, and the "Medical and Surgical History of the War of the Rebellion," 1879. He was a member, during his residence in Philadelphia, of the Philadelphia County Medical Society; was a member of the American Medical Association, Second Vice-President in 1875; was a delegate to the International Medical Congress at Philadelphia, 1876, and of the Medical Association of the District of Columbia. Dr. Woodward was associated in the management of President Garfield's case after he was shot, and the confinement, anxiety and labor to which he was subjected during the President's long illness proved too great for him, and hastened the sickness that terminated his life. In addition to his connection with scientific societies, including his election in 1873 to the National Academy of Sciences, he was President of the American Medical Association and of the Philosophical Society of Washington.

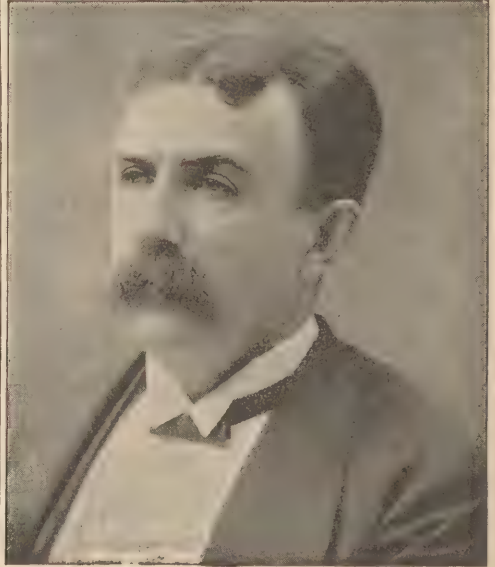

WOODWORTH, John Maynard, of Washington, D. C., was born at Big Flats, Chemung county, N. Y., August 15, 1837, and died at the National Capital, March 14, 1879. His parents removed to Illinois during his childhood. He pursued his literary and classical studies at Warranville Seminary, in that State, and in the University of Chicago. He then studied pharmacy, and afterward engaged in business on his own account, at the same time attending lectures on materia medica and chemistry at the Rush Medical College. He subsequently began the regular study of medicine in that institution, and completed a course of qualitative and quantitative analysis under Prof. J. V. Z. Blaney. He graduated M. D. in 1862 at the Chicago Medical College. In 1865 he visited Europe, where he spent one year, chiefly in the hospitals of Berlin and Vienna, taking special courses of instruction in both these institutions. In 1866 he established himself in Chicago. He was a member of the Chicago Medical Society; of the State Medical Society of Illinois; of the American Medical and American Public Health Associations (being one of the twelve sanitarians who organized the latter in 1872); of the American Association for the Advancement of Science; the Philosophical Society of Washington, D. C.; corresponding member of the Chicago Academy of Sciences and Philadelphia Academy of Sciences; honorary member of the Kentucky State Medical Society; president of the Alumni Association, Chicago Medical College, in 1870; member of the State Charities Aid Association of New York; of the Centennial Medical Commission; of the Military Order of the Loyal Legion, and vice-president of the Society of the Army of the Tennessee. He was the author of "Primary Surgery of General Sherman's Campaigns," 1866; "The Mystery of Life," an address, 1871; "Regulations of the United States Marine Hospital Service," 1873; "Hospitals and Hospital Construction," 1873 and 1876; "The Immigration Service of the

United States," 1873; "Cholera in 1873 in the United States;" "Migrants and Sailors in their Relations to Public Health," and "Safety of Ships and Those who Travel in Them," Transactions of American Public Health Association, and "Quarantine, with Reference to Cholera and Yellow Fever," read before the International Medical Congress in 1876, in relation to which subject the six propositions submitted by Dr. Woodworth were adopted. He also issued the "Provisional Nomenclature of Diseases of the College of Physicians in London, in 1874," as the nosological standard, and adapted it for the use of the marine hospital service. Beside these he was the author of the annual reports of that service, in which are contained very valuable contributions to practical hygiene and medicine. He took part in organizing the Chicago Academy of Sciences, and in 1858 became the curator of its museum, to which he gave much of his time, making several excursions west of the Mississippi for the purpose of collecting specimens of natural history. In 1859 he was appointed Naturalist to the University of Chicago, and commissioned to establish a museum of natural history. The winters of 1859, 1860 and 1861 he passed in the Smithsonian Institution, working under the personal direction of Prof. Spencer F. Baird. In 1866 he was elected Demonstrator of Anatomy in the Chicago Medical College (he had previously declined the chair of Physiology and Histology in the same institution), and joined with it a course of lectures on comparative anatomy; and for one year filled the chair of Natural History in the University of Chicago, during the absence of the incumbent. After graduating in 1862 he immediately entered active service in the army of the Union as Assistant Post Surgeon at Camp Douglas, Chicago, and shortly after was appointed Assistant Surgeon of volunteers, and joined Gen. Sherman in the field near Corinth, remaining with his command until the Union armies were mustered out in 1865. In 1863 he was promoted to Surgeon, and assigned to duty as Medical Inspector of the Fifteenth Army Corps, and afterwards Medical Inspector and Medical Director of the Army of the Tennessee. During the Atlanta campaign he established field hospitals, for which he was complimented in general orders. On the "march to the sea" he took charge of one hundred men, moving them in ambulances, and although there were among the wounded three on whom amputation of the thigh had been performed, arrived at Savannah without the loss of a single life, the wounds having completely healed when that city was reached. He was brevetted lieutenant-colonel for his services, which were so highly appreciated that he was the recipient of two communications, one from Major-General Logan and the other from Brevet-Colonel and Surgeon John Moore, United States Army, approved by General Sherman, in which reference is made to his patriotism, capability and energy, as well in a professional capacity as in the frequent performance of his duties, by no means obligatory, of aide-de-camp. In 1868 he was appointed Surgeon of the Soldiers' Home, of Chicago, and Sanitary Inspector to the Chicago Board of Health. In 1871 he was appointed Supervising Surgeon-General of the United States Marine Hospital Service, which position he held until his death. On receiving

this appointment he immediately removed to Washington to assume charge of that service, which had been until that time, though in the seventy-third year of its existence, without any medical head. For six years he had labored to perfect the organization of that service by introducing systematic business methods of conducting its affairs. Instead of appointing medical officers solely on political grounds, candidates are now required to pass a satisfactory examination, and instead of the costly unsanitary hospital buildings of iron and stone, comparatively inexpensive pavilions are adopted. In April, 1878, a large number of physicians of the City of New York, among whom were gentlemen at the very head of the profession, joined in a letter to him in which they warmly expressed the cordial appreciation with which they regarded the important work he had devoted himself to, and how much his investigations in marine and hospital hygiene had commended him to the favor of the medical profession. He married, June, 1873, Maggie C. Hannahs, of Chicago.

WOOLEN, Green Vinton, of Indianapolis, Ind., was born in that city June 24, 1840. He is of English descent, and the second son of Milton Woolen, a native of Kentucky, and Sarah (Black) Woolen, of Maryland, who were both early pioneers of Indianapolis. The subject of this sketch, having lived on a farm during his boyhood days, received his preliminary education under private instructors and in the public schools of his native place. He began the study of medicine with Dr. Samuel Record, at Lawrence, Ind., and finished with the late Prof. John S. Bobbs, of Indianapolis, who then was the recognized surgeon of the State. He attended his first course of lectures at the Cincinnati College of Medicine and Surgery, in 1859-60, and was graduated in medicine at the Bellevue Hospital Medical College in the spring or 1865. He was appointed Camp Surgeon of Camp Morton, at Indianapolis, in the spring of 1861, before he was of age, and was commissioned Assistant Surgeon of the Twenty-seventh Regiment Indiana Volunteers the following September, and served three years as such in the armies of the Potomac and Cumberland, being Surgeon-in-Chief of the Artillery Brigade, and subsequently the Twentieth Army Corps. He was Surgeon-in-Chief of Seminary Hospital at Murfreesboro, Tenn., during the spring and summer of 1864. He was captured at Cedar Mountain, and held as one of Pope's officers as a hostage in Libby Prison till his order to forage off of the country was rescinded. Dr. Woolen was elected a member of the Indiana State Medical Society in 1861, and was secretary of that society from 1870 to 1880, during which time, under the direction and assistance of the late Dr. Wm. Lomax, of Marion, Ind., he reorganized the society on the representative basis, when it became one of the largest medical organizations in the United States. He was a member and secretary of the Indianapolis Academy of Medicine, from the time of its organization, in 1865, until it was merged into the Marion County Medical Society in 1875, since which he has been a member of that organization, and was president in 1885. He reorganized the Indianapolis City Hospital at the close of the war into a civil institution, and was superintendent of it for the ensuing four years. From 1870 till 1882, he pursued the general practice of his profession, and was

a frequent contributor of papers on general medicine, to the Marion County and Indiana State Medical Societies, as well as the Mitchell District, Mississippi Valley, and American Medical Association. Many of these papers were subsequently published in the leading medical journals. In 1882 Dr. Woolen took up the special study of diseases of the upper air passages, and in 1884-85 took an extended course of instruction in this branch of medicine in the New York Polyclinic Post-Graduate School, and under the special training of Drs. Kitchen, Griffin, and Ellsberg. He spent the first half of the year 1886 in Europe, principally at the London Throat Hospital in the further study of his special line of work, taking a full course in the hospital, and an exhaustive special course under the private training of Mr. Mark Hovell. He returned from abroad in July, 1886, and entered upon the exclusive treatment of diseases of the

Green V. Woolen.

upper respiratory organs, in which field of practice he has had excellent success. In 1889 he was made Professor of Rhinology and Laryngology in the Central College of Physicians and Surgeons, a position he now holds. Of late years he has been a frequent contributor to medical societies and journals on subjects pertaining to his specialty. He was married February 4, 1864, to Miss Mary A. Smith, only daughter of the late D. R. Smith, Esq., for many years Associate Judge of the Probate Court of Marion county, Ind. He is a member of the G. A. R. and Military Order of the Loyal Legion of the United States. He has always been an active member in the Baptist Church, this being the only interest that has in any way been associated with his exclusively professional life. He is yet well preserved and actively engaged in a large and lucrative practice.

WOOTEN, Thomas Dudley, of Austin, Tex., was born in Kentucky, March 6, 1829, of Virginia parents who settled in the former State in the early days. He was the youngest but one of several sons. At fifteen he was left by

the death of his father master of a large farm and slaves. "He received such education as the schools of the country afforded, aided by diligent reading at night and in the interval of labor. He studied medicine with Dr. George Rogers at Glasgow, Ky.; entered the Medical Department of the University of Louisville in the fall of 1851, when Gross, the elder Flint, Yandell, Sr., Drake, and other distinguished men were in the zenith of their fame, and graduated in the spring of 1853. Before graduating he was married to Miss Henrietta C. Goodall, daughter of Dr. Turner Goodall, of Kentucky. He located at the town of Tompkinsville, Ky., and entered upon an active practice. In 1856 he removed to Springfield, Mo. Doing a general practice he had a natural fondness for surgery, and soon acquired distinction in that branch. On the breaking out of the war and the transfer of the Missouri troops (in which he had enlisted as a private) to the Confederate army, Dr. Wooten was chosen by the medical staff for Medical Director of the First Army Corps (composed of Missouri and Arkansas troops), and took rank as such on the staff of Major-General Sterling Price, commanding. Upon the transfer of this command to the east side of the Mississippi river, when General Price was placed in command of the Department of Tennessee, Mississippi, Louisiana and part of Alabama, Dr. Wooten was made Medical Director of the Department. Gen. Price being transferred to the West, in command of the District of Arkansas, Dr. Wooten retained position on his staff and served till the end of the war. His rise and sustained success in the army were remarkable. Being only thirty-two years of age at the outbreak, he rose from private to Medical Director without prestige or influence, and in competition with some of the most eminent and influential men in St. Louis and the West. On the cessation of hostilities Dr. Wooten, ruined in fortune, settled in the village of Paris, Tex., in 1865. Here he soon built up a fine practice and recuperated his fortune. He removed to Austin in 1876, and has continuously resided there to date. His reputation and success as a surgeon are part of the history of the medical profession of Texas. He is a prominent member of the Texas State Medical Association, the American Public Health Association, and was a delegate to the Ninth International Medical Congress at Washington. Upon the organization of the Austin District Medical Association, in 1887, he was elected president. Upon the inauguration of the University of Texas, in 1881, Dr. Wooten was appointed by Governor Roberts one of the original Regents, and was reappointed by Governor Ireland. In January, 1886, upon the death of Dr. Ashbel Smith, Dr. Wooten was unanimously elected president of the Board of Regents, which position he still holds. From the first, he has been one of the most active and earnest friends of the University, and has labored for its successful establishment with a zeal and fidelity that have faltered under none of the discouraging indifference and even hostility to the State's great seat of learning." To Dr. Wooten the people of his adopted State owe a debt of gratitude; he has been the steadfast friend of education, and to him is also in a large measure due the successful inauguration of the high grade medical branch, which in time will be universally recognized as

an honor to the great State of Texas. He and his able colleagues have carried out what the great founders of the commonwealth conceived and foreshadowed.

WORMLEY, Theodore G., of Philadelphia, Pa., was born in Cumberland county, that State, April 1, 1826, and was brought up in Carlisle, becoming in due course a student at Dickinson College, although he did not graduate there. "After the prescribed preliminary course of study, pursued under the direction of Dr. John J. Myers, in Carlisle, he matriculated, and in due time received his degree of M. D. He grew to manhood in very humble circumstances, and had not only his own way to make, but to support his mother, in which duty he always proved himself a good son. His name has for many years been known far and wide as a chemist and toxicologist. For a considerable period he held the chair of Chemistry and Toxicology in the Starling Medical College, and of Natural Science in the Capital University, Columbus, O. On the resignation of Prof. R. E. Rogers, in 1877, he was called to fill the chair of Chemistry in the Medical Department of the University of Pennsylvania." From Dickinson College he received in 1870 the degree of Ph. D., and he has also had conferred upon him that of LL.D. His principal work is entitled "Micro-Chemistry of Poisons, Including their Physiological, Pathological and Legal Relations: Adapted to the Use of the Medical Jurist, Physician and General Chemist," illustrated, New York, 1867. The steel illustrations were drawn and engraved by Mrs. Wormley. "When these illustrations were submitted to engravers, one and all declined to undertake their execution, alleging that the work called for was so delicate that it would ruin their eyesight. This proved a great disappointment to the author, but his devoted wife resolved that the illustrations should be executed in the manner designed by her husband, set herself to master the art of steel-plate engraving, and, having mastered it, completed all the illustrations herself." How well she succeeded in her self-imposed task is very felicitously stated by the *American Literary Gazette*, of September 16, 1867, which, speaking of the illustrations, says: "They are of the highest order of merit in their kind, and the courage of the fair artist and its excellent results are of great value, not only in the art and science concerned, but as a proof of that executive faculty that many men deny to women." Prof. Wormley was appointed a member of the Centennial Medical Commission having in charge the arrangements for the International Medical Congress of 1876, and was a delegate therefrom to the International Medical Congress, held in Philadelphia in September, of that year. He delivered an address before this body on "Medical Chemistry and Toxicology," which is published in its Transactions.

WRIGHT, Charles E., of Indianapolis, Ind., was born in that city November 1, 1843, and died February 22, 1893. His collegiate education was obtained at Asbury (now DePauw) University, Greencastle, Ind. During the war he held the position of Quartermaster Sergeant of Camp of Instructions, afterwards Superintendent of Commissary Stores at Nashville, Tenn., and Chief Clerk of the Chief Commissary of Subsistence Department of Kentucky, in the Union Army. He next became a stu-

dent of medicine at Cincinnati in the Medical College of Ohio, where he graduated in March, 1868. Returning to Indianapolis he began the practice of his profession, making a specialty of the diseases of the eye, ear and nose, in which branches he attained no small distinction. He soon took rank not only in his special branches, but also as a member of the profession at large and as a thorough student, not only successful in practice, but fully competent to perform his share in advancing the cause of medical science, both with his pen and in the discussions of medical associations. His contributions to the medical literature of his time were numerous and valuable, and covered the entire period of his professional career. He was for some time editor of the *Indiana Medical Journal*, and contributed many editorials, reports of cases and papers that attracted attention in his profession. One of his earliest themes was on "Spontaneous Evolution," which appeared in the *Western Journal of Medicine* in

C. E. Wright.

March, 1868. His reports appeared in the Transactions of the Indiana State Medical Society for a period reaching back over twenty-one years. He read papers at the annual meetings of the Association of Superintendents of American Institutions for the Care of the Insane, and the same were published and attracted, like all his contributions to medical science, no small share of attention. Dr. Wright was the oldest member of the faculty of the Indiana Medical College in continuous service. He was at first Demonstrator of Anatomy, and afterward filled the chair of Diseases of the Eye, Ear and Nasal Cavities; and then of *Materia Medica* and Therapeutics until 1887. He was Professor of Diseases of Children until 1889, and was Professor of Diseases of the Mind and Nervous Systems from

the latter year until the time of his death. He had at various times filled the office of secretary and president of the same institution. Dr. Wright was a valuable member of the Indiana State Medical Society and of the Marion County Medical Society, and was a delegate to the American Medical Association at its last meeting in Washington, D. C. He was for four years Physician to the Indiana Institute for the education of the Blind; Surgeon-General with rank of Colonel on Governor Williams' staff, and also on Governor I. P. Gray's staff during the latter's term of office; was for two years president of the Indianapolis Board of Health, in 1875 and 1876; was president of the Indiana Medico-Legal Fraternity, in 1877 and 1878. He served as a member of the staff to St. John's Home for Invalids, and as Chief of Staff of St. Vincent's Hospital, as well as a member of the Board of United States Examining Surgeons for the Pension Bureau under President Cleveland's first administration, and filled other posts equally responsible. He was one of the vice-presidents of the New York Medico-Legal Society. He was prominent in many circles, and was a thirty-third degree member of the Masonic Order. In none of the many positions which Dr. Wright was called to fill was there a better field for his work and capacity as an executive than the one as Superintendent of the Central Hospital for Insane. He was appointed by the Board of Trustees to take control of this institution in 1888, and was in charge of the same at the time of his death. He was the head of it not only in name but in fact, and on him rested the responsibility for the entire internal management. The annual expenditures averaged over a quarter of a million dollars. The value of the property in round numbers is over \$1,600,000. The number of patients reached a total of 1,557. The per capita cost of keeping patients, which in the present decade has risen as high as \$194 per annum, was reduced under Dr. Wright's efficient superintendency to \$159.96, the lowest figure reached at any time for many years, and it is said that the patients were as well if not better cared for and fed than ever before. Dr. Wright's administration was humane, enlightened and progressive. The hospital was not conducted on the idea that it was a place merely in which to restrain people, but the great idea was to cure them. The old system of repression and physical restraint as a system was done away with. The plan of giving convalescents full liberty and open doors was put into successful practice, and it is but one of the instances of many in the same class where wise and healthful changes were successfully carried out. "Dr. Wright was truly eminent in his profession, an active, skilled practitioner, an able teacher, and a beloved physician. His clientèle embraced a large class of devoted patrons to whom he was endeared and attached by one common love. As a teacher of medicine he was scholarly, forceful, pleasant and instructive, beloved by his pupils and respected by his confreres. He faithfully performed the duties of his position under physical embarrassments which would have incapacitated one less devoted and earnest in his work." In November, 1870 he married Anna, daughter of Emanuel Haugh, Esq., of Indianapolis, who with a son and daughter, Charles Wright and Mrs. Edmund Gall, sur-

vive him. Appropriate memorials relative to his death were adopted by the trustees of the Indiana Central Hospital for the Insane, the Faculty of the Indiana Medical College, the Marion County Medical Society, and other organizations in his native city. He was buried in Crown Hill Cemetery. The funeral ceremonies, witnessed by the medical fraternity and a large assembly of friends, were in charge of the exalted degree Masons, with whom for many years Dr. Wright was affiliated with the closest and most affectionate relationship.

WRIGHT, Joel Williston, of New York City, was born in Sullivan, N. H., July 30, 1840. He studied medicine with Drs. T. S. Wright and H. M. Lilly of Fond du Lac, Wis., and with Dr. E. H. Parker, of Poughkeepsie, N. Y. During his pupilage he served one year as Assistant Superintendent of the State Lunatic Asylum at Auburn, N. Y. He attended lectures at the Geneva Medical College, and at the College of Physicians and Surgeons, New York City, and received his medical degree from the latter institution in 1866. He first settled at Poughkeepsie, but in 1867 established himself in New York, where he has since remained. In 1868 Dr. Wright was married to Miss Sarah H. Lockwood, of Brooklyn, N. Y. He has held the position of Surgeon to the Northern Dispensary; Demonstrator of Anatomy in the Woman's College of the New York Infirmary; Lecturer on Surgical Dressings and Minor Surgery in the same institution, and on the same subject in the Medical Department of the University of the City of New York. In July, 1876, he was appointed Lecturer on Obstetrics and Diseases of Women and Children in the last named school, and in January, 1877, was made full Professor of this branch, and retained the chair until 1879. He served as Professor of Surgery in the University of the City of New York from 1879 to 1889, and was Professor of Surgery in the University of Vermont from 1884 to 1889. He was Visiting Surgeon to Bellevue Hospital from 1881 to 1889, and to the Mary Fletcher Hospital, Burlington, Vt., from 1884 to 1889. Dr. Wright is now Consulting Surgeon to Gouverneur Hospital; *Emeritus* Professor of Surgery in the Medical Department of the University of Vermont; member of the New York Academy of Medicine, New York Pathological Society, and the New York County Medical Society, and also of the New York Physicians' Mutual Aid Association.

WRIGHT, Thomas Lee, of Bellefontaine, Ohio, was born at Windham, in the same State, August 7, 1825. He was educated at the Miami University and at the Ohio Medical College, Cincinnati, graduating M. D. from the latter institution in 1846. During the same year he was married to Lucinda Lord, daughter of A. H. Lord, of Bellefontaine. Dr. Wright soon afterward established himself in Kansas City, Mo., where he practiced chiefly among the Wyandotte Indians, located at that time near that city. In 1854 he removed to the city of his present residence, where he has since been engaged in the general practice of his profession. During the session of 1855-56 he delivered a course of lectures upon the Theory and Practice of Medicine in the Wesleyan University. He has been an active member of the Ohio State Medical Society, and in 1877 was president of the Logan County Medical Society in his native State. He has made valuable contributions to

medical literature, and among his published writings may be mentioned: "Notes on the Theory of Human Existence," 1848; "Disquisition on the Ancient History of Medicine," 1860; "Inquiry into the Value of Testimony Respecting Facts as they Appear to a Mind Partly Conscious," Transactions of the Ohio Medical Society, 1860; "The Deterioration of the Race upon the Western Continent," 1874; and a paper upon "Transcendental Medicine," 1878. He was formerly editor of the *Ohio Censor*, a political journal, published at Bellefontaine. (Dr. Wright died June, 1893.)

WYCKOFF, Cornelius C., of Buffalo, N. Y., was born at Romulus, Seneca county, New York, August 5, 1822. Having received his preparatory education at Wesleyan Seminary, he studied medicine and entered the Buffalo Medical College, and was graduated M. D. at that institution in 1848. In the same year he established himself in the city of his present residence, where he has since been engaged in the successful practice of medicine and surgery. Dr. Wyckoff has been an active member of the American Association and of the New York State Medical Society, and has repeatedly served as a member of the Board of Censors. He was president of the Erie County Medical Society in 1864, and of the Buffalo Medical Association in 1858, and also in 1876. He was appointed Attending Physician to the Buffalo General Hospital in 1859, and has served for many years in that capacity.

WYKOFF, James H., of Princeton, N. J., was born near Long Branch, March 16, 1832. He was educated at West Nottingham Academy, Maryland, and the College of New Jersey. He then studied medicine, and entered the Medical Department of the University of New York, from which he was graduated M. D. in 1854. He first established himself at Hightstown, in his native State, where he remained about five years, and in 1859 removed to the city of his present residence, where he has since been successfully engaged in the practice of general medicine and surgery. Dr. Wykoff has been an active member of numerous medical organizations, including the Academy of Medicine of Newark and the New Jersey State Medical Society, as well as the Medico-Legal Society of New York.

WYMAN, Morrill, of Cambridge, Mass., was graduated A. B. from Harvard University in 1833, and received the degree of M. D. from the medical department of the same institution in 1837. He has been an active member of the Massachusetts Medical Society, to which he was admitted soon after he entered upon the duties of his profession. He is also a member of the Cambridge Society for Medical Improvement and of the American Academy of Arts and Sciences. He has made important contributions to medical literature. His published writings include: "A Treatise on Ventilation," 1846, and "Autumnal Catarrh," New York, 1872, and Boston, 1876.

WYNNE, Thomas, of Philadelphia, Pa., was born in Wales, about 1625, and died in 1692. In an interesting article, written by Wharton Dickinson, Esq., one of Dr. Wynne's descendants (*Magazine of American History*), it is stated that the subject of this sketch was born in the town of Caer-Wys, Flintshire, North Wales, and that he was the son of Peter Wynne, who was fifth son of Sir John Wynne, of Gwydis, and Sydney,

daughter of Sir William Gerard, Chancellor of Ireland. Dr. Wynne was sent to London in 1650, and entered the Royal College of Surgeons, and was subsequently licensed as a surgeon and physician, and practiced on the Surrey side of the Thames. He married Mary Battall. Dr. Carson writes, that when Penn made up his company of emigrants, which, under his own guidance, landed on the shores of the Delaware, in 1682, he was not unmindful of the medical wants of his incipient colony. Several well-educated members of the profession united their destiny with that of the party who arrived that year. It is known that one at least of these physicians was on board the proprietary's own vessel, the *Welcome*, where his services were called into requisition on the voyage from England, as small-pox broke out among the crew and passengers shortly after their embarkation. The attention of a practitioner of the healing art must have been beneficial to those who were attacked by the disease, and, under such appalling circumstances, his presence must have been a source of encouragement and comfort to all who constituted the adventurous company. The individual referred to as having been on board the *Welcome* was *Thomas Wynne*. In a recent address before the Medical Association of the Pennsylvania Hospital, upon the early physicians of Philadelphia, prior to the year 1700, by Dr. J. F. Levick, the author states in the preface, "That all of the Philadelphia physicians of that time were natives of Wales—a very significant fact, inasmuch as the Welsh immigrants constituted but a part of the population of the new city. It appears from the records that the sphere of operation in the immediate line of medical practice was too limited for all the gentlemen who had arrived, and as they were men of the highest order of intelligence and acquirement, their talents were also turned to account in organizing the settlement. Dr. Wynne served as speaker of the first Provincial Assembly of Pennsylvania. His death occurred ten years after his arrival in this country. During this time he was actively employed in political and professional affairs. It is said that Penn was warmly attached to him, and gave the name of Wynne street to one of the principal thoroughfares of the new city (Philadelphia), which it retained until the other parallel streets had been called after the forest trees, when, for the sake of uniformity, it took the name of Chestnut street. Dr. Wynne left a son-in-law, Dr. Edward Jones, also one of the immigrants of 1682. This physician settled near Philadelphia and practiced his profession with considerable reputation, and was the father of Dr. John Jones, the most renowned and skillful surgeon of the Revolutionary War.

YALE, Leroy Milton, of New York City, was born at Martha's Vineyard, Mass., February 12, 1841. His ancestry were among the early settlers of Connecticut and Massachusetts, who came to this country about 1636. He received his preliminary education at the Meriden Academy, New Hampshire, and at Columbia College, New York City. He studied medicine in Bellevue Hospital Medical College, and received the degree of M. D. from that institution in 1866. Immediately after he was graduated he established himself in New York City, where he has since remained, engaged in a

successful general practice of his profession. He is a member of the New York County Medical Society and of the New York Academy of Medicine. His contributions to medical science consist of articles in medical journals, his principal literary work being editorial and reviewing. He was formerly Lecturer on Obstetrics in the University of Vermont, and Adjunct Lecturer on Orthopedic Surgery in Bellevue Hospital Medical College, and was connected with that institution in various other positions since 1870. He was also Surgeon to Charity and Presbyterian Hospitals, N.Y. City.

YANDELL, Lunsford Pitts, of Louisville, Ky., son of Dr. Wilson Yandell, of Rutherford county, Tenn., and of Elizabeth (Pitts) Yandell, was born near Hartsville, Sumner county, Tenn., July 4, 1805, and died February 4, 1878. His classical education was received in Murfreesboro, and his medical education at Transylvania University, Lexington, Ky., and also at the University of Maryland, from which he graduated in 1825. He settled in Murfreesboro in 1826, but removed to Nashville in 1830, to Lexington, Ky., in 1831, and to Louisville in 1837. He was a member of the Lexington Medical Society; of the Medical Society of Tennessee, of the Academy of Sciences, Boston; of the Philadelphia Academy of Natural Sciences; president of the Louisville, Lexington, and Kentucky Medical Societies; and of the Louisville College of Physicians and Surgeons; and member of the American Medical Association. He was for six years editor of the *Transylvania Journal of Medicine*, also editor of the *Western Journal of Medicine and Surgery* from 1840 to 1856; and besides editorial articles, contributed many papers to their pages, among them a prize essay on "Fever." He was the author of a report on "The Medical Sciences" to the American Medical Association, 1849; and one on "American Medical Literature" to the same in 1873; also of an address on the last subject before the International Medical Congress held in Philadelphia in 1876. In 1831 he was elected Professor of Chemistry in Transylvania University; in 1837 to the same chair in the Medical Institute of Louisville; to the chair of Physiology and Pathological Anatomy in the University of Louisville in 1849; and to the chair of the Theory and Practice of Medicine in the Memphis Medical College in 1859. Dr. Yandell was long regarded as one of the most eminent physicians of the South. He was the father of the present Prof. David W. Yandell, the well known surgeon; editor of the *American Practitioner*; ex-President of the American Medical and American Surgical Associations, and Medical Director in the Confederate army during the Civil War.

YOUNG, Irene D., of Bordentown, N. J., was born May 12, 1827, at Rockland, Del. He was educated at Newark, and received the degree of M. D. from the Pennsylvania Medical College, Philadelphia, in 1848. He soon after became Resident Physician of Wills Hospital, and for a short time Resident Physician of the Pennsylvania Hospital. In 1849 Dr. Young established himself in the city of his present residence, where he has since devoted special attention to the treatment of the eye and ear, in which field he has had excellent success. He is an active member of the Burlington County Medical Society, and of the New Jersey State Medical Society.

APPENDIX.

ABBOTT, Frank W., of Buffalo, N. Y., was born at Sandoway, Aracan, Burmah, December 24, 1841. His father, at the time of his birth, was a missionary to the East Indies. Young Abbott was educated at Falley Seminary, Fulton, N. Y., and at the University of Rochester, in the same State. He studied medicine in the Medical Department of the University of Buffalo, and was graduated M. D. at that institution in 1866. Upon receiving his medical degree he established himself in the city of his present residence, where he has since been engaged in the special treatment of diseases of the eye and ear, in which field of practice he has had excellent success. Dr. Abbott is an active member of the American Otological Society; of the Medical Society of the County of Erie; and of the Buffalo City Medical Society. He has translated the "Recent Progress in Theory of Vision" (Helmholtz), and has contributed to medical journals important articles relating to ophthalmic and aural diseases.

ANDERSON, Washington F., of Salt Lake City, Utah, was born in Williamsburgh, Va., January 6, 1823. He is of English and Scotch-Irish ancestry. His preliminary education was received at Sumterville, Ala., and at the University of Virginia. He studied medicine under the preceptorship of Dr. Leroy H. Anderson, of his native State, after which he entered the University of Maryland, Baltimore, Md., and received his medical degree from that institution in the spring of 1844. He had been an attendant of the clinics of Baltimore Almshouse Hospital for three years prior to his graduation, and after this he established himself in general practice at Yorktown, Va., where he remained two years. In 1846 he removed to the Pacific Coast and practiced his profession in Yolo county, Cal., for five years. He finally located in Salt Lake City, where he has been engaged in a successful practice of general medicine and surgery for thirty-seven years, and has devoted special attention to lithotomy and ovariectomy. From 1857 to 1867 Dr. Anderson served as Surgeon of the Utah Militia, with rank of Lieutenant-Colonel. He was a member of the Utah Legislature in 1860-61, and in 1876 he was elected president of the Salt Lake Medical Society.

ARNOLD, Edmund Samuel Foster, of Newport, R. I., was born in Bermondsey, London, England, January 30, 1820. He is the second son of the late William Rowland Arnold, for thirty years Accountant-General of the South Sea Company, London, and for forty years secretary and accountant of Guy's Hospital, London; also by descent of the elder branch of the Arnolds of Lowestoffe, Suffolk, England. He was educated first in a private school, then at the Moravian Institution at Neuwied, on the Rhine; entered Guy's Hospital, London, as a house pupil, in 1835; remained there continuously till 1844, with the exception of session 1837-38, when he attended the anatomical and physiological lectures of Mayer and Weber, at the University of Bonn. In 1842 he was licensed medical practitioner at Apothecaries' Hall, London, and in 1844 made

a member of the Royal College of Surgeons of England (the two constituting the fully qualified medical practitioner of England). In 1848 he received the degree M. D. from the Jefferson Medical College in Philadelphia. He began his professional career as an assistant to a large practice in the suburbs of London. In 1847 he came to the United States; from 1848 to 1854 was settled in New York City; from 1854 to 1872 at Yonkers, on the Hudson, when he retired from active practice, by reason of ill health, and took up his residence in Newport, R. I. Among the cases which he has attended are mentioned two remarkable ones of arm and shoulder presentation, delivered spontaneously by the head, and a case of compound dislocation of ankle-joint, both of which were published in *American Medical Times*, in 1861. He is a Fellow of the New York Academy of Medicine, elected 1861; member of the American Medical Association; permanent member of the New York State Medical Society, from which he was a delegate to New Jersey in 1864, to Pennsylvania in 1865, to Massachusetts in 1866, to Connecticut in 1868; also more than once to the American Medical Association; member of the Westchester County Medical Society, of which he was president, 1867-68; member of the New York Medical Journal Society, of which he has been a trustee; corresponding member of the New York Medico-Legal Society, and was active in the establishment of St. John's Riverside Hospital, Yonkers, of which he was the first Physician. He has contributed various articles to the *American Medical Times*, among them "Letter of a Country Surgeon," favoring the establishment of a life-saving institution to be incorporated with the railroad system. Subsequently, after consultation with Dr. Valentine Mott as to the necessity of the movement, published the following papers: "On Medical Provision for Railroads, as a Humanitarian Measure, and as a Source of Economy to the Railroads," and "Medical Provision for Railroads," read before the surgical section of the Academy of Medicine, New York, 1862; "On Opium in Shock and Reaction," before the same section, New York Academy, enlarged and published in *Pennsylvania State Medical Transactions*, 1865. From 1862 to 1868 he was Health Officer of Yonkers, during the latter period merged into the New York Board of Health, and from 1865 to 1872 Physician at the Motherhouse and College of Mount St. Vincent, Sisters of Charity, of St. Vincent de Paul, Hudson River; in 1871-72 he was Surgeon of the Third Westchester Regiment, New York State Militia. In 1856 he married Eliza, daughter of Hon. James R. Whiting, then one of the Judges of the Supreme Court, State of New York.

BANCROFT, Frederick Jones, of Denver, Col., was born May 25, 1834, at Enfield, Conn. A biographer in a recent number of the *Magazine of Western History*, referring to the ancestry, early training, and professional achievements of the subject of this sketch, writes as follows: He is descended on the paternal side from the Bancrofts and the Heaths, and on the

maternal side from the Wolcotts and Bissells, all well known early settlers of New England. He was educated at Westfield Academy, Mass., and at Charlotteville Seminary, N. Y. His medical education was acquired at the University of Buffalo, from which institution he was graduated in 1861. His education was secured through his own efforts. Soon after receiving his medical degree he established himself at Blakeley, Penn., where he remained engaged in the general practice of his profession for six months, and then entered the Union army. In October, 1861, he was detailed by Surgeon-General Smith, of Pennsylvania, to take special charge of the "Church Hospital" in Harrisburg, "with power of officer in command." When the regiments left the city for the field, early in the spring of 1862, he was ordered to join the Seventy-sixth Pennsylvania Volunteers, stationed at Hilton Head. In May, he was ordered to take medical direction of the forces at Pinckney Island, Seabrooks, and Elliott's Plantations, South Carolina, and was present at the bombardment of Fort Pulaski and the attack on Charleston. In September, 1862, the yellow fever, which destroyed Gen. Ormsby Mitchell, and other prominent officers in the Department of the South, also laid low many of the Seventh New Hampshire Volunteers, and he was sent to New York City in charge of a detachment of this regiment on the steamer Delaware. He then proceeded to Philadelphia, where he remained as Examining Surgeon of recruits until the early spring of 1863, when he was ordered to fit up a hospital for the accommodation of Confederate prisoners at Fort Delaware, Delaware Bay; after which he rejoined his regiment, the Third Pennsylvania Artillery, at Camp Hamilton, Virginia. In June, 1863, he was assigned to duty as Post Surgeon of Fortress Monroe, where he remained until December, 1865, when, the war having closed, he left the United States Military Service. In the autumn before leaving the army he, with two other commissioned officers, was detailed by the Secretary of War to investigate the management of all hospitals, past and present, near Fortress Monroe. After returning to Philadelphia he attended the lectures at the University of Pennsylvania in 1865-66, and on the first day of the following June he settled in Denver, Col., where he has since remained engaged in the general practice of medicine and surgery, but devoting special attention to the latter. Among his notable surgical cases may be mentioned that of a girl ten years of age who was run over by a locomotive engine, in which case he removed the left arm two inches below the elbow, the right arm three inches below the shoulder joint, and the left leg at the junction of the middle and upper third of the tibia, with the result of a rapid recovery. Dr. Bancroft has been associated with many enterprises and organizations. He is a member of the Denver Medical Society, of which he was president in 1868; also member of the Colorado Medical Society, of which he was President in 1879; a member of the American Public Health Association; member of the American Medical Association, and a Vice-President of the National Association of Railway Surgeons. From 1868 to 1885 he held the office of Examining Surgeon for the United States Pension Bureau. He was also City Physician of Denver from 1872 to

1879. In 1876 Governor Routt appointed Dr. Bancroft a member of the first State Board of Health of Colorado, and he was made president of that organization. In his inaugural address he treated chiefly of sanitary regulations; intemperate use of alcoholic liquors; over-taxation of strength, and interest in the education of the young, with reference to commodious, cheerful and well ventilated and heated school buildings. His earnest remarks upon the latter subject, doubtless, had something to do primarily with the present efficient school system and school buildings of Denver. Referring in his address to the effect of altitude upon children, Dr. Bancroft said: "This country has not been settled long enough to yet allow us to verify with facts the exact extent of mental and physical growth of those born here or brought here in early childhood, except as regards the Indian. Intellectually, the Ute, mountain Indian, is equal to the average of his race; the Sioux, prairie Indian, is bold, ferocious and cunning, occasionally more than a match for the white man in war and in making treaties. Physically, the Ute is short and possesses a deep and broad chest, giving great capacity to the vital organs. The Sioux is tall and athletic; no better specimens physically can be found in the *genus homo* than among the Sioux. The practical bearing of this on our subject is to ascertain in what localities and at what altitude the growing child may gain the best physical and mental development. If high altitude increases the breathing capacity and strength of the heart, and the plains produce the tall athletic men, it is not improbable that places may be found in Colorado where growing children may attain the best possible health and longevity, where the majority of males, who attain adult years, may have a weight of 180 pounds, and a chest girth of forty inches, with height of six feet, which measurements approach as near to physical perfection as is often attained. This added to the exhilarating effect of the atmosphere, which induces activity, and the brilliant and ever changing sky scenery, the magnificent views amidst our grand mountains and plains, which are to most nature's ennobling, refining and Christianizing, would render such places of national importance as sources of physical and intellectual strength. For in view of the great number of children growing up in large cities, too delicate to improve their privileges, or to take any worthy part in the battle of life, it seems to me that no one boon would be a greater national blessing than a place where superior educational advantages can be found combined with certainty of thorough physical development." Soon after Dr. Bancroft's arrival at Denver he became Surgeon of the Ben Holladay Stage Lines, which radiated from that city between 1860 and 1870. From 1870 to 1876 he was Surgeon of the Kansas Pacific and Denver Pacific Railroads; and Surgeon of the Denver and Rio Grande from its construction in 1870 till 1886. As chief surgeon of this important road he organized a medical service which was described in the *American Railway Journal* of January, 1886, as the most efficient in the United States. The plans and regulations for the hospital fund are exceedingly careful and comprehensive, and affording protection from all outside infringements; and reserving the surplus moneys

for pensioning disabled employes, and the needy families of the deceased contributors to the fund. A peculiar feature of the service is the provision of a medicine chest, to be the charge of the conductor of every train; this contains laudanum, ammonia mixture, styptic collodium, bicarbonate of soda, styptic cotton, needles on chamois, saddlers' silk, wax, sponges, adhesive plaster bandages, lint, and scissors. Printed directions are added, illustrated with wood-cuts. From 1874 to 1876 Dr. Bancroft was president of the Denver Board of Education. He was for years a member of the standing committee of the missionary jurisdiction of Colorado, and on the board of trustees of Wolfe Hall, of Jarvis Hall, and St. Luke's Hospital. Dr. Bancroft was president of the Agricultural Ditch Company for the first ten years after its organization, and has a large and valuable ranch under irrigation by waters supplied by its construction. He is medical referee for the New York Life Insurance Company, for the New York Mutual Life Insurance Company, for the Manhattan Life Insurance Company, and for the Mutual Benefit Life Insurance Company of New Jersey. Dr. Bancroft has been president of the Colorado Historical and Natural History Society since its organization in 1877, and has taken an incessant interest in the objects of that association. A very successful meeting was held in its behalf, February 5, 1885, on which occasion Dr. Bancroft delivered an address from which the following extracts are presented: "We desire to secure a full collection of the fossils entombed in our mountains, so many of which, both animal and vegetable, enrich eastern and foreign museums, exciting wonder and stimulating scientific research. We desire to secure pre-historic relics found among the cliff and cave dwellings of the southern portion of the State, many of which, as bones, pottery, household utensils, weapons and parts of garments, have already been carried outside of our borders. We ought to have specimens from noted mines, with maps and histories thereof, and the names of those notably enriched by them. We should have well preserved specimens of all the animals, birds, fishes, reptiles, insects, plants, flowers and cereals to be found in the State. We should have on file reports of each State institution, private and public educational institutions, charitable works, as well as those relating to cattle, agricultural, mining and manufacturing industries; also files of the leading newspapers, a copy of each book written in Colorado, maps published at various times, photographs of notable edifices and our wonderful scenery, portraits and biographies of those prominent in the early history of the State, such as Kit Carson, Pike, Long, and Fremont; the early governors, judges, bishops and editors." This meeting had important results, as many of the leading citizens of Colorado became active members and took great interest in carrying out the aims and plans of the organization. Dr. Bancroft married, June 20, 1871, the daughter of Mr. George A. Jarvis, of Brooklyn, N. Y. Their residence upon Grant Avenue is one of the largest and most beautiful in Denver. Mrs. Bancroft shares her husband's interest in pre-historic races and relics and his desire to have the Mancos Canon with its historical treasures preserved by the government for a national park. Dr. Bancroft's med-

ical writings relate chiefly to the climate of Colorado and to matters of hygiene.

BARCLAY, Joseph B., of Longmont, Col., was born in Northampton County, Pa., near Easton, March 19, 1819. At the age of seventeen he entered the office of his uncle, John W. Jenks, M. D., a graduate of the Medical Department of the University of Pennsylvania, and an excellent physician and surgeon, where he remained under his tuition two years, and entering Jefferson Medical College, Philadelphia, Pa., received his medical degree, in 1841, since which time he has been actively engaged in the practice of his profession, for almost half a century. When the thundering of rebel cannon was heard battering the walls of Fort Sumter, he was quietly practicing his profession in Brownsville, Pa., on the banks of the Monongahela. His eldest son, John Morgan Barclay, a patriotic youth of seventeen years of age, when the drums beat to arms, enlisted in the Eighth Pennsylvania Reserve Corps, for three years or during the war, as a private soldier; although so young he was not sick or home on furlough or off duty one hour; he was killed in action in front of Richmond, Va., at Gaines' Mill, June 27, 1862. The doctor having a young family to care for, deemed it his duty to remain at home, and aid the cause of the Union all in his power by encouraging enlistments. As the war progressed, more soldiers were called into the field, requiring surgeons; he accordingly tendered his services to the government. He was commissioned assistant surgeon September 12, 1864, by that loyal war governor, Andrew G. Curtin. He immediately reported for duty at Harrisburg, Pa., and was assigned by the Surgeon-General of the State to the 209th Regiment Pennsylvania Volunteer Infantry, which in a few days was marched by rail to Baltimore, took shipping on an old rickety vessel, and sailed down the Chesapeake Bay and up the James to City Point, landing there in safety. During the voyage the vessel, which was hardly seaworthy, with one thousand men on board, encountered a severe gale, but it weathered the storm and arrived at its destination without an accident. Whilst the storm was raging without, a curious incident occurred in the cabin within. Many of the boys were seated around the tables busily engaged in a game of cards. It was Sunday night; the raging of the elements and the plunging of the old ship evidently alarmed the card-players; soon the tables were vacated and the cards thrown overboard, strewing the bay! The boys had no notion of going to the bottom with a deck of cards in their hands. "Arriving at City Point, the regiment was sent over to Bermuda Hundreds, in the Army of the James, under the command of Major-General B. F. Butler. Here, from swampy ground and an unhealthy location of the camp, considerable sickness broke out, such as diarrhea, dysentery, intermittent and typho-malarial fever. He treated successfully most of these cases in quarters, as the boys dreaded being sent to the hospital. Here for a brief period he had medical charge of what was left of the Twelfth New Hampshire Regiment." In a short time his regiment was transferred to the Army of the Potomac and assigned to a position in front of Petersburg, at Mead's Station, about half a mile east of Fort Steadman. During the fall and winter of 1864-65 his regi-

ment participated in military movements along the Weldon Railroad, Hatcher's Run and Stony Creek, Virginia. In all these movements and while at Mead's Station more or less of rheumatism, fevers, ague, diarrhea, and colds from exposure and the fatigue of the winter raids prevailed. The great object kept steadily in view was to prevent sickness by proper sanitary and hygienic regulations, such as good warm woolen clothing, good food properly cooked, cleanliness of person and comfortable quarters, fresh earth thrown into the sinks every day to cover up human excrements, and to keep the men in good fighting condition; the result was not over two or three deaths in the regiment after being sent to hospital, and none while in quarters. "On the morning of March 23, 1865, before daylight, General Lee ordered an assault on Fort Steadman, being informed that there were but two or three Pennsylvania regiments supporting it, his object being to cut our lines at this point and capture immense military stores at City Point, and thus bag Grant's forces encircling Petersburg. Accordingly an entire brigade of rebels came crossing the narrow space separating the lines of the belligerents, and taking the Federal troops by surprise were in a few minutes pouring into Fort Steadman by hundreds, and as soon as they had captured it turned the guns of the fort against the Union forces. The cheering of the rebels soon notified the regiment, which lay half a mile east of the fort, that they had possession, and by daylight they had advanced their lines within forty yards of his camp. Dr. Barclay relates that a curious incident occurred here. The morning being foggy, a young rebel with his musket in his hands strayed into the Federal camp supposing it to be his own. A fifer who had not gone out with the regiment presented his fife at him and ordered him to ground arms and surrender, which he did; being considerable crest-fallen when he discovered that the fifer was totally unarmed. Dr. Barclay's regiment was soon under arms and by daylight the action began by making a charge on the rebel lines securely posted behind our inner earthworks. The regiment charged at double quick time to within thirty yards of the rebel line and suddenly dropped into a ditch six feet deep, which they knew to be there, completely hidden from view. In this charge but one man was lost, Lieutenant Jones, who, in the exultation of the moment from some unaccountable impulse, rashly raised himself upon the embankment waving his sword. He was immediately shot dead. The cross fire from the adjacent forts and fifty pieces of artillery began playing upon the enemy and sweeping the open narrow space between Fort Steadman and the enemies' lines with a perfect hail-storm of shot and shell, so that two thousand surrendered as prisoners of war, rather than run the risk of getting back in safety to their own lines. The action was over by 11 o'clock A. M. It lasted about five hours. Surgeon Barclay and his assistants were on the field of battle, administering to the wants of the wounded, at times being obliged to lie flat on the ground to avoid the incessant storm of shot and shell from the Union batteries. This brilliant action made General Hartranft a major-general. In the fall of 1864 and spring of 1865, his regiment not only operated in front of Peters-

burgh but along the Weldon Railroad, Hatcher's Run, and a long and disagreeable night march to Stony River, Va., to cover the retreat of the Second Army Corps in their raid, tearing up Virginia railroads and doing mischief to the enemy in general. On April 2, 1865, the final assault was made on the enemy's works in front of Petersburg. In this assault his regiment, being part of the Ninth Army Corps, did their duty. On Saturday night, April 1st, the regiment marched out into Fort Hell (Rice), whilst a fierce cannonading began, extending along the entire line, from Richmond to Five Forks, a distance of thirty miles, or more, making the heavens lurid with bursting shells; just before daylight the cannonading ceased, and the assault of the Ninth Corps was made at 4 o'clock A. M., and by 6 o'clock had carried two lines of outer works. Joining on the left were the Sixth, Fifth, and Second Corps, and Sheridan's Cavalry at Five Forks, like a gate, the Ninth Corps being the hinge, the other corps swinging round scooping in everything in their way. The whole of that memorable Sunday the conflict raged fiercely, the surgeon (Barclay) in charge caring for the wounded on the field of battle, and such as could not be properly treated there were sent in an ambulance to the hospital. Here was lost Captain McCullough, a brave officer, who was mortally wounded by a shell tearing away his thigh; he lived but a few hours. Major Ritchie was also wounded in the groin. Night closed the contest for that day, and the soldiers lay on their arms that night, expecting to renew the conflict next morning. About two o'clock A. M., of April 3d, a fire was seen in the direction of Petersburg. It was soon discovered that two large tobacco warehouses had been fired by the rebels, and the Appomattox bridge burned after crossing in full retreat. They withdrew so silently that it was not known that they had gone until the next morning. The first division of the Ninth Corps was detailed to collect and bury the dead, while the second and third divisions marched in triumph through the city of Petersburg, the drums beating and the United States flags flying from the public buildings. The exultations of that hour amply paid the loyal soldiers for all the sacrifices made to capture that city. A provost guard was soon established and the city placed under military rule. On the evening of April 3d, his regiment and the Ninth Army Corps were ordered to take their march down the South-Side Railroad, Virginia, in order to head off General Lee's army from forming a junction with General Joe Johnson, in North Carolina. They marched by night and by day until they reached Notaway Court-House, where the forces encamped for two weeks, or until the final surrender of Lee at Appomattox." On May 31, 1865, after participating in the grand review in Washington, Surgeon Barclay with his regiment was mustered out of the military service of the United States, near Alexandria, Va., and honorably discharged. From the time he was mustered in until he was mustered out he was, like his son, never absent from his post of duty or absent on furlough or sick an hour. Proceeding to Harrisburg, Pa., he was paid off partly in ten-cent "shin plasters," sufficient to fill both pockets of a large pair of saddle bags; he then returned to Washington City, settled up his accounts

with the government, and returned to his family in Brownsville, Pa., where he resumed the practice of medicine and general surgery. In the fall of 1870 he removed to Greeley, Colorado, and finally settled on a farm near Longmont, Boulder county, in that State.

BATMAN, William F., of Ladoga, Ind., was born near Bainbridge, Putnam county, Indiana, October 22, 1858. He is of English descent, and the son of Elijah Batman, a prominent farmer and stock dealer in the western part of the State. The subject of this sketch divided his time between laboring on his father's farm and attending school until early manhood, by which means he acquired habits of industry, a good physique and an academic education. He then began the study of medicine at Bainbridge, in his native county, under the preceptorship of Dr. R. F. Stone, in whose office he remained three years. He attended his first course of lectures at Rush Medical College, Chicago, in 1878-79, hearing the surgical instruction of such noted men as Gunn and Parkes, and taking a special course in chemistry under Prof. Haines. The following year he entered the Jefferson Medical College, Philadelphia, where he finished his medical education under the teaching of Gross, Da Costa and Bartholow, and received his medical degree from that institution March 16, 1880. Dr. Batman, soon after graduation, established himself at Carpentersville, near his home, and engaged in the general practice of his profession for three years. In 1883 he went to New York City and took special courses of instruction in physical diagnosis under Prof. Edward Janeway, in gynecology under T. Gaillard Thomas, attended the clinical lectures of Loomis and Otis, and also heard the last course of lectures delivered by the late Prof. Austin Flint. On his return to Indiana he resumed the general practice of medicine and surgery at Roachdale, a town a few miles distant from his former location, where he remained six years and then established himself in the town of his present residence, in an adjoining county. In all the towns in which Dr. Batman has practiced his ability as physician and surgeon has been well recognized, and his success has been extraordinary. Soon after establishing himself at Carpentersville he married Miss Ida E. Harris, daughter of Dr. W. C. Harris, an old and popular physician of that village, and with whom he was for awhile associated in the practice of his profession. Dr. Batman is an active member of the Putnam County and the Indiana State Medical Societies, and was a delegate from his county to the American Medical Association at the meeting at Nashville, Tenn., in 1890. His contributions to professional literature relate to important papers and reports of cases, which have been read before the medical organizations with which he is connected. Dr. Batman is also a member of the order of Masons and of the Knights of Pythias. He is a most excellent musician, and a genial and accomplished gentleman. His ancestry were from the South, and he inherits their fondness for field sports and fine horses. Of the latter he is a judge, and usually has a valuable string of them in his stables.

BAUSMAN, A. B., of Chicago, Ill., was born at Millersville, Lancaster county, Pa., November 27, 1853, and is of German descent. He was graduated in medicine at Rush Medical College, Chicago, in 1882, and has been in

active practice in Chicago since then. He is a member of the Chicago Medical Society, the

A. B. Bausman.

Chicago Pathological Society, and the American Medical Association.

BEARDSLEY, Charles E., of Ottawa, Ohio, was born at Newark, in the same State, October 14, 1834. He is of New England ancestry. His literary and classical education was obtained at Westbedford, Ohio, and he studied medicine at Ann Arbor, Michigan, where he was graduated M. D. at the University of Michigan in 1863. He also received an *ad eundem* degree at Bellevue Hospital Medical College, New York, in 1870. During the War of the Rebellion Dr. Beardsley served as a private soldier, and in the capacity of physician in the military hospitals. On March 5, 1862, he married the daughter of Governor Davenport of Ohio. He first established himself at Ottawa, where he has since remained, and where he has been engaged, since the rebellion, in an extensive and successful general practice of his profession, but devoting special attention to surgery. During this period he has several times operated successfully on the hip-joint, and once removed the os pubis, the body and the left ramus with a perfect recovery. He is a member of the Ohio State Medical Society, the Northwest Medical Society, and is ex-President of the Putnam Medical Society. He was a delegate from his State Society to the International Medical Congress held in Philadelphia in 1876. He has contributed important articles, on operative surgery and on the practice of medicine, to various medical journals.

BECK, Carl, of New York City, was graduated in medicine at the University of Jena, Germany, in 1878. He is now Surgeon to St. Mark's Hospital and German Polyclinic, and Instructor in Clinical Surgery in the New York Post-Graduate Medical School and Hospital. Dr. Beck is a member of the New York County Medical Society, German Medical Society,

Academy of Medicine, and Society of Medical Jurisprudence, in New York.

BECK, John Crafton, of Cincinnati, Ohio, was born in Vienna, Scott county, Indiana, January 19, 1822. He is of Scottish ancestry, and a lineal descendant of those of his name who fought at the battle of Falkirk, in Scotland, in 1298. He is a great-grandson of James Beck, who immigrated to this country from Surrey, England, and settled in Prince George county, Maryland, about the beginning of last century. Dr. Beck began the study of medicine early in life, and in 1848 entered the Medical College of Ohio, and was graduated M. D. from that institution in 1849, and received his *ad eundem* degree from the Cincinnati College of Medicine and Surgery in 1863. He commenced the practice of his profession at Azalia, Indiana, afterwards removed to Newbern, and finally settled at Cadiz, in that State, and remained in the latter town thirteen years. In 1858 Dr. Beck established himself in Cincinnati, where he has since remained, engaged in a successful practice of general medicine and surgery. He was a member of the Indiana Medical Society, when a resident of that State, and also of several county and district medical societies, in many of which he held office. He has been a permanent member of the American Medical Association since 1858. Dr. Beck has made important contributions to periodical literature relating to his varied and extensive medical and surgical practice.

BECK, William Stephen, of Indianapolis, Ind., was born on a farm in Boone county

William S. Beck.

that State, November 20, 1862. He is a son of the late Palemon Beck and Susanna (Shultz) Beck, both of German descent, and was one of a large family of children. He lived on the farm, attending country schools until fifteen years of age, when he moved with his family to Trader's Point, and entered an academy at that place. He then attended the Danville Normal School one year, taking courses in the

scientific and preparatory medical departments of that institution. With Dr. J. W. Marsee as his preceptor he studied medicine, and in 1886 entered the Medical College of Indiana, from which he was graduated in 1888. While there he was president of the Sydenham Medical Society of the College, and at his graduation delivered the opening address. In April, 1888, Dr. Beck began the practice of medicine in Indianapolis, where he still remains. Besides doing a general practice, he has been Secretary of the Board of Health; Physician to the County Jail, and in October, 1892, was elected Coroner of Marion county, which office he now holds.

BEGGS, William N., of St. Louis, Missouri, was graduated M. D. at the St. Louis Medical College in 1886. He is now Instructor of Histology and Pathology, and Director of the Histological and Pathological Laboratory of that institution. He is also Consulting Pathologist to the St. Louis City and Female Hospitals. He is a member of several medical societies of St. Louis.

BERNAYS, Augustus C., of St. Louis, Missouri, was educated at the University of Heidelberg, Germany, from which institution he received his medical degree in 1876. He was also graduated in medicine at the Royal College of Surgeons, London, in 1877. He is Consulting Surgeon to the Missouri Pacific and the Wabash Railroads. He is an active member of the Mississippi Valley Medical Association, St. Louis Academy of Medicine, life member of the German Surgical Association, and was secretary of the Surgical Section of the International Medical Congress that convened at Berlin.

BIDDLE, Andrew P., of Detroit, Michigan, was graduated M. D. at the Detroit College of Medicine in 1886. He is now Lecturer on Dermatology in that institution, and Assistant Dermatologist to St. Mary's Hospital Clinic. Dr. Biddle is a member of the Detroit Medical and Library Association, and Medical Examiner and Advisor for the Manhattan Life Insurance Company.

BIGGS, Hermann M., of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1883. He is Professor of Clinical Medicine, Therapeutics and Pathological Anatomy in that institution; Pathologist and Visiting Physician to Bellevue Hospital; Consulting Pathologist to the Bethlehem, Israel and Italian Hospitals and Hospitals of the Workhouse and Almshouse of New York City. Dr. Biggs is also Chief Inspector of the Division of Pathology, Bacteriology and Disinfection in the New York City Health Department.

BLACK, G. Melville, of Denver, Colorado, was graduated M. D. from the Missouri Medical College, St. Louis, in 1887. His medical education and training were supplemented by attending the Bellevue Hospital Medical College, New York City, in 1889, and also by taking special courses at the New York Post-Graduate Medical School and Hospital, the New York Polyclinic and the Manhattan Eye and Ear Hospital during the same year. Dr. Black is now Professor of Laryngology and Rhinology in the University of Colorado Medical School. His practice is limited to Diseases of Eye, Ear, Nose and Throat. He is a member of the Denver Medical Association, the Arapahoe County and the Colorado State Medical Societies.

BLACK, John A., of Pueblo, Col., was born in 1857, in the city of Wheeling, W. Va. He received his primary education in the schools of that city. He then devoted himself to the drug business, serving an apprenticeship of six years in one of the leading pharmacies of Wheeling. He then took up the study of medicine; finished a three years' course at the Columbian University, in the City of Washington, D. C., 1882. Having graduated he journeyed westward, selecting Pueblo,

J. A. Black

Col., where he engaged in the practice of medicine and surgery. He is a member of various medical societies; is one of the visiting Physicians to St. Mary's Hospital and Sanitarium; one of the local Surgeons of the Denver and Rio Grande Railway Company, and has served a term as Coroner for the county of Pueblo.

BLANEY, James V. Z., of Chicago, Ill., was born in New Castle, Del., May 1, 1820, and died at his home in the former city December 11, 1874. "He received a good primary education and was graduated at Princeton College, New Jersey, when only eighteen years of age. He entered directly upon the study of medicine in Philadelphia, and received the degree of M. D. from the Jefferson Medical College at the age of twenty-one years. He early acquired a special fondness for the study of chemistry, and for a time acted as an assistant in the laboratory of Professor Henry. Having thus qualified himself for an active and successful professional career, he started in search of an appropriate field of labor in the Mississippi Valley, in 1842. He spent the following winter in St. Louis, and rendered some service for the medical department of Jefferson Barracks. In the summer of 1843 he traveled as far north as St. Paul, Minn., but returned to Chicago in time to receive the appointment of

Professor of Chemistry and Materia Medica in Rush Medical College, then being organized for active work. It was the position for which he was admirably fitted, and though youngest in years, he was the first in scientific attainments, and soon became the most popular lecturer in the Faculty, and by his high social qualities he won and for several years enjoyed the most lucrative professional practice of any physician in Chicago. He edited the first medical journal published in what was then called the Northwestern States, under the name of the *Illinois and Indiana Medical Journal*, and was one of the active founders of the Chicago Medical Society and the Illinois State Medical Society, in 1850. In 1870 he was elected president of the latter society, and of both he remained a warm supporter until near the close of his life. In 1861 he entered the medical department of the Volunteer Army and served through the War of the Rebellion; was medical director and inspector at Fortress Monroe nearly two years, and at the close of the war, in 1864, he was stationed at Chicago as Medical Purveyor. His duties in connection with the army were discharged with strict fidelity and honor, and caused his advancement to the rank of Lieutenant-Colonel. Not long after the close of the war, however, he resigned his position in the medical corps of the army, and resumed his duties as Professor of Chemistry in the Rush Medical College. But his health had become impaired, and in a few years he was compelled to relinquish all public professional duties, and died at the early age of fifty-six years." He was buried with Masonic honors, in which order he had attained the highest official position.

BOONE, Levi D., of Chicago, Ill., was born near Lexington, Ky., in December, 1808, and died in the former city in February, 1882. He was a distant relative of the celebrated Daniel Boone. He began the study of medicine in early life, and was graduated M. D. from the Transylvania University, in 1829, at the age of twenty-one years. He commenced practice at Edwardsville, Illinois, and subsequently removed to Hillsboro, in the same State. On the breaking out of the "Black Hawk War," in 1832, he was one of the first to enlist in that vicinity, and served as captain of a cavalry company. This having interrupted his professional practice, in 1836 he became a resident of Chicago, and first engaged in insurance business, but the great financial panic of 1837 forced him to resume the practice of his profession. He served as City Physician from 1849 to 1851, which included the seasons of epidemic cholera that prevailed with great malignancy during those years, and rendered faithful and valuable services to the public. He also served three terms as Alderman, and was elected Mayor of Chicago in 1855, as the leader of what was called in those days the "Temperance and Know-Nothing" party. "There was a strong disposition on the part of many citizens to insist on more efficient measures for restricting the amount of liquor-selling and drinking, and another large element of the population were equally opposed to the election of foreign-born citizens to office. It was the combination of these two classes of voters that elected Dr. Boone to the mayoralty as well as a majority of the aldermen. In accordance with the recommendation of the mayor an ordinance was passed raising the fee for licenses to sell liquor

from \$50 to \$300 per annum. A large proportion of the saloon keepers refused to pay the increased fee, and in a few weeks about two hundred of their number had been arrested and imprisoned. This aroused so much ill feeling and excitement, especially among the Germans, that they made an organized attempt to forcibly liberate those under arrest. Through the firmness and promptness of the mayor, fully sustained by an efficient police force, the rioters were met and dispersed with the death of but one of their number and several others wounded." The affair is known in the history of the city as the North-Side Beer Rebellion versus Dr. Boone. "At the close of his term of office Dr. Boone resumed, for a time, his professional practice, and was one of the physicians at Camp Douglas during the time that a large number of Confederate prisoners were confined there, and faithfully gave his support to the Union cause. Dr. Boone was one of the strong pillars of the Baptist Church, and one of the founders of the Chicago University." Early in his professional life he married Louise M. Smith, daughter of Judge Smith, of the Illinois Supreme Court, and became the father of eleven children, six of whom survived their parents.

BOZEMAN, Nathan, of New York City, was born in Butler county, Alabama, March 26, 1825. He studied medicine in the University of Louisville, Kentucky, and was also private pupil of Prof. S. D. Gross, then Professor of Surgery in that institution, and graduated M. D. in 1848. He was Assistant Demonstrator of Anatomy while in attendance at this school. He settled in Montgomery, in his native State, the following year, and engaged in general practice, which after some years changed into the special branch of gynecology. For a brief period in 1853 he was associated in practice with Dr. J. Marion Sims, then a resident of Montgomery. In 1854 he performed the second operation in the United States for elephantiasis of the scrotum, the morbid tissue removed weighing forty-six pounds. He also successfully performed, the same year, an original operation for vesico-vaginal fistula, complicated with laceration of the cervix uteri; made the combination of a new form of suture (button suture), instituted a plan of treatment, applicable to all classes of vesico-vaginal fistula, and especially to such 'as were complicated with excessive loss of tissue, or with cicatrized obstruction in the vagina, which had never been done before; and by these improvements demonstrated seven successive cases as cured, the highest uniform success which, at that date, had been reached by any operation. In 1856 he performed successfully an original operation for vesico-uterine fistula, distinguished by the preservation of the procreative functions; also in the following year he performed an original operation having for its object the disengagement of the cervix uteri from its morbidly fixed position in the bladder, and the closing of the co-existing vesico-utero-vaginal fistula, with preservation of all the functions; and the same year devised an original operation for laceration of the female urethra. In 1858 he visited Europe and introduced some of his operations for vesico-vaginal fistula into the hospitals of London, Edinburgh, Glasgow and Paris. Returning to this country he opened a private hospital in New Orleans

for diseases of women in 1859. At the breaking out of the Civil War he was commissioned a Surgeon in the Army of the Confederate States; was at the first battle of Manassas, and was appointed on the Medical Board for the Examination of Surgeons. He settled in New York in 1866, and opened a private hospital there for the treatment of diseases of women in 1868; about this time he perfected a self-retaining speculum and a portable operating-chair, intended to better utilize the knee-chest position, for the treatment of the more complicated cases of vesico-vaginal fistula. In 1870 he again performed successfully an original operation for utero-vaginal fistula, and in 1871 for recto-utero-vaginal fistula. Having been drawn into a controversy with Professor Gustave Simon, with regard to the priority and value of "kolpokleisis" as a means of treating vesico-vaginal fistula, and having protested against its wide and indiscriminate employment then known to exist, on the grounds of danger to life, and of unnecessary mutilation of the vagina, he visited Germany in the autumn of 1874, and made a practical test with the German professor of the range of applicability of their respective methods of operating at the Surgical Clinic of the University of Heidelberg; also with Professor Karl von Braun, in the General Hospital of Vienna, in the spring and summer of 1875; and Professors Dolbeau and Le Fort, in the Hospital Beaujon, Paris, in the winter and spring of 1876. He returned to New York in the spring of 1877. He was Attending Surgeon to the Charity Hospital, New Orleans, in 1861; Consulting Surgeon to St. Mary's Hospital, Hoboken, N. Y., in 1867; and was for many years Surgeon to St. Elizabeth's Hospital, New York City. He is a member of the American Medical Association; permanent member of the New York State Medical Society; of the New York County Medical, Pathological and Medico-Legal Societies; Fellow of the New York Academy of Medicine; corresponding member of the Boston Gynecological Society; of the Obstetrical Society of Philadelphia, and honorary member of the Obstetrical Society of Louisville. Dr. Bozeman is one of the earliest and most eminent gynecean surgeons of this country, and his success in his field of practice has gained for him a world-wide reputation. In October, 1852, he married Fannie M. Lamar, daughter of the late Rev. Benjamin B. Lamar, of Georgia; she died in 1861. In February, 1867, he married Mrs. Aurelia L. Ralston, the daughter of the late Judge Henry G. Lamar, of the same State, also since deceased.

BRAINARD, Daniel, of Chicago, Ill., was born in Westernville, Oneida county, N. Y., May 15, 1812, and died October 10, 1866. He received a fair general education; studied medicine in the office of Dr. Pope, of Rome, N. Y., a prominent surgeon, and was graduated in medicine from Jefferson Medical College, Philadelphia, in 1834, at a time when Dr. George McClellan, the founder of that institution, was in the zenith of his renown. Dr. Brainard immediately commenced the practice of his profession in Whitesboro, a village in his native county; but the next year, prompted by a just ambition for a wider field for professional work, he removed to Chicago. Hon. John Dean Catton, who had been a student of law in Rome, N. Y., while Dr. Brainard was studying medicine in the same place, but who

had already established himself in a law office in Chicago, describes the arrival of the latter in the following language: "About the first of September, 1835, Dr. Brainard rode up to my office wearing pretty seedy clothes and mounted on a little Indian pony. He reported that he was nearly out of funds, and asked my advice as to the propriety of commencing practice here. I knew him to have been an ambitious and studious young man of great firmness and ability, and I did not doubt that the three years since I had seen him had been profitably spent in acquiring a knowledge of his profession. I advised him to go to the Indian camp, where the Pottowatomies were gathered preparatory to starting for their new location west of the Mississippi River, sell his pony, take a desk, or rather a little table in my office, and put his shingle by the side of the door, promising to aid him as best I could in building up a business." He appears to have made rather slow progress during the first two years. But in 1838 a laborer on the canal, several miles from the city, received a fracture of the thigh bone, and before complete union had taken place he came to Chicago on foot, which induced so much inflammation that at a council, at which were present Drs. Brainard, Goodhue, Maxwell and Eagan, it was decided that amputation was necessary. The majority advised amputation below the trochanters, while Dr. Brainard thought it should be done at the hip-joint. Dr. Brainard was selected to operate, while Dr. Goodhue was to compress the femoral artery. The young surgeon dexterously removed the limb below the trochanters, but finding the medullary substance of the bone diseased higher up, he immediately proceeded to amputate at the hip-joint. The patient progressed favorably for one month, and the wounds were nearly healed when secondary hemorrhage occurred and proved fatal. The *post-mortem* examination revealed a large bony neoplasm attached to the pelvic bones and surrounding the femoral artery. The case attracted much attention at the time, and contributed largely towards giving the operator a leading position as a surgeon. In 1839 he visited Paris, France, and spent some time in further studies, having reference to the opening of the new medical college in Chicago, which was accomplished in December, 1843, and named in honor of Dr. Rush. In this institution Dr. Brainard became the Professor of Anatomy and Surgery. He now rapidly acquired a high reputation as a teacher and surgical operator, and for twenty years did a large surgical practice, more extensive in fact than any other in the northwest. In 1852 he visited Europe the second time, was elected an honorary member of the Surgical Society of Paris, and brought home some osteological specimens for the museum of Rush Medical College. "In the spring of 1866 he crossed the Atlantic a third time, and spent a few months on the continent, but returned home in time to commence his annual course of lectures on Surgery in Rush Medical College. The epidemic cholera had been prevailing in many places in this country during the summer of 1866, and had prevailed moderately in Chicago, from the last week in June to the middle of August, when it entirely ceased. Consequently all those citizens who had left the city early in the season to escape exposure to the dreaded disease, returned in September,

supposing all danger passed. But about the first of October the disease suddenly developed with renewed violence, and caused a thousand deaths before the end of the month. Among the early victims was Dr. Brainard, who was attacked soon after leaving the lecture-room of the college, and died in a few hours. He had been a firm believer in its direct contagiousness, and had in all previous epidemics, from 1849 to 1854, avoided as far as possible any personal contact with cases of the disease. Neither is it known that he had been directly in contact with any case before the final attack upon himself." Dr. Brainard was a close student, an original, or rather an independent thinker, and an active investigator. During the years from 1849 to 1851 he used a solution of iodine and of iodide of potassium by injection into serous sacs filled with serous fluid, including cases of ascites, hydrocephalus, spina bifida and even edema of the extremities, on the theory that changing the quality of the dropsical fluid would stop further effusion and promote absorption. He reported several cases as much improved, but the effects were generally temporary. During the same years he tried many experiments in the hope of finding some remedy that would cure cancerous growths, by destroying the cancer cells, either by local application or by injection into the blood, or by both. He prepared solutions of a dozen or more substances, such as bichloride of mercury, arsenic extract of conium, iodine and lactate of iron, into which he put pieces of cancerous tumor and noted carefully the effects upon cancerous tissue. The mercury, arsenic and iodine, being good antiseptics, preserved the tissue, while the lactic acid, with the iron, rapidly digested or dissolved it. He then injected between five and ten grains of lactate of iron, dissolved in pure water, into the sphenoid vein of a moderate-sized dog, without any injurious effects. Encouraged by this result, he began to treat all cases of cancer that came under his care by giving ordinary doses of lactate of iron by the stomach, and injecting once in from six to ten days a solution of the same into the blood through a vein in the arm, especially to destroy such cancer cells as might be diffused, while when practicable the cancerous growths were thoroughly removed by surgical operation. He reported several cases as favorably affected by the treatment, and one case of encephaloid disease of the eye-ball in an adult was reported in the *American Journal of Medical Sciences* as effectually cured. Unfortunately, however, the disease reappeared in a few months and proceeded to a fatal termination. One fact was developed during the progress of these experiments worth remembering, namely, that a given substance may be injected into the venous blood with safety; that if injected into the arteries or into the areolar tissue would produce the most destructive effects. Several times when endeavoring to inject a solution of lactate of iron into one of the veins of the arm a few drops were allowed, by mistake, to infiltrate the areolar tissue, and it invariably destroyed all such tissue, leaving a clean ulcerated surface. While in the active prosecution of these experiments a patient came under the care of Dr. Brainard with a well-formed popliteal aneurism. Instead of ligating the artery he conceived the idea of coagulating

the blood in the aneurismal sac. Of course it was carried into the capillaries of the leg, and it was speedily followed by an inflammation so intense and extensive that amputation of the limb became necessary. While in Paris in 1852 Dr. Brainard prosecuted a series of experiments with iodine to neutralize the poison of serpents, and communicated the results to the Surgical Society of that city; and after his return he presented an essay embodying the same facts to the Illinois State Medical Society. Another line of investigation that engaged his attention for several years was the successful treatment of false joints by the subcutaneous perforation of fractured bones by means of wire sutures. This surgical procedure, however, was not original with him, as it had been successfully established by Dr. Physick, in the early part of the present century. The results obtained, however, by Dr. Brainard were embodied in an essay presented to the American Medical Association at the annual meeting at St. Louis in 1854, which received the prize awarded that year and was published in the Transactions for that year. In subsequent years Dr. Brainard, like others of his adopted city, yielded to the temptation to increase his pecuniary resources by dealing in real estate and public business, and gave correspondingly less attention to original investigation, or even to the practical duties of his profession. After the great Rebellion had begun in 1861 he was appointed on the State Board for examining candidates for appointment as surgeons and assistant surgeons to the numerous regiments of Illinois volunteers, and rendered good service in that capacity. Physically, he was tall and well proportioned, dignified in manner, bordering upon reserve; as a public speaker, whether in a political assembly or in his lecture-room in the college, he was clear, forcible and always commanded attention and retained his popularity and controlling influence as Professor of Surgery and president of the Rush Medical College, of which he was the chief founder, until his sudden death, which occurred when aged only fifty-four years and when at the height of his eventful and exalted professional career. He lived, however, to see the city of his adoption, in which he had always been a conspicuous personage, increase from a population no greater than an ordinary county seat to a metropolis of two hundred thousand. At the time of his death he had been engaged on an extensive surgical work, which remains unfinished. But those yet living who have listened to his clinical teaching and have witnessed his skill as an operator will long remember him as one of the most eminent of American surgeons.

BRAINARD, Dudley S., of Osage, Ia., was born in Williamsburg, N. Y., now a part of Brooklyn, January 3, 1851, and died in the former town September 9, 1893. He came to Wisconsin with his parents in 1861; six years later they removed to Zumbrota, Minn. He received his medical education at the University of Buffalo, New York, graduating February 23, 1875. After practicing a short time in Minnesota and Wisconsin he removed in 1879 to Stacyville, Ia., where he resided until a short time before his death. Dr. Brainard prized his profession highly, and was regarded as one of the strongest men in regular medicine in Northern Iowa. At the time of his death he was a member in good standing in the County,

State and American Medical Associations. He was a faithful attendant at the meetings of these societies, contributing frequently papers, which were listened to with interest. Dr. Brainard was married in 1876, and his estimable wife and two children survive him. His memory will long be held in loving esteem among those who knew him as a faithful physician, a loyal friend, a noble man, and a Christian.

BRASHEAR, Walter, of St. Mary's Parish, La., was born in Maryland, February, 1776, and died at an advanced age at his home in Louisiana. For the details concerning the life and achievements of the subject of this sketch the editor is indebted to a recent address of Dr. D. W. Yandell, of Louisville, on "Pioneer Surgery of Kentucky." Dr. Brashear came of an old and wealthy Catholic family of Maryland, and when eight years of age his father journeyed to Kentucky and cleared a farm near Shepherdsville, in Bullitt county. Walter was his seventh son, and was therefore set apart for the medical profession. When a youth he was enrolled in the literary department of the Transylvania University, where it is said he ranked high as a scholar in Latin. At the age of twenty he began the study of medicine in Lexington with Dr. Frederick Ridgeley, a very cultivated physician and popular man, who had won distinction in the medical staff of the Continental Army. After two years spent in this way he rode on horse-back to Philadelphia and attended a course of lectures in the University of Pennsylvania. At this time Rush, Barton and Physick were teachers in that venerable seat of learning. His was a restless nature, and after a year spent in Philadelphia he shipped to China as surgeon of a vessel. While among the celestials he amputated a woman's breast, probably the first exploit of the kind by one from the antipodes. Upon his return to Kentucky he established himself at Bardstown, and in August, 1806, he performed in that village the earliest original surgical work of any magnitude ever done in the State. This consisted of an amputation at the hip-joint. It proved to be the first operation of the kind in the United States. The undertaking was made necessary because of extensive fracture of the thigh with great laceration of the soft parts. The subject was a mulatto boy, seventeen years of age, a slave of the monks of St. Joseph's College. His assistants were Dr. Burr Harrison and Dr. John Goodtell; the result was a complete success. The operator divided his work into two stages. The first consisted in amputating the thigh through its middle third in the usual way, and in tying all bleeding vessels. The second consisted of a long incision on the outside of the limb, exposing the remainder of the bone, which, being freed from its muscular attachments, was then disarticulated at its socket. Far-seeing as the eye of the frontiersman was, he could not have discerned that the procedure by which he executed the most formidable operation in surgery came so near perfection that it would successfully challenge improvement for more than fourscore years. Hundreds of hips have since been amputated after some forty different methods; but that which he introduced has passed into general use, and (though now known under the name of Furneaux Jordan's) remains the

simplest, the least dangerous, the best. In his address as president of the American Surgical Association, Dr. Yandell, referring to the history of the above operation, says: "The first genuine hip-joint amputation executed on living parts was done by Kerr, of Northampton, England, 1774. The first done for shot wounds was by Larrey, in 1793. I feel safe in saying that Brashear had no knowledge of either of these operations. He therefore set about his work without help from precedent, placing his trust in himself, in the clearness of his own head, in the skill of his own hands, in the courage of his own heart. The result shows that he had not overestimated what was in him. But whether or not Brashear had ever heard or read a description of what had been accomplished in this direction by surgeons elsewhere, the young Kentuckian was the first to amputate at the hip-joint in America, and the first to do the real thing successfully in the world. Dr. Brashear seems to have set no high estimate on his achievement, and never published an account of the case. Had he done so, the art of surgery would thereby have been much advanced, his own fame have been made one the precious heritages of his country, and, what is better, many valuable lives would have been saved. Eighteen years after the Jesuits' slave had survived the loss of his limb, the report of the much-eulogized case of Dr. Mott appeared." Unfortunately for science, Dr. Brashear when abroad learned the method of the Chinese for clarifying ginseng, and thinking, after his return home, that he saw in this an easy way to wealth, he abandoned the profession in which he had exhibited much originality, judgment and skill, and engaged in merchandizing. A few years of commerce and its hazards, left him a bankrupt in fortune, but brought him back to the calling in which he was so well fitted to shine. He moved, in 1813, from Bardstown to Lexington, where he at once secured a large practice, especially in diseases of the bones and joints. He was thought to excel in the treatment of fracture of the skull, for the better management of which a trephine was made in Philadelphia, under his direction, which, in his judgment, was superior to any then in use. The same temper which led him to leave Philadelphia without his medical degree, sail to China, and afterward enter commerce, again asserted itself, and he forsook for the second time his vocation. With his family he now moved to St. Mary's Parish, La., and engaged in sugar-planting. During his residence in the South he served his adopted State in the Senate of the United States. He employed much time in the study of the flora of the West. "During the winter of 1843-4, when Henry Clay was on a visit to New Orleans" (says a writer in the *New Orleans Medical and Surgical Journal*), "we had the pleasure, together with some twenty-five physicians, of spending the evening with him at the house of a medical friend. While at the table one of the company proposed the health of the venerable Dr. Brashear, 'the first and only surgeon in Louisiana who had successfully performed amputation at the hip-joint.' Mr. Clay, who sat next to Dr. Brashear, with characteristic good humor, immediately observed, 'He has you on the hip, Doctor,' to the great amusement of Brashear and the rest of the company." Dr. Brashear

was a man of fine literary taste and many and varied accomplishments. In conversation he was always entertaining, often brilliant. His voice was pleasant, his manners affable. In stature he was short; in movement, quick and nervous. But in the make-up of the man one essential of true greatness—fixedness of purpose—had been omitted. He lacked the staying qualities. He was "variable and fond of change." "His full nature, like that river of which Alexander broke the strength, spent itself in channels which led to no great name on earth." By a single exploit, at the age of thirty, he carved his name at high-water mark among the elect in surgery. Most of his life thereafter he wasted in desultory labors. As the learned Grotius said of his own life, he consumed it in levities and strenuous inanities.

BRIGHAM, Amariah, of Utica, N. Y., was born at New Marlborough, Berkshire county, Mass., December 26, 1798, and died in the former city, September 8, 1849. In a life sketch of this noted neurologist, Dr. E. K. Hunt, his biographer, writes as follows: His father was a highly respectable farmer, who died after an illness of several years, leaving a widow and six children. His estimable and eminently pious mother, regarding only the welfare of her beloved child, was induced, soon after the death of her husband, to accept the offer of his brother, a physician of considerable reputation, living at Schoharie, N. Y., to take Amariah into his family, and educate him to his own profession. Though the youngest of four sons, and only eleven years of age, of a slender and delicate frame, and possessing a constitution by no means vigorous, he left the home of his childhood, with all its endearments, to spend, as was then supposed, the several succeeding years beneath the roof and under the guidance and direction of his paternal uncle. One short year, however, only elapsed before he, too, followed the deceased brother, and his youthful charge was again left without a guide, without means, or other counselor than his wise and affectionate mother. He was naturally a thoughtful and self-reliant boy, made so in part by the circumstances of his condition, which had served to awaken and develop these qualities of his mind. This we may safely infer also from the fact that, not long after his uncle's death, at an age which could not much have exceeded thirteen years, he made his way to Albany alone, and there, without a friend to assist or advise him, procured for himself a place as clerk in a book-store, where he spent the three following years. Here he performed the round of duty which usually devolves upon boys occupying a position of this kind, but, it is said, had much leisure time, which he spent not slothfully or in idleness, nor in the society of thoughtless or vicious companions, but in the constant reading of books to which he had access. While his reading was, doubtless, without a definite plan, and probably quite miscellaneous, he here acquired a fondness for books, and habits of study, which ever after constituted a noticeable feature of his character. Indeed, the numerous observations which he made while abroad, relating to historical and other matters with which he was manifestly quite familiar, may, many of them, be safely referred to this, as the time when he first became conversant with them. Here, too, he also had an opportunity to acquire a knowledge of men, as well as of

books, which he would not be likely to neglect; and by having no one to look up to for counsel or assistance, developed still further that confidence in himself which his destitute situation required. On leaving Albany, he returned again to New Marlborough, where his mother now resided, and there spent the four following years; at first in the studies usually pursued by advanced pupils in our schools, and at length entering the office of Dr. E. C. Peet, of that town, as a student of medicine. It does not appear that his advantages during any part of this preparatory course at all exceeded those that usually fall to the lot of medical students, or that he obtained a diploma from any medical college. One of his biographers says, "he spent a year in New York attending lectures," which, in the absence of other evidence, may fairly be supposed to signify that he attended during a single session or term, which at that day was regarded by the profession as sufficient to qualify a candidate to enter upon practice. Subsequently, and before commencing the active duties of professional life, he spent about a year with the late Dr. Plumb, of Caanan, Connecticut; and from a brother practitioner, now of Hartford, but who then resided in a neighboring State, and often saw him, we learn that, while his habits of study were somewhat peculiar and original, he was, nevertheless, a diligent and successful student. The period which elapsed between the time of his leaving Albany and entering upon the duties of his profession must have been a little less than five years, all of which was spent in the pursuit of knowledge, either of a professional or general character. Having acquired a fondness for books, improved, and, to some extent, tested the powers of his mind, during his residence in Albany, he was, indeed, in some respects highly favored in the privileges which he enjoyed in the quiet town in which he spent the several following years. Here was nothing to be found calculated either to distract his mind or to call off his thoughts, even temporarily, from study; while the great fact constantly stood forth fully, and sometimes, doubtless, painfully, before him, that he was to be the sole architect of his own fortune. He commenced practice as a youth somewhat short of his majority, in the town of Enfield, Mass., where he remained but two years. He removed thence to Greenfield, Franklin county, a large and flourishing town, lying on the Connecticut river. Of his history while at Enfield we are left to conjecture; but the fact that, after so short a period of practice, he should have felt himself qualified to submit his claims to notice and support, to so searching an ordeal as that of a refined and cultivated community, and was willing to risk the results of active professional competition, shows, at least, his estimate of himself, and his confidence of success. His determined boldness stands out in still stronger relief when we learn that he purchased, at the outset, the entire property of a practitioner then in ill health, a brother of Judge Washburn, consisting of a dwelling-house and out-buildings, horse, carriage, and library, the payment of which not only absorbed the savings of the previous years, but also must have involved him pecuniarily to some extent. Here that industry and system in the management of his affairs, that patience, and accuracy of observation, and soundness of

judgment which characterized his after years, were exhibited and largely developed. Here, also, shone forth those genial social qualities which made him everywhere welcome, and the delight of a large circle of admiring friends. He practiced at Greenfield uninterruptedly about seven years, and it is well known that he early secured the confidence of his fellow-citizens, was extensively patronized, and eminently successful. He was especially fond of surgery, and achieved considerable reputation in this branch of our art, indeed, so much that he became widely known, and was largely employed in this department. That he was during all this time a diligent student and growing man, though fully employed in the active duties of his profession, we learn in part from the fact that he prepared and delivered a course of popular lectures on chemistry while here, at once indicating great fondness on his part for natural science, and much careful study of a branch which it would otherwise have been supposed he would most likely neglect. Besides, he began with his professional life that most improving of professional exercises, a detailed daily history of every case he was called to treat, a practice certain to sharpen the powers of observation, excite to study and research, improve the reflective faculties, strengthen and mature the judgment; while it also gives one imperceptibly a readiness in the use of the pen, a capacity of expression, which are not the growth of a day, but which, when acquired, become invaluable to the possessor. He at times, also, left temporarily the field of his active labors, ostensibly for relaxation, but in fact, that by visits to the larger cities, intercourse with their medical men, and examinations of their hospitals, he might increase his store of practical knowledge. That a young man, but twenty-nine years of age, whose purse had always been slender,—whose scanty support, for several years previous to the commencement of professional life, had been procured, in part at least, if not wholly, by teaching, during the winter months, district schools,—whose opportunities for mental improvement had been such only as are usually regarded as inferior, and even meager,—whose self-denials of every sort had been many and great,—should so soon, upon the removal of this burden from his mind and spirits, have aspired not only to high rank in his profession, but have boldly resolved to do what very few then undertook, and still fewer of these from resources of their own earning, for the purpose of improving himself professionally and otherwise, by foreign travel, exhibits to every one who reflects upon the procedure, a degree of self-reliance, intelligence, and manly courage, not often equaled. It appears, however, that it was a plan which he devised while engaged in active practice, the contemplation of which, as the obstacles to its fulfillment yielded one by one to his prolonged reflections, was a solace, doubtless, to many a dark and weary ride. He had already, in a period of seven years, paid for the place which he purchased on commencing business at Greenfield, had steadily added to his library, lived suitably to his position, and, besides, had accumulated means sufficient, with the sale of his property, to meet the expenses incident to a voyage to Europe, which he had now decided to make, and a year's residence there. In the fulfill-

ment of this purpose, he was obliged, though most reluctantly, doubtless, to leave the place in which he had spent the dawn of his manhood, had numerous friends, and unquestionably many and tender attachments. He left on this voyage July 16, 1828, then in his thirtieth year. It would be interesting and instructive to follow him in his travels, which embrace a tour and residence, more or less prolonged, in England, Ireland, Scotland, France, Italy, Sicily, and Spain, and extract liberally from his voluminous journal, but the space allotted us will not permit. He made a daily record of his observations, indeed, of whatever especially attracted his notice, which formed five folio volumes in manuscript. It is apparent from these, and, I think, will be admitted by those who subsequently became acquainted with Dr. Brigham, that the basis of that character, which was afterward so well illustrated in a public capacity, was fully established before he went abroad. His systematic, independent, and often original observations and descriptions, show that those qualities of mind from which they spring were already well developed and in active exercise. He visited most of the larger hospitals and benevolent institutions in the countries through which he passed, and describes, often minutely, their architectural characteristics, internal arrangements, general management, and often adds a description of the personal appearance and manner of lecturing of the distinguished physicians in attendance. He left London in October for Paris, and passed a month in the latter city, in visiting the public and benevolent institutions and places of note, and especially those devoted to art. Here as well as elsewhere, judging from his manuscript notes, he seems to have spent much time at the Louvre, and other places where either superior pictures or statuary were to be found, indicating a much stronger relish for such works than he was generally supposed to possess. He then took tickets at the School of Medicine, where he continued in daily attendance on the lectures for three months. He occasionally attended lectures at other institutions and at the various hospitals, on all of which occasions he made copious observations descriptive of buildings and internal arrangements, as in London. Every day seems to have been fully and well occupied in collecting useful information, as well as valuable materials for thought and reflection in after years. His habits while in Paris were eminently social, his evenings, many of them—indeed, the majority of them—having been spent in general society. His diary, in its description of the forms of etiquette observed at the social and larger parties at which he was present, as well as the comments often accompanying, indicate how close an observer of men and things he was at that period. And here we would observe, and it is worthy of notice, that though his journal contains only the hastily-written observations of each day, and was doubtless prepared without a thought of its ever being opened to the inspection of any other than his own eye, or possibly to the glance of here and there a partial and trusted friend, it is characterized in its entire extent both by correctness of thought and expression. There is not to be found in it anything at variance with good taste or sound morals, but, on the contrary, everything to indicate great

purity of heart and correctness of conduct, although at that time he was not controlled by any special religious scruples. Just before quitting Paris, he made a visit to the institution for the Deaf and Dumb, founded by Abbé de l'Épée, in 1760, of which he gives a very interesting detailed account, evincing the deep interest he then felt in the educational as well as other benevolent establishments for the care and elevation of the unfortunate. During his stay at Genoa he visited, among other places, the Hospital for Incurables, of which he thus writes: "It is a noble institution, and has the look of being old, as it is embellished with the statues of many of its benefactors, that look old and black. The number of its inmates is between eight and nine hundred, I think. The bedsteads are of iron, but without curtains or posts for them. The rooms are spacious, tolerably well aired, and clean for an old house. I noticed most of the incurables were deformed—maimed men, women, and children, also maniacs. These last interested me much. I was surprised to see them all—that is, all the crazy men—in one room, and without any partitions. Most of them had strong chains fastening them to their beds; and I saw some in the women's apartment, where they were eating a breakfast of lettuce and oil, I thought. But O! the fury and noise!—probably some excited by my entering. Some were hallooing, some laughing, some eating, and screaming like fiends. Some beckoned to me with fury, others with smiles. In fact, I never had so perfect an idea of bedlam as in these rooms, where are from fifty to a hundred crazy people. It seems to be very wrong that all should be thus together, as their beds joined, and nothing intervened." From Genoa he went to Pisa, and from thence to Florence and to Rome, stopping, however, at other less important cities, and remaining long enough in each place to make an intelligent notation of whatever was of historical interest, exhibited the manners and customs of the inhabitants, or the practical working of their civil and political institutions. The extent of his survey, and his numerous and interesting comments, bear ample testimony of his industry and peculiar habits of observation, and show that he was a man of methodical mind, of quickness of perception, of much more than ordinary powers of analysis, and further, that he was a man of extensive reading. On his route to Italy he visited the Maddalena, a lunatic asylum situated between Capua and Naples, and founded by Murat. He thus writes: "It is spacious, and has a large garden and church attached to it. It contains about five hundred patients, who are well attended, and treated with great gentleness and indulgence. Each pays about fifteen dollars a month, which defrays all expenses. I noticed one singular but pleasant arrangement—the windows, from the outside, look as though they were filled with beautiful flowers; but, on examination, I found that the iron grates had been made thus, and painted, in order to give a pleasing appearance to the eye. The contrast between this and the asylum I had just seen at Genoa was great and striking. Here they are all comfortable and cleanly, and well attended; there they were all confined in one room, each chained to his bed—the ravings of one exciting others, so that, when I entered, the shouting, swearing, and attempts to break their chains,

for a moment frightened me. I can not believe another such a horrid bedlam exists on earth." He spent several weeks in Naples, during which time he twice visited the long-buried cities of Pompeii and Herculaneum, and also Vesuvius. The relics of Pompeii, as all now know, are numerous, and, even then had been collected and well arranged under the auspices of the government. These he saw again and again, enumerates the several classes into which they are divided, and describes many of them with considerable minuteness. Leaving Italy, he proceeded to Sicily, but his stay at Messina was short, and nothing occurred which it is necessary to notice. Here he took ship for the United States, stopping only at Gibraltar, where they were detained many days, which gave him an opportunity to visit the principal objects of interest to be found here—as the fortress and town—which he did not fail to improve. At length they set sail, and landed at Boston, July 4, 1829, twelve days less than a year from the time he embarked at the port of New York. After making hasty visits to some of his relatives, he once more returned to Greenfield, Mass., and again commenced the active duties of his profession, about the middle of August. He was now near thirty-two years of age, and his ambition had in no respect been cooled, nor his confidence in himself abated, by travel and a more extended acquaintance with the world. It was not long, therefore, before he began to cast about for a more conspicuous and lucrative field of labor; and having received a friendly invitation from some of the most intelligent and influential citizens of Hartford, Conn.,—among them several of its leading physicians—to make it his residence, he concluded to do so, and removed to that place some time during the month of April, 1831. Of the number of those who expressed a desire to this end was the late Rev. Daniel Wadsworth, who, to other inducements, added the offer of an eligible office, rent free. In every respect his qualifications for taking an elevated position, both professional and social, were far greater at the time of his settlement at Hartford than when he had presented himself, a youthful candidate for practice, to the citizens of Greenfield. He was now matured in intellect, his character was established, his attainments, both theoretical and practical, highly respectable in every department of his profession; while his manners, and knowledge of men and the forms of cultivated society were superior. He came to Hartford, continues his biographer, rather as a surgeon than physician, there being at that time a more than usually favorable opening for one well informed in this department. He at once took the elevated position for which it was anticipated he was well prepared, and maintained it, in and out of the profession, so long as he remained here. He at no time wanted for business nor had he ever any anxiety about it, and for many years his income was probably not far from \$2,500 per annum. He always had an office, where he kept his library, chiefly professional, of about two thousand volumes—many of them in the French language, which he read with correctness and facility—quite a variety of surgical and medical apparatus, casts, dry and wet specimens in morbid anatomy, and drawings, which, coupled with an easy, not over-cleanly look, made it not

uninviting, either to the common people or to gentlemen. He generally, if not at all times, had one or more students, who enjoyed the use of his library, saw considerable office and other practice, and had the benefit of his kind and sufficiently familiar intercourse. He prepared for professional life some who since became highly respectable and useful practitioners, in whose air and bearing, as well as in their views of things, could be traced the impress of their teacher's influence. To his other qualifications as a physician, his careful and patient investigation of disease, and acknowledged skill in diagnosis resulting therefrom, sound common sense and superior judgment were added; making him at the same time a successful practitioner and valuable counselor. It was a not uncommon practice with him, on going out of town for the purpose of consultation, to ascertain beforehand something about the character of the case, and carry with him some standard author who treated of the disease in question. He did not stand in fear of any inference which such a proceeding might have, either upon the mind of the patient, his friends, or the practitioner in attendance. In society, he mingled in preference with that class characterized by refinement of manner, cultivation of taste and intellect, and who at the same time enjoyed in due degree the social glass, a quiet game of whist, a good dinner, and granted large freedom of opinion, both religious and political; rather than the more stern, rigid, and puritanical, who in that day required, as a condition of good fellowship, not only intelligence and a becoming deportment, but decided temperance in eating and drinking, particularly the latter, an orthodox faith and practice, and sound whig sentiments. I mean not to be understood as intimating that he was not on friendly terms with, or did not entertain the highest respect for, many of those from whom his opinions, and, to some extent, his practice, differed, and for whose society he had no special relish; nor that he was not, in return, appreciated and largely patronized by them; for it was notoriously true that he was, perhaps, more largely consulted by clergymen than any other practitioner then resident in Hartford. In politics he was a Democrat, and so devoted to party that he made its distinctive issues a prominent topic of conversation on the eve of exciting elections, attended party meetings, at which he sometimes spoke, and interested himself to such an extent in the result as to allude to it afterwards, when his excitement had abated, as a matter of surprise even to himself. When he first became a resident of Hartford, infant schools were in operation, and in high public favor; also a method of arousing the public mind, and creating a strong religious interest, by means of what was known as "protracted meetings," when a whole community, or an entire denomination in a city, would devote ten days, and sometimes even a fortnight, to religious purposes, in the progress of which a high state of nervous excitement would, almost of necessity, take place on the part of many of the more devoted among the worshipers, and conversions also, in numerous instances, were claimed to follow. Though he was a regular attendant at the First Congregational Church, and, as has elsewhere been said, sincerely respected religion and all needful religious ordinances, without being a professor, or particularly interested in

the subject itself, he set his face boldly and earnestly against both of these popular customs of the times; giving his views to the public in regard to the former in an unpretending little volume, entitled "Influence of Mental Cultivation on Health," published in 1832, and also one in regard to the latter, entitled "Influence of Religion on the Health and Physical Welfare of Mankind," published in 1836. To the latter work I shall hereafter briefly refer, and shall only stop to say of the former that it reached a third edition, which was published by Lea & Blanchard, of Philadelphia, in 1845—an edition having been previously issued at Glasgow, by Dr. Robert Macnish, and another at Edinburgh, by James Simpson, Esq., advocate, each preceded by a preface, highly commendatory of the character and object of the work. About this time the cholera first made its appearance on this continent, attended in many places with a frightful mortality, and spreading terror through the country. It seemed at the time like a direct visitation of God, sent to afflict the nations, so steadily and rapidly did it advance, in spite of every opposing barrier—so mysteriously, and with such fatal power, did it fall upon its victims—so little was it amenable to treatment, and so little as to its pathology was revealed by dissection. No medical man, whether young or old, could fail to look with searching scrutiny upon a phenomenon so obscure, yet so appalling, scan with the utmost care the features of the disease, study its history, and inform himself, so far as possible, as to the most successful way of managing it. Dr. Brigham did more than this. He not only studied the disease with care, but published, during the same year, a work which he styled, "A Treatise on Epidemic Cholera." It is an octavo volume of 368 pages, accompanied by a map, showing the route westward of the cholera, from the place of its supposed origin. It contains, of course, little strictly original matter, but consists chiefly of selections from reports, treatises, lectures, and essays, and was intended, as its author states, "to furnish a correct history of the disease, together with all the most important practical information that has been published respecting its nature, causes, and method of treatment." The work probably had a limited sale, and added little either to the purse or reputation of its author, though much discriminating labor and research were expended upon it. Regarding himself, about this time, as permanently settled in Hartford, he married, January 23, 1833, Susan C. Root, of Greenfield, an accomplished lady, to whom he had undoubtedly become attached while in practice there. She, with their four daughters, survived, to mourn the irreparable loss of an affectionate husband and father. The next, which was the last systematic work published by Dr. Brigham, was entitled, "An Inquiry Concerning the Diseases and Functions of the Brain, the Spinal Cord, and the Nerves;" a duodecimo volume of upwards of three hundred pages, appearing in the winter of the year 1840. It was prepared while the author was engaged in practice as a physician and surgeon, and, doubtless, with no more than a general reference to the specialty to which he subsequently and so soon devoted himself. Though small and unpretending, it is a valuable work, which might well find a place in the library of every practitioner, as

a book to be carefully read, and not unfrequently consulted with advantage. It found a ready sale, and it is believed was favorably received by the profession. These several volumes constitute the greater part of his literary labors while a resident of Hartford, though he occasionally prepared an article for some medical journal, and sometimes for the newspapers; and, becoming interested, if not a believer in the doctrines of phrenology, as set forth and advocated by Gall and Spurzheim, is said to have lectured acceptably on the subject. He also, in 1837, having probably become tired of the harrassing labors devolving upon him in the discharge of his duties, accepted the professorship of anatomy and surgery in the College of Physicians and Surgeons, New York. He spent a year and a half there, but finally returned again to Hartford, preferring the comparatively active life to which he had so long been accustomed, with all its attendant inconveniences, to a permanent residence in New York. The little volume which he published in 1836, on the "Influence of Religion on the Health," was attacked with spirit, in one quarter at least, and led to a controversy in print, as caustic and bitter as disputes of this nature usually are. It also created, in connection with his strong party views, prejudices in the minds of many worthy and influential citizens. Their opposition, however, was probably made up, in a pecuniary point of view, by the favor of those whose good will and patronage were thereby secured. But when he became a candidate for the office of Physician and Superintendent of the Retreat for the Insane, at Hartford, Conn., which he did in 1840, he found in its board of directors a number of those who had conscientiously opposed him previously, and who felt unwilling to intrust the interests of that institution to his hands. Their opposition was at length, as is well known, overruled, and the appointment conferred, as was afterwards demonstrated, upon one well qualified for the position. That perfect system which, as we have already seen, had become an element of his character, was at once brought successfully to bear upon every department of the institution, so soon as he became its principal officer, and each subordinate had marked out for him, and was made duly responsible for, the discharge of his duties. A long and extensive acquaintance with general society enabled him, both in sentiment and manner, to adapt himself to all classes of the inmates, so that, without wounding the pride or sensibilities of any, he equally secured the confidence and respect of all. He was not only a man of order, but was also a superior disciplinarian; and while every person, whatever his position, was treated with justice, and, the patients especially, with the utmost kindness, none were indulged with undue license, and all felt the restraining and controlling influence of the governing head. His previous studies and practice had been such as to make him unusually familiar with the treatment of nervous diseases, and his success while at Hartford, indicated the soundness of his pathological opinions, and the correctness of his treatment. His discussion of topics relating to the medical jurisprudence of insanity, as he met with illustrative cases—his investigations relating to the pulse of the insane, the size and shape of the head, the condition of the senses, the temperature of the body, and the state of the

secretions, together with his remarks on the medical treatment of the insane—which are embodied in his annual reports, published while connected with the Retreat, exhibited a capacity for intelligent inquiry, a willingness to *search* for facts, and a fondness for them most creditable to himself, and which added very much to the value of the reports themselves. The office which, as we have seen, he accepted in the spring of 1840, it was expected by all would terminate, probably, only with the life of the incumbent. However in the fall of 1844, to the surprise and regret it is believed of every officer and friend of the Retreat, as well as to a large circle of friends in Hartford, it was announced that Dr. Brigham had accepted a similar appointment tendered him by the managers of the New York State Lunatic Asylum, located at Utica, and would shortly remove there. Notwithstanding the faithful performance of his duties, and a wise regulation of the institution, both required that his time should be devoted exclusively to the Retreat, his former patrons continued to feel that he was still within reach, and in an emergency could be consulted, and hence felt less keenly than they otherwise would the trial of separation. When, however, it was ascertained that he was to leave the place altogether, and his lot from henceforth to be cast in a neighboring State indeed, but at a distance too great for ready access, there were many and sincere regrets expressed by those who had experienced, in seasons of sickness and suffering, his tender sympathy and superior skill. His office and duties as superintendent and physician at the Retreat at Hartford terminated about the first of October, 1842, and from that time forth he became identified with the institution at Utica, to which he gave every thought, and all his energy of soul; his hearty devotion to it only terminating with his life, which appropriately closed within its walls, amidst the scene of his untiring labors and proud success. For this position may be justly claimed for him the possession, in a superior degree, of every quality requisite in a physician-in-chief. The native vigor and practical character of his mind; a training in that sober school in which every pupil is made to feel daily that there is no hope or chance for honors or rewards aside from well-directed personal efforts; that reflective self-reliance, equally removed from rashness and timidity, which we see early characterized his movements; his varied attainments, his extensive, thorough knowledge of men, his great and systematic industry, his practical experience of the peculiar wants and treatment of the insane—all served, we repeat, to make him one of the foremost in the wide field of labor to which, with redoubled earnestness, he had once more and anew dedicated himself. The walls of the noble structure which now does honor even to the great State of New York, and which was destined to give an enduring reputation to our subject, were at that time erected; the internal arrangements and furnishing awaiting, for the most part, the direction of the superintendent. Though the original plan contemplated accommodations for a thousand patients, with their officers and attendants, it had, previously to this period, been decided to carry out but partially the design, and provide for about half this number. Indeed, at this time the center building and main wings only were erected,

and nothing had been done toward laying out the grounds, or constructing the necessary out-buildings. Here, therefore, the scope of his duties demanded his attention without as well as within the establishment. To plan and carry out the design of the institution to its completion—to arrange and organize all its different departments, wading through the mass of details requisite in order that the security, comfort, and convenience of all should be best consulted, was a work of great magnitude, and its thorough accomplishment of incalculable importance. To this work Dr. Brigham brought what was required, not only sound, practical common-sense, but a previous and well-improved experience, to which was united a correct estimate of the value of money, and the best method of making the most of it; or, in other words, an enlightened, intelligent economy. Elevated, then, to this new and truly exalted position, the problem just suggested was given him to solve. How correctly it was wrought out must be left to the decision of those who have entered upon his labors, and have had in experience the benefit of his judgment. But there appears to be no doubt that his comprehensive mind grasped readily the entire details of his plans, while yet they existed only in his own brain, and that he clearly saw at the outset the work as it stood when completed, and justly estimated its practical operation. This is inferred by Dr. Hunt both from his knowledge of the man and from the qualifications with which his previous observations and experience had endowed him. Though many improvements in ventilating, warming, and lighting public buildings have been brought into successful operation since that period, which, had they then been known, would doubtless have been adopted—improvements which unquestionably might have produced greater results—still we are well assured that his ideas, as embodied in his labors, were quite equal with, if not in advance of, the knowledge of that day. As the governing head of such an institution, he was fitted, as we have heretofore observed, by the possession of those qualities of mind and heart, both natural and acquired, which enabled him to secure the confidence, win the respect, and insure the control, so far as might be requisite, of all those, whatever their position, who constituted his household. His patients respected him as a man, confided in him as a physician, and in many instances entertained for him sentiments of sincere and lasting friendship. Toward attendants and subordinates he was kind and just, but decided. That rigid, yet most excellent code of by-laws which he drew up soon after the opening of the institution at Utica, were laws for all, for himself as well as others; and no one of them could be broken or infringed with impunity. At Hartford this was equally true, and it secured for him the invaluable services of a competent and faithful corps of assistants. Of the operation of this code it will be sufficient to quote the following opinion, expressed, some two or three years subsequent to a visit to this asylum, by the late James Cowles Pritchard, himself at the time in charge of one of the largest of the English institutions for the insane, and also the author of one of the ablest treatises on insanity and diseases of the mind extant in our language; in a word, one

of the most competent of judges. To a gentleman making the tour of Europe, principally for the purpose of examining the condition and mode of conducting similar institutions, he said: "I can show you nothing here that will compare with your own well-ordered asylum at Utica. No medical superintendent ever exhibited greater fertility of invention in providing occupations and amusements suited to the wants of the inmates of institutions of this class, or was more keenly alive to their importance. As to the moral and purely medical treatment of insanity, Dr. Brigham's views differed in nothing essential from those usually prevailing among physicians engaged in the care and management of the insane. While he occasionally tried remedies comparatively new, his usual practice was to employ a few agents of well-known and established character discriminatingly, and in moderation as to quantity; governed, however, in this respect, by the exigencies of each case as it came under his notice. Though he had abundant confidence in the efficacy of medicine appropriately employed, he had also great confidence in the recuperative power of nature, wisely assisted by medicine as occasion required. Not satisfied with superintending to its completion in all its details the great institution of which he had charge, and subsequently conducting its numerous and weighty affairs, he voluntarily undertook the publication and editorship of the *Journal of Insanity*, a quarterly of upwards of one hundred pages, the object of which was, as its name imports, to present a medium for whatever of value relating to this specialty he, in connection with his co-laborers in this field, could furnish. The intention was laudable, doubtless, yet, under the circumstances of his precarious health, hardly to be considered as wise or judicious, as it would require an outlay of time and strength, already engrossed in the discharge of his immediate duties to the institution. However, it was begun in 1844, the first number being issued in July of that year, from which time onward, until the completion of the fifth volume, he continued in charge of it. Indeed, the first number of the following year contains one or more articles prepared by him, as also the miscellaneous matter; while the succeeding one, that for October, contains his obituary. Whatever may be said of the wisdom of his undertaking a work of this character, all things considered, it is not to be doubted that the design was a good one, and has resulted in bringing the subject of insanity in all its aspects more fully before the public than would in any other way have been possible; making known, extensively, many valuable facts, and forming a medium for the full discussion of many important subjects. It was most natural that a mind so practical as his, so fully stored with information on his favorite branch, and feeling also so keenly as he did the importance of spreading abroad everywhere this knowledge, should have suggested the method which was adopted for accomplishing his object, and, therefore, that he became the founder of this department of periodical literature in this country. That it accomplished much good, and answered the expectations of Dr. Brigham, is evident, whether we regard its intrinsic merits, the extent of its circulation, or the fact that it continues still to disseminate, without essential

change in design or purpose, the important information it was established to promulgate. When, now, we contemplate our subject as the head of an institution having more than five hundred persons constantly to direct and control, a large proportion of them bereft of reason, and requiring the most watchful professional care; looking not only after the great interests of his household, as it was his duty to do, but also to many minor matters, which it was his infirmity that he could not delegate to other parties; conducting a large correspondence, not only with the friends of patients, but also with the State government, and having, moreover, the responsibility of editing and publishing the *Journal of Insanity* continually resting upon his mind, we behold a man struggling beneath a burden, in part self-imposed, it is true, but quite too great for the strongest long to sustain. During this and the previous year his labors had been augmented, in consequence of his having been required to attend courts, at Binghamton, Auburn, New York City, Northampton, and elsewhere, in cases where the plea of insanity was set up, and his opinion as an expert demanded. It is not probable, however, that his health suffered from this; the change, and relief from other duties for the time being, acting, as a soothing and grateful stimulus to his exhausted nervous system. His digestive organs continuing to grow weaker, his bowels on several occasions to give evidence of excessive irritability, and his general health still further to fail, it was deemed indispensable, both by himself and others, that he should withdraw for a season from the care of the institution, and seek, by the relief which it was hoped that this, in connection with change of climate would afford a return of that strength and health for which he had so long been striving in vain. He accordingly left Utica on the 17th of February, 1848, in company with two esteemed friends, managers of the asylum, and made the circuit of the southern portion of the United States, proceeding south on the Atlantic coast, and returning during the latter part of the succeeding April, by the Mississippi and Ohio rivers. On this journey, of which he left copious notes, he made it a part of his duty, as would naturally be expected, to visit most if not all of the institutions for the insane along the route, publishing in the *Journal of Insanity* of the succeeding July, such remarks in relation to them, and other objects of interest which he met with, as seemed appropriate. The principal purpose he had in view in leaving the institution for so long a time—the improvement of his health—seems to have been to a considerable extent realized, for he says, in his journal of July following: "My health has been better since my journey, but still I have the swelling of my side, though it does not trouble me much; my appetite and sleep are pretty good. I feel more as if I might live some years, though heretofore I have not thought so." Soon after this record he was called to submit to one of the severest trials which humanity is ever compelled to encounter—the illness and death of an only son, an interesting and promising boy of twelve years of age. The notes which from time to time were made subsequent to this event not only express, so far as language can the intensity of his sorrow, but also indicate that its effects, both upon his health and spirits,

had more than counterbalanced the benefit which he had derived from his winter's relief from active labor. Sickness and prostration, which his vital powers could not overcome, nor the remedies which were employed successfully resist, soon succeeded in accomplishing a fatal result, and, as his biographer and medical adviser at that time tells us, he expired without a struggle or a groan, at a period but little beyond the meridian of ordinary life, but with him after an eventful career of long and extraordinary professional achievements. In person Dr. Brigham was tall, though somewhat less than six feet in height, and very slender; his weight, in health, probably not exceeding one hundred and thirty pounds. His features were well proportioned, though rather small than otherwise; eyes of a soft blue, expressing more than is usual the varying emotions of the mind. His hair was thin, of a brown color, and slightly, if at all, gray at the time of his death. His gait was naturally slow, and by no means graceful, while his voice was soft, low, and quite melodious. As a whole, however, his appearance and manner indicated to the observer a superior and cultivated intellect, a firm will, perfect self-possession, a social disposition, a kind and generous heart. A few remarks relating to his religious character will conclude this sketch; and it is approached with the greater pleasure, as abundant proof is found in the recorded meditations of Dr. Brigham, both of his religious views and the operations of his mind on this great theme, particularly during the last years of his life. There can be no doubt, judging from his writings, that, during the earlier part of his life, without being an unbeliever, or even regarding the truths of Christianity with indifference, he was not a pious man. Having a mind at once bold and independent, as well as active and inquisitive, he separated with a searching, perhaps too searching discrimination, the essentials from the non-essentials, both of a religious creed and a religious life; and while he held the former in sincere respect, treated the latter with an apparent, probably real levity, that touched and wounded the sensibilities of many good people. Such a mental constitution, however, as he possessed, and such views, will account for everything he has written, which at one time occasioned much dissatisfaction, as we have already noticed, and subsequent active opposition to him as the proposed head of a public institution for the insane; and it was his well-known kindness of heart and real benevolence of character, in connection with his many other qualifications for the position, that secured his election, in spite of the remonstrances and votes of some well-meaning but mistaken men. During the last years of his residence in Hartford, however, it was the opinion of that distinguished philanthropist and good man, the Rev. Thomas H. Gallaudet, who was at the time chaplain at the Retreat, and in the habit of daily and familiar intercourse with Dr. Brigham, that his mind was much and seriously exercised on the subject of religion—that he habitually read and meditated upon the word of God, and daily engaged in the exercise of private and family devotion—that, in short, he gave satisfactory evidence of being a Christian; and, after, his removal to Utica, the correspondence which was maintained but served to confirm the previously formed

opinion of his revered friend. A better, and, indeed, convincing evidence of his deep and humble piety is to be found in quite a large manuscript volume, entitled "Religious Thoughts," which was commenced several years before his death. The writings of Baxter, Doddridge, Hannah, Moore and others, are often referred to as affording most instructive reading, and much food for profitable reflection, as well as presenting great truths in a strikingly forcible manner. But the Bible, and particularly the writings of the evangelists and apostles, manifestly furnished him the most satisfactory and pleasing topics of thought, and pages of his journal are often devoted to comments upon passages that especially interested him. Among the many texts which he had selected for special contemplation were the following: "Whosoever shall confess me before men, him will I also confess before my Father which is in heaven." "Every idle word that men shall speak, they shall give an account thereof in the day of judgment." "Come unto me, all ye that labor and are heavy laden, and I will give you rest." Breathing forth such sentiments, and with a mind full of thoughts like these, he was preparing himself daily for that rest with the people of God for which he had long and fervently prayed, and at the age of about fifty-one years—an age at which the vigor of the intellect, soundness of the judgment, and the experience of manhood are but matured and perfected, when the strength has not been overtaken and exhausted—exchanged the cares, labors, and responsibilities of life for the quiet and repose of the grave. His life, as we have seen, had been from its very outset one requiring the active, energetic exercise of every power and faculty, both of mind and body—at first from the necessities of his condition, and subsequently continued, doubtless, partly from the force of habit, but in part, also, from the aspirations of a laudable ambition. It is also unquestionably true that, at the time of his death, he had accomplished, and nobly, too, the labors of a long, elevated, and eventful career. Nor is it too much to believe that his name will go down to posterity among that bright galaxy of distinguished men who, self-made, have attained to eminence through the steady, well-directed efforts of sound, well-balanced, and well-informed minds, aided by a strength of will and firmness of purpose which no obstacles could successfully oppose, nor discouragements long depress; a model worthy the imitation of all who would excel in manly gifts, or in the honorable performance of duty among men.

BROWN, Bedford, of Alexandria, Va., was born in Caswell county, North Carolina, and is the son of Bedford Brown, United States Senator from North Carolina. He studied medicine at the Transylvania University, Lexington, Ky., and at the Jefferson Medical College, Philadelphia, graduating from the former in 1848, and from the latter in 1853. He first settled in Yanceyville, N. C., whence he removed to Alexandria, Va., where he still resides. He is a member of the Medical Society of the District of Columbia. From 1855 to the present time he has made numerous contributions on various medical subjects to the leading medical journals of this country. Among others he is the author of the following-named articles in the *American Journal of Medical Sciences*: An article on the "Treatment of Hy-

drocele," in 1855; on "Typhoid Pneumonia," in 1858; on "The State of the Nutritive Functions During the Progress of Continued Fevers," in 1859; on "The Treatment of the Malignant Forms of Remittent Fever with Nitric Acid," in 1859; on "A Case of Extensive Compound Fracture of the Cranium, Severe Laceration and Destruction of a Portion of the Frontal Lobes of the Brain, Followed by Fungus Cerebri and Terminating in Recovery." This is probably the first, if not the only case on record in which chloroform was used in extensive injuries of the kind, and in which the effects of its action on the physical functions of the brain were demonstrated to the eye. It was published in 1860. Since then other articles have appeared from his pen entitled "Epidemic Diphtheria;" "Internal Use of the Tincture of the Chloride of Iron in Cutaneous Affections;" "The Use of

ville was elected president of the association. He presided at New Orleans in 1893 and delivered an able address on the origin, objects and aims of this organization. He has read before this body the following papers: "Medical Treatment of Fibroid Tumors of the Uterus;" "Treatment of Gangrenous Wounds and Diseases;" "Systemic Infection from Gonorrheal Poisoning;" "The Simple, Septic, Traumatic and Specific Forms of Cervicitis;" "Personal Recollections of the Late Dr. Benjamin W. Dudley and His Surgical Methods." Dr. Brown was also a member of the Pan-American Medical Congress. He was a member of the advisory council of the section on military medicine and surgery, and read a very interesting paper in that section on his personal experience in the sanitary condition of the Confederate States Army. He is also a member of the American Medical Association, and has read papers before the association on "The Antiseptic Treatment of Infantile Entero-colitis;" an elaborate paper on "Septic Dysentery and its Treatment;" also one on the "Practical Treatment of Accidental Abortion." Dr. Brown has for the past forty years enjoyed a large and lucrative practice.

BUMSTEAD, Freeman J., of New York, was born in Boston, Mass., April 21, 1826, and died in the former city November 28, 1879. His father was Josiah F. Bumstead, a merchant; his mother, Lucy D. Willis, sister of N. P. Willis, the poet. He received his preparatory education at the Boston High School and the Boston Latin School; pursued his academical course at Williams College, and graduated in 1847. In 1851 he graduated from the Harvard Medical School, subsequently attending medical lectures in Paris, and settling in New York City in 1852. He made a specialty of venereal diseases. He was a member of the New York Academy of Medicine; the County Medical Society; the Torrey Botanical Club, of which he was vice-president in 1875-76; a corresponding member of the Dermatological Society; and was formerly a member of the American Ophthalmological Society, having resigned in 1876. He held the posts of Surgeon to the New York Eye and Ear Infirmary; Surgeon to St. Luke's Hospital, New York; Surgeon to the venereal wards of Charity Hospital, Blackwell's Island; Consulting Surgeon to the Strangers' Hospital, and that of Clinical Professor of Venereal Diseases at the College of Physicians and Surgeons, New York. Among his contributions to medical literature is the translation of Ricord's notes to Hunter's "Treatise on the Venereal Disease;" "Bumstead's Pathology and Treatment of Venereal Diseases," 1861; the translation of Cullerier's "Atlas of Venereal Diseases;" and various papers in medical journals. His "Pathology and Treatment of Venereal Diseases" was his most important work, and of which several editions were issued. He was married in 1861 to M. Josephine White, daughter of Ferdinand E. White, of Boston, who with five children survived him.

BYFORD, William Heath, of Chicago, Ill., was born at Eaton, Ohio, March 20, 1817, and died May 21, 1890. He was the son of an honest toiler, upon whose health and strength alone depended the comfort and happiness of his family. A recent biographer, H. L. Conard, writes that Henry T. Byford, the father

Bedford Brown.

Bromide of Potassium in Affections of the Testis;" "Contributions to the Pathology of Adherent Placentæ;" "The Treatment of Membranous Croup by Means of Large Doses of Iodide of Potassium;" and "The Pathology and Treatment of Injury from Burns." During the Rebellion he was Surgeon and Medical Director in the Confederate Army. Dr. Brown is a member of the Medical Society of the State of Virginia, and is an ex-president of that society. Among the papers read by him before the State Medical Society are the following: "Treatment of Infantile Pneumonia;" "Treatment of Puerperal Convulsions;" "Treatment of Lacerations of the Cervix Uteri Without Surgical Operation;" "Personal Experience in the Treatment of One Thousand Cases of Pneumonia." When the Medical Examining Board of Virginia was organized, ten years ago, he was elected a member, and has continued so to the present time. Dr. Brown is also a member of the Southern Surgical and Gynecological Association; was elected vice-president at its organization, and then a member of its judicial council, and at its session in the city of Louis-

of the subject of this sketch, was a mechanic of very limited means, and thinking to better his condition removed, soon after the birth of his son, from Ohio to New Albany, Ind., where he located in what was then a new and very sparsely settled country. After remaining in New Albany about three years he moved farther west to the village of Hindostan, where he was struggling after the fashion of the pioneers to obtain a modest competency when death suddenly ended his labors, and left a wife and three orphan children to care for themselves and each other as best they could. Of the three children William was the eldest, and he was but nine years of age. For three or four years before his father's death he had been kept in school the greater part of the time, and had made flattering progress in his studies considering his age. It was well for him that he had made good use of the time which he had been permitted to spend in this way, because this was to serve as his only basis for the self-education which he afterward acquired. His school days were over, because the widow Byford found the wolf looking in at the door, and much as she regretted having to do so, she was compelled to call upon her nine-year-old boy to render such assistance as he could in supporting the family. For four years from that time he labored at whatever he could find to do, and his scant earnings oftentimes dropped into the lap of his widowed and sorely distressed mother like blessings from above. At the end of that time the mother moved to Crawford county, Ill., and joined her father, John R. Swain, who was living on a farm. This move improved the condition of the family somewhat, and after William had put in two years working on his grandfather's farm, it was decided that he should learn a trade, or rather that his wish to learn a trade should be gratified. The boy himself had not fully made up his mind what the trade should be; but when the time came for him to make a choice he set out on foot for the village of Palestine, several miles distant, and when he reached it he presented himself at a blacksmith shop and asked the smith if he would undertake to teach him how to shoe horses and become a skillful worker in iron. The blacksmith declined to have anything to do with him, for the reason that he had no need of an assistant, and the would-be apprentice continued his tramp from one shop to another with no better success until he finally caught sight of a tailor's sign and concluded to try his luck with the clothes-maker. This was an occupation for which he had no particular fancy, but he had come to town to make all necessary arrangements for learning a trade, and he was determined not to return home without accomplishing what he set out to do, if it could possibly be avoided. The tailor, whom Dr. Byford always alluded to as a kind-hearted Christian gentleman by the name of Davis, received the young man kindly, and when he started home that night it had been agreed that he should be received in the tailor's family as an apprentice, provided a certain Methodist minister in his neighborhood would recommend him as "a moral and industrious boy." This recommendation he had no difficulty in getting, and in a little time he found himself duly installed as a tailor's apprentice. At the end of two years his employer removed

to Kentucky, and the young apprentice went to Vincennes, Ind., where he finished learning his trade. He was at this time twenty years of age, and had made the discovery that learning a trade did not, as he had anticipated it would some years earlier, gratify his ambition. While serving his apprenticeship he had devoted all his spare time to study, and, day after day, he had worked industriously upon a garment, half concealing some old textbook which was contributing to his store of knowledge. In this way he had gained a fair knowledge of both the Greek and Latin languages, read Cicero, Virgil, Sallust, the *Historia Sacra*, Homer's *Iliad* and the Greek Testament. Then he turned his attention to physiology and chemistry and began to get interested in the study of medicine to such an extent that he determined to make an effort to become a physician. With this object in view he entered upon a course of study with Dr. Joseph Maddox, of Vincennes, and at the end of eighteen months was examined, according to a custom then prevailing in Indiana, by three commissioners appointed for the purpose, who certified that they were satisfied with his acquirements and authorized him to engage in the practice of medicine. He began his professional avocation at Owensville, Ind. Two years later he removed to Mt. Vernon, in the same State, where he associated himself in practice with Dr. Hezekiah Holland, whose daughter he afterward married. He received his medical degree from the Ohio Medical College, in 1844. Dr. Byford remained at Mt. Vernon until 1850. During the ten years that he was established there he had taken high rank among the physicians of the State. He was then called to Evansville, Ind., to take the chair of Anatomy in the Evansville Medical College. In 1852 he was transferred to the Professorship of Theory and Practice, a position he retained until 1856, at which time the institution ceased to exist. He continued to practice medicine in Evansville, and in 1857 was elected vice-president of the American Medical Association. Soon after this he was called to Rush Medical College, Chicago, to take the chair of Obstetrics and Diseases of Women and Children. When differences between members of the Faculty of Rush College led to the organization of the Chicago Medical College in 1859, Dr. Byford was associated with other gentlemen in building up the new college, and was prominently identified with that institution until 1879, when he was again called to Rush College to take the chair of Gynecology, a new professorship created by the trustees of the institution, with the understanding that he would accept it. While connected with the Chicago Medical College he was instrumental in building up the Women's Medical College of Chicago, one of the three or four institutions of the kind now being successfully carried on in the United States. What led to the foundation of this institution were certain circumstances which appealed to Dr. Byford's sympathetic nature and induced him to put forth his best efforts in behalf of those whose ambitions it seemed to him were being needlessly and unfairly circumscribed and held in check. With characteristic energy he set about carrying out this new project. In a short time, as a result of his efforts, the Women's Hospital Medical College was organized and a faculty

was selected, made up of some of the most prominent physicians of the city. Dr. Byford was made president of the Faculty, and also of the Board of Trustees, and both of these positions he held until his death. In the fall of 1870 the new college opened its doors, and eleven female students attended the first course of lectures, but the fire of 1871 swept everything belonging to the college out of existence. Notwithstanding this heavy loss, rooms were again fitted up in connection with the Hospital for Women and Children, and the fall term of the institution commenced at the regular time. Since that time the college has been divorced from the Hospital for Women and Children, and now depends entirely upon its own resources. A short time before Dr. Byford's death a handsome college building, worth about forty thousand dollars, was completed, with facilities for the accommodation of about two hundred and fifty lady students, and the Women's Medical College now takes rank among the prominent educational institutions of Chicago. While giving much time and attention to the affairs of the different medical colleges in Chicago with which during the last years of his life he was connected, Dr. Byford also found opportunities for much other work. In 1876 a number of the eminent physicians of the country organized the American Gynecological Society. Dr. Byford was prominently identified with this movement and was elected one of the first vice-presidents. In 1881 he was made president of that society. In 1875, when the Medical Press Association of Chicago was organized and the two medical journals then published in the city, under the titles, respectively, of *Medical Journal* and *Medical Examiner*, were consolidated, under the name of the *Chicago Medical Journal and Examiner*, Dr. Byford was a prominent mover in the enterprise which gave to the city a medical periodical of character and standing, and for three years he was editor-in-chief of that publication. He also contributed many valuable monographs and text-books relating to subjects within his special field of practice, among which may be mentioned, "Chronic Inflammation of the Cervix Uteri," "Treatise on the Chronic Inflammation and Displacements of the Uterus," 1864; "Practice of Medicine and Surgery Applied to Diseases of Women," 1865; and, a "Treatise on the Theory and Practice of Obstetrics," 1870. Revised editions of some of these works have been issued. While his writings have covered a broad field within professional lines, only once did he venture outside of that domain. That was when he wrote and published, in 1868, a small octavo volume entitled, *The Philosophy of Domestic Life*, which met with a favorable reception from the reading public. In the city which, for more than thirty years was the home of Dr. Byford, he was no less noted for the broad liberality of his views, and the kindly impulses of his nature than for his success in his chosen field of labor; while his views upon question pertaining to the practice of medicine were always clearly defined, and his convictions relative to public policy always positive, he apparently never had either the time or the inclination to engage in profitless controversy, to criticise the methods of brother practitioners, or to find fault with those who held opinions differing from his own. As a gynecian surgeon he

ranked with the most eminent of this country. For fifty years he had been in active life, and nearly all that time engaged in the practice of a profession which brought him in contact with all classes and kinds of people, and yet it is said that among all those with whom he has been associated professionally, and otherwise, probably not one could be found to-day who would be willing to admit any but the kindest feeling and remembrance for this distinguished physician. It is said that the young practitioners of medicine who were thrown in contact with Dr. Byford, never found a better friend. Himself a self-made man, he never forgot his own early struggles, and never missed an opportunity of giving to others similarly situated, so far as lay in his power, the aid and encouragement which would have been of such inestimable value to him in his early manhood.

CALE, George W., of St. Louis, Mo., was graduated M. D. at the St. Louis College of Physicians and Surgeons in 1887, and is now Professor of Descriptive, Surgical and Pathological Anatomy and Clinical Genito-Urinary Surgery in that institution; also Secretary of the Faculty. Dr. Cale is Fellow of the Royal Microscopical Society, London; member of the St. Louis Medical Society; Missouri State Medical Society, and the Mississippi Valley Medical Association.

CAMPBELL, Daniel, of Saxtons River, Vt., was born in Westminster, Vt., March 20, 1820.

D. Campbell

His grandfather was a noted physician and a direct descendant from the house of Argyle, Scotland. He received his education in the common schools, and at the Burr & Burton

Academy, in Manchester, Vt. His medical education was obtained at the Vermont Medical College, Woodstock, and at the Berkshire Medical College, Pittsfield, Mass. He was Demonstrator of Anatomy at Berkshire for a year or more, and was associated in practice with Professor H. H. Childs, at that time Lieutenant-Governor of Massachusetts. After leaving Pittsfield he returned to Westminster, Vt., where he remained about ten years, and then removed to Saxton's River, where he has since resided. Several years ago he was offered the chair of Theory and Practice in Dartmouth College, but declined the offer, preferring the bedside of his patients to a professor's chair. He represented his town in the Vermont Legislature of 1864 and 1865, and was the Democratic candidate for speaker. Has several times been that party's candidate for County Senator. In 1880 was Democratic nominee for Congress, being defeated by Judge James M. Tyler, Republican. Dr. Campbell was formerly a member of the American Medical Association, Vermont Medical Society, and other local societies, but for several years has partly retired from active practice.

CAMPBELL, Edward Raymond, of Bellows Falls, Vt., son of Dr. Daniel Campbell, was born in Westminster, Vt., September 27, 1853. He was educated in the common schools, Kim-

Edward Campbell

ball Union Academy, Meriden, N. H., and Dartmouth College (scientific department). Studied medicine with his father and at Dartmouth, graduating from the University of Vermont, in 1875, being elected valedictorian by his class. He practiced medicine for two years in Turner's Falls, Mass., where he joined the Massachusetts Medical Society. In 1878 he removed to Bellows Falls, Vt., where he has since resided. He married Miss Inez E. Morse

in 1876. In 1886 he was elected vice-president of the Vermont State Medical Society, and its president in 1888, and has from time to time contributed a number of papers to its Transactions. Has been a member of the American Medical Association since 1880, and is a member of several other medical societies. He has been United States Examining Surgeon for Pensions since 1885.

CAMPBELL, Donald S., of Detroit, Mich., was graduated in medicine at the University of Michigan, Ann Arbor, in 1877, and his medical education and training were supplemented by attending the New York Polyclinic in 1885. He is a member of the Niagara Medical Society, New York; and also of the American Medical, American Electro-Therapeutical Associations; Detroit Medical, and the Michigan State Medical Societies. He is Medical Examiner and Advisor for the State Mutual Life Insurance Company of Massachusetts. Dr. Campbell devotes special attention to the treatment of diseases of ear, nose and throat.

CALLAN, Peter A., of New York City, was graduated M. D. from the University of the City of New York in 1867. He is Professor of Ophthalmology in the New York Post Graduate Medical School and Hospital; Ophthalmologist to St. Vincent Hospital; Surgeon to the New York Eye and Ear Infirmary, and Consulting Ophthalmologist to the New York Foundling Asylum. Dr. Callan is an active member of the American Medical Association, and of the New York Ophthalmological Society. He is also president of the Medical Board of St. Joseph Hospital, Yonkers, N. Y.

CASE, Charles E., of Tacoma, Washington, was graduated M. D. at the California Medical College, San Francisco, in 1880. His medical education and training were supplemented by attendance at the College of Physicians and Surgeons, Chicago, 1886, New York Polyclinic and New York Post Graduate Medical School, 1888, and the Chicago Polyclinic in 1890. Dr. Case was formerly Professor of Anatomy in the California Medical College. Since settling at Tacoma his attention is devoted especially to the practice of surgery and gynecology, in which field of medicine he has attained eminent success.

CATTANACH, Andrew J., of Denver, Col., was graduated in medicine at McGill University, Montreal, in 1871, and in 1878 became a licentiate of the Royal College of Physicians and Surgeons, of Edinburgh, Scotland. He is a member of the College of Physicians and Surgeons, Ontario; Assistant Surgeon of the Denver & Rio Grande Railroad; Consulting Physician to the Deaconess Home and Hospital, Denver; member of the American Medical Association; Colorado State Medical Society; Denver Medical Association, and Arapahoe County Medical Society, Colorado.

CHEATHAM, William, of Louisville, Ky., was graduated in medicine at the University of Louisville in 1873, and now holds the Professorship of Diseases of the Eye, Ear, Nose and Throat in the Louisville Medical College. Dr. Cheatham is an active member of the Kentucky State Medical Society; American Medical Association; Medico-Chirurgical, Louisville Clinical, Louisville Surgical, and Jefferson County Medical Societies; and is president of the Medico-Chirurgical Society. He is also Physician in his special field of practice to the Louisville City Hospital.

CHEESMAN, Hobart, of New York City, was graduated M. D. from the University of the City of New York, in 1878. He was Instructor in Genito-Urinary Practice, New York Post-Graduate Medical School and Hospital for several years, and is now Medical Director of the Commercial Life Insurance Company, New York. Dr. Cheesman is a member of the New York Academy of Medicine, New York County Medical Society, Manhattan Medical and Surgical Society, and the Society for the Relief of Widows and Orphans of Medical Men.

CHENEY, Frederick E., of Boston, Mass., was graduated M. D. at Harvard in 1885, and is now Instructor in Ophthalmoscopy in that institution. Dr. Cheney is also Assistant Surgeon to the Massachusetts Charitable Eye and Ear Infirmary; Ophthalmic Assistant to the Massachusetts General Hospital; secretary of the New England Ophthalmological Society; member of the Massachusetts Medical Society; Boston Society for Medical Improvement, and the Boston Society for Medical Observation.

COBLEIGH, E. A., of Chattanooga, Tenn., was graduated M. D. at the Atlanta Medical College, Atlanta, Ga., in 1874. He is now dean of the Faculty of the Chattanooga Medical College and Professor of the Principles and Practice of Medicine and Dermatology in that institution. Dr. Cobleigh is a member of the Board of United States Examining Surgeons for the Pension Bureau, and an active member of the Chattanooga Medical Society; Tennessee Medical Society; American Public Health Association, and of the Tri-State Medical Society, which includes the States of Alabama, Georgia, and Tennessee.

COE, Henry Clarke, of New York City, was born in Cincinnati, Ohio, February 21, 1856. He is descended from an old Puritan stock, being the seventh generation in direct descent from John and Priscilla Alden. His maternal great-grandfather was an officer on board Paul Jones' ship, the "Bon Homme Richard," in the fight with the "Serapis." His paternal grandfather settled in Newport, R. I., where he at one time during the war of 1812 commanded at Fort Adams. Dr. Coe received his early education in Cincinnati, and entered Yale College in 1874, graduating with the degree of A. B. in 1878. Three years later he received the degree of A. M. from Yale after an examination in modern languages. He graduated from the Harvard Medical School in 1881, and from the College of Physicians and Surgeons, New York, in 1882. After spending a year and a half as *Interne* in the New York State Woman's Hospital he went abroad and pursued his medical studies in London and Vienna, devoting his attention largely to obstetrics. While in London he entered the Middlesex Hospital, and received degrees from the Royal College of Physicians and Surgeons. He returned to New York City in 1884, where he has since been engaged in a lucrative practice, devoted almost entirely to gynecology and obstetrics. Dr. Coe has contributed over one hundred articles to various medical journals and has written several monographs for works on gynecology and obstetrics, his interest lying chiefly in the direction of pelvic pathology, especially that of malignant diseases. He has held the position of Secretary of the American Gynecological Society for several years, and is a member of various local

medical societies. Dr. Coe has been Professor of Gynecology at the New York Polyclinic for four years, and is at present connected with the following institutions (in which he has held positions for five or six years): Gynecologist to the New York Cancer Hospital; Obstetric Surgeon to the New York Maternity Hospital, and Assistant Surgeon to the Woman's Hospital, in the State of New York.

COE, Henry W., of Portland, Ore., was graduated in medicine at the Long Island College Hospital, Brooklyn, N. Y., in 1880. He is now Professor of Anatomy in Willamette University. He is an active member of the Portland Medical Society, Portland Clinical Society, Oregon State Medical Society, National Association of Railway Surgeons, and American Association for the Advancement of Science. Dr. Coe is editor of the *Pacific Medical Record*, and Medical Examiner and Advisor for several of the leading life insurance companies of the United States.

COGSWELL, William, of Bradford, Massachusetts, was born of New England parents in 1819, and died at his home August 15, 1891. He began the study of medicine in early life, and was graduated M. D. at Dartmouth Medical College in 1840. He was president of the Massachusetts State Medical Society in 1876, and in the year following was a member of the Governor's Council. Dr. Cogswell was a well-known, accomplished and highly esteemed physician, and occasionally contributed important articles to periodicals on medico-legal subjects.

COLE, Frederick, of Garden City, Kansas, was born in Cornish, Maine, March 30, 1829.

Frederick Cole

He received an academic education and prepared himself for a teacher and taught school for several years. He went to Illinois in 1852; taught there till 1862. Studied medicine in Rockford, Ill., and was graduated at Rush Medical College, 1865, and was commissioned by Governor Oglesby as Assistant Surgeon One Hundred and Fifty-first Illinois Volunteers, then in Georgia, and was mustered

out 1866. He removed to El Paso, Ill., in 1867, and continued in the general practice of medicine and surgery there till 1886, when he moved to his present location. He was one of the prime organizers of the Woodford County Medical Association and the North Central, both of Illinois, the latter comprising many counties of the central and northern parts of the State. He is a member of the Illinois State Medical Society and of the American Medical Association. He organized the Garden City and Southwest Kansas Medical Association, and was its first president. He received the *ad eundem* degree from Bellevue Hospital Medical College, New York, in 1870. Dr. Cole was Surgeon for the Illinois Central and Wabash and St. Louis Railroads for many years; U. S. Examining Surgeon for the Pension Bureau in Illinois, and organized a Board in Garden City in 1887, of which he has been a continuous member. He has taken an active interest in all medical associations, contributing much in the way of essays, addresses and clinical reports. Several of these have been printed—one on "Conservative Surgery" and "Our Profession" in pamphlet form. He made a report on "Conservative Surgery in Railroad Accidents," at the second meeting of the Wabash Railroad Surgeons at Fort Wayne, Ind., June 4, 1883. He has always taken an active interest in educational matters since teaching, delivering lectures before educational associations, and having been a member of school boards many years. He is an active Mason, having filled several important positions in the order, and been exalted to the Scottish Rite, Thirty-second Degree. Giving up the general practice, he confines himself to office work and consultation, having been elected president of the Bank of Western Kansas.

COLLINS, John Wallace, of Denver, Colorado, a native of Green county, Alabama, was born December 22, 1835. He studied medicine from 1857 to 1860, and graduated March 20, 1860, from Medical Department of University of Louisiana. Locating in Southern Alabama, he practiced there eighteen months. He joined the Confederate States Army in September, 1861, as third sergeant, Company C., Third Alabama Cavalry; was appointed acting assistant surgeon of his regiment, March, 1862; was commissioned surgeon of the Eighth Tennessee Regiment (infantry), Cheatam's Division, in September, 1862, in which regiment he served as surgeon until the eve of the engagement at Murfreesboro, Tennessee, known as Stone's River, when he was transferred to the First Regiment Tennessee Infantry, with which regiment he served until September, 1863, when he was transferred to the Artillery of Polk's Corps, with which command he served as chief surgeon until the campaign of Chickamauga, when he was transferred to the Cavalry Division of Gen. W. T. Martin, of Wheeler's Corps, with which command he served until January, 1865; he was then furloughed, because of a wound received at Martin's Bluff, South Carolina, just before the close of the War of the Rebellion. After which he located at Shubuta, Eastern Mississippi; removed to Jackson, West Tennessee, November, 1869. He afterwards located at Colorado Springs, Colorado, November, 1879; removed to Pueblo, Colorado, in 1881, and to Denver, Colorado, in 1885. Dr. Collins has been twice married—Miss E. E. Gil-

more, his first wife, to whom he was married September 3, 1856, died at Pueblo, Colorado, in 1884; he was again married in 1885, to Miss Annie B. Rhodes, of Denver. Upon locating in Denver he limited his practice to gynecology; was elected to the chair of Gynecology and Abdominal Surgery, in the Faculty of the Medical Department of the University of Denver, 1887, which chair he now holds. He was elected president of Colorado State Medical Society for the years 1889 and 1890. He is a member of the Colorado State Medical Society, member of Denver Medical Association, and of Arapahoe County Medical Society, and also of the Denver Obstetrical and Gynecological Society. On account of failing health from sedentary life in office work, he has again engaged in general medical and surgical work, in connection with gynecology and abdominal surgery.

COMFORT, Aaron Ivins, of Milwaukee, Wisconsin, is a native of Bucks county, Pennsylvania. After having acquired a common school education, he devoted himself to the study of mathematics and the elementary classics, teaching school during vacation, and graduated at Williston Seminary, East Hampton, Massachusetts. Subsequently, a short scientific course was entered upon at Amherst College, Massachusetts, after which he accepted a situation in a private seminary in the city of Philadelphia and taught mathematics, the classics and some of the natural sciences, and delivered lectures, once a week, upon anatomy, physiology and hygiene in that institution. He graduated in medicine at the University of Pennsylvania in the class of 1860. Immediately after graduating he accepted the position of Assistant Demonstrator of Anatomy in his *Alma Mater*, and at the same time he became Attending Physician, and, subsequently, Consulting Physician to the Southern Dispensary in the Moyamensing district of Philadelphia. He likewise held the position of Attending, and, subsequently, Consulting Accoucheur, in the Philadelphia Lying-in Charity. In the early part of February, 1862, he entered the Government service as an Acting Assistant Surgeon United States Army, and was assigned to duty with troops in the field, viz.: the Anderson troops, a company of volunteer cavalry acting as Gen. D. C. Buell's escort, and subsequently, in the autumn of 1862, he was assigned to duty as the only medical officer, with the Fourth Regiment United States Cavalry, in which capacity he served until about the 9th of June, 1863. In the capacity of a medical officer he was present at the battle of Pittsburg Landing, Tennessee; at the siege of Corinth, Mississippi; at the battle of Perryville, Kentucky, and at the battle of Murfreesboro, Tennessee, at which battle he rode in person with that regiment in its now historical charge. At that battle he received favorable mention in the report of the medical director of the Army of the Cumberland, and also in the report of the commanding officer of the Fourth Regiment of United States Cavalry. While on the battle-field, during the engagement, and in search of a wounded officer, he captured a Confederate soldier, disarmed him, and made him a prisoner of war. During the first half of 1863 he was in a charge of the Fourth Regiment United States Cavalry, at Snow Hill, Tennessee; in a charge of that regiment at Franklin, Tennessee, and, also, with that

regiment in a number of other charges, skirmishes and similar engagements in the vicinity of Murfreesboro, Tennessee. During August and several subsequent months, he was on duty at the United States General Hospital at Chester, Pennsylvania. In the spring of 1864 he accepted from President Lincoln a commission as Assistant Surgeon United States Volunteers, having previously passed a satisfactory examination by a board of Medical officers of the Regular Army. As Assistant Surgeon of Volunteers, he was during a part of the spring of 1864 on duty with troops in the field. During the summer and autumn of that year he was in charge of a small-pox hospital; and also a post hospital at Columbia, Tennessee. At the advance of the Confederate General Hood upon Nashville, when it seemed impossible to prevent the sick and wounded, in the field hospital at Columbia, Tennessee, from falling into the hands of the enemy, he was detailed to remain "in charge" of the sick and wounded; and but for the fact that they were subsequently removed under the cover of the night, he, with them, would have been made prisoner of war. From the battle of Franklin he was sent in charge of a hospital train to Nashville. He was present at the battle of Nashville. He was on duty at the Cavalry Corps Hospital, at Gallatin, Tennessee, during the greater part of January and February, 1865. During the spring, and a greater part of the summer of that year he was "Surgeon in Charge" of Hospital No. 16 at Nashville, said hospital having a capacity of four or five hundred beds, and a staff of five or six medical officers. After the close of the war, when the general hospitals were closed, he was ordered to sell, at auction, the unserviceable property of Hospitals No. 8 and No. 16 and of one or two others, and the sum of several thousand dollars, realized therefrom, reverted to the treasury of the United States. During the greater part of the summer and autumn of 1865 he was in charge of Post Hospital at Clarksville, Tennessee. On the third of November, 1865, he was mustered out of the service with the brevet rank of Captain of Volunteers, but he was assigned to duty as acting Assistant Surgeon United States Army, at the headquarters of Major-General George H. Thomas at Nashville, and at once made Post Surgeon, or "Physician in attendance upon officers and their families." During the spring, summer and autumn of 1866 he was on duty as the only medical officer with the Third Battalion of the Sixteenth United States Infantry at Sibley Barrack, Nashville. During the summer of that year an epidemic of Asiatic cholera of great fatality prevailed, not only in the city of Nashville, but among the troops stationed there, and he suffered with a mild attack of that disease. From December 6, 1866, to March 4, 1868, he was engaged in a civil practice near Philadelphia. At the latter date he again accepted a situation as acting Assistant Surgeon United States Army, and was assigned to duty at the headquarters of Major-General Alfred Ferry at St. Paul, Minnesota, but in the latter part of the spring of that year he was stationed at Fort Wadsworth, now Fort Sisseton, Dakota, as Post Surgeon, where he remained on duty until the spring of 1869, when he was ordered to Fort Ripley, Minnesota, as Post Surgeon, where he remained on duty until near the first of January,

1870, when he was stationed at Fort Randall, Dakota, until the spring of 1871, and for the greater part of this time he was the only medical officer at that post. From the spring of 1871 to January 1, 1877, he was stationed at Fort Sully, Dakota, excepting during the spring and summer of 1876, when he was stationed at Cheyenne Indian Agency. On several occasions and for several months at a time, while at Fort Sully, he was the only medical officer at the post. On the first of January, 1877, his contract was annulled. On the twenty-fifth of December, of the same year, upon application to the medical director of the Department of the Missouri, under whom he had served in the Army of the Cumberland, he was again employed as an acting Assistant Surgeon United States Army, and assigned to duty at the camp of the Nez Percés Indians, who were then held as prisoners of war on the Military Reservation, near Fort Leavenworth, Kansas. Excepting one month, when he was post surgeon at Fort Hays, Kansas, he remained as physician to these Indians until July 4, 1878, when he was ordered to Fort Lyon, Col., as post surgeon, and subsequently to Fort Wallace, Kansas, as the only medical officer stationed at that post. In the autumn of 1878 he was on duty with troops in the field, operating against the Cheyenne Indians, who were then on the "war-path," having escaped from their reservation near Fort Reno, Indian Territory. From mid-summer, 1879, to February, 1880, he was on duty at the cantonment on the north fork of the Canadian river, Indian Territory. During the spring, summer and autumn of 1880 he was on duty with troops stationed in the field. From December 1, 1880, until April 9, 1881, he was post surgeon at Fort Garland, Colorado, and from April 12, 1881, until the 12th of May he was post surgeon at the cantonment on the Uncompahgre river, Colorado. From mid-summer until the latter part of autumn of that year he was on duty with troops in the field, operating against hostile Indians in Middle Park, Colorado. After the return of the troops from their summer campaign and during the following winter he was on duty at Fort Hays, Kansas, having, during the autumn of that year, accompanied as the only medical officer the Nineteenth United States Infantry to Fort Brown, Texas, and returned in the same capacity with the Twentieth Infantry to Fort Leavenworth, Kansas. From about the middle of April, 1882, until about the middle of July he was stationed at the cantonment on the north fork of the Canadian river, Indian Territory, and when the post was abandoned he accompanied the troops to Fort Elliott, Texas, and, upon his return to the cantonment, transferred the hospital property to Fort Reno, Indian Territory, after the completion of which he was stationed for a short time as the only medical officer at Fort Riley, Kansas; subsequently, for several months he was on duty at Fort Leavenworth, Kansas, and late in the autumn of that year he was ordered to accompany a battalion of the Fifteenth Regiment of United States Infantry from Fort Lyon, Colorado, to Fort Randall, Dakota. During the winter of 1882-83 he was on duty at Fort Hays, Kansas, and about the middle of April, 1883, he was ordered to the cantonment on the Uncompahgre river, Colorado, where he remained on duty until about the middle of June, 1884.

From the middle of June, 1884, until the early part of July, 1887, his station was Fort Lewis, Colorado, though when troops were ordered to the field he accompanied them as their only medical officer in attendance. During the summer campaigns of 1884, 1885 and 1886 he was on duty with troops in the valley of the San Juan river, in Colorado, New Mexico and Utah, operating against hostile Indians. In the early part of July, 1887, he left Fort Lewis, Colorado, under orders to report in person to the commanding officer of Fort Reno, Indian Territory, and from thence he was ordered to the Osage Indian Agency as the medical officer with a troop of cavalry on duty in the field. Upon the return of the troops to their winter quarters, he was ordered on duty at the United States Military Prison at Fort Leavenworth, Kansas. Dr. Comfort now holds the position of First Assistant Surgeon of the Northwest Branch of the National Home for Disabled Volunteer Soldiers, at Milwaukee, Wisconsin. Although he has not sought to acquire a literary reputation, preferring to devote his attention practically to his profession, he has contributed a monograph on "Aboriginal Archeological Indian Mounds" to the Smithsonian Institution, which appeared in one of its reports for the year 1871. Articles from his pen have appeared in our medical journals. A valuable collection of Indian crania and skeletons of the race of mound builders have been contributed by Dr. Comfort to the Army Medical Museum in Washington, D. C. For more than a quarter of a century he has performed the duties of a commissioned medical officer of the United States Army in many positions of trust, responsibility and danger. His professional opinion is not unfrequently sought, in consultation, in cases of diseases and injuries of a grave character or doubtful diagnosis.

CORLETT, William Thomas, of Cleveland, Ohio, was graduated M. D. at the Medical Department of the Western Reserve University, Cleveland, in 1877. His medical education and training were supplemented by attending the Royal College of Physicians and Surgeons, London, and he became a licentiate of that institution in 1881. He is Professor of Dermatology in the Medical Department of the Western Reserve University; Consulting Physician for Diseases of the Skin to City and Charity Hospitals, Cleveland; member of the American Dermatological, and the American Medical Associations; Cleveland Society of Medical Science; Cuyahoga County and Ohio State Medical Societies; also of the Union Medical Association of Northeastern Ohio.

CORWIN, Theodore W., of Newark, New Jersey, was graduated in medicine at College of Physicians and Surgeons, New York City, in 1879. He is Attending Physician to St. Barnaba's Hospital, and Throat Surgeon and Assistant Dermatologist to St. Michael's Hospital, Newark. He is an active member of the Essex County District Medical Society, Newark Medical Association, and Practitioners' Club. Dr. Corwin is Examining Physician for the order Knights of Honor, and for numerous life insurance companies.

CRAIG, Burdette P., of Jersey City, New Jersey, was graduated M. D. at the Bellevue Hospital Medical College, New York City, in 1885. He is Attending Physician to the St. Francis and Christ Hospitals, and also to the

Home of the Homeless, Jersey City. Dr. Craig is a Fellow of the New Jersey Academy of Medicine, and an active member of the Hudson County and the New Jersey State Medical Societies. He is Medical Examiner and Advisor for the Pennsylvania Mutual Life Insurance Company of Philadelphia, and also for the Mutual Reserve Life Insurance Company of New York.

CROFFORD, Thomas J., of Memphis, Tennessee, was graduated M. D. at the Hospital College of Medicine, Louisville, Kentucky, in 1876. He is now Professor of Physiology in the Memphis Hospital Medical College, and is an active member of the Memphis Medical Society; Tennessee State Medical Society; Tri-State Medical Society, and honorary member of the Mississippi State Medical Society. He is also gynecologist to St. Joseph's Hospital, Memphis, and proprietor of Crofford's Sanitarium for Women.

CROSE, Samuel E., of Indianapolis, Indiana, was born in Cloverdale, in the same State, November 18, 1865. He is a son of the late John A. Crose, of the First National Bank of Greencastle, a gentleman of well known integrity and business capacity, whose death occurred October 28, 1891. His mother was a Johnson, and of the same family to which the late President

-Samuel E. Crose.

Johnson belonged. He is also related to the Buskirks, of Indiana, well represented in the Bench and Bar of that State, and is a brother of W. M. Crose of the United States Navy. Dr. Crose was educated at De Pauw University, from which he graduated in 1885, receiving at that time the degree of B. Ph., and in 1888 that of A. M. As a student his favorite branches were the natural sciences, and more especially chemistry, in which he took an extended course of laboratory experiments and training. His aptitude in mathematics he perhaps inherited from his father, who was noted for his proficiency in this branch of science. Dr. Crose studied medicine in the office of Dr. G. C. Smythe, of Greencastle, an ex-president of the

Indiana State Medical Society, and also president of the Board of Trustees of the Central College of Physicians and Surgeons. It was at this institution that the subject of this sketch attended lectures, and from which he was graduated in 1888. At this time he was awarded a gold medal, the Faculty prize, for the highest general average in the college examinations. He was also awarded a position as one of the City Hospital physicians, as a result of a competitive examination, open to all the graduates of the regular medical colleges of Indianapolis. After serving a year in this capacity, Dr. Crose began the general practice of medicine and surgery, in which for a young man he has already attained excellent success. He was elected Demonstrator of Chemistry in his *Alma Mater* in 1889; also Professor of Chemistry and Toxicology in the Indiana Veterinary College in 1892, and has creditably filled those positions ever since. He is also a member of the staff of the City and Polyclinic Dispensaries, and is a member of the Marion County and the Indiana State Medical Societies. On June 1, 1893, Dr. Crose was married to Miss Georgie Gordon in Toronto, Canada.

CROWELL, Homer C., of Kansas City, Missouri, was graduated M. D. from the Medical Department of the University of Vermont, in 1875, and his medical education and training were supplemented by attending the New York Post-Graduate School in 1888. Dr. Crowell is now Gynecologist to All-Saints' Hospital, Kansas City. He is an active member of the Missouri State Medical Society, Missouri Valley Medical Society, Jackson County Medical Society and the Kansas City Academy of Medicine.

CRUMMER, Benjamin F., of Omaha, Nebraska, was graduated in medicine at the University of Michigan, Ann Arbor, in 1869, and also at the University of the City of New York, in 1875. He is Physician-in-chief to the Methodist Hospital and Visiting Physician to St. Joseph's Hospital. He is Professor of Physiology and Diseases of Children in the John A. Creighton Medical College, Omaha, and a member of numerous medical societies, including the American Medical Association.

CUDDY, John W., of Baltimore, Maryland, son of John P. and Ruth C. Cuddy, was born in Baltimore county, April 7, 1840. Referring to the ancestry, early life, and professional achievements of the subject of this subject, we quote the following extract from the Biographical Cyclopaedia of Representative Men of Maryland: "His grandfather, Captain Lawson Cuddy, bore a brave and conspicuous part in the War of 1812-15. Dr. Cuddy pursued a classical and scientific course at Calvert College, New Windsor, Maryland, and received therefrom the degree of Master of Arts. He was decidedly literary in his tastes, and intended to fit himself for a professorship, but on leaving college he was induced by the family physician, Dr. Joshua R. Nelson, to commence the study of medicine. He accordingly placed himself under the instruction of the celebrated Professor Nathan R. Smith, the acknowledged leader in medicine and surgery, in Baltimore, and attended a thorough course of lectures at the University of Maryland, from which he received, in March, 1863, his degree of Doctor of Medicine. He was for sixteen months an assistant surgeon in the

Federal Army during the late war, and was stationed in the hospitals of Washington and Alexandria. Since that time he has pursued a highly successful practice in Baltimore. He was united in marriage, March 17, 1863, with Laura C. Graham, of that city. His only child, Clarence Eugene Cuddy, was born October 23, 1868. He is decidedly conservative in religion and politics, endeavoring to keep the happy mean between all extremes, and to hold fast to all that is good, rejecting whatever seems to him unworthy. He is a man of fine personal appearance. His manner is exceedingly pleasant, frank, and cordial, inspiring instant confidence in his character and skill. He holds a deservedly high rank in his profession, and is greatly esteemed in the community." Dr. Cuddy is of a literary turn of mind; writes for the public press; and lectures on popular subjects throughout the country, his most popular lecture being on "Manhood and its Requirements." Has also published a novellette, entitled, "Dr. Milton's Sweetheart—a Story of the War." Among his many articles published are the following: "Marked Uses and Actions of Veratrum Viride;" "Original Research in Typhoid Fever;" "A Quarter of a Century in Medicine;" "The Relation of Physician and Druggist;" "Pharmacy Then and Now;" "Some Phases of the Civil Law in Relation to the Development of Man." The two last mentioned were read before the American Medical Association. Also, a report of "A Remarkable Cardiac Hypertrophy, with Account of Necropsy." This hypertrophied heart, which the doctor has in his possession, is one of the largest, if not the largest ever known in this country. After being emptied of its liquid contents, it weighed forty-six ounces. In 1888 Dr. Cuddy was elected Professor of *Materia Medica* and Therapeutics and Clinical Medicine in the Baltimore University School of Medicine, a position he still retains.

CULLEN, Gilbert I., of Cincinnati, Ohio, was graduated M. D. at the Cincinnati College of Medicine and Surgery in 1890. He is editor of the *Cincinnati Medical Journal*; Consulting Laryngologist to the Cincinnati Free Surgical Hospital for Women; Demonstrator of Laryngology and Otology in the Woman's Medical College of Cincinnati, and Assistant Professor of Laryngology and Otology in the Cincinnati College of Medicine and Surgery. Dr. Cullen is also Treasurer of the Ohio State Medical Society.

CULLEN, J. S. Dorsey., of Richmond, Virginia, was educated at the Medical College of Virginia, and received his medical degree from that institution in 1853. He is an active member of the Medical Society of Virginia, and the Richmond Academy of Medicine and Surgery and ex-President of the same. He is also a member of the American Medical Association. Dr. Cullen is now Professor of Surgery in the Medical College of Virginia and Dean of the Faculty. He served in the Confederate Army during the rebellion, and was Medical Director of General Longstreet's First Corps of the Army of Northern Virginia.

CURTIS, Edward, of New York City, was graduated in medicine at the University of Pennsylvania, in 1864. He served as Medical Cadet and Assistant Surgeon in the United States Army nine years. He is Professor *Emeritus* of *Materia Medica* and Therapeutics

in the College of Physicians and Surgeons of New York City. Dr. Curtis is now Medical Director of Equitable Life Assurance Society.

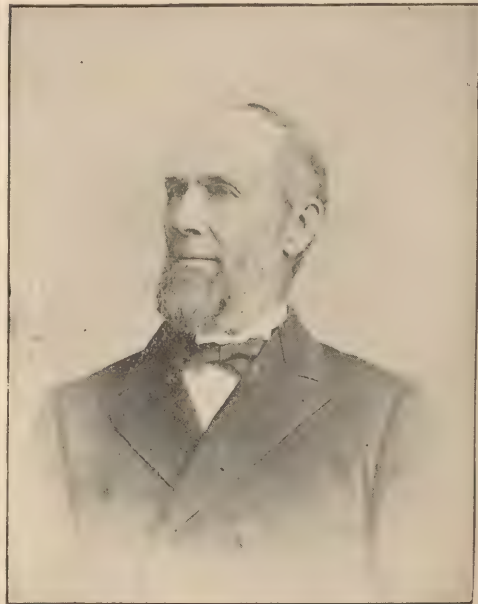

DA COSTA, Jacob M., of Philadelphia, Pennsylvania, was born in the Island of St. Thomas, West Indies, February 7, 1833. He received his literary and classical education in Germany, and pursued his medical studies at the Jefferson Medical College in Philadelphia, his preceptor being Professor Mütter, of that institution. He graduated in 1852. After passing two years in the hospitals and schools of Paris and Vienna, he returned to Philadelphia in 1854, and established himself in practice there. While pursuing a general practice he has devoted himself especially to diseases of the heart and lungs. His contributions to medical literature have been large, and upon a variety of subjects, among them being a monograph on "Epithelial Tumors and Cancer of the Skin," 1852; "An Enquiry into the Pathological Anatomy of Acute Pneumonia," 1855; "The Physicians of the Last Century," 1857; "On Cancer of the Pancreas," 1858; "On Serous Apoplexy," 1859; "Medical Diagnosis, with Special Reference to Practical Medicine," first published in 1864, of which several editions have since been issued; "Inhalation in the Treatment of Diseases of the Respiratory Passages," 1867; numerous articles in the Pennsylvania Hospital Reports, and in the *American Journal of Medical Science*; and a long series of clinical lectures, which have appeared in the *Medical and Surgical Reporter*, and the *Philadelphia Medical Times*, for many years. He was for some time Attending Physician at the Episcopal Hospital, and subsequently held the same position at the Philadelphia and Pennsylvania Hospitals. In 1864 he was appointed Lecturer on Clinical Medicine at the Jefferson Medical College, and in the spring of 1872 was chosen by the trustees of that institution to fill the chair of Professor of the Theory and Practice of Medicine, made vacant by the death of Professor Dickson. Dr. Da Costa is now *Emeritus* Professor of Practice of Medicine and Clinical Medicine in that institution. He is perhaps the best known authority on physical diagnosis in this country, and for the past thirty years has had an unexcelled reputation as a clinical teacher.

DALTON, Henry C., of St. Louis, Missouri, was born in Mississippi in 1847. He removed to St. Louis immediately after the close of the war, and engaged in the study of medicine and surgery, and in 1870 graduated from the Missouri Medical College. He served for two years as Assistant Physician in the St. Louis City Hospital. In 1884 he was appointed by Governor D. R. Francis, then mayor, Surgeon in charge of the St. Louis City Hospital, an institution through which 8,000 patients pass annually. This position he held for over four years. He is a physician and surgeon of eminence, is First Vice-President of the Missouri Medical Association, and is Professor of Surgery in the Marion-Sims College of Medicine of St. Louis. He is also a member of the American Medical Association, and during its last session attracted prominent notice by a paper which he prepared and read to the surgical section of the association. He is a thorough, positive man, first assuring himself by every means in his power of the correctness of a position, and when once assured, steadfast in his adherence to his convictions. The

Knights of Honor are indeed fortunate in securing the services of such an eminent man for the position of Supreme Medical Examiner.

DANFORTH, Isaac N., of Chicago, Illinois, was graduated M. D. at the Medical Department of Dartmouth College, in 1862. He is now Professor of Renal Diseases in the Northwestern University Medical School for Women, and Professor of Clinical Medicine in the Northwestern University Medical School. He is also Physician to St. Luke's and Wesley Hospital, Chicago. Dr. Danforth is an active member of the American Medical Association and of the Association of American Physicians.

DAVISON, Francis Barker, of Fleetville, Lackawanna county, Pennsylvania, was born in Thompson, Connecticut, July 8, 1827, and is a descendant of Nicholas Davison, who came from London, England, to Massachusetts in 1639. He came with his parents to Pennsylvania in 1830 and to a wilderness, where he had limited opportunities in the

Francis B. Davison.

common schools, but studied in the Carbondale High School and at Le Raysville Academy, and engaged in teaching several years. He studied medicine in the office of the late Prof. Wm. Darrach, of Philadelphia and graduated from the Medical Department of Pennsylvania College in 1853. He was married to Miss Nancy Gardner, of Tunkhannock, Pennsylvania, and settled in Waterloo, Black Hawk county, Iowa, in 1855, and within this year received the appointment of treasurer and recorder of the county. He was an enthusiastic admirer of General Fremont, and attended the convention which nominated him for President in 1856, and sat with the Iowa delegates. In 1858 he returned to Pennsylvania and followed his profession, and was for a time engaged in mercantile pursuits. In 1862 he was commissioned Assistant Surgeon and assigned to the One Hundred and Twenty-fifth Regiment Pennsylvania Volunteer Infantry, and in 1864 he was

Assistant Surgeon of the Second Regiment Pennsylvania Cavalry, and from this regiment was promoted to Surgeon of the Forty-fifth Regiment Pennsylvania Volunteers, which regiment was renowned by the illustrious services of Col. Theodore Gregg, Gen. John I. Curtin and ex-Gov. James A. Beaver. He was post-master from 1871 to 1874, three and one-half years. He became a member of the American Medical Association in 1885, and a member of the Pennsylvania State Medical Society the same year, and was elected president of the Lackawanna County Medical Society in 1886.

DAVISON, Henry Gardner, of Fleetville, Pennsylvania, only son of the above Francis B. Davison, was born June 28, 1862, and died October 22, 1886. Attended school at Key-

Henry G. Davison.

stone Academy, Factoryville, Pennsylvania, and Kingston Seminary, and studied medicine one year at the University of Michigan, and two years at the University Medical College, New York City, whence he graduated in 1885. He was building up a very large practice in Archbald, Pennsylvania, when he contracted a fatal attack of diphtheria from a little patient and died in one sense a martyr to his professional duty. He was a member of the Lackawanna County Medical Society, and was elected a delegate to the Pennsylvania State Medical Society in 1886, and since his death Dr. F. B. Davison, the broken-hearted father, has taken little interest in public affairs.

DAVIS, George W., of Kansas City, Missouri, was graduated M. D. at the Medical Department of the University of the City of New York, in 1876. He is now Professor of Genito-Urinary, Venereal, and Skin Diseases in the University Medical College, Kansas City, and Treasurer and Curator of that institution. Dr. Davis is a member of the American Medical Association; Missouri State Medical Society, and also of the Jackson County and Kansas City District Medical Societies.

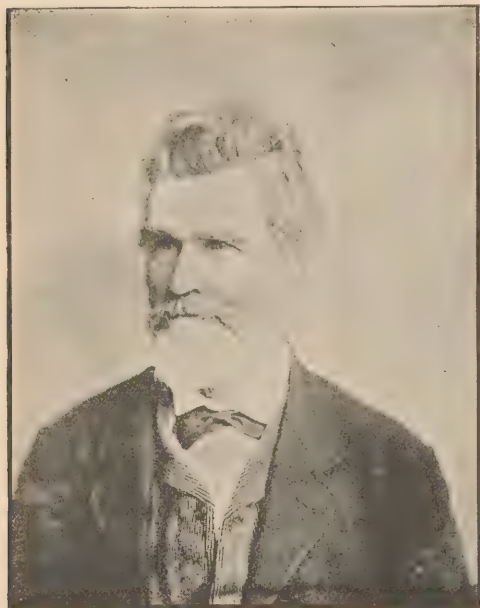

DAVIS, William C., of Denver, Colorado,

was first graduated in medicine at the College of Physicians and Surgeons, Keokuk, Iowa, in 1878, and his medical education and training were supplemented by attending the Medical College of Indiana, Indianapolis, from which institution he also received the degree of Doctor of Medicine, in 1886. Dr. Davis is an esteemed and highly accomplished physician and surgeon. He is a member of the American Medical Association; Mississippi Valley Medical Association; Denver Medical Association; Arapahoe County Medical Society, and of the State Medical Societies of Iowa, Indiana, and Colorado.

DAY, Ewing W., of Pittsburgh, Pennsylvania, was graduated M. D. at the Medical Department of the University of Georgetown, Washington, D. C., in 1889. He is now Lecturer on Diseases of the Nose and Throat, in the Western Pennsylvania Medical College; and Otologist to the Pittsburgh Free Dispensary. Dr. Day is an active member of the Allegheny County Medical Society, and the Pittsburgh Academy of Medicine.

DAY, Richard Hence, of Baton Rouge, Louisiana, was born June 9, 1813, in Calvert county, Maryland, and died December 4, 1892. His father, Robert I. Day, and his mother, Mary Hence, were both of English descent and of New England parentage. His medical education began in early life; his preceptor was Dr. Benjamin J. Day, of Bladensburg, Maryland. He graduated from the Washington Medical College of Baltimore in March, 1832. In May, 1837, he emigrated to Illinois and located in Mount Carmel, Wabash county, and soon entered upon a large practice, embracing obstetrics and surgery. In 1843 he moved to Batesville, Arkansas, where he remained till 1846, doing a full practice, but on account of continued bad health, had to seek a more southern latitude. In 1846 he settled in Patterson, St. Mary Parish, Louisiana. Here he rapidly regained his health and soon succeeded in getting a large practice and many warm-hearted friends. In 1851 he was elected to the State Legislature, serving two terms. In January, 1854, he located in Baton Rouge, the capital of the State, where he remained until his death, and did a large practice, enjoying the respect and esteem of his fellow-men, and the full confidence and respect of the entire profession. In 1868 he was State Senator from the Parish of East Baton Rouge. Dr. Day was always a hard student, a close observer, and a laborious worker in his profession, and contributed largely to its literature. Many of his contributions have been warmly and favorably noticed by the medical press, and by men distinguished in the profession for learning and ability. Among them the lamented Prof. S. D. Gross, Prof. Joseph Jones, of Tulane University, Louisiana; Prof. J. McF. Gaston, of Atlanta, Georgia, and Prof. George Harley, M. D., F. R. S., of London, England. Dr. Day was a permanent member of the American Medical Association, and ex-president of Louisiana State Medical Society. In 1889 he was elected on the medical staff of the New Orleans Polyclinic as Instructor of Diseases of Children, resigning after one term; and in 1887 was awarded an honorary diploma, unsought, by the Louisville Medical College in appreciation of his contributions to the literature of medical science. Dr. Day was thrice married. His first wife was Miss Elizabeth

Miller, of Bladensburg, Maryland, whom he married December, 1832; his second wife was Miss Lavinia Elam, of Baton Rouge, Louisiana,

Richard H. Day

whom he married May, 1853, and his third wife, who survived him, was Miss Celestine P. Rentrop, of St. Mary Parish, Louisiana, whom he married in October, 1868.

DEAN, Dexter V., of St. Louis, Missouri, was graduated M. D. at the University of Michigan, Ann Arbor, Michigan, in 1865. He is now Professor of Pathological Anatomy and Bacteriology in the Beaumont Hospital Medical College; Consulting Physician and Surgeon to the St. Louis City Hospital, and St. Louis Female Hospital. He was three years St. Louis City Chemist and Microscopist; ten years Superintendent and Surgeon-in-Charge of the St. Louis City Hospital. Dr. Dean is an active member of the American Medical Association; American Public Health Association; American Society of Microscopists; American Association for the Advancement of Science, and of the leading medical and scientific societies and organizations in his city.

DELAFIELD, Francis, of New York City, was graduated M. D. at the College of Physicians and Surgeons, New York, in 1862. He is now Professor of Pathology and Practice of Medicine in that institution. He is also Attending Physician to Roosevelt Hospital, and Consulting Physician to Bellevue Hospital. Dr. Delafield is an active member of the Association of American Physicians, and of numerous other medical and scientific organizations.

DEVENDORF, Charles A., of Detroit, Michigan, was graduated M. D. at the Bellevue Hospital Medical College, New York, in 1866. He is now Professor of Obstetrics in the Detroit College of Medicine and Visiting Physician to Harper Hospital, Woman's Hospital, and

Children's Free Hospital, Detroit. He is also Medical Examiner and Adviser for several of the leading life assurance companies of the United States. Dr. Devendorf is a member of the Michigan State Medical Society; Detroit Obstetrical Society; American Academy of Medicine, and Detroit Medical and Literary Association.

De WOLF, Oscar C., of Chicago, Illinois, was graduated M. D. at the Medical Department of the University of the City of New York, in 1858. He is now Professor of State Medicine and Public Hygiene in the Chicago Medical College. He is a member of the American Medical Association, Massachusetts Medical Society, Illinois State Medical Society, and of the British Association for the Advancement of Sciences. He is also secretary and treasurer of the Mutual Medical Aid Association.

DIEFFENBACH, Richard G. P., of Newark, New Jersey, was graduated M. D. at the College of Physicians and Surgeons, New York City, in 1874. He is now Consulting Physician and Surgeon to the German Hospital, Newark. He is an active member of the Essex County Medical Society, New Jersey State Medical Society and American Medical Association. He is also a member of the Newark Medical Association and Practitioners' Club.

Di MOISE, Bettini, of New York City, was born in Cherso, Istria (Austro-Hungary), September 29, 1849. He is a lineal descendant of the distinguished family whose name he bears, which is one of the oldest of the Venetian nobility (1384 A. D.). At the great battle of Lepanto (October 7, 1571), in which the first Papal Spanish and Venetian forces took part, two Moise brothers fitted up at their own expense two Galere, and they were distinguished for deeds of great valor. He studied in his native town, and at ten years of age he entered St. Stephen College, Padua, Italy, where he studied ancient and modern letters, physics, mathematics, rhetoric and philosophy in a course of eight years. He then made his maturity examination. From there he entered the Royal University of Padua to study medicine, where he was matriculated; he then went to Vienna, Berlin, Paris, Heidelberg, Florence and Rome to attend the lectures, and afterward he graduated from his *Alma Mater* of Padua, August 16, 1876. After this he entered as surgeon in the Austro-Hungarian army. To have the necessary qualification to be admitted to the Surgeon corps, he was obliged to pass another examination—"Nostrificationis Causa"—at the University of Buda-Pesth, and on December 7, 1877, he graduated with distinction. After some time he was Director of the Hospital of Lussino, a climatic island in the Adriatic Sea, where he made a special study of the diseases of a zymotic nature, and wrote "La Malaria e il Tifo nelle Isole del Quarnero," which monograph obtained the prize of the Hygienic Provincial Commission of Istria. After this he made a tour of the university and hospitals of Paris; he then went to the Antilles and to Mexico to make a careful study of yellow fever in the St. Sebastian Hospital of Vera Cruz; he there made a very important polemic, in which dispute he showed his profound study in microscopy and bacteriology. After this he went to New York City, where he occupies a high standing among the practicing physicians and surgeons

of that city, especially among the Italian residents, so that the celebrated Ristori and Salvini have him as their attending physician. Since the first year he went to New York he has been a member of the County Medical Society, of the City of New York, and a Fellow and Librarian of the Medico-Legal Society, and he is delegated by that body to attend the International Medical Congress, which will convene in Rome, in April, 1894, and where he will read a paper, "La tisi Causa e Ragione Legittima di Divorcio" (Consumption a Legitimate Reason for Divorce). For ten years he has been a special visiting physician (to Italian children) for the Children's Aid Society, and for a year past has been Medical Superintend-

Bettini di Moise.

ent of the Italian Hospital of New York City. At the time the Government tried to select a commission to send to Mexico to study yellow fever, as the Academy of Mexico claimed to have discovered a sure method of securing immunity against that disease, the *New York Herald* published, in part, Dr. Bettini di Moise's experience with the disease, and proved this commission futile. When the discovery of Professor Koch was announced in America, on the same day, Dr. Bettini di Moise was selected by the *Progresso Italo Americano* (a journal that has taken a deep interest in the question), to visit Berlin, and there he spent some months in the study of the subject, under Professor Koch's instruction. Dr. Bettini di Moise is a society man, and speaks all the modern languages of Europe.

DOCK, George, of Ann Arbor, Michigan, was graduated M. D. at the University of Pennsylvania in 1884. He is now Professor of Theory and Practice and Clinical Medicine in the University of Michigan, and Visiting Physician to the University Hospital. He is also a member of the American Medical Association and of the Michigan State Medical Society.

DORSET, Walter Clagett, of Columbia, Tennessee, was born July 19, 1841, in Anne Arundel county, Maryland. He is a son of Thomas

J. Dorset and Harriet (Clagett) Dorset. His father died when he was only five years old. His mother, who is still living, is now aged eighty-five years. His early education was unmethodical, closing with four months at the Virginia Military Institute in the fall of the famous John Brown Raid, when he returned to care for his mother and sister on the farm in Maryland. He was a Union man during the War of the Rebellion. While on a visit to relatives in Tennessee in 1869 he began the study of medicine. After attending one course of lectures at the University of Maryland, Baltimore, and two more courses at Bellevue Hospital Medical College, New York, he graduated from the latter institution in 1870, and in the following May began the practice of his profession at Columbia, Tennessee, where he has since remained. During this time he was nine years Jail Physician and five years County Health Officer, being the first incumbent of the latter office, which was created by the legislature in 1885. Dr. Dorset has been a member in good standing of the American Medical Association, and Vice-President of the Maury County Medical Society. He has been quite a successful general practitioner of medicine, and has accumulated a very comfortable and ample amount of property by his professional labor. He has always been conservative and pains-taking in his practice, and many of his surgical and obstetric cases have been formidable and unique. His success is attributable to his uprightness of character, to his persevering industry and strict attention to business.

DRAKE, G. Werter, of Chattanooga, Tennessee, was graduated M. D. at the Vanderbilt University, Nashville, Tennessee, in 1877. He is now Professor of Physiology and Hygiene in the Chattanooga Medical College. He is ex-president of the Chattanooga Medical Society; ex-vice-president of the Medical Society of Tennessee; member of the Board of Councilors of the Tri-State Medical Society, which includes the States of Alabama, Georgia and Tennessee. Dr. Drake is also a member of the Chattanooga Board of Health.

DRAPER, John Christopher, of New York, eldest son of Prof. John William Draper, was born in Mecklenburgh, Virginia, March 31, 1835, and died December 20, 1885. He was educated at the University of the City of New York, from the medical department of which he graduated in March, 1857, settling permanently in New York. From March, 1856, to July, 1857, he was House Physician and Surgeon to Bellevue Hospital; from December, 1858, to 1871, Professor of Analytical Chemistry in the University of New York, and from 1860 to 1863 Professor of Chemistry in the Cooper Institute. In 1863 he was chosen Professor of Natural History and Physiology in the College of the City of New York, and in 1866 Professor of Chemistry in the Medical Department of the University of New York. In July, 1873, he received the degree of LL. D. from Trinity College. He was a member of the New York Academy of Medicine; and of the New York Century Club. His principal contributions to medical literature are papers bearing the following titles: "Is the Urea in Urine Due to Muscular Motion?" "Experiments on Respiration;" "Experiments on Insensible Perspiration;" "Experiments on Adulterations of Coffee;" "The Production of Muscular Force;" "Determination of Arsenic in

Poisoning (Improved Process);" "Heat of the Body and Effects of Cold," and "Experiments with Quinine." Of books he had published "A Practical Laboratory Course in Medical Chemistry," 1882, and a "Text-book of Medical Physics," 1885.

DUDLEY, A. Palmer, of New York City, was graduated M. D. at Dartmouth College, Hanover, New Hampshire, in 1877. He is now Visiting Gynecologist to Randall's Island Hospital, and Instructor in Gynecology at the New York Post-Graduate Medical School and Hospital. Dr. Dudley is an active member of the American Gynecological Society, and of numerous other medical, scientific and social organizations of New York.

DUFFIELD, George, of Detroit, Michigan, was graduated M. D. at the Detroit Medical College in 1882. He is now Professor of Pathology in that institution; Pathologist to the Woman's Hospital, and a member of the staff of Medical Microscopists to Harper Hospital, Detroit. He is Medical Examiner and Adviser for the United States Mutual Accident Association of New York. Dr. Duffield is a member of the American Medical Association; Michigan State Medical Society; Detroit Academy of Medicine; Detroit Medical and Library Association, and of the American Microscopical Society.

DUNCAN, James K. L., of DeWitt, Nebraska, was born July 6, 1845, at Frankfort Mineral Springs, Washington county, Pennsylvania. He is a son of Colonel Jonathan and Agnes (Leeper) Duncan, who were of Scotch-Irish extraction. He gained his first fundamental principles of knowledge in the private schools of his native place. In 1854, when nine years of age, he removed with his parents to Illinois, locating on a farm near Monmouth, that State, and as it became necessary for more advanced education he was sent to Monmouth College, of which his father had a life scholarship. During one winter, prior to his attending Monmouth College, he had the benefit of the preceptorship of Rev. Robert Young, it being the great desire of his mother's life that James should fill a pulpit. Before he had completed his literary education "the War for the Union" kept before him the thought that his services were demanded by his country, but his parents were unable to give him their consent, having already two sons in the Union Army. Young Duncan had yearned for what was denied him until his patriotism got the better of him, and when the college year was closed, June 25, 1863, he boarded the train for Chicago and there entered the United States Navy for one year. On March 2, 1864, at Harrisonburg, Louisiana, he was awarded a "Medal of Honor" for gallantry in action, and his name inscribed on the "Roll of Honor" of our country's defenders, of which less than five hundred were thus distinguished out of near three millions of men enrolled. When his time had expired he returned home and to Monmouth College, and remained there during the fall and winter terms, at the close of which he re-entered the United States Navy, and again served on the Mississippi river, but was soon transferred to the Gulf Squadron. In September, 1865, he was, on account of sickness, for the first time during his service, sent to a hospital. After regaining his health, Surgeon John J. Abernethy procured his discharge for the purpose of appointing him apothecary of the

Naval Hospital at Pensacola, Florida, and he began the reading of medicine under the instruction of the eminent Drs. Wunderlich and Gale, who were then both surgeons in the navy, and attached to the hospital corps of surgeons. He remained at the hospital for nearly three years. Returning home in the fall of 1868, he attended the College of Physicians and Surgeons at Keokuk, Iowa, the following winter, and in the spring, as soon as lecture season closed he went to Memphis, Tennessee, and entered on the practice of medicine; but his health beginning to fail, from long continued close confinement and arduous habits of study, he left the South, and next hung his "shingle" out at Hamlet, Mercer county, Illinois, near his parents and old home. He remained there until the spring of 1871, when he located at Waukeee, Iowa. He there engaged in continuous active and laborious practice until the

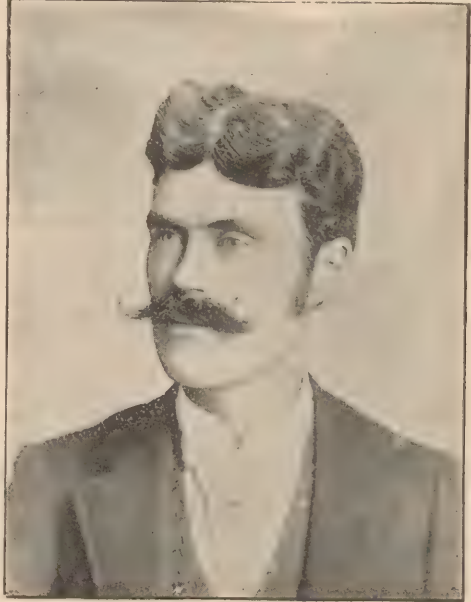

J. K. L. Duncan.

spring of 1880, when he located in his present place of residence, where he has built up a busy and lucrative practice, second to none in his section of the State. In the meantime he returned to the College of Physicians and Surgeons, Keokuk, Iowa, and was graduated at that institution in 1875. Dr. Duncan claims the priority of the operation of circumcision for the cure of convulsions due to reflex action through the sympathetic system of nerves; his first operation for it was August 1, 1880, at DeWitt, Nebraska, the patient a child five years of age; the effect, immediate relief and complete success. This treatment is now incorporated in our text-books, but at that time was not suggested in any medical literature extant. He performed ovariectomy successfully, in September, 1880, one of the first cases on record in Nebraska. In October, 1883, he treated a penetrating gunshot wound of the intestines, by the opium and rest plan (as first suggested by Professor Alonzo Clark, of New York), laparotomy not then being in vogue as now. Dr. Duncan was called to the patient within a few

minutes after he was shot, and gave him two pills of camphor and opium, which were followed every two hours by the administration of morphine in one-fourth grain doses, until eight were given, and then the same quantity every three hours for four days, and then every four hours for twelve days, thus holding the bowels in check for sixteen days and seven hours from the time he was wounded before they were allowed to be evacuated, and along with this defecation also came the thirty-eight caliber ball, which the man now carries in his pocket. Dr. Duncan has introduced many original ideas of practical value, more especially in the surgical line, one of which is his continuously threaded needle; another is his fracture bed, a device noted for its utility and simplicity. He takes great interest in his chosen profession, generally having from one to three students reading under him, and his various book-cases are well stocked with the best obtainable medical publications. He is a member of the Nebraska State Medical Society, and permanent member of the American Medical Association. Among his contributions to medical literature may be mentioned papers entitled "A Ready Diagnosis" and "Cerebro-Spinal Meningitis." Dr. Duncan was married on November 4, 1879, at Des Moines, Iowa, to Miss Lillian J. Middlekauff, by whom he has four daughters and two sons; and for the purpose of giving his children the increased educational facilities which a city offers, he has for some time past been investing in improved property in Lincoln, Nebraska, with the expectation, in the near future, of removing to that educational center of his State.

DUNN, James H., of Minneapolis, Minnesota, was born at Fort Wayne, Indiana, May 29, 1853, of Irish parents, who in 1855 removed to the territory of Minnesota, locating near the present city of Winona. Losing his father in 1859, he was given a home in the family of Mr. Jesse Wheeler, a prominent pioneer farmer of Winona county. On the death of that gentleman in 1868, when a lad of fifteen, with the progress made in the common country school, he set out on his own career without further aid or counsel from any one, first deciding upon the vocation of a teacher. After two years in the local High School he entered the Winona State Normal School, graduating in 1873, supporting himself in the first years by various kinds of labors, and latterly by teaching summer schools. On graduating he was selected as a Lecturer in the Minnesota State Teachers' Institute, in which he took a prominent part during the following five years. While in this work, at the request of the late Hon. D. Burt, Superintendent of Public Instruction, he gave special attention to the instruction of teachers in physiology and hygiene, and was led to take a medical course, the better to fit himself for this special instruction, and in accordance with the prevailing custom selected as his preceptor Dr. J. B. McGaughey, of Winona, in the summer of 1875, and received his degree of M. D. from the University of New York City in 1878. On graduating he was appointed Professor of Natural Sciences in the Mankato Normal School; but after two years the insufficiency of the salary caused him to change his profession to that of medicine, locating at Shakopee, Scott county, where he at once won a large general country practice. In 1883 he went to Europe

to take two years' post graduate studies, mainly at Vienna and Heidelberg, and on his return located at Minneapolis in May, 1886. He was Professor of Genito-Urinary Diseases and Dermatology in the Minnesota Hospital College from 1886 to 1889, and has occupied the chair of Genito-Urinary Diseases in the Medical Department of the University of Minnesota since its establishment in 1889. In 1888 and 1889 he was City Physician of Minneapolis, organizing its first municipal hospital, and is one of the Surgeons to St. Mary's Hospital,

James H. Dunn

and president of the hospital staff. He was president of the Minnesota State Medical Association in 1888. His practice is genito-urinary diseases and general surgery. While making no claim to special abdominal work, a very considerable experience in abdominal surgery has fallen to his lot with marked success; his first twenty-three ovariectomies recovered without accident. He has been a frequent contributor to northwestern medical journals.

DUNOTT, Thomas J., of Harrisburg, Pennsylvania, was graduated M. D. at the Jefferson Medical College, Philadelphia, Pennsylvania, in 1852. He is now Senior Surgeon and Attending Physician and Ophthalmologist to Harrisburg Hospital and Industrial Home. He is also surgeon to several important railway companies and Honorable Member of the American Chirurgical Society, American Medical Association, American Surgical Association, American Railway Surgeons' Association, Pennsylvania State Medical Society and Dauphin County Pathological Society.

DUNSMOOR, Frederick A., of Minneapolis, Minnesota, was graduated in medicine at the Bellevue Hospital Medical College, New York City, in 1875. He is now Dean of the Faculty of the Minnesota Hospital College and Professor of Clinical and Operative Surgery in the

Medical Department of the University of Minnesota and Surgeon to the Dispensary of the Minnesota Hospital College; Surgeon to Mary's and St. Barnabas Hospitals and to the Northern Pacific Railway Company, as well as to several other important railroads of the Northwest. Dr. Dunsmoor is an active member of American Medical Association and the Minneapolis Academy of Medicine.

DUNSTER, Edward Swift, of Ann Arbor, Michigan, was born September 2, 1834, at Springvale, York county, Maine, and died May 3, 1888. He was a lineal descendant of Henry Dunster, the first president of Harvard College, who emigrated to this country from England in 1640. Fitted for college in the public schools of Providence, Rhode Island, he afterwards entered Harvard College, graduating therefrom A. B., 1856; A. M., 1859; and subsequently studied medicine in New York as a private pupil of Professor Peaslee, and graduated at the New York College of Medicine and Surgery, with the degree of M. D., in 1859. He also attended one course of lectures in the Medical Department of Dartmouth College. After graduating he entered St. Luke's Hospital, and in 1860 commenced practice in the city of New York. Entering the army in June, 1861, as Assistant Surgeon, he subsequently served in Western Virginia and the Peninsula campaign under McClellan, in charge of various hospitals, and as Medical Inspector and Medical Director of hospital transports; in charge of Turner's Lane Hospital, Philadelphia; Assistant in Surgeon-General's office, Washington; Attendant Assistant Surgeon at the United States Military Academy, West Point; and resigning February 1, 1866, recommenced the practice of his profession in New York, making a specialty of obstetrics and diseases of women and children. He was editor of the *New York Medical Journal* from 1866 until 1872; Resident Physician-in-Charge of hospitals on Randall's Island, New York, from 1869 until 1873; Professor of Obstetrics and Diseases of Women and Children, University of Vermont, from 1868 until 1871; Professor of Obstetrics and Diseases of Women and Children, Long Island Medical College, Brooklyn, New York, from 1869 until 1875; and in 1871 he became Professor of Obstetrics in the Medical Department of Dartmouth College, and from 1873 until his death he was Professor of Obstetrics and Diseases of Women and Children in the University of Michigan. He was a member of the New York County Medical Society; New York Academy of Medicine; New York Pathological Society; American Geographical and Statistical Society; New York Historical Society; Michigan State Medical Society and American Medical Association. Among his contributions to the literature of his profession are included papers on "Relations of the Medical Profession to Modern Education," "The Logic of Medicine," "Notes on Double Monsters," "History of Anesthesia," "The Comparative Mortality in Armies from Wounds and Diseases," and "History of Spontaneous Generation."

DUNTON, William Rush, of Philadelphia, Pennsylvania, was born in that city, March 10, 1831. He was educated at the University of Pennsylvania, both in the department of arts and of medicine, graduating in medicine in 1853. After serving as Resident Physician at the Philadelphia Dispensary, and at the

Pennsylvania Hospital, supplemented by two years' study in Europe, he commenced practice in his native city, and became one of the Physicians to the Children's Hospital. In 1863 he removed to Germantown, where he served as Acting Assistant Surgeon at the Cuyler United States Army Hospital, during the War of the Rebellion. He is a member of the College of Physicians, Pathological and Obstetrical Societies of Philadelphia, and one of the Consulting Physicians to the Germantown Hospital. Dr. Dunton has been a successful general practitioner of medicine in Philadelphia for forty years, and is one of the links connecting the past and present generations of distinguished physicians of that city.

DUZAN, George N., of Indianapolis, Indiana, was born near Lebanon, Boone county, that State, July 8, 1841, and died at his residence, November 8, 1893. He began the study of medicine at an early age, and at the close of his student life commenced practice in the town of Zionsville, in his native county, where, says Dr. Eastman, one of his early friends and colleagues, he was first known as the "boy doctor," and where he continued to live and enjoy the confidence of the community over twenty years. During the war he entered the army, and served as Assistant Surgeon of the Fifty-fifth Regiment of Indiana Infantry. He received his medical degree from the University of Nashville, in 1865. He was married to Miss Nellie B. Crutchfield, who, with one son (his name-sake) still survive him. He had the natural qualifications for the profession of medicine, and during his active period of life did a large practice, with an extensive consultation business. His work was not limited to the practice of medicine, but included general surgery, in which he performed all the ordinary operations and a number of the capital ones, as lithotomy and ovariectomy, with skill and ability. Soon after the organization of the Central College of Physicians and Surgeons at Indianapolis; and while still a resident of his county town he occupied the chair of Physiology in that institution, where he taught with credit to himself and benefit to those who attended his lectures, being clear, thorough, and direct in all his efforts to instruct his classes. Several years ago he removed to Indianapolis, with the hope of regaining his health, being much worn by the hardships of a country practice. During his stay there he maintained his high standard professionally as an able practitioner, whilst his quiet and unobtrusive manners as a gentleman commended him to all who were associated with him. Following steadily and persistently his vocation, and though much enfeebled by long-standing diseases, from which he was a constant sufferer, and which culminated in his death, yet he rarely complained and never faltered in the discharge of duty. Referring to his medical attainments and personal characteristics, one of his biographers, Dr. Levi L. Todd, writes as follows: "He was the possessor of endowments far beyond those of the ordinary physician—a clear, comprehensive mind, acute conceptive faculties and strong reasoning powers, with sufficient will and energy to bring these into action, and a capacity to obtain knowledge independently of the ordinary aids upon which so many are compelled to rely, and although not wanting in scholarly attainments, his edu-

cation was more from thought than from books. His handsome face, fine form and graceful, genial manners served him as passports to a social as well as a business acquaintance, which his solid mental qualities were amply sufficient to maintain, and to make good any ordinary draft upon his resources. His hold upon the regards and confidence of those whom he served for years is well attested by the numbers of his old patrons and friends who followed him for aid and counsel as long as he was able to serve them, and who comforted him in his last hours by their presence, and later still, paid their last tribute of sympathizing sorrow at his grave. He has gone, but the lessons of his life remain. His experiences were but the same old story: of ambitions and labors, of cares and sorrows, and of disappointments which fill up in large measure the round of human existence. His death, though early in life's afternoon, still gave him time enough to have solved the problems that were within his grasp, and to have performed his full share of its labors—long enough for the profile of character to be drawn out in all its lines. Finally, we may say of him that when the end came it found him busy with his work, fighting bravely on, striving to fulfill his chosen task." Testimonials relative to his eminent professional attainments and suitable resolutions of condolence for his family were adopted by the medical fraternity of Indianapolis at a special meeting of Marion County Medical Society, of which Dr. Duzan had formerly been an honorable member.

DWIGHT, Henry E., of Philadelphia, Pennsylvania, was educated at several of the most noted institutions of this and foreign countries. He received the degree of A. B. from Yale in 1852, and that of A. M. from the same institution in 1855, and that of B. D. from Andover in 1857. He was a member of the University of Halle in 1862; University of Berlin, and the University of Paris in 1863. He received the degree of M. D. from the University of Pennsylvania in 1867, and that of D. D. from the University of Washington and Lee in 1882. Dr. Dwight was Professor of Latin and Greek in Brooklyn Gymnasium from 1852 to 1856, and living in one house and on one street in Philadelphia he has been engaged in the regular practice of medicine for a period of thirty years.

DYAS, William Godfrey, of Chicago, Illinois, was born in Dublin, Ireland, in 1807, and was the son of William Dyas, a general practitioner of medicine, who was one of the learned and influential men of the age and country in which he lived. A biographer, in the *Magazine of Western History*, says: The subject of this sketch, in many respects a remarkable man himself, has descended from one of the most remarkable families of which authentic history has left us a record. The name Dyas has been anglicized into its present form. The original name is of Spanish origin and is written "Diaz." Three hundred years ago both Diaz and Dias were names well known to the Old World, and inseparably connected with the history of two kingdoms. The first, as has been already stated, was a Spanish name, the second Portuguese. It was Bartolomeo Dias, the noted explorer, who discovered the *Cabo de Buena Esperanza*, as it was called by the Portuguese King—Cape of Good Hope, we say in English—who associated with greatness the name of the Portuguese family,

and among his descendants who have achieved distinction Gonzalvo Antonio Dias, the Brazilian poet and professor of history in Dom Pedro College and Pedro Jaao Dias, the celebrated Brazilian Statesman and Diplomat, who died in 1870, have been the most noted. The Spanish family of Diaz were of ducal rank in the Fifteenth Century; on their shield they bore the motto of the Albigensian Church: *refulgens in tenebris*, and from the descendants of this "ancient and honorable house" a long list of illustrious names has been given to history. To this family belonged Juan Bernardo Diaz de Lugo, one of the Roman Catholic bishops, who sat in the famous Council of Trent in the Sixteenth Century; Alonzo Diaz, a Spanish soldier and adventurer of the sixteenth century, who sought his fortune in the New World, and whose daring deeds and feats of strength in the wilds of Panama furnished a fruitful theme for Spanish song and story writers; Camargo Antonio Diaz, the first explorer of portions of Brazil in the seventeenth century; Gonsalvo Diaz de Pineda, who was with Pizarro in Peru in 1531; Juan Diaz de Solis, the Spanish navigator who won distinction in the early part of the fifteenth century; Miguel Diaz, who was with Bartholomew Columbus, brother of the great discoverer, at Santo Domingo in 1495; Pedro Diaz, a noted Spanish missionary, who died in Mexico in 1618; and last, but by no means least distinguished, General Porfirio Diaz, now serving his third term as President of the Republic of Mexico, and by far the ablest Mexican statesman of the age. The branch of this illustrious family to which Dr. Dyas belongs, or rather that of which he is a lineal descendant, drifted away from the parent stock and the ancient family seat at the Castle of Burgos, in Spain, as a result of religious persecutions. They belonged to that class of Spanish dissenters from the doctrines of the Romish Church who renounced the authority of the Pope, and entertained beliefs identical with those of the Albigenes, against whom Pope Innocent III had carried on a relentless warfare. When they were driven out of Spain by the adherents of the Church, they found a refuge in Navarre, where their relative, the famous mother of Henry IV, of France, Jeane D' Albret, opened her arms to receive them. This was in the early part of the sixteenth century, and the family maintained its allegiance to the French government until the edict of Nantes, promulgated by Henri IV in 1598, under which his Protestant subjects enjoyed a season of religious liberty, was revoked by Louis XIV in 1685. History informs us that as a result of this revocation four hundred thousand Protestants left France and took refuge in Great Britain, Holland, Prussia, Switzerland and America. The house of Diaz was again compelled to change the location of the family seat, and the family tree was planted in Holland, where it flourished under the protection of the house of Orange. From Holland they found their way to England as adherents of William III, where they became conspicuous subjects of the British crown. It was after the family located in England that the change of a single letter from the original spelling of the name gave it its present form and an English pronunciation. Edward Dyas became a colonel on the staff of William III, and distinguished himself on numerous occasions in

the service of that monarch, who became the idol of the Protestant world. For gallant and meritorious services at the Boyne and on other battle fields of that era, Colonel Edward Dyas received from the crown various grants of land in the counties of Meath and Cavan, Ireland. In the early part of the eighteenth century he located on his estate in Ireland, and became the progenitor of the Irish branch of the Dyas family. These estates are still in the hands of his descendants, the present head of the family being Nathaniel Hone Dyas, of Athboy Lodge, high sheriff of the county of Meath. The venerable and highly-esteemed Chicago physician, Dr. Wm. G. Dyas, is a descendant in the fifth generation from Colonel Edward Dyas. The subject of this sketch received careful and thorough education in his early boyhood, and when he was fifteen years of age he entered Trinity College. From this renowned institution of learning he was transferred to the Royal College of Surgeons, and became a licentiate of that college in 1830. In 1832 he was designated to take charge of the Cholera Hospital, in the County Kildare, under government supervision. When the cholera epidemic of that year subsided, and the necessity no longer existed for keeping this hospital open, he took charge, first of two, and later of three government dispensaries, and also of a fever hospital. He became a Fellow of the Royal College of Surgeons in 1845, and at the end of twenty-five years spent in the hospital and dispensary practice, he returned to Dublin in 1855, a year memorable in Ireland by reason of the failure of crops, particularly of the potato, and the famine which followed. Upon his return to Dublin, he became a Demonstrator of Anatomy in Trinity College, remaining connected with that institution until 1856, and adding to his professional knowledge through his association with some of the most eminent physicians and surgeons of the age. The famine of 1855-56 had a most depressing effect, not only upon every branch of business in Ireland, but upon the spirits of the people as well, and thousands of them sought homes elsewhere. Dr. Dyas had been married in 1830, to Miss Georgiana Keating, daughter of Rev. George Keating, an Episcopal clergyman, of Edgeworthstown, County of Longford, and in 1856 he found himself with a growing family dependent in a measure for support upon his professional income. While he had no lack of patients, the depression which prevailed in the country was such that their ability to pay for services rendered, even by the much needed physician, was very greatly limited. As the outlook of better times in the immediate future was not promising, he felt it incumbent upon him to seek a location where his labors would be better rewarded, and notwithstanding his love for the Emerald Isle, he determined to immigrate to America. Arrived in this country he located first at Bridgeport on the Ohio River, near Wheeling, West Virginia. This location was unsatisfactory, and he removed to Canada, locating near London, Ontario. There he spent two years, and then went with his family to Chicago. In that city he at once engaged in the general practice of his profession, and also became the editor of the *Medical Journal*, through the columns of which he made valuable contributions to the professional literature of the country until a rapidly growing practice com-

pelled him to retire from the editorial chair. As an educator he has been prominently identified with the Woman's Medical College of Chicago. Having been one of the prominent medical gentlemen who gave that institution their countenance and support at the date of its inception, he has ever since taken a deep interest in its welfare, and spared no effort to aid in its advancement. He accepted the chair of Theory and Practice of Medicine in the college, a position which he held for eleven years, and did much to give character and standing to that educational institution. For many years he was a Consulting Surgeon to the Cook County Hospital, a position he accepted upon the invitation of his professional friends. While his advanced age has made it necessary for him to shift some of his professional burdens to younger shoulders, although the oldest practicing physician in Chicago, and one who has seen the city grow to twenty times the size it was when he located there, he may still be found, at the age of eighty-six years, in his office on South Clark street, in the heart of the city, every day from 9 o'clock A. M. to 1 o'clock P. M., as regularly as the days come and go. Now and then, of course, he is called out of the city or is kept away from his office by patients who have to be treated at their homes; but few of the younger practitioners of that metropolis attend with greater regularity to their professional duties than does this noted octogenarian, who has been for more than three score years a practicing physician. White-haired and in a certain sense venerable in appearance, Dr. Dyas still retains in great part the vigor of his earlier manhood, and his general appearance is that of a man who has seen fifteen or twenty less years of life. With the courtliness of manner characteristic of an old-school gentleman, a face expressive of broad intellectuality, and a store of reminiscences enriched to an unusual degree by his many years of active life, in whatever company he makes his appearance he attracts attention, and at the meetings of the various medical organizations of his city he has been for years a conspicuous figure. He is still Consulting Physician to the Women's and Children Hospital (with which the Women's College was formerly connected), and Consulting Surgeon to St. Joseph's Hospital. Dr. Dyas has always enjoyed in a high degree the confidence and esteem of the medical profession of Chicago, and few men who have engaged so long in the practice of medicine in one place have had the good fortune to keep on such terms of good-fellowship with active competitors. A cultured, intelligent, honest and high-minded gentleman, he has borne his part well in discharging his duties as a citizen, shirking no responsibility which he was called upon to assume. A thoroughly well-educated physician and a conscientious and successful practitioner, he has contributed his full share toward building up the reputation of the profession in his city, and in the years to come he will be remembered as one of the eminent men who in a modest way graced his calling in the earlier history of Chicago. His first wife having died while a resident of Canada, Dr. Dyas was married in 1861 to Miranda B. Sherwood, of Bridgeport, Connecticut. Three of his sons have become prominent in professional life. The eldest, Dr. G.

K. Dias, is engaged in the practice of his profession in Chicago. Joseph E. Dias, another son, is practicing law at Paris, Illinois, and a third son, William G. Dias, is a prominent barrister of Colusa, California.

EARLE, Charles Warrington, of Chicago, Illinois, was born in Westford, Vermont, April 2, 1845, and died November 19, 1893. He was of English ancestry and a lineal descendant of Ralph Earle, of Exeter, England, a loyal supporter of the British Crown, who came with his wife, Joan, to Rhode Island, about 1634, and became the founder of an American family which is to-day represented in every State in the Union. With the history of many of the Eastern and New England States, as merchants, manufacturers, and professional men, the descendants of Ralph Earle have been especially conspicuous. To this family belonged the late Dr. Pliny Earle, the noted neurologist. Moses L. Earle, the father of the

Charles Warrington Earle

subject of this memoir, moved to Lake county, Illinois, in 1854, when the son was nine years of age, and Dr. Earle's life history may be epitomized in the following words: farmer boy, soldier, student, practitioner, medical writer, and teacher. As the eldest son of a thrifty and ambitious farmer, even before emigrating from Vermont to the northern part of Illinois, he had been firmly impressed with the idea that his life was to be no prolonged play-spell, but must be devoted to a continuous round of tasks, and in the performance of these he became acquainted with all the details of transforming a prairie into a cultivated farm. After this change of location was made he divided his time between the performance of such labor and attendance in the country school-room, but the former received by far the greater share of his attention. In this way were passed the first seven years of his life in the West. Then the War of the Rebellion commenced, and the sixteen-year-old boy, a brawny, muscular, well-developed youth, per-

sued his father to allow him to become a soldier. His eventful service was in the Fifteenth and the Ninety-sixth Regiments Illinois Volunteers. Referring to his military and professional career his biographer, H. L. Conard, of Chicago, writes as follows: He enlisted in the first-named regiment early in 1861, which was intended for the "three months' service;" but when the recruits reached the camp of instruction at Freeport they were informed that the full quota of "three months' men" had already been sent to the front, and that they could either return to their homes or enlist for three years. They did not hesitate much as to which course they would pursue, and before long found themselves in the field attached to General Fremont's army, then operating in Missouri. In the fall of the same year, after six months' service, young Earle was discharged on account of disability, incurred while detailed to assist in unloading a transport of army supplies on the Missouri River. He returned to his father's home, and after a time recovered sufficiently to feel that he was again fitted to enter the service. His father declined, however, to permit him to enlist a second time, and sent him to the Academy at Burlington, Wisconsin, where he pursued his studies until the spring of 1862, when, in response to President Lincoln's call for 300,000 volunteers, he again enlisted in the Ninety-sixth Regiment of Illinois Volunteer Infantry, and continued in the service until the close of the war. He occupied successively the position of private orderly-sergeant, lieutenant commanding company, and aid-de-camp, and assistant inspector-general on brigade staff, and captain of the United States Volunteers. His regiment first went into camp at Rockford, Illinois, and remained there until the Confederate general, John Morgan, began threatening the cities on the Ohio River, when it was sent south and became a part of General Gordon Granger's command. In the spring of 1863 they were sent to the assistance of Rosecrans in Tennessee, and went into active service. At the organization of his company, Charles W. Earle had been appointed orderly sergeant, and when the regiment was at Franklin, Tennessee, he was promoted to the second lieutenantcy of the same company. At the battle of Chickamauga, where he commanded his company, he was twice slightly wounded, and received special commendation for his conduct upon the field, in the report of his regimental commander. The loss was thirty-five in a company of forty-five, several of the survivors being slightly wounded. In an address delivered by Colonel George Hicks, at Kingston, Jamaica, several years after the war, relative to the services of the Ninety-sixth Illinois Regiment at the battle of Chickamauga, the following quotation should be recorded: "I found that I had now but a very few men with me, and I should have thought that I had wholly strayed away from my regiment, were it not that I had with me the colors of the regiment, together with the commander of the color company—the intrepid boy-lieutenant, lion-hearted, fearless, unflinching Charley Earle, whose name must be inscribed high among the highest on the roll of Chickamauga heroes." The next day after the battle, while the Union forces were concentrating at Chattanooga, or rather making an effort to concen-

trate there, Lieutenant Earle's company was directed to reinforce the pickets on the summit of Missionary Ridge, and to remain in the position to which they were assigned "until relieved by proper authority." Their position was greatly exposed, and through the cowardice of a staff officer, who failed to relieve them at the proper time, they fell into the hands of the Confederates as prisoners of war. This was the beginning of an experience for the young lieutenant which, bitter as it was, did not differ materially from that of thousands of other inmates of Southern military prisons, except in the manner of its termination, which constituted one of the most thrilling and memorable episodes of the Rebellion. He was captured on the 22d of September, 1863, and on the night of the first day of October he landed at Richmond, Va., and passed inside the gates of Libby Prison, where he was ushered into the company of Gen. Neal Dow, of Maine, the famous "Chaplain" McCabe, fourteen colonels, thirty-five lieutenant-colonels, thirty-nine majors, more than three hundred captains, and about seven hundred and fifty lieutenants, all, like himself, captured Union officers. With these men he shared the hardships of a prison life for a period of four months and a half, or until the 9th day of February, 1864, when he made his escape at the time of the famous prison delivery, planned by Col. Thomas E. Rose, of the Seventy-seventh Pennsylvania Regiment of Volunteer Infantry. Of the days and weeks of burrowing under ground, where men worked with knives and sticks of wood to complete the tunnel through which they were to escape, it is unnecessary to speak in this connection. It is only required to say that Lieutenant Earle and his particular friend, Capt. Charles E. Rowan, were let into the secret some time after the tunnel was commenced, and when the time came to "make the break for liberty," they were ready for action. Crawling into the long, dark tunnel, which was just large enough for a man to drag himself through, they emerged from the opening outside the sentry lines, moved away without attracting the attention of the guards, and before midnight on the night of the escape found themselves on the Charles City Railroad, one mile beyond the city limits of Richmond. Of his subsequent experience no more interesting or entertaining account can be found in the annals of the Civil War than the following, which appears in a pamphlet written and published by Dr. Earle himself some years since: "Our escape through the fortifications around Richmond was made without any great difficulty. We really crawled on the ground a great part of the *first night*, stopping every few minutes and scanning every bush and tree where, from previous experience, we would expect a picket to be posted or a scout secreted. The following day was occupied in maturing our plans for the journey, devising schemes to meet emergencies which might arise. We also divided the bread and meat we had managed to escape with into six parts, expecting that our journey would consume six days, and agreed to eat only a daily portion, knowing well that we should need as much the sixth as the first day. The *second night* we traveled a little south of east, and toward morning, being somewhat in doubt as to our whereabouts, we approached a small

cabin, which we supposed to be occupied by a negro. We were correct in our opinion, and he gave us some general directions and a small piece of cornbread—it was all he had. We suffered greatly during the day, when in our places of concealment, from the cold. We avoided all roads and pushed directly through swamps and tall briers, so that by morning our clothes would be thoroughly wet and considerably torn. We would then secret ourselves and with our wet clothing clinging to us the cold air caused us to suffer severely. "We had anticipated great trouble in crossing the Chickahominy river, as my companion could not swim and I had no desire to engage in that pastime in the middle of February. Toward the morning of the *third night* we reached what we supposed to be a swamp, and concluded to stop on the banks until early light and then pass through it. We rested under a tree and went to sleep. Imagine our surprise on awakening to find ourselves on the Chickahominy, and also to find within a few feet of where we rested a large tree which had been blown down and across the narrow, rapid stream, making for us a complete bridge. It was the work of only a few moments to pass the point where we expected to find our greatest difficulty. During the *fourth night* out, finding that our strength was becoming somewhat exhausted we planned to approach a farm-house and confiscate a chicken, which we intended to eat raw. We felt the need of a change of diet. The bread and meat we had expected to last for six days had disappeared, and the water, of which we took large quantities, did not seem to strengthen us for our severe march at night and the terrible cold of the day. We had kept the 'pop' bottle which we had when we started, and at every little stream crossed we would not only drink large quantities but fill the bottle, as the water seemed to revive us somewhat till the next stream was reached. While we were reconnoitering the outbuildings of a farm-house for the chicken I have mentioned above, we were discovered by a negro. He knew at once who we were, and said we were, 'Yankee officers 'scaped from prison,' but he gave us such assurance of sympathy and help that we trusted him at once. We were taken immediately to his cabin and were soon before a blazing fire in an old-fashioned fireplace. A guard of colored people were posted to prevent surprise, and the mother of the family began to prepare us something to eat. How the 'pones' of corn-bread, shaped in the old 'granny's' hands and baked in the ashes before us, disappeared, and how delicious was that meat! I have always thought it was stolen expressly for us from the slave-holder's pantry. And the cabbage fried in a skillet! No Grand Pacific Hotel bill of fare ever equaled that meal. We were thoroughly warmed and well fed, and started out with new courage and definite directions in regard to our route. One of our greatest fears throughout the entire journey was from dogs. It seemed as if the country was full of them. One of these animals would commence to bark a little to our left, another over to our right, and then one directly in our path, and then they would all bark. It is no exaggeration when I say that it *seemed* as if there were a hundred thousand dogs on that peninsula. We avoided them by deflection from our course many, many times.

During the *fifth day* we suffered greatly on account of our exposed position for concealment, and to add to our discomfort, it commenced to snow shortly after noon. About four o'clock, unable to remain quiet, we started on our way, the snow falling rapidly and thawing quite as fast, making it very difficult to travel. We were deprived of our only safe and constant guide, the North Star, and after proceeding until nearly dark, we came to the exact spot whence we had started two hours before. We were exceedingly discouraged, very tired, cold, wet and hungry. Just at this time we saw a one-horse covered cart approaching, and supposing its occupant one of our colored friends, we halted him, but to our dismay found it was a white man. We told him we were Confederate scouts and desired information as to the position of the Yankees. A few minutes' conversation, however, convinced us that he was a Union man and our friend. He gave us valuable information in regard to roads; where to find a negro family who had the means to furnish us some food, and also assured us that in all probability we would come in contact with some of our troops, if we eluded the Rebel scouts during the next twenty-four hours. He informed us, however, as did the colored man, who at midnight gave us a substantial meal of cornbread, pork and rye coffee, that we were on very dangerous ground—the scouting ground between both armies; a place full of 'guerrillas' and 'bushwhackers.' We traveled very cautiously and met with an exceedingly vexatious delay in crossing a river, concerning which we knew nothing, but called by the negroes the Diascon. At this time in our journey, the *sixth night* since our escape, and at a time when we were almost within our own lines, the strength and heroism and capacity to direct and decide, which were all virtues of my companion, all at once seemed to disappear. From the terrible mental and physical exertion of the week, from exposure to cold and suffering from hunger, he became absolutely prostrate. He had experience in an attempt to escape when in Georgia before he arrived in Libby, and he had really decided most of our movements until now. Not only was he prostrate but he was indifferent. I urged him forward with all the power of persuasion left; but a little before daylight we were obliged to stop and rest. At sunrise we concluded to travel during the forenoon, as we were confident our troops must be near us, and as the country was more open and exposed, the facilities were not so good for concealment during the day. In fact it was the last effort we could make, and for the first time we traveled in a road. About nine o'clock there suddenly appeared, as a curve in the road was attained, a squad of cavalry a few hundred yards in our advance. We recognized them at once as our own men, and knew that we were safe. It is impossible to express in appropriate words our feelings at that time—indeed, I doubt my ability to do so. No words of mine could form a fitting peroration to that event, commencing at the terrible battle of Chickamauga—a battle, than which none could be more bravely fought, in which scores of my young friends went down, schoolmates and neighbors, and ending with an escape from military prison, the anxiety and solicitude of that picket duty, the thousand-mile trip to a Confederate prison, the joys and

sorrows, the hopes and disappointments, the waitings and watchings while incarcerated, and the days and nights of peril and sufferings, and cold and hunger, the swamps and brier thickets, the anticipation of success and the despair at the thought of recapture; all this, and finally freedom and home and friends—what words can express it all? We came into our lines a few miles from Williamsburgh. Some of the escaped officers reached our lines the third day out from Richmond, and General Butler, who was at that time Commandant at Fortress Monroe, sent out on alternate days the Eleventh Pennsylvania Cavalry and the First New York Rifles to drive back the enemy, and to patrol the country with tall guidons to attract the notice of the escaping prisoners. The First New York Rifles were our deliverers. No one can describe the kindness shown to us by this body of men. Every attention was showered upon us. We were banqueted at Company A's headquarters, and fêted at Company B's, and banqueted again at Company C's, and so on. As soon as possible we reported at Washington. Every paper was full of the escape from Libby. Fifty-five out of one hundred and nine reached our lines; the others were recaptured. We were ordered to rejoin our respective regiments, permission being given to delay reporting for thirty days." Lieutenant Earle then rejoined his regiment to perform the largest part of his military service as commander of a company and Brigade Staff Officer. On returning to his command he was first promoted to a first lieutenancy, and commenced the Atlanta campaign with his regiment. Within a few days, however, after the battle of Resaca he was ordered to take charge of a company whose conduct had never been satisfactory to the regimental commander, yet whose record steadily and rapidly improved under the leadership and strict discipline of its new officer. In the series of battles around Atlanta he was assigned to duty as Adjutant of the Regiment, and during the last eight months of the war was detailed as Aid-de-Camp and acting Assistant Inspector-General on the staff of General W. C. Whittaker. At the close of the war he was breveted captain of United States Volunteers for gallant and meritorious conduct at the battles of Chickamauga, Resaca, Kenesaw Mountain, Franklin and Nashville. He was mustered out of the service in 1865, and in the fall of that year entered Beloit College, Wisconsin, for the purpose of completing his education and fitting himself for professional life. He devoted three years to his collegiate course at that institution, from which he received the degree of A. M. in 1868. He graduated at the Chicago Medical College in 1870, as a student of the late Prof. William H. Byford, of whose advice and friendship he was always the favored recipient. He had been engaged in general practice since 1870, paying particular attention perhaps to diseases of children and obstetrics, subjects which he taught most of that time. In 1870, at the organization of the Woman's Medical College, Dr. Earle became Professor of Physiology, and was probably its youngest member and at the bottom of the list in the faculty. At the end of twenty-one consecutive years of service, on the death of Prof. Byford, he became president of the institution. He was one of the founders of the College of Physicians and

Surgeons and Professor of Obstetrics, and after the death of Dr. Jackson, was elected to its presidency. He was Professor of Operative Obstetrics in the Post-Graduate School of Chicago. Dr. Earle was a member of the American Medical Association and Illinois State Medical Society. He was also a member of the Pediatric Society; of the different local societies, and of the British Medical Society, to which he was a delegate in 1885. He has occupied the position of president of the Illinois State Society; of the Chicago Gynecological Society, and was at the time of his death president of the Chicago Medical Society. He was also a member of the G. A. R. and of the Loyal Legion, of the Lincoln and the Irving Clubs; the former a political organization, and the latter a prominent literary club on the West Side. Notwithstanding the enormous demands of his practice, Dr. Earle has written a large number of medical articles on a wide range of subjects which have attracted the attention of the profession, not only in America but in Europe. After a course of study in the hospitals of Vienna, Florence, and Berlin, in 1885, he wrote a series of essays on obstetrics. From his occupancy of the chair of Diseases of Children in the Woman's Medical College, Dr. Earle was able to publish many papers on pediatrics. Among others is one entitled, "Diphtheria and its Municipal Control," after the reading of which before the Chicago Medical Society, the following resolution was offered and passed with only one dissenting vote: "Inasmuch as the contagiousness of diphtheria is recognized by the great majority of medical practitioners, resolved, that the Commissioners of Health will be justified in placarding, or otherwise designating the houses infected with this disease." He was engaged, before his death, in writing articles on typhoid fever and influenza, for the forthcoming American Text-Book on Diseases of Children. As a teacher he was earnest, forcible, and emphatic, and endeavored to impart practical facts and demonstrations for daily use at the bedside, rather than theories not proven by clinical experience. Dr. Earle was Attending Physician to the Washingtonian Home for eighteen years, during which time he treated more than ten thousand inebriates. In regard to the personal characteristics of Dr. Earle, the following appears in the World's Columbian Dictionary, written by a brother physician, whose name is not known: "Great, honest-hearted, noble man; his bluff exterior hides one of the tenderest hearts that ever beat. Gentle as a child, perfectly honest and disinterested in his practice, he could not be hired to do a dishonorable thing. He was a man of brains and ability, and devoted profound thought to the care of his cases. He was held in the highest esteem by his colleagues in the general profession and in the schools to which he was connected, and in the Woman's Medical College of his city his work was beyond all praise." Physically and mentally Dr. Earle was regarded as a vigorous man. The heavy professional burdens which pile themselves up on the physician who has an extensive city practice apparently rested easily upon his broad shoulders, and, notwithstanding the demands made upon him by his patrons, he found time to contribute to medical and general literature some exceedingly interesting discussions of

practical questions in addition to those previously enumerated. Among these monographs, which have been published from time to time, the following are deserving of especial mention: "Electricity in Post Partum Hemorrhage" and a series of papers on obstetrical subjects, including the "Treatment of Convulsions," "Puerperal Fever," "The Watery Discharges in Pregnant Women," "Retained Débris as a Cause of Puerperal Sepsis," "The Use of the Curette," and one entitled "How Far can the Antiseptic Procedure be Introduced into Private Practice?" The major part of these papers were written after his return from Europe, and were his convictions and conclusions after observing the low mortality in the maternity hospitals of the Old World. In his address as retiring President of the Gynecological Society of Chicago he used the expression, and repeated it with great emphasis, that in his judgment the antiseptic obstetrical procedure was saving more valuable lives each year than were saved in all other departments of medicine and surgery. In his articles on "Cirrhosis of the Pancreas," one of which was read at the International Medical Congress at Washington, D. C., in 1887, the question was suggested as to his priority of description, or whether the disease had ever before been described. The matter was believed to be of enough importance to cause the appointment of a committee of pathologists, composed of a representative from this country, one from Great Britain and one from the Continent, to report on the subject at the next Congress, which was to be held at Berlin in 1890. One of his first papers before the Chicago Gynecological Society was entitled "Tubercular Meningitis," and during the epidemic of 1876 and 1877 he wrote "Scarletina in Chicago." Later, appeared "Cephalematoma of the New-born" and "Summer Diseases of Children," published in the *Archives of Pediatrics*, of which he was one of the associate editors. He contributed to the Ninth International Medical Congress a paper entitled "The Influence of Sewage and Water Pollution on the Prevalence and Severity of Diphtheria," and to the Chicago Medical Society one on the contagiousness of the same disease. A second one on the municipal control of that malady has already been referred to. Dr. Earle believed that the proper education of the people on such topics of public health would do much towards reducing the prevalence of disease, and consequently diminish very largely our mortality rates. During the many years that he was connected as Physician to the Washingtonian Home—a noted Chicago institution for the reformation of drunkards—he had as good an opportunity as any man in the United States to analyze the vice of drunkenness and reach correct conclusions as to the best methods of dealing with those wrecks of mankind who constitute a dangerous element in every community. Among the articles which have appeared from his pen, bearing upon these topics, may be noticed particularly "Inebriety as a Vice," "The Opium and Alcoholic Habit," and "The (alleged) Cinchona Cure of Intemperance." In dealing with the last named subject he not only explained to the public the nature of the drug cinchona and demonstrated that it could not destroy the appetite for intoxicating liquors, but went to the trouble of gathering a mass of statistics to

show what its effects had been in cases where it had actually been administered. As President of the Illinois State Medical Society he delivered an address in 1889 on "The Responsibilities and Duties of the Medical Profession Regarding Alcoholic and Opium Inebriety," which contained more practical suggestions for suppressing the vice of intemperance than are to be found in all the "resolves" of the temperance reform organizations given to the public within the past ten years. In this address he boldly combated the theory that any man had the right to plead an uncontrollable hereditary appetite for drink, and declared that what the medical profession should do to bring about desired reforms was to exercise greater care in prescribing alcoholic and opium preparations; to aid in the proper education of the young; to work among those who honestly desire a reformation, and are willing to accept the means which will produce it, and to use their influence to legislate for that uncontrollable, incorrigible class who are a burden to the community. Of this latter class, and the means which should be used to bring about their reformation, he said: "They have never learned to obey; they are undisciplined, and generally lack all feeling of responsibility. They are the men who beat their wives and starve their children; the men who steal the hard earned money from their wives' purse, and the knives and napkins from their tables to buy alcohol or opium; and when perfectly sober or free from the drug, if you expostulate with them, they will laugh and assure you that they know their own business. The State should assume the guardianship of this class, and should put them in an institution, whose management should be remarkable for its kind administration of affairs and for discipline most rigid. This institution should be situated on a farm, and men of this class sent there for not less than two years. From ten to twelve hours' work every day during this commitment, combined with judicious and strict discipline, with the assurance that the State would again assume charge of them if they returned to their former habits, would produce an effect on these men which would result in the reformation of nearly all. Let them learn that it is some one's business if they become absolutely indifferent to all the responsibilities of life. The medical profession should be alive in bringing about such sentiments, and by precept and practice, enable them to become laws. Let us be in a position to educate the young and those of maturer years, so that the second class shall not form the habit. The third class we are always ready to assist, and regarding the fourth class, those uncontrollable, incorrigible, undisciplined men and women, let us, in the language of Dr. Bucknell, bring about a sentiment that these men are not to be 'coddled' in luxurious indolence, nor impressed with the pernicious idea that they are interesting but helpless objects of social and psychological science." Not long after proposing this eminently practical plan of dealing with incorrigible drunkards Dr. Earle severed his connection with the Washingtonian Home to establish a somewhat similar institution, designed for the cure of a particular class of victims of the drink and opium habits. Dr. Earle was married in 1871 to Miss Fannie Bundy, a sister of Major Bundy, of the New York Mail and Express. His good-fellowship

made him an agreeable companion everywhere. In person, he was impressive and deservedly popular. He loved his country and profession, his brother practitioners and his patients. In every avocation of his life its duties were efficiently and nobly performed, and the world was better because he had lived in it. His death, which occurred from cerebro-spinal meningitis after one month's illness, leaves a vacancy in Chicago medical circles that will be difficult to fill. His funeral took place November 22, 1893, and was attended by many friends as well as representatives of the medical colleges and societies of his city.

EATON, Frank B., of Portland, Oregon, was graduated M. D. at Cooper Medical College, San Francisco, California, in 1875. He is now Professor of Diseases of the Eye, Ear, Nose, and Throat in the Medical Department of the University of the State of Oregon, Ophthalmic and Nasal Surgeon to St. Vincent and Good Samaritan Hospitals, Portland, and Oculist to the Union Pacific Railroad.

EDSALL, Frank H., of Pittsburgh, Pennsylvania, was educated in medicine at the University of Pennsylvania, Philadelphia, and received the degree of M. D. from that institution in 1885. He is now Ophthalmic Surgeon to St. Francis Hospital and Pittsburgh Free Dispensary; Consulting Ophthalmic Surgeon to Rosalie Foundling and Maternal Hospital; Expert Examiner of the Eye and Ear for the United States Pension Bureau; member of the American Medical Association and Allegheny County Medical Society.

EDSON, Cyrus, of New York City, was graduated M. D. at the College of Physicians and Surgeons, New York, in 1881. He is now Sanitary Superintendent of the Health Department of New York City; Surgeon and Lieutenant-Colonel of the National Guards of the State of New York; President of the Board of Pharmacy of the city and county of New York, and member of the New York County Medical Society.

EDWARDS, Landon Brame, of Richmond, Virginia, was born September 20, 1845, in Prince Edward county, Virginia, his father being the Rev. John E. Edwards, D. D., of the Methodist Episcopal Church South. His primary education was received at the Lynchburg Military College, and at the Randolph-Macon College, Virginia. In 1863 he enlisted in the artillery corps of the Confederate Army, where he served until the close of the war. He attended courses of medical instruction at the Medical College of Virginia and the University of Virginia, and received his degree of M. D. at the University of the City of New York in 1867. During the same year he served as House Physician to the Charity Hospital, Blackwell's Island, and then as Assistant Physician to the Hospital for Nervous Diseases, under the management of Dr. M. Gonzales Echeverria at Lake Mahopac, New York. In the spring of 1868 he removed to Lynchburg, Virginia. At the organization of the Medical Society of Virginia in 1870 he was elected Recording Secretary. In 1872 he was appointed a member of the State Board of Health. Later in the same year he removed to Richmond, Virginia, where he has since remained. In 1873 he was elected Corresponding Member of the Gynecological Society of Boston, and at the session of the Medical Society of Virginia, held the same year, he was elected its treas-

urer. In April, 1874, he established the *Virginia Medical Monthly*, of which he still continues editor and proprietor. About the same time he was elected Lecturer on Anatomy in the Medical College of Virginia, and in the spring of 1875 he was elected Lecturer on *Materia Medica* and Therapeutics in the same institution, but resigned both positions in the spring of 1876. Dr. Edwards is ex-President of the Richmond Medical and Surgical Society and ex-Surgeon of the First Regiment of Virginia Volunteers. He is an active member of the American Medical Association and of numerous other medical organizations. On January 17, 1871, he was married to Miss Nannie Rucker, daughter of George M. Rucker, of Lynchburg, in his native State.

ELDRIDGE, John W., of Chicago, Illinois, was born in Hamilton, New York, October 2, 1808, and died January 1, 1884. He was graduated in medicine from the College of Physicians and Surgeons at Fairfield, in Western District of New York, and commenced practice in Pittsfield, Pennsylvania, where he remained until he went to Chicago in 1834. He was possessed of an active intellect, a strong will, persevering industry and a roughness of manner and speech that quickly attracted the attention of the masses, and he soon acquired an active general practice and retained it for a quarter of a century or more. While he wielded considerable professional influence, it was entirely due to his personal efforts and characteristics. His methods of practice and administration of medicine were of the most prompt and decided character. He had a favorite prescription for an active cathartic that became generally known as Dr. Eldridge's "thunder and lightning pills." He ceased actual practice in 1868, but continued his residence in Chicago until his death.

ELLIOTT, John B., of New Orleans, Louisiana, was graduated M. D. at the Medical College of the State of South Carolina in 1867. He is now Professor of Theory and Practice of Medicine in Tulane University and Visiting Physician to Charity Hospital, New Orleans. Dr. Elliott is president of the Louisiana State Medical Association and a member of the Orleans Parish Medical Society.

ELLIS, G. Manning, of Chattanooga, Tennessee, was graduated M. D. at the Medical Department of Dalhousie University, Nova Scotia, in 1884, and received an *ad eundem* degree from the University of Tennessee, Nashville, in 1887. He is now Lecturer on Physical Diagnosis and Sanitary Science in Chattanooga Medical College. Dr. Ellis is an active member of the Chattanooga Medical Society; and the Tri-State Medical Association of Alabama, Georgia and Tennessee.

ELLIS, William H., of Barron, Wisconsin, was graduated M. D. at Rush Medical College, Chicago, in 1880. He is secretary of the Board of United States Examining Surgeons for the Pension Bureau, County Physician, Medical Examiner and Adviser for several of the leading life insurance companies of this country; member of the American Medical Association, and of numerous other medical societies.

ELSNER, John R., of Denver, Colorado, was graduated M. D. at Bellevue Hospital Medical College, New York, in 1866. He is now Professor of Theory and Practice of Medicine, and Clinical Medicine in the Gross Medical College, Denver. Dr. Elsner is an active mem-

ber of the American Medical Association, American Health Association, American Microscopical Association, Rocky Mountain Medical Association, and the International Medical Congress. He is also honorary member of the California State Medical Society; member of the Colorado State Medical Society; Denver Medical Association; Arapahoe County Medical Society, and of the Bellevue Alumni Association.

EMERSON, Justin E., of Detroit, Michigan, was educated at Williams College, from which institution he received the degree of A. B. in 1865. His medical degree was obtained at Harvard University Medical School, Boston, in 1868. Dr. Emerson is Neurologist to Harper Hospital and to the Children's Free Hospital, Attending Physician to St. Joseph's Retreat, and Medical Examiner for the Commercial Travelers' Mutual Accident Association. He is president of the American Academy of Medicine, member of the American Medical Association, Detroit Academy of Medicine, Michigan State Medical Society, and numerous other medical organizations.

EMMONS, Francis Asbury, of Chicago, Illinois, was born in Bristol, that State, August 14, 1839. His father was a thrifty or prosperous farmer, and a much esteemed citizen. His biographer, in a recent number of the *Magazine of Western History*, writes as follows: There are few families more distinctively American than the one to which the subject of this sketch belongs. Not only is it more than two hundred and twenty-five years since the family tree was planted in American soil, but in the wars which established the Independence of the United States, as well as that waged in defense of the Union from 1861 to 1865, they have taken no unimportant part. Issac Emmons, the great grandfather of Dr. Emmons, who lived the latter years of his life at Long Branch, New Jersey, was a soldier in the Revolution; his grandfather, Francis Emmons, served in the War of 1812, and in our last great struggle—the War of the Rebellion—their descendants were among those who established, by force of arms, the fact that the union of the States is indissoluble. His mother, Lydia Ann Morris, was a descendant of the distinguished family, of which Lewis Morris, the first Governor of the Province of New Jersey, his grandson, Lewis Morris, a signer of the Declaration of Independence, and Gouverneur Morris, the eminent statesman, diplomat and financier, were illustrious members. Dr. Emmons, the third son of nine children, grew up among the "natives," of what was then the "Far West," and his advantages in early life, like those of all children of the pioneers, were somewhat limited. He attended the country schools until he was seventeen years of age, when he went to Aurora Academy, looked upon in those days as one of the leading educational institutions of that part of the State. After spending some time at the academy he commenced reading medicine under the preceptorship of Dr. Robert Hopkins, of his native town. In 1859 he attended his first course of lectures at Rush Medical College, then under the management of the noted surgeon, Dr. Daniel Brainard. After attending three full sessions he was graduated from that institution in 1863 and at once entered the government military service as an assistant

surgeon. He was assigned duty at Camp Douglas, which had been built up in the open prairie near Chicago in the summer of 1861, and turned over to the general government by Governor Yates, of Illinois. It was named after Stephen A. Douglas, and is pointed out to visitors nowadays as one of the historically interesting places about the city, although the site of the camp is covered with fine buildings, and its outlines can only be traced by those familiar with its history. Immediately after the capture of Fort Donelson, in 1862, Colonel Tucker, who was in command at Camp Douglas, was ordered to prepare for the reception of Confederate prisoners, and a few days later between eight and nine thousand of the captured rebels arrived at the camp to be taken care of and carefully guarded. From that time to the close of the war, in 1865, the camp was not only a station for recruiting, drilling and equipping Union soldiers, but a military prison, in which more than thirty thousand prisoners in all were confined at one time and another. About the time Dr. Emmons entered the service, small-pox broke out among the prisoners, and he was designated to take charge of the small-pox hospital, where he rendered efficient service in keeping the dreaded disease under control, and improving the sanitary condition of the camp, visiting sometimes as many as three hundred cases of the disease daily. In the important position of surgeon-in-charge of the prison hospitals, he was brought into close contact with a large proportion of the imprisoned Southerners, and was noted for treating them with the greatest consideration, consistent with strict military and prison discipline. Intensely loyal, as antecedents, early education and training could make him, his sympathetic nature nevertheless attracted to him those whom the fortunes of war had transferred from Southern battle-fields to Northern prisons, and many were the pathetic, and in some instances, romantic stories, which were poured into his ears as a sort of father confessor. One of the secrets which came to him in this way, was that of a modern Damon, who found himself immured within prison walls, was the result of unbounded confidence in a friend, whom he sought to oblige. A delicate, girlish-looking youth, who made his appearance in the hospital one morning, attracted the doctor's attention, and inquiry as to how he happened to be in the Confederate military service at so tender an age, brought out the statement that he had never been regularly enlisted in the rebel army, but was the victim of an unfortunate combination of circumstances. His home was at Strawberry Plains, in Eastern Tennessee, and when a regiment of Confederate troops were quartered near that place, he had consented one night to don the uniform and answer to the name of a regularly enlisted soldier, who desired to visit his friends, or perhaps a sweetheart, who lived some miles distant. Before he returned, or perhaps before he had time to return, an engagement took place between the Federal and Confederate troops, and when it ended the Confederates found themselves prisoners of war. The youth who had stepped into his friend's shoes just in time to be captured, answered to his assumed name as a prisoner and remained at Camp Douglas until he was returned to the South through an exchange of prisoners. Dr. Emmons remained on duty at

Camp Douglas eighteen months, during the most exciting and dangerous period in the history of Chicago. There were then ten or twelve thousand prisoners in camp, including the prisoners of Morgan's command, who were considered the flower of southern chivalry; and it was during this time that the plot was matured by southern sympathizers to liberate these prisoners, and turn them loose fully armed, to be aided by a horde of ruffians gathered for the purpose from all parts of the country, in the work of pillaging and destroying the city; a plot which was thwarted and crushed through the masterly activity, coolness and judgment of General B. J. Sweet. In the winter of 1864-65, after he had completed the work of rebuilding the hospital at Camp Douglas, Dr. Emmons was commissioned as Surgeon of the 147th Illinois Volunteer Infantry Regiment and ordered south. He served with the regiment but a short time, when he was detailed to act as Medical Director on the staff of General H. M. Judah, then at Dalton, Georgia. He remained in Georgia all the following summer, having charge as Medical Director of a district covering a large area of territory, and being one of the youngest officers in this branch of the service holding so responsible a position. In September of 1865 he was mustered out of service with the rank of Major, and soon after that returned to Chicago. Up to that time he had never engaged in the general practice of medicine, or rather, had but little to do with civil practice, as he had gone direct from college into the military service. His experience as a hospital physician and surgeon had, however, been more valuable to him than many years of experience in any other field of labor, and when he returned to Chicago he was fully prepared to enter into an active practice which has kept pace with the growth of the city, and given him a comfortable fortune as the financial result of his professional labors. He is a member of the Chicago Medical Society and of the Illinois State Medical Society, and secretary of the Rush College Alumni Association. He has been for over twenty years the physician in charge of the "Old People's Home"—one of Chicago's prominent charitable institutions—and for several years he was County Physician of Cook county. While he has devoted himself carefully and conscientiously to the practice of his profession, he has at the same time taken a lively interest in politics, and has filled several important offices, to which he was elected by the Republican party, with which he has always been in hearty sympathy. In 1871, when the destruction of the city by fire heaped heavy responsibilities upon nearly all the city and county officers, he was a member of the County Board of Supervisors and chairman of the Hospital Committee of the Board. In this position he was one of the men who labored most assiduously to bring order out of chaos, and systematize the work of caring for the suffering and destitute victims of the fire fiend. He also contributed material assistance to the rebuilding of Rush Medical College, which, through his influence, was furnished temporary quarters in the hospital building and enabled to continue the course of lectures which had been so suddenly and unexpectedly interrupted by the fire. To educational matters he has given his full share of attention,

having filled at one time the chair of Physiology in the Chicago University and served as a member and president of the County Board having in charge the important school interests of Cook county. For sixteen years prior to the change of National Administration in 1885, he was a member of the Board of Examining Surgeons for the United States Pension Bureau in Chicago, and he held other offices of minor importance. In 1876 Dr. Emmons was married to Miss Georgiana, daughter of R. Lancaster, a retired lumber merchant and real estate owner of Chicago, who was one of the pioneer residents of the city. His accomplished wife and three interesting children—one son and two daughters—complete the family circle.

ENGEL, Hugo, of Philadelphia, Pennsylvania, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1874. He is now Consulting Physician for Nervous Diseases to the St. Joseph's Hospital. He was formerly Lecturer in the Jefferson Medical College, and has become Professor of Nervous Diseases and Clinical Medicine in the Medico-Chirurgical College, Philadelphia. Dr. Engel is a Fellow of the American Academy of Medicine, and an active member of numerous other medical organizations.

ERSKINE, Alexander, of Memphis, Tennessee, was graduated in medicine at the University of the City of New York in 1858. He is now Professor of Obstetrics and Diseases of Children in the Memphis Hospital Medical College. Dr. Erskine is a member of the Memphis Medical Society, and of the Tri-State Medical Society of Alabama, Georgia and Tennessee.

ESKRIDGE, J. T., of Denver, Colorado, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1875. He is now Professor of Nervous and Mental Diseases and Medical Jurisprudence in the University of Colorado, and is Dean of the Faculty. Dr. Eskridge was formerly Post-Graduate Instructor of Nervous Diseases in Jefferson Medical College. He is a member of the American Neurological Association; Philadelphia Neurological Association; New York Medico-Legal Society, and is ex-President of the Colorado State Medical Society.

EVANS, Ezra Bert, of Greencastle, Indiana, was born near Atkinsonville, Owen county, Indiana, August 5, 1846. He is of English descent, and the son of Samuel Parker Evans, an industrious and thrifty farmer, who was a soldier in the Union army during the War of the Rebellion. The early life of the subject of this sketch was passed on his father's farm and in attending common schools and Asbury University. He commenced the study of medicine in 1868 at Greencastle, under the preceptorship of the late Dr. John Wilcox, one of the most accomplished physicians and surgeons of western Indiana. He then entered the University of Virginia, and received his medical degree from that institution in 1871. Soon after graduating he established himself in the city of his present residence and engaged in an active and extensive practice of general medicine and surgery, which for a number of years rivaled that of his distinguished preceptor. In 1873 he was married to Miss Mary A. Goulding. Dr. Evans has performed most all the capital operations of general surgery, as amputation of limbs, trephining the skull, ligating the subclavian, and other important arteries, and

has devoted considerable attention to gynecological surgery, having successfully performed most of the operations in this department of the profession in accordance with the methods of Nathan Bozeman and J. Marion Sims. He has also had a large consultation practice. Throughout Putnam county, in which he lived, and in adjoining counties, his advice was often required not only as a surgeon, but as a skillful physician. During the time he engaged in medical practice he has been the preceptor of more than thirty medical students, all now graduated, and each doing well in their chosen profession. He has been Local Surgeon of all the railroads which pass through his city, and Medical Examiner and Adviser for many of the leading life and accident insurance companies in this country. He is ex-president of Putnam County Medical Society, and is a member of the Indiana State Medical Society, American Medical Association, and the National Association of Railway Surgery. Dr. Evans has always possessed a sound constitution and good health, and hence performed an immense amount of mental and physical labor. His industrious, persevering and energetic habits, his genial disposition, his laudable ambition to excel in his professional pursuits, as well as his almost intuitive knowledge of human nature and most excellent business capacity, are personal characteristics and factors which have not only contributed to his phenomenal success in the practice of medicine, but which have enabled him to accumulate sufficient wealth, while still comparatively a young man, to justify his retirement from the active duties of his profession.

FEARN, Herbert, of Brooklyn, New York, was born in England in 1834, and died June 25, 1892. He was brought to this country while a child. His medical education was obtained in New York City at the New York Medical College, with which Carnochan Peasly and Fordyce Barker were identified, graduating there in 1857. He was a member of numerous societies, accepting official responsibilities in a few of them. He read before the Kings County Medical Society, in 1871, a paper on the use of veratrum viride in large doses as a substitute for blood-letting in puerperal convulsions, which was probably an original proposition with him. Many physicians subsequently reported favorable results, and Dr. Fearn was led to believe that not a few lives of mothers, and infants as well, had been saved by an heroic dosage of veratrum. He was an earnest, thoughtful and considerate physician, and was constantly employed in the welfare of humanity.

FELL, George E., of Buffalo, New York, was graduated in medicine at the University of Buffalo in 1882, and received an *ad eundem* degree from Niagara University in 1886. He is now Professor of Physiology and Microscopy in the latter institution; Physician to the Hospital of the Sisters of Charity; ex-president of the American Microscopical Society; member of the New York State Medical Association, American Medical Association, Erie County Medical Society, Buffalo Medical and Surgical Association, Buffalo Obstetrical Medical Union Club, and is also a Fellow of the Royal Medical Society of England.

FERGUSON, James F., of New York City, was graduated M. D. at the University of the City of New York in 1861, and at the Bellevue

Hospital Medical College in 1862. He is now Visiting Surgeon to Charity Hospital and to the Hospital for Nervous Diseases, Blackwell's Island, and Medical Superintendent of Falkirk, Central Valley, New York. Dr. Ferguson is an active member of the New York County Medical Society, New York Neurological Society, and of several other noted medical organizations of New York City.

FINLAYSON, Daniel W., of Des Moines, Iowa, was graduated M. D. at the University of Michigan, Ann Arbor, in 1875, and his medical education was supplemented by attending the Bellevue Hospital Medical College, New York City, from which institution he received an *ad eundem* degree in 1880. Dr. Finlayson is now Professor of Anatomy and Clinical Surgery in the Iowa College of Physicians and Surgeons. He is a member of the American Medical Association, Iowa State Medical Society, and the Polk County Medical Society of his State.

FISK, Samuel A., of Denver, Colorado, was graduated M. D. at Harvard University Medical School, Boston, Massachusetts, in 1880. He is now Professor of the Practice of Medicine in the Medical Department of the University of Denver, and Secretary and Treasurer of the Faculty. He is also Visiting Physician to Arapahoe County Hospital; St. Luke's Hospital and Deaconess Home and Hospital, Denver. Dr. Fisk is ex-President of the Colorado State Medical Society; member of the Association of American Physicians; American Academy of Medicine, and American Climatological Association.

FITZPATRICK, Thomas V., of Cincinnati, Ohio, was graduated at the Cincinnati College of Medicine and Surgery in 1875, and his medical education was supplemented by attendance of special courses at the Post Graduate Medical School and Hospital, New York City, in 1888. He is now Professor of Laryngology and Otology in the Cincinnati College of Medicine and Surgery, and holds the same chair in the Woman's Medical College of Cincinnati.

FLAGG, John D., of Buffalo, New York, was graduated M. D. at the McGill University, Montreal, Canada, in 1887, and became a Licentiate of the Royal College of Physicians and Surgeons, Edinburgh, Scotland, during the same year. He is now Professor of Practical and Surgical Anatomy in Niagara University and Surgeon to the Buffalo Medical and Surgical Dispensary. Dr. Flagg is an active member of the Erie County Medical Society; Buffalo Medical and Surgical Association; also of the Buffalo Obstetrical and Clinical Societies.

FOLSOM, Charles Follen, of Boston, Massachusetts, was born at Haverhill, that State, April 3, 1842. He is of English descent and his ancestry were among the first settlers of New England. The subject of this sketch received an academical education, entered Harvard University, graduating from the collegiate department in 1862, and from the medical school in 1870, having meanwhile pursued his professional studies. He established himself in Boston, where he has since remained engaged in an extensive and successful practice of general medicine, and where he has been Visiting Physician to the Massachusetts Infant Asylum, Carney Hospital and Boston Dispensary, and later, First Assistant Physician

to the McLean Insane Asylum, at Somerville. He is a member of the Massachusetts Medical Society; of the Health Department of the Social Science Association, and of the Boston Societies for Medical Observation, Medical Improvement and of the Medical Sciences. As an author, his writings have been confined to health reports and to contributions to medical journals; among his notable papers furnished to the latter may be mentioned: "Limited Responsibility;" "General Paralysis;" "Insanity in England and America;" "Letters from Europe," in the *Boston Medical and Surgical Journal*. He spent the year 1873-74 and the summer of 1875 studying in Europe. Dr. Folsom has devoted special attention to public hygiene, and has served as secretary of the Massachusetts State Board of Health.

FOSTER, Addison H., of Chicago, Illinois, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1866. He is now Physician to the Washingtonian Home and the Chicago Hospital for Women and Children. Dr. Foster is a member of the American Medical Association, American Academy of Medicine, Illinois State Medical Society, and the Chicago Medical, Pathological and Gynecological Societies.

FOSTER, Frank P., of New York City, was born at Concord, New Hampshire, November 26, 1841. Receiving his preliminary education at the Concord High School, he attended medical lectures at Harvard University, and at the College of Physicians and Surgeons, New York, graduating from the latter in 1862. After a hospital course of two years, he established himself in general practice in New York, where he has since remained. His introduction into New York, in 1870, of animal vaccination gave him a prominent position in his profession, and to him is largely due the general adoption of this highly efficacious method. He is a member of the American Medical Association, Fellow of the New York Academy of Medicine, member of the New York County Medical Society, member of the Medical Journal Association, of which he has been Librarian, and member of the New York Dermatological Society, of which he has been Secretary, and also President. From 1862 to 1864 he served on the Surgical Division of the House Staff of the New York Hospital. He was an Acting Assistant Surgeon United States Army in 1865. He married October 18, 1869, Georgiana, daughter of Elias Molleson, of New York. He has furnished occasional contributions to medical periodicals, his more important papers being: "Herpes Contagiosus Varioliformus;" "On the Management of the Prolapsed Arm in Transverse Presentations;" "Treatment of Stumps After Amputation," and a series of articles upon vaccination. But Dr. Foster is perhaps more widely known as the able editor of the *New York Medical Journal*. For several years he has been engaged, with the collaboration of other distinguished medical men, in the preparation of an "Illustrated Encyclopedic Medical Dictionary," which is to consist of four large volumes, three of which are now (1893) completed and published by D. Appleton & Co., of New York. This work is a Dictionary of the technical terms used by writers on medicine and the collateral sciences in the Latin, English,

French and German languages. The distinctive features of this publication are as follows: It is founded on independent reading, and is not a mere compilation from other medical dictionaries, consequently its definitions are more accurate. Other medical dictionaries have, it is true, been consulted constantly in its preparation, but what has been found in them has not been accepted unless scrutiny showed it to be correct. It states the sources of its information, thus enabling the critical reader to provide himself with evidence by which to judge of its accuracy, and also in many instances guiding him in any further study of the subject that he may wish to make. It is the only work of the kind printed in the English language in which pictorial illustrations are used. It tells, in regard to every word, what part of speech it is, and does not define nouns as though they were adjectives, and *vice versa*; and it does not give French adjectives as the "analogues" of English or Latin nouns. It contains more English and Latin major headings than any other medical dictionary printed in English or Latin, more French ones than any printed in French, and more German ones than any printed in German, all arranged in a continuous vocabulary. The sub-headings are usually arranged under the fundamental word, making it much more encyclopedic in character than if the common custom had been followed.

FOSTER, William S., of Pittsburgh, Pennsylvania, was graduated at the Jefferson Medical College, Philadelphia, in 1866. He is now Chief Examining Physician at Pittsburgh for the Baltimore and Ohio Railroad, and member of the Surgical Staff of Allegheny City Hospital. Dr. Foster is an active member of the American Medical Association; American Railway Surgeons' Association; Pennsylvania State and the Allegheny County Medical Societies.

FORD, William Henry, of Philadelphia, Pennsylvania, of Anglo-German ancestry, was born in that city, October 7, 1839. His literary and classical education was obtained at Lawrenceville High School, and at Princeton College, New Jersey, graduating at the former in 1857, and at the latter in 1860. In 1862 he was appointed Acting Medical Cadet, United States Army, stationed at the Wood Street United States Army General Hospital, Philadelphia; also, in the same year, was detailed as medical officer on board the hospital steamer *Whilldin*, in the Pamunky River, and, continuing in the service, was again stationed at Wood Street Hospital till the spring of 1863. In the summer of 1863 he was appointed Assistant Surgeon of the Forty-fourth Regiment Pennsylvania Volunteers, and soon after Surgeon, and continued with the regiment till the retreat of Lee after the battle of Gettysburg, when he was mustered out of the service. He pursued his medical studies at the Jefferson Medical College, taking his degree of M. D. at that institution in 1863. In 1865 he visited Europe, where he remained nearly three years engaged in the study of languages, following special medical studies at the universities, and attending the hospitals of Bonn, Berlin, Heidelberg, Vienna, Paris and London. He returned to Philadelphia in 1868, when he immediately commenced private practice. In 1869 he was elected a member of the Pathological Society of Philadelphia; in 1870 a member of the College of Physicians; in 1872 a

member of the Philadelphia Obstetrical Society, and in 1874 a member of the American Public Health Association. He is the author of a thesis on "Gunshot Wounds of the Chest," suggested by experience in military hospital wards, and illustrated by cases treated; also editor of the reports of the Board of Health of Philadelphia; compiler of annual vital statistics of Philadelphia from 1872 until 1875; author of "Statistics of Births, Marriages and Deaths in the City of Philadelphia," 1874. He also acted as one of the associate editors of the *Philadelphia Medical Times* in 1870 and 1871. In 1863 he was elected Resident Physician to Philadelphia Hospital, and was re-elected in 1864; from 1869 until 1871 he was Assistant Demonstrator of Anatomy in the Philadelphia School of Anatomy; member of the Centennial Medical Commission of Philadelphia, and chairman of its committee on sanitary science, in 1876, and delegate to the International Medical Congress assembled in Philadelphia the same year. In 1871 he was appointed a member of the Board of Health of the city of Philadelphia, and has since been twice reappointed, and has served as secretary of the board. In this position he devoted much time and labor on behalf of measures which had for their object the improvement of the sanitary condition of his city, and also labored earnestly to extend the scope and improve the character of the annual publications of the board, especially in regard to the subject of vital statistics. In 1876 he was elected Physician to the Foster Home.

FORDYCE, John A., of New York City, was graduated M. D. at the Chicago Medical College in 1881, and at the Frederick Wilhelm University, Berlin, Germany, in 1888. He is now Lecturer on Dermatology in the New York Polyclinic and Attending Surgeon for Skin and Genito-Urinary Diseases to Bellevue Hospital out-door patients. Dr. Fordyce is an active member of the American Association of Genito-Urinary Surgeons, American Dermatological Association, New York Dermatological Society, and a Fellow of the New York Academy of Medicine.

FOWLER, George Ryerson, of Brooklyn, New York, was graduated M. D. at the Bellevue Hospital Medical College in 1871. He is now Surgeon to St. Mary's and the Methodist Episcopal Hospitals, Consulting Surgeon to the Relief and the Norwegian Hospitals, member of the American Surgical Association, New York Surgical Society, Brooklyn Surgical Society, American Medical Association, and a Fellow of the New York Academy of Medicine. Dr. Fowler is also Examiner in Surgery for the State Medical Examining Board.

FOX, George Henry, of New York City, was graduated M. D. at the University of Pennsylvania in 1869. He is now Professor of Diseases of the Skin in the College of Physicians and Surgeons, New York, and in the New York Post-Graduate Medical School and Hospital. Dr. Fox is Attending Physician to the New York Skin and Cancer Hospital; Consulting Dermatologist to Randall's Island Hospital; Consulting Physician to Woman's Hospital, Brooklyn, and author of "Photographic Illustrations of Skin Diseases and Cutaneous Syphilis." He is an active member of the American Dermatological Association, New York State Medical Society, New York County Medical Society, New York Dermatological

Society, as well as of several other leading medical organizations in New York City.

FRANKHAUSER, Fremont W., of Reading, Pennsylvania, was graduated M. D. at the Jefferson Medical College in 1880, and received an *ad eundem* degree from the Medico-Chirurgical College, Philadelphia, in 1888. He is now Pathologist to the Reading Hospital, and Expert Oculist for the United States Pension Bureau. Dr. Frankhauser is an active member of the American Medical Association, Medical Society of the State of Pennsylvania, Medical Society of the County of Berks, and of the Reading Medical Association. He devotes special attention to diseases of the eye and ear.

FRENCH, George Franklin, of Minneapolis, Minnesota, was educated at Harvard, from which institution he received the degree of A. B. in 1859, and that of M. D. in 1862. He was Surgeon of United States Volunteers during the War of the Rebellion, and was formerly Assistant Surgeon United States Army. He is now Instructor of the Practice of Medicine in Portland School of Medical Instruction, Professor of Obstetrics in the Minnesota Hospital College, Professor of Gynecology in the Minneapolis College of Physicians and Surgeons, president of the Minnesota State Examining Board, member of the American Medical Association, American Public Health Association, and the American Association for the Advancement of Science, also of numerous other medical and scientific organizations.

FREV, Clarence L., of Scranton, Pennsylvania, was graduated M. D. at Jefferson Medical College, Philadelphia, in 1872. He is now Special Examiner of the Eye and Ear for the United States Pension Bureau, and is Ophthalmic Surgeon and member of the staff to Lackawanna Hospital. He is a member of the Lackawanna County Medical Society, and American Medical Association.

FULTON, Andrew L., of Kansas City, Missouri, was graduated in medicine at the University of Victoria College, Toronto, Ontario, in 1869, and also received an *ad eundem* degree from Bellevue Hospital Medical College, New York City, in 1870. Dr. Fulton is now Professor of Anatomy and Clinical Surgery in the Kansas City Medical College. He is editor of the *Kansas City Medical Record*; member of the American Medical Association, British Medical Association, Missouri State Medical Society, Kansas State Medical Society, and Jackson County Medical Society.

FURNISS, John Perkins, of Selma, Alabama, son of Dr. John P. Furniss, a native of Maryland, was born September 24, 1841, near Columbus, Miss. He graduated from the University of Mississippi, at Oxford, in June, 1860. During the Civil War he was Assistant Surgeon in the Confederate Army; and was recommended in March, 1865, for promotion. He received the degree of M. D. from the New Orleans School of Medicine in March, 1866, and settled the next month in Selma, Alabama, where he has since remained engaged in the active and successful practice of his profession. His specialty is genito-urinary surgery. He is a member of the Selma Medical Society, of which he was secretary from 1869 to 1875, and vice-president in 1876 and 1877, and of the Medical Association of the State of Alabama, and has served as a member of its Board of Councilors. He is the author of an essay on

the "Anatomical and Physiological Peculiarities of the Negro," which was published in the *New Orleans Medical and Surgical Journal*.

GALLEY, John K., of Detroit, Michigan, was graduated M. D. at the Medical Department of the University of New York in 1877. He is now Attending Surgeon to the Children's Free Hospital, and Harper Hospital, ex-Superintendent of the latter hospital, and Physician to the Home of the Friendless, Detroit. He is an active member of the Detroit Medical and Library Association, Michigan State Medical Society, and other medical and social organizations in the city of his residence.

GARMANY, Jasper J., of New York City, was graduated M. D. at Bellevue Hospital Medical College New York, in 1882, and he became a Fellow of the Royal Chirurgical Society of England, in 1885. He is Instructor of Surgery in the New York Post-Graduate Medical School and Hospital, Fellow of the New York Academy of Medicine, and a member of the British Medical Association.

GEHRUNG, Eugene C., of St. Louis, Missouri, was graduated in medicine at the College of Physicians and Surgeons, St. Louis, in 1870. He is now President of the St. Louis Obstetrical and Gynecological Society; member of the American Gynecological Society; American Medical Association; American Electro-Therapeutical Association; Corresponding member of the Obstetrical and Gynecological Societies of Paris, and the Electro-Therapeutic Society of France. Dr. Gehrung is also Gynecologist to the South-Side Free Dispensary, and Consulting Gynecologist to the St. Louis Female Hospital.

GETCHELL, Francis Horace, of Philadelphia, Pennsylvania, was born in Waterville, Maine, December 8, 1836; his family, resident for six generations in America, being originally of English extraction. His great-grandfather served as a surgeon in the War of the Revolution, and his grandfather was a captain in the war of 1812. Receiving his primary education at the Watertown Academy, he entered Bowdoin College, passing thence to the Medical Department of Dartmouth College, whence he graduated M. D. in 1859. He established himself in Brooklyn, but upon the breaking out of the Civil War he entered the United States service as Assistant Surgeon, being attached to the Third Maine (Colonel O. O. Howard's) Regiment. He remained with the army, in field or hospital duty, until the end of the Rebellion. Upon being mustered out of the service he established himself in Philadelphia, where he has since remained engaged in the active practice of his profession. In 1872, having a second time attended lectures, he received the degree of M. D. from Jefferson Medical College. While engaged in a general practice, he devotes especial attention to obstetrics and gynecology; and has been Clinical Lecturer upon the Diseases of Women to Jefferson Medical College; Gynecologist to the Jefferson College Hospital, and Obstetrician to the Catherine Street Dispensary. He is a Fellow of the College of Physicians, member of the Pathological Society, and a corresponding member of the Gynecological Society of Boston. For several years he has been a liberal contributor to medical periodicals, and is the author of a standard work upon the "Maternal Management of Infancy."

GIBBES, Heneage, of Ann Arbor, Michigan,

was educated at the University of Aberdeen, Scotland. He became a Licentiate of the Royal College of Physicians, London, in 1879, and received the degree of Doctor of Medicine from the former institution, in 1881. He is now Professor of Pathology in the University of Michigan; Consulting Pathologist to Harper's Hospital, Detroit; Fellow of the Royal Medical and Chirurgical Society, of London; also, a member of the Medical and Pathological Society of that metropolis; member of the British Medical Association, Association of American Physicians, Michigan State Medical Society, and corresponding member of the Pathological Society of Philadelphia. He has made valuable contributions to medical literature, and is the author of a work entitled, "Practical Pathology and Morbid Histology."

GIBBONS, Henry, of San Francisco, California, grandson of Dr. William Gibbons, and son of Dr. Henry and Martha (Poole) Gibbons, was born in Wilmington, Delaware, September 24, 1840. Having graduated from the San Francisco High School, he entered the Medical Department of the University of the Pacific, and from that institution received in March, 1863, his degree of M. D. In the same year he was appointed an Acting Assistant Surgeon in the United States Volunteer Army, and was for the ensuing two years on duty at the Douglas General Hospital. In January, 1866, he established himself in San Francisco, where he has since remained engaged in the active practice of his profession. In 1870 he became Dean of the Faculty of the Medical Department of the University College, formerly University of the Pacific. From the same year until 1873 he was Professor of *Materia Medica*, and in 1874 was made Professor of Obstetrics and Diseases of Women in that institution. From 1870 to 1873 he was Professor of *Materia Medica*. He is a member of the California State Medical Society and of the San Francisco Medical Society, of the latter secretary for several years, and president in 1875. From 1873 to 1875 inclusive, he was Health Officer in San Francisco. He married December 18, 1871, Marie C. Raymond, daughter of S. A. Raymond, Esq., formerly of Toledo, Ohio.

GIBIER, Paul, of New York City, was graduated in medicine from the Faculty of Medicine, Paris, France, in 1884, and is ex-house physician to hospitals in Paris. He is now Medical Director of the Pasteur Institute and Private Sanitarium. Dr. Gibier is a member of the New York Academy of Sciences, New York County Medical Society, and the New York County Medical Association.

GIBNEY, Virgil P., of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1871. He is now Surgeon-in-Chief of the Hospital for Ruptured and Crippled, Professor of Orthopedic Surgery in the New York Polyclinic, and Orthopedic Surgeon to the Nursery and Child's Hospital. Dr. Gibney is author of a work entitled, "The Hip and its Diseases." He has also made other valuable contributions relating to his special field of practice.

GIRVIN, Edwin R., of Denver, Colorado, was graduated M. D. at the University of Pennsylvania in 1875. He is a member of the Philadelphia County Medical Society, Denver Medical Association, Arapahoe County Medical Society and the Medico-Legal Society of Denver. Dr. Girvin is Ophthalmologist to the

Deaconess Home Hospital and the Colorado Woman's Hospital. His practice is limited to the treatment of diseases of the eye and ear.

GLASGOW, Frank A., of St. Louis, Missouri, was graduated M. D. at the St. Louis Medical College, in 1878. He is now Professor of Gynecology in that institution, Consulting Physician to the St. Louis Female Hospital, Physician to Augusta Free Hospital for Children, and Gynecologist to St. Louis Mullanphy Hospital. Dr. Glasgow is a member of the American Medical Association and of numerous other medical organizations in this country.

GLEITSMANN, Joseph W., of New York City, was graduated M. D. at the University of Würzburg, Germany, in 1865. He is now Professor of Laryngology and Rhinology in the New York Polyclinic, Laryngologist and Otologist to the German Dispensary and Consulting Laryngologist to West Side German Dispensary. Dr. Gleitsmann is an active member of the New York Academy of Medicine, American Medical Association, and Medical and Chirurgical Society of Maryland.

GLENN, William Frank, of Nashville, Tennessee, was born in Sumner county, near Gallatin, Tennessee, October 28, 1853. He is of English and Scotch-Irish ancestry. His paternal grandfather was one of the first settlers in Nashville, and owned the first boot and shoe factory in Tennessee. His maternal grandfather was first cousin to General Washington. Young Glenn was educated in the High School of Nashville, and studied medicine in the Medical Department of the university of that city, graduating in February, 1873, at the age of nineteen, winning the prize offered for excellence in the study of zymotic diseases. He settled in Nashville in the general practice of medicine and surgery, in April, 1873, and has been engaged in an active and successful practice of his profession in that city for the past twenty years, having devoted considerable attention to general surgery. He is a member of the Davidson County Medical Society, of the Tennessee State Medical Society, and of the American Association for the Advancement of Science. He has reported several important cases through the medical journals; has written an essay on, "What is Disease?" read before the Nashville Society, and published in the *Richmond Medical Journal*; also a pamphlet on "Venous Circulation," advocating the suction action of the heart as the prime cause, and an article on the "Glycogenic Function of the Liver." In September, 1874, he was appointed First Assistant Demonstrator of Anatomy in the University of Nashville and Vanderbilt University. In September, 1876, he was called to the chair of Physiology in the Nashville Medical College, and also has held in the same institution the chair of the Principles of Surgery, and the chair of Anatomy and Venereal Diseases.

GODMAN, John D., of Philadelphia, Pa., was born in Annapolis, Maryland, December 30, 1794, and died at the former city April 17, 1830. He was the son of Captain Samuel Godman, an officer of the Revolution. Of his parents, little is known, except that his mother died before he was two years old and his father in less than three years thereafter. Dr. T. G. Richardson, his biographer, states that on the death of his mother he was placed under the care of an aunt, then residing at Wilmington.

in the State of Delaware; a lady who, from the superiority of her intellect and education, as well as the sweetness of her disposition and her elevated piety, was eminently qualified to unfold, impress and direct the youthful mind. Under such culture he received the first rudiments of his education and his earliest moral impressions. His alphabet was taught him upon the knee of his grandmother, and it is said that before he was two years old he was able to read. When he had attained the age of four years his aunt removed from Delaware to Chestertown, upon the eastern shore of Maryland, and there she placed the interesting orphan at school. He had already become the idol of the family, but now he manifested such a precocity of intellect, such a fondness for books and such an aptitude to learn, and, withal, evinced so much sensibility, frankness and sweetness of disposition that he gained the affection and excited the admiration of all. He thus gave indications at this early age, not only of that brilliancy of intellect which subsequently exhibited itself in such splendid colors, but also of that deep-seated religious sentiment that became the governing principle of the latter years of his life. But the favorable auspices under which his early training was begun were destined soon to become overshadowed by the dark wings of the destroyer. At the age of six, the aunt who had watched over him so faithfully, loved him so fondly, and of whom he was heard to say on his dying bed, "If I have ever been led to do any good, it has been through the influence of her example, instruction and prayers," was called to another world, and he was again thrown upon the charity of his friends and relatives. Who became his protector, or what special influences were brought to bear upon his mental constitution from this time until he was fifteen years of age, is not known. It is said, however, that the life of dependence to which he was obliged to submit grated harshly upon his tender sensibilities and somewhat marred the natural joyousness of his disposition. Some time subsequently, in a letter to a friend, he thus expressed himself in regard to this period of his existence: "Let me now give you a retrospect of the days of my life. Since I have returned from you, I have discovered my real age, in an old book of my father's, and you would hardly suppose it, I was twenty-one years old on the 20th day of December, 1815. Before I was two years old I was motherless; before I was five years old I was fatherless and friendless. I have been cast among strangers; I have been deprived, by fraud, of property that was mine by right; I have eaten the bread of misery; I have drunk the cup of sorrow; I have passed the flower of my days in little better than slavery; and have arrived at what? manhood, poverty, and desolation. Heavenly Parent, teach me patience and resignation to thy will!" In 1810 young Godman, then living in Baltimore, made the acquaintance of a gentleman who subsequently became his benefactor and most intimate friend. This gentleman was Dr. W. N. Luckey, who was then a senior student in the office of Dr. Thomas E. Bond, of Baltimore, and who in a letter to the late Dr. Daniel Drake, relates the circumstance in the following manner: "The office (of Dr. Bond) was fitted up with taste; and boys, attracted by its appearance, would frequently drop in to

gaze at the labeled jars and drawers. Among them I discovered one evening an interesting lad, who was amusing himself with the manner in which his comrades pronounced the 'hard words,' with which the furniture was labeled. He appeared to be quite an adept in the Latin language. A strong curiosity prompted me to inquire, 'Who are you?' 'Don't you recollect,' said he, 'that you visited a boy at Mr. McCreery's who had a severe attack of bilious colic?' 'I do; but what is your name, my little boy?'—He was small for his age.—'My name, sir, is John D. Godman.' 'Did you study the Latin language with Mr. McCreery?' 'No, he does not teach any but an English school.' 'Do you intend to prosecute your studies alone?' 'I do; and I will, if I live, make myself a Latin, Greek, and French scholar.'" How fully he carried out this determination will appear in the sequel. Some time toward the close of 1811, or the early part of 1812, he was bound as an apprentice to the printer of a newspaper in Baltimore. But it may be readily imagined that, to one of such lofty aspirations and refined sensibilities, the duties of the office were far from agreeable, and the drudgery actually repugnant; which may sufficiently explain the difficulties set forth in the following paragraph, from a subsequent letter to his friend, Dr. Luckey, who was then practicing his profession at Elizabethtown, Pennsylvania. "Everything is in *statu quo* with me. The same series of oppressions, impositions, and insults are still my lot to bear. But I will not bear them long. From the oldest to the youngest, master and man, all seem to have a disposition to pick at me. You will, or may, be surprised to hear that I can never make a printer. It is an erroneous opinion of some people that no one can make a printer unless he be a scholar. On the contrary, scholars can hardly, if at all, be printers. I would not wish you to think that I count myself a scholar. On the contrary, I think myself no scholar." It was while thus engaged in an occupation so ill suited to his tastes, so repugnant to his tender sensibilities, and so exacting upon his naturally delicate constitution, that he suffered from a train of symptoms which were supposed at the time to be due to hypertrophy of the heart, but which may have been the first indication of that insidious malady which, seventeen years after, brought him to a premature grave. In a letter dated October, 1813, he says: "A continued pain in my breast, and at night a slow but burning fever, convince me that I am traveling down a much-frequented road, to the place where disease has no effect. This, my friend, is no phantasy. I do not say it from affectation; I feel it. I can not believe in this disease being contagious, or I should be certain that I have caught it. I sleep with a youth who was born with it, and has it fully developed." It was during this time also that he conceived the idea of studying medicine, as we learn from the following letter to his friend, dated January, 1814: "At the suggestion of Dr. Anderson I have determined to commence the study of chemistry, as he says it will be a great improvement to the mind, and more, as I may be enabled, the ensuing season, if I should live so long, to attend the lectures at the University; and it seems to run greatly in Dr. Anderson's head that I shall one day be a physician. How far

this surmise may be right, time will disclose. It may indeed so happen; and should I study chemistry now, I shall not have it to do at a future period." Wearied and disgusted, as he very naturally was, of standing from morning until night over a font of type, poring over the dirty and oftentimes unintelligible manuscript of newspaper scribblers, and thus wearing out both body and mind in a labor which, except so far as it kept him from immediate starvation, was every way opposed to his natural inclination, and the high purposes for which his superior gifts and attainments qualified him, while at the same time it contributed to the development of the disease, the seeds of which had been already deposited in his system, it is not surprising to learn that the young printer, therefore, abandoned his calling as soon as he could rid himself of his apprenticeship. In the fall of 1814, fired by the patriotic sentiments which had already enlisted many of his comrades and acquaintances in the service of his country, then engaged at war with Great Britain, he joined the flotilla, stationed at that time in the Chesapeake Bay, under the command of Commodore Barney, and in the capacity of a common sailor, was present at the bombardment of Fort M'Henry. Quitting this, however, soon after, either from choice or in consequence of the termination of the war, he presents himself to us again, continues his biographer, as the guest of his sister, Mrs. Stella Miller, of Baltimore, but still without the means of fulfilling the longings of his heart, to pursue the study of medicine, or even of gaining a livelihood. And now, actuated by that high sense of honor that disdained the charity of his family or friends, he is a second time about to engage himself to a newspaper publisher, again to sweat out the noble aspirations of his mind and heart over a printer's desk, from the uncongenial labor of which he had once escaped, when a letter from his friend, Dr. Luckey, animated his desires afresh, and opened the way for the gratification of his tastes. This was in the early part of the year of 1815, when Dr. Luckey, already "captivated by his genius and touched by his misfortunes," resolved to invite him to his house at Elizabethtown, and afford him all the facilities in his power for studying the profession to which he aspired. His acceptance of Dr. Luckey's generous offer is couched in the following touching and enthusiastic language, expressive of his delight, and the grateful emotions with which his heart overflowed upon the reception of this unexpected pleasure: "I have this hour received your last letter, and I can assure you that language is inadequate to express to you my sincere, unfeigned joy for the pleasing news you have communicated to me. Let the manner in which these lines are penned convince you of the state of my mind at present. I was, thirty minutes before I received your letter, on the point of going to a printer in this city, to seek employment, and, but for Providence, I should have done so. You may suppose, that as soon as I read your letter, I abandoned this intention and returned to my sister's house, 'with fire in each eye and paper in each hand,' to answer your epistle of friendship's own dictating. I must lay this aside until my mind becomes settled and undisturbed. I stopped at the line above, that I might recover a small degree of composure, in order to express myself as I ought to

so good a friend. I will certainly comply with your request, should it please God to continue my health and strength, during the ensuing week. Should it please the mercy of Providence to suffer me to take up my residence with you, I shall endeavor, by the most indefatigable study and diligence, to give you the satisfaction your kindness to me deserves. I am in hopes that I shall be able to come some day in the course of next week; but as my journey must be a pedestrian one, I shall not wish to mention a particular day." "Four days after the date of this letter, he arrived," says Dr. Luckey, "at my house, and took up his residence in my family. He made his promises good, for in six weeks he had acquired more knowledge in the different departments of medical science than most students do in a year. During this short period, he not only read Chaptal, Fourcroy, Cheselden, Murray, Brown, Cullen, Rush, Sydenham, Sharp and Cooper, but wrote annotations on each, including critical remarks on the incongruities in their reasonings. He remained with me five months, and at the end of that time you would have imagined, from his conversation, that he was an Edinburgh graduate." These, says Dr. Richardson, must have been glorious days in the life of our young student. After having been tossed about upon the restless sea of adversity, grasping at every object that offered the least hope of supporting him until he could reach the desired haven for which he was so manfully striving, his heavy body was now, for the first time, at rest; while his mind, left to range at will over the fields of science, revelled in the delightful scenes that presented themselves at every step. Now the object of his heart's desire is within his grasp, and with what idolizing love he pressed it to his bosom may be learned from the assertion of his appreciating benefactor, who says of him that, "when he sat down to study, so completely was he absorbed by his subject that it seemed as though the amputation of one of his limbs would scarcely withdraw his attention." But with such an ardent thirst for scientific knowledge, he must have soon drained the contents of the small library of a country physician of that day, for it is learned that in a few short months he determined to seek more abundant sources. Returning to Baltimore he became a pupil of Dr. Hall, of that city, and the succeeding autumn entered upon the course of medical lectures in the University of Maryland; but it would seem under pecuniary difficulties. By the friendly interposition of Dr. Davidge, however, he prosecuted his studies, and "with such diligence and zeal," says Dr. Sewall, "as to furnish, even at that early period, strong intimations of his future eminence. So indefatigable was he in the acquisition of knowledge that he left no opportunity of advancement unimproved, and, notwithstanding the deficiencies of his preparatory education, he pressed forward with an energy and perseverance that enabled him not only to rival, but to surpass all his fellows." He attended the lectures in the Medical Department of the University of Maryland, during the two succeeding winters, under the pupilage of his new friend, Professor Davidge, and was graduated at the commencement in the spring of 1818. During the last session of his attendance, a circumstance occurred which is well worthy of being mentioned here, as illus-

trating his high standing in the class, and the confidence which the faculty of the institution placed in his abilities. Dr. Davidge, who was the Professor of Anatomy, having met with an accident by which his thigh-bone was broken, was prevented from attending to his professional duties for several weeks, and in the meantime it became necessary to provide a temporary substitute. The Faculty, with one accord, selected Mr. Godman, who, confident of his own attainments and of his ability to make a lecturer, having already acted as a demonstrator in the dissecting-rooms, consented to fulfill the appointment, and such was the enthusiasm and eloquence of his delivery, the clearness and simplicity of his style, the forcible appositeness of his illustrations, and, withal, the modesty and propriety of his deportment, that he won the applause and commendation of all who heard him. When he came to be examined for his degree, the superiority of his mind, as well as the extent and accuracy of his knowledge, were so apparent that he was marked by the professors as one who was destined at some future period to confer high honor upon the profession. "Confessedly the most important and interesting period in the life of a young man who has studied a profession is that at which the degree, whether it be of medicine, law or divinity, is conferred upon him. It is then that his friends look upon him with emotions of unusual pleasure and anxiety; gratified that he has thus far succeeded in the calling of his choice, but anxious, lest contented with his attainments, he may turn aside into the paths of idleness, or seek others leading away from that upon which he has already made satisfactory progress. How many there are, especially among those upon whom Providence has bestowed intellectual gifts of a superior order, who having reached this point with the highest honor, and given promise of a career of great distinction and usefulness, suddenly stop short, and either sink into insignificance, or, what is worse, become as notorious in some vicious pursuit as they were for a while distinguished in their endeavors after knowledge. Such was not the case with the subject of this narrative. The period of his graduation in medicine was not a turning-point in his life, but only a mile-stone upon that road to eminence which he continued subsequently to tread with such rapid strides." Another point in this connection is worthy of notice. It might be supposed, from the preceding account of Dr. Godman's trials and privations, that he entered upon the study of medicine without any more preparatory education than what he might have picked up during the few years of schooling which he enjoyed when a boy, as is unfortunately the case with so many young men who apply for and gain admission into our medical colleges. But this is very far from being true, for, notwithstanding the many and serious disadvantages under which he labored, he had succeeded, by dint of indomitable perseverance, backed by a high appreciation of the qualifications necessary to enable him thoroughly to grasp the recondite truths of medical science, in making himself an excellent scholar. "In this respect he was a shining example; and his subsequent success should animate every friendless young man, who may engage in the study of medicine, to imitate his industry and unflinching perseverance. By

these means, if not blessed with his genius, he may prepare himself for an extensive usefulness, and earn respectability, if not renown." Destitute of the means necessary to enable him to wait the slow course of professional business in a city where, doubtless, he would have much preferred to remain, Dr. Godman proceeded to the country, and became a candidate for practice in the village of New Holland, State of Maryland, whence, however, he removed in a few months to the banks of the Patapsco, not far from Baltimore. Here he succeeded in obtaining business, and here, also, he made those observations in natural history, which became some years subsequently the basis of a series of popular papers entitled "Rambles of a Naturalist." But his ardent temperament was little adapted to the stagnant existence of a village doctor. He thirsted for competition, and longed to engage in the rivalries which prevail among the candidates for fame. Nature seems to have urged him on. It was she who revealed to him the compass of his intellectual powers; and bid him seek a theater commensurate with their efficiency." He looked with eager anticipation upon the time when he should have an opportunity of employing his talents as a public teacher of anatomy, and had no little expectation of being called to the University of Maryland, to occupy, as a professor, the place which he had temporarily filled during the last course of lectures that he attended. But being disappointed in this latter, he boldly resolved to move to Philadelphia, then, as still, the emporium of medical teaching in this country, and the Mecca of all his hopes and aspirations, there to strike out upon his individual account as a lecturer upon anatomy and physiology. But he had hardly taken up his residence there, and began to attract the attention which his talents almost immediately elicited, when he was solicited by the late Dr. Drake, who was then in search of men of ability, to complete the organization of the Faculty of the Medical College of Ohio, to accept the Professorship of Surgery in that institution, the first session of which had closed a few months previously. To this he consented, and on the 6th of October, 1821, he left Philadelphia, and after a tedious journey of two or three weeks, arrived at Cincinnati just in time to enter upon his professional duties. Referring to this event his biographer, Dr. Richardson, writes as follows: Looking back from this distant day at the then apparently poor prospects of the Medical College of Ohio, and the comparatively little fitness of Dr. Godman for the chair which he was called to fill, this seems to me at first thought to have been an exceedingly ill-judged move. But, on the other hand, it must be taken into account that his ambition to become a public teacher, was second only to his insatiate thirst for knowledge; that he possessed a thorough acquaintance with the leading principles of medicine; that he was admirably versed in the subject of anatomy, with which surgery has so close a connection; that the only other medical school then in operation in the great West, was the one at Lexington, Kentucky; that Cincinnati, although containing but about ten thousand inhabitants, was the largest city west of the Alleghanies; and that the probability of his getting rapidly into practice was far greater than it would have been in Philadelphia, or any of the other older

settled cities of the East. Such, doubtless, were the arguments which influenced him to emigrate to Cincinnati; but the sequel, while it did not disprove their cogency, proved to him an unfortunate experience. Indeed, he may be ranked among the first victims to the remarkable ill success which befell nearly all those who were about that time, and subsequently, persuaded to leave their eastern homes to join the illustrious Drake in his attempts to build up the Medical College of Ohio. Scarcely had he delivered his introductory address when he was compelled to resign his appointment, and thus to abandon the principal object which he had in view in leaving Philadelphia. Of the precise causes which led him to take this step we have no definite information, but only the simple statement of Dr. Drake, that "difficulties of which he was neither the cause nor the victim were generated in the faculty; the class was small, and the prospects of the institution overcast." Although again foiled in his efforts to secure an official position commensurate with his talents as a public teacher and the pecuniary wants of his family, Dr. Godman was not the man to succumb under such adverse circumstances. His ascent up the precipitous and rugged hill, upon which the temple of fame is said to stand, was not thus to be prevented, and hardly had the last lightly-rooted shrub given way beneath his weight before we find him again upon his feet, struggling up another pathway, and, with undiminished strength, seizing upon other objects which promised a more secure hold. Disappointed and thwarted by the failure of the Medical College, he engaged immediately in the establishment of a medical journal, and the *Western Quarterly Reporter*, the first periodical of the kind west of the Alleghanies, was the result of his enterprise. It may be true that he was not the originator of this scheme, the credit of which is ascribed to his friend Dr. Drake, but the labor of having carried it into execution was certainly his, as the pages of the *Reporter* amply attest. But alas for his hopes, he could not have laid hold of a weaker support. Medical journalism was then, as it has ever since proved to be in this country, the least profitable investment of talent, labor, or money within the range of a professional man's pursuit, and it is not surprising to learn that, after the issue of six numbers, the enterprise was abandoned. Notwithstanding the brief existence of the *Reporter*, its establishment under the existing circumstances is sufficient evidence to those who are familiar with such labors, of a degree of energy on the part of the editor almost unparalleled in the history of medical journalism, either in this or any other country; and the signal ability with which it was conducted is hardly equaled by any of the numerous similar periodicals with which American medical literature is at present supplied. Its pages indicated great literary merit and intrinsic value; and some idea of the enormous labor bestowed upon it by Dr. Godman may be gained from the statement that more than three hundred pages of its contents were contributed by his own pen. Of these contributions many were of an ethical nature, relating to medical education, medical quarrels, medical excellence and medical duties; others were of a purely scientific character, and quite a number were reviews of med-

ical works; any one of which would command attention in journals of the present day. Dr. Godman did not remain in Cincinnati until the suspension of the *Reporter*, but impelled by the same high ambition which had led him from the banks of the Patapsco to Philadelphia, and from the latter city to the banks of the Ohio, he retraced his steps to Philadelphia in the autumn of 1822, having resided in the West but a single year. During this brief period, however, he had not only accomplished the work above alluded to, and attended to his practice, which is said to have been considerable for a stranger, but occupied himself with many other less important objects bearing upon the good of the profession or his own individual improvement. Among other things it is mentioned that "he erected an apparatus for sulphurous fumigation, and translated and published a French pamphlet on that remedy; he read many medical books and current works of general literature; prosecuted the study of the German and Spanish languages; and labeled the ancient coins and medals in the Western Museum. In the midst of the whole he also found time to cultivate his social relations, and every day added a new friend to the catalogue of those who loved him for his simplicity and frankness, not less than they admired him for his genius, vivacity and diligence. In October, 1822, Dr. Godman, with his wife (who was a daughter of the distinguished artist, Peale) and infant child, bid farewell to the West and set out to retrace his steps across the mountains. The journey was a long and tedious one, performed entirely by stage, and in a letter written on the road he characterizes it as exceeding in misery any twenty journeys that he had ever before undertaken. He arrived in Philadelphia, the theater of his future renown, just as the medical students were assembling for the annual course of lectures in the University of Pennsylvania, then the only medical school in the city. Having no time to lose, he went immediately to work to provide himself with the means for establishing himself as a private lecturer upon anatomy and physiology. For this purpose he hired the rooms in College avenue, which had been previously occupied for one or two years by Dr. Jason Lawrence, and which have ever since his time been devoted to the same objects by various gentlemen, many of whom have become well known to the profession as men of science and teachers of great ability. Here he commenced lecturing, and in a few weeks his eloquence as a speaker, his great powers as a delineator of the subjects which he undertook to teach, and his winning manners as a companion, attracted large numbers, not only of students of medicine, but of others not directly interested in medical studies. His talents, indeed, soon became the theme of remark throughout the numerous circles of scientific and literary men of Philadelphia, and requisitions were frequently made upon him for addresses before various professional and non-professional assemblies. Never, however, did he condescend to anything like a political harangue, for, notwithstanding the fervid patriotism which he exhibited whenever occasion occurred to call it forth, he seems to have lived above even the knowledge of the tricks and slips of party demagogues. Whenever he consented to appear before public audiences, which he not unfrequently did, the subjects

which he selected for discussion were almost invariably of a scientific character, and thus while those who crowded to hear him were entertained by the display of his brilliant imagination, deep enthusiasm and graceful delivery, they never failed to receive more or less valuable instruction. In the addresses which he delivered about this time, and which were collected and published in a volume some years afterwards, will be found some specimens of his eloquence as a speaker, and skill as a reasoner, which clearly evince the remarkable talent with which he was gifted. It was not, however, to private instruction or public lecturing that Dr. Godman devoted his whole time, exacting as these duties were. During the four years in which he occupied the rooms in College avenue he made many contributions to anatomical science, and more especially to surgical anatomy, most of which were published in the *Philadelphia Journal of the Medical Sciences*. Of this periodical he afterwards, in 1824, became one of the editors, and continued to use his pen for its support to within a short time of his death. His more elaborate anatomical investigations of the human body were published in a separate volume, given to the profession in 1824. He also issued a tract of eighty-six pages, entitled "Contributions to Physiological and Pathological Anatomy, Made at the Philadelphia Anatomical Rooms, During the Winter of 1825." But by his removal to Philadelphia, a still wider field for research was opened before him. Since his first settlement upon the banks of the Patapsco he had employed every suitable opportunity for cultivating a practical acquaintance with general natural history, and had already become proficient in many of its branches; but here, through the Academy of Natural Sciences, of which he had been made a member before his departure for the West, he was enabled to extend his investigations, and soon conceived the idea of writing a book upon the subject, which should be the crowning labor of his life. By the most indefatigable industry and perseverance this was accomplished, and in 1826 appeared his *American Natural History*, in three octavo volumes, a work which, considering the circumstances under which it was produced, is at once a valuable addition to the scientific literature of the country, and a worthy monument to his memory. In addition to his strictly scientific labors, which, in viewing what he accomplished, one would suppose must have occupied every moment of his working hours, Dr. Godman dipped somewhat into general literature, and wrote several elaborate analytical and critical reviews for the *American Quarterly*, and translated and published a number of papers from the Latin, French, and German languages, among which, were Lavasseur's "Narrative of Lafayette's Visit to the United States." Such was the life of incessant toil that he was leading in Philadelphia, a sacrifice of mind and body, which met with but little recompense in a pecuniary point of view, when he was called to the Professorship of Anatomy in Rutgers' College, in the city of New York. The office was one of honor; the school, boasting among other well-known names upon its list of lecturers, those of Mott and Hosack, promised to obtain a rapid success. Having consented to the appointment, he went to New York in the fall of

1826, and lectured, with almost unparalleled popularity, during the ensuing session. The following winter his health, which had been declining for some time previous, became so much impaired that he was obliged to quit about the middle of the course, and resign his chair. Being advised to leave New York for a warmer latitude, he went to Santa Cruz, where he remained three months, and returned to Philadelphia in May, after a rather unpleasant, and, so far as his health was concerned, an unsatisfactory visit. Convinced now that he was in the advanced stages of consumption, he did not attempt—indeed, being reduced to a mere skeleton, he was physically unable—to resume his anatomical labors, but taking a house at Germantown, he continued to labor with his pen for the support of his family. It was here, while for most of the time unable to leave his room, and often too weak to sit up, that he wrote for *The Friend*, a weekly magazine, published at Philadelphia, those delightful letters, entitled, "Rambles of a Naturalist." These were subsequently collected, and published in Waldie's Select Circulating Library, but after the author's death were issued in an independent volume, edited by Dr. Reynell Coates, and prefaced by a memoir taken from the *Western Journal of the Medical and Physical Sciences*, for which it had been prepared by the editor, Dr. Daniel Drake. Dr. Godman also continued to work for the *Encyclopedia Americana*, the natural history department of which had been exclusively confided to him, but which he did not live to complete. In this condition he passed nearly two years; occasionally able to go out and enjoy the sunshine and the landscape, which to his genial heart seemed so bright and green, but for the most of the time confined to the house, husbanding his strength for the performance of those labors upon which the daily bread of his family depended. But, with all the appliances which science and art could suggest or contrive, the unrelenting attentions of his friends, of whom Dr. Samuel Jackson seems to have been the most devoted, and the affectionate nursing of his attached wife, his disease made steady inroads. During this period he was fully aware that his end was not far off, and often thought it immediately at hand, but never once did he repine or complain. Throughout the whole of his sickness, he maintained a remarkably cheerful frame of mind, and would not permit any exhibition of sadness in his chamber. He finally commended his family to the Father of mercies, and calmly resigned himself into the hands of the Savior in whom he trusted, and thus fell from the firmament of the American profession, before he had reached his meridian splendor, one of the brightest stars which have yet risen above its horizon.

GOLDSMITH, William Thomas, of Atlanta, Georgia, was born in Greenville county, South Carolina. His paternal grandparents came to this country from England at a period antecedent to the Revolutionary War, and settled in Virginia; his maternal grandparents also came from England, and made Maryland and Virginia their homes. His maternal grandfather was Lord Wickliffe, who emigrated to Maryland in company with Lord Baltimore; on the paternal side the origin of the family is found in the Goldsmiths of England. His grandparents were "rebels" in the struggle for American independence, and in various capacities

performed excellent service for the cause of freedom. After the termination of hostilities between the two countries they moved to South Carolina. Shortly after his birth his parents settled in Charleston, that State, where he received his preliminary education in the Charleston High School. Before the opening of the late war he moved with his family to Barton county, Georgia, where he studied medicine under the supervision of Dr. R. M. Young. He was graduated from the Medical College of Georgia, at Augusta, in 1852; he then entered upon the active practice of his profession at Cartersville, Georgia. During the progress of the Civil War he was on the medical staff of the Confederate army, and was in hospital service at Richmond, Virginia; Atlanta, and Macon, Georgia, and Corinth, Mississippi; and from the opening to the closing of the conflict was constantly employed in his professional capacity. At the close of the Rebellion he removed to Atlanta, where he has since resided. At the present time, while engaged in general practice, he makes a specialty of gynecology. He is a member of the Georgia State Medical Association, and of the Atlanta Academy of Medicine; and for several terms officiated as president of the Fulton County Medical Society. He was elected Police Commissioner for Atlanta two years, and at the expiration of his term was re-elected for an additional period of three years. He was appointed by the city authorities of Atlanta one of the Sanitary Commission of 1876, which body issued a large volume, containing a lengthy and valuable report by him, as chairman of a committee on municipal hygiene. He has from time to time contributed various articles to medical journals on "Erysipelas," "Dysentery," "Chloroform in Obstetrics," "Gynecological Medicine," and other subjects of professional and public importance.

GORDON, Thomas Winslow, of Georgetown, Ohio, was born at Warren, in the same State, September 23, 1819. He is of Anglo-Scotch ancestry, and whose first progenitor in this country was Edward Winslow, a "Mayflower" pilgrim. Dr. Gordon's early education was obtained in the common schools of his neighborhood, and his literary and classical education at Warren Academy, and from private tutors. He pursued his medical studies at the Western Reserve College, from which he graduated in March, 1846, settling first in Bagetta, in his native State, and removing to Georgetown in 1850. His specialty is diseases of women, although he has also made eye diseases a subject of particular study and treatment. He is a member of the Ohio State Medical Society, elected in 1849, and was its first vice-president in 1876; of the American Medical Association, elected in 1853; honorary member of the Indiana State Medical Society, elected in 1856; besides several other medical and literary societies. To the medical journals he has at various times contributed articles of much value to the profession and the people; among others on "Asiatic Cholera," "Scarlet Fever," "Dysentery," and various essays and reports of cases which have occurred in his extensive professional experience. In 1857 and 1858 he held the position of Professor of Materia-Medica and Therapeutics in the Cincinnati College of Medicine and Surgery, and that of Professor of Chemistry and Pharmacy from 1858 until 1860 in the same institution.

In 1874 he was President of the Brown County (Ohio) Academy of Medicine. He has held the position of Examining Surgeon for Pensions many years. From 1862 until 1864 he was Surgeon of the Ninety-Seventh Regiment Ohio Volunteer Infantry, United States Army, and was also Military Surgeon of Brown county, Ohio, in 1865. He was a member of the International Medical Congress of 1876. Since the war he has been chairman of a number of county and congressional committees, and is recognized as one of the oldest and most highly-esteemed members of the medical profession in the section of the State in which he lives.

GORDON, Seth Chase, of Portland, Maine, was born in Fryeburg, in the same State, August 17th, 1830, and is of Scotch descent. He was educated at the public schools and at Fryeburg Academy, and studied medicine at Fryeburg, Dartmouth and Bowdoin Medical Schools, and was graduated M. D. from the latter institution in 1855. He commenced the practice of his profession at Gorham, in his native State, soon after receiving his medical degree. In December, 1861, he entered the army as Assistant Surgeon in the Thirteenth Maine Volunteer Infantry, and October 17, 1863, was appointed Surgeon in the First Louisiana Volunteer Infantry, serving principally in the Department of the Gulf. In the summer of 1864 he was made Surgeon-in-charge of the General Hospital at Natchez, Mississippi, and in the following winter Surgeon-in-charge of the District of La Fourche, Louisiana, on General Cameron's staff, leaving the service July 12, 1865. At the close of the Civil War he established himself at Portland, where he has since remained engaged in the active pursuits of his avocation. He has made surgery and gynecology in some degree a specialty, having performed ovariectomy several times, and twice successfully. He is a member of the Maine Medical Association and the Cumberland County Medical Society, in both of which he has been elected to subordinate offices, and of the American Medical Association. He is an honorary member of the Detroit Academy of Medicine. He has contributed occasional articles to medical journals. He has been a member of the common council and of the school committee of Portland, and president of the Portland Army and Navy Union. He is an associate corporator of the Maine General Hospital, of which he has served as one of the Attending Surgeons. He has also been Lecturer on Diseases of Women in Portland School for Medical Instruction.

GOTTHEIL, William S., of New York City, was graduated in medicine at the College of Physicians and Surgeons, New York, in 1881. He is now Lecturer on Dermatology in the New York Polyclinic; Professor of Pathology in the American Veterinary College, and Dermatologist to the Northwestern Dispensary. Dr. Gottheil is a member of the New York Academy of Medicine, and of numerous other medical societies in that city.

GOULEY, John W. S., of New York City, was born in New Orleans, Louisiana, March 11, 1832, of French parentage. He received his classical education under private instructors, and was graduated M. D. from the College of Physicians and Surgeons, New York, in the spring of 1853. After serving on the house staff of Bellevue Hospital one year he

established himself in New York City in 1854, where he has since remained engaged in the active practice of his profession, devoting especial attention to the field of general and genito-urinary surgery. During his practice he has twice performed the successful excision of half of the lower jaw, 1859 and 1860; excision of the entire radius, 1863, and the entire lower jaw in 1864, and up to that time over five hundred other surgical operations. He became a member of the New York Pathological Society in 1855, of the New York Academy of Medicine in 1856, Medical Society of the County of New York in 1865, American Medical Association in 1873, and the Medical Society of the State of New York in 1875. He is also a member of numerous other medical and scientific organizations. From 1861 to 1864 he was Assistant Surgeon United States Army, on hospital duty in Washington, D. C.; with the army in the peninsular and Maryland campaigns, at the battle of Fredericksburg, and in charge of the United States General Hospital, Central Park, New York, till his resignation. The following are some of his contributions to medical literature: "Polypus of the Larynx," "Laryngo-Tracheotomy," "External Perineal Urethrotomy; an Improved Method to Relieve Obstinate Stricture," Transactions State Medical Society, New York, 1869; "Instruments for Exploration of the Urethra," "Treatment of Intractable Stricture," "Internal Urethrotomy," "Strictures in the Meatus Urinarius and Fossa Navicularis," "Modern Lithotripsy," 1870; "Urethral Fever from Catheterism," "Case of Retention of Urine by Diseased Kidney," "Rupture of Bladder," 1872; "Diseases of the Urinary Organs," 1873; "Perityphlitic Abscess from Perforation of Appendix Vermiformis," Transactions of Medical Society, State of New York, 1875; "Chronic Cystitis," "Urethroplastic Operations to Remedy Hypospadias, Epispadias, and Incurvation of the Penis," and "Stone in the Bladder, Its Removal," 1876. In 1856 he was Professor of Anatomy in the Vermont Medical College, Woodstock, Vermont; from 1855 to 1859 Curator of Pathological Museum, Bellevue Hospital; from 1859 to 1861 and 1864 to 1866, Demonstrator of Anatomy in the Medical Department of the University of New York, also Instructor in Histology and in Operative Surgery in the same institution. He was chosen in 1859 Attending Surgeon to Bellevue Hospital, and served as Surgeon to St. Vincent's Hospital from 1864 to 1867. He was Professor of Clinical Surgery and Genito-Urinary Diseases in the Medical Department of the University of New York, from 1866 to 1871; and was made Professor of Diseases of the Genito-Urinary System, University of New York, in 1876, and Consulting Surgeon to the Bureau of Medical and Surgical Relief of Outdoor Patients of Bellevue Hospital, New York. In July, 1869, he married Miss Isabelle Mary Caulfield, of Lexington, Kentucky.

GRANT, Henry Horace, of Louisville, Kentucky, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1878. He is now Professor of Principles and Practice of Surgery in the Hospital College of Medicine, Louisville, and Surgeon to the Louisville City Hospital. Dr. Grant is an active member of the Jefferson County Medical Society, Kentucky State Medical Society and of the American Medical Association.

GRANT, Henry Young, of Buffalo, N. Y., was graduated M. D. at the Medical Department of McGill University, Montreal, in 1886. He is now Lecturer on Diseases of the Eye and Ear in the University of Buffalo, and Surgeon to the Buffalo Eye and Ear Infirmary. Dr. Grant became a member of the College of Physicians and Surgeons, Ontario, in 1886. He is also a member of the Erie County Medical Society, Buffalo Medical and Surgical Association, and Buffalo Clinical Society.

GRAY, Landon Carter, of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1873. He is now Professor of Nervous and Mental Diseases in the New York Polyclinic; Visiting Physician to St. Mary's Hospital and Neurologist to the Hospital for Ruptured and Crippled. Dr. Gray is ex-president of the New York Neurological Society; Fellow of the New York Academy of Medicine, and president of the Neurological Section of the same; member of the American Neurological Association and ex-president of the same; president of the Society of Medical Jurisprudence; member of the New York County and Kings County Medical Societies, and the Society of German Physicians, New York City.

GREEN, Caleb, of Homer, New York, was born of Anglo-Scotch parentage, at Lafayette, in the same state, November 14, 1819, and received his preliminary education at Lafayette High School, whence he was transferred to Cortland Academy, New York, graduating subsequently from Geneva Medical College, January 23, 1844. He first entered upon the practice of his profession at Homer, where he has remained almost half a century. He was for many years secretary of the Medical Association of South Central, New York, and afterward became president of that institution; was twice president of Cortland County Medical Society, and for several years officiated as secretary; is a permanent member of the New York State Medical Society since 1858, member of the American Medical Association since 1853, and is honorary member of the Buffalo Natural History Society. In 1855 he was elected Professor of Materia Medica and General Pathology in Geneva Medical College. After two courses the departments were reorganized, and he was appointed to the chair of Physiology and Pathology, which position he resigned in November, 1862. In 1863 he was requested to perform the duties of Professor of Materia Medica in the Berkshire Medical College, at Pittsfield, Massachusetts, but declined; he was afterward offered the Professorship of Obstetrics and Diseases of Women in Geneva Medical College, but also declined that position. In 1872 he was elected to the Professorship of Obstetrics and Diseases of Women and Children in the Medical Department of Syracuse University, but declined this offer preferring to devote himself wholly to the practice of his profession. In 1877 he became vice-president of the Central New York Medical Association. His honorary degree of A. M. was conferred by the Madison University. While devoting himself to a general practice, he has also bestowed considerable attention upon various departments of natural history, botany, entomology, conchology, and geology. In 1849 he made a report (Transactions of Medical Association South Central New York) in favor of a thorough preparation for the study of medicine,

one of the earliest papers on the subject presented to the profession in New York State. In 1843 he published in the *Boston Medical and Surgical Journal*, an essay on "Epidemic Influenza," with special reference to the epidemic of that year; also, in the same journal in 1845, an original thesis on the "Functions of the Oblique Muscles of the Eye," founded on his own investigations.

GREEN, John, of St. Louis, Missouri, was born in Worcester, Massachusetts, April 2, 1835. He entered Harvard College in 1851; was graduated A. B. in 1855; S. B. in 1856; A. M. in 1859, and M. D. in 1866. He was admitted a Fellow of the Massachusetts Medical Society by examination in 1858. He studied medicine at Cambridge, Massachusetts from 1855 to 1858 under the direction of Professors Morrill and Jeffries Wyman, and in Europe, from 1858 to 1860. He was elected a member of the Boston Society of Natural History in 1856, and Curator of Comparative Anatomy in 1857. In the latter year he accompanied Professor Jeffries Wyman on a scientific expedition to Surinam. He commenced the practice of medicine in Boston, Massachusetts, in 1861. He was a member of the Boston Medical Association, and of the Suffolk District Medical Society, and elected Secretary of the latter Society in 1865. He was also a member of the Boston Society for Medical Observation, and Physician to the Boston Dispensary. During 1862 he was in the medical service of the Western United States Sanitary Commissions, and held the position of Acting Assistant Surgeon for a few months in the armies of the Tennessee. He was for several years a delegate to the American Medical Association. Dr. Green visited Europe a second time in 1865 for the purpose of continuing studies in ophthalmology, and in 1866 removed to St. Louis, where he has since remained, engaged in the treatment of diseases of the eye and ear. He is a member of the American Ophthalmological Society; one of the original members of the American Otological Society, founded in 1868; a member of the International Ophthalmological Congress; delegate to the International Medical Congress of 1876, and was Secretary to the Section on Ophthalmology. He has contributed papers to the leading medical journals of this country, and to the Transactions of the American Ophthalmological Society, Transactions of the American Otological Society, and made reports of the International Ophthalmological Congresses, London, 1872, and New York, 1876; also notes to the American edition of "Carter on the Eye," Philadelphia, 1876. He was elected Professor of Ophthalmology and Otolaryngology in the St. Louis College of Physicians and Surgeons in 1868; was appointed Lecturer on Ophthalmology in the St. Louis Medical College in 1871; Surgeon to St. Louis Eye and Ear Infirmary in 1872; Consulting Ophthalmic Surgeon to the City Hospital, St. Louis, in the same year, and in 1874 became Ophthalmic Surgeon to St. Luke's Hospital.

GREENE, Robert H., of New York City, was graduated in medicine at Harvard, in 1886. He is now Visiting Physician to St. John's Guild Free Hospital for Children. Dr. Greene is an active member of the New York County Medical Society, West End Medical Society, Northwestern Medical and Surgical Society, New York Academy of Medicine, Physicians'

Mutual Aid Association, and Harvard Medical Society, New York.

GREENOUGH, Francis B., of Boston, Massachusetts, was born in that city December 24, 1837. He is the son of Henry Greenough and nephew of Horatio Greenough, the well-known artist. His mother was Frances Boott, daughter of Merchant Boott, and niece of Kirk Boott, one of the first Lowell manufacturers. He graduated at Harvard University in 1859, from which he subsequently received the degree of A. M., and, after spending a year in the Lawrence Scientific School, went abroad for three years, studying medicine at the University of Pisa, Italy, and at Florence, and on his return home entering the Harvard Medical School, and graduating in 1867, having served during the summer and autumn of 1864 as Acting Assistant Surgeon in the United States Army at the United States General Hospital in Portsmouth Grove, Rhode Island, and in 1865-66 as House Physician in the Massachusetts General Hospital. On his graduation he spent a year at Vienna, and finally, in October, 1867, settled down to the practice in his native city. He has devoted special attention to diseases of the skin and venereal diseases, but practices general medicine and surgery. He is a member of the Massachusetts Medical Society, and of the Boston Society for Medical Improvement, of which he was secretary in 1871, and an honorary member of the New York Roman Medical Society, and was formerly a member of the Boston Society for Medical Observation, and also of the Boston Society of Medical Science, but has resigned his membership of these organizations. He has contributed several articles to the medical press. He has been Surgeon to the Carney Hospital and to the St. Joseph's Home, and Physician to the Children's Hospital, and subsequently in charge of the skin and venereal department of the Boston Dispensary, and Clinical Instructor in Venereal Diseases in the Harvard Medical School.

GRIFFITH, Jefferson D., of Kansas City, Missouri, was graduated M. D. at the University Medical College, New York City, in 1872. He is now Professor of Principles and Practice of Surgery and Clinical Surgery in the Kansas City Medical College, president of the State Board of Health of Missouri, Surgeon-General of the State of Missouri, member of the American Orthopedic Association, American Medical Association, Missouri Valley and Mississippi Valley Medical Associations, also a member of the Missouri State, Kansas State, Jackson County, and Kansas City District Medical Societies, and the Kansas City Academy of Medicine.

GROSS, Onan Bowman, of Camden, New Jersey, was born in Ephrata, Lancaster county, Pennsylvania, February 19, 1851, and is a lineal descendant in the fifth generation of George Gross, who emigrated from Germany to North Carolina about 1747, and Daniel Bowman, of Germany, in 1738, who settled at Ephrata, Lancaster county, Pennsylvania. His nationality, therefore, is German, excepting a great grandfather, Col. John Wright, of Revolutionary fame, who emigrated from Ireland just prior to the Revolution. The preliminary education of Dr. Gross was obtained at the Ephrata Academy. In 1875 he matriculated at the University of Pennsylvania with Drs. H. C. Chapman and Reynell Coates as preceptors;

graduated in 1878, and received the H. Lenox Hodge gold medal for anatomical proficiency and distinguished merit for his thesis. He has been in continuous practice in Camden, New Jersey, since graduation, and has filled such positions as County Physician and District Sanitary Inspector for the State Board of Health, and secretary of the Board of United States Pension Examining Surgeons. He is a member of the Pathological Society of Philadelphia, American Medical Association, and all local medical societies. Dr. Gross is now Lecturer on Anatomy and Clinical Surgery for the Camden Training School for Nurses, and a

O. B. Gross

Surgeon on the staff of the Cooper Hospital since 1884. He has been a liberal contributor to many medical journals, the subjects being usually surgical or pathological. The principal papers written were the following: "Complete Artresia of the Vagina," "Foreign Bodies in the Bronchial Bifurcation," "Extra-Uterine Pregnancies," and "Rare Cases of Abdominal Surgery," issued a few years ago.

GULICK, Charlton R., of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1882. He is now Consulting Physician to the Skin and Venereal Department of Amity Dispensary, and Examiner in Lunacy for the State of New York. Dr. Gulick is an active member of numerous medical societies of New York City and State, and of the American Medical Association.

GUNN, Moses, of Chicago, Illinois, was born in East Bloomfield, Ontario county, New York, April 20, 1822, and died November 4, 1887. His father, Linus Gunn, and mother, Esther (Bronson) Gunn, were natives of Massachusetts and pioneers of Western New York. The family trace their ancestry in Scotland through a long series of lairds into a very remote past. Although prevented by dangerous and protracted illness from passing through a regular collegiate course, he received a thorough academical education, and graduated at

Geneva Medical College in 1846. He settled in Ann Arbor, Michigan, and commenced practice. Contemporaneously he instituted a course of anatomical lectures, which was attended by a class of thirty or more students and practitioners. This was the first systematic course of lectures on anatomy given in that State. The course was repeated through three successive years, when, upon the organization of the Medical Department of the State University, he was appointed over numerous competitors to the chair of Anatomy and Surgery. For three years he gave the lectures upon these departments, each course extending to seven months. After that time he was relieved from the anatomical teaching, and during the remainder of his connection with the institution, some fifteen years, filled the chair of Surgery. In 1853 he removed to Detroit, visiting Ann Arbor twice a week to deliver his lectures. In 1856 he received the honorary degree of A. M. from Geneva College. In 1857 he became senior editor of the *Medical Independent*, a monthly journal, which eventually was merged with another medical periodical, of which for some time he was one of the editors. In 1851-52 he made a series of dissections and experiments to determine what particular tissue opposes the effort to reduce dislocations, particularly of the hip and shoulder-joints. These were repeated for several sessions before the medical classes. The results and details of the processes by which they were arrived at were embodied in a paper read before the Detroit Medical Society in the summer of 1853, and were also published in the *Peninsular Medical Journal* in September of that year. The first class to which he lectured in the University was then considered remarkably large, though numbering but ninety-two; the last class, session 1866-67, numbered five hundred and twenty-five. Dr. Gunn entered the medical department of the army in September, 1861, accompanying General McClellan through the Peninsular campaign, seeing much active and arduous service. During a short absence he gave some fifty lectures to the students at the University, filled with just the kind of information needed by the large number who soon after entered the army. In the spring of 1867, at the unanimous invitation of the Faculty and Trustees of Rush Medical College, he accepted the chair vacated by the death of the distinguished surgeon and teacher, Daniel Brainard, M. D., the position which he occupied until his death. The prosperity of the Rush Medical College during the period of his connection with that institution was largely due to his business energy, his professional skill and personal popularity as a teacher. At the commencement exercises of the University of Chicago in 1877, he was honored with the degree of LL. D. He was married in 1848 to Jane Augusta Terry, daughter of J. M. Terry, M. D. Three children survived, the eldest son, Glyndon, a youth of remarkable promise, having been accidentally drowned at Detroit. Professor Gunn was a member of the city and State Medical Societies; and of the American Medical Association. Besides his position in the Medical College, he was Surgeon to Cook County Hospital (the principal hospital in Chicago); Surgeon to St. Joseph's Hospital; Consulting Surgeon to St. Luke's Hospital, and several other minor charities. He had not contributed largely of

late to the medical press, preferring to bring all the treasures of his long and ripe experience and reading to those who from year to year came up to personally profit by his teaching. He was a man of elegant personal appearance, affable in manners and an interesting lecturer. He not only maintained a good reputation until his death, but contributed largely to the renown of the medical schools with which he had been associated.

GUNSTER, Peter F., of Scranton, Pennsylvania, was born at Lockweiler, Germany, February 1, 1848. He received a scientific education at the Sheffield Scientific School, of Yale, and studied medicine at the Bellevue Hospital Medical College, where he graduated M. D., March, 1871. He settled in Scranton, but soon after visited Europe, where he spent two years. On returning he located in Wilkesbarre, but after a year's residence there, returned to Scranton, where he has been engaged for the past twenty years in an active and successful practice of general medicine. He is a member of the Luzerne County Medical Society, was elected its censor in January, 1876; was a delegate to the State Medical Society at Philadelphia in the same year. He has served on the medical staff of the Lackawanna Hospital, of Scranton, as Visiting and Consulting Physician to the same.

HADDEN, Alexander, of New York City, was educated at Union College, and received the degree of A. M. from that institution in 1856. He studied medicine at the College of Physicians and Surgeons, New York, and was graduated M. D. in 1859. He was House Physician to Bellevue Hospital in 1860, Physician to Nursery and Child's Hospital from 1862 until 1865, and Attending Physician to Presbyterian Hospital from 1872 until 1885. Dr. Hadden is an active member of the New York State and New York County Medical Societies, and Fellow of the American and New York Academies of Medicine, also a member of the New York Society for the Relief of Widows and Orphans of Medical Men, and the American Health Association. He was the founder of the Northeastern Dispensary, vice-president of its Board of Trustees, and Consulting Physician to that institution.

HALL, Rufus B., of Cincinnati, Ohio, was educated in medicine at the Miami Medical College, from which institution he received the degree of M. D. in 1872. He is now Surgeon to the Cincinnati Free Surgical Hospital for Women; Clinical Lecturer on Gynecology in Miami Medical College; Fellow of the British Gynecological Association, London; Fellow of the American Association of Obstetricians and Gynecologists; also a member of the American Medical Association and the Ohio State Medical Society.

HALLEY, George, of Kansas City, Missouri, was graduated in medicine at the University of the Victoria College, Toronto, Ontario, in 1869. He is now Professor of Clinical Surgery in the University Medical College, of Kansas City, Missouri; proprietor of Halley's Surgical Hospital, and editor of the *Kansas City Medical Record*. Dr. Halley is an active member of the American Medical Association, Missouri State and Jackson County Medical Societies, and is also a member of the Kansas City Academy of Medicine and the Kansas State Medical Society.

HAMLIN, Augustus Choate, of Bangor,

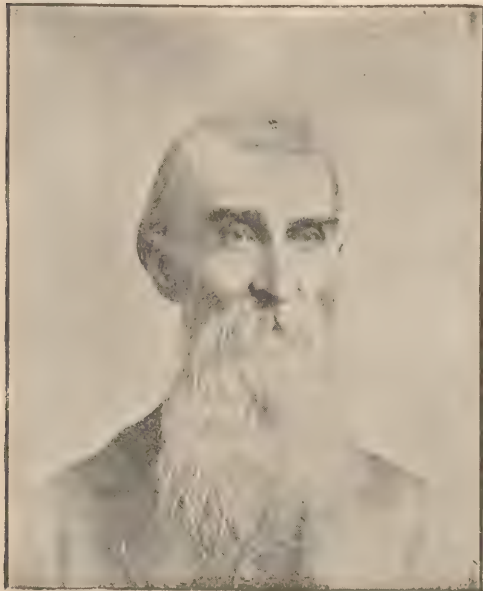

Maine, of English ancestry and Norman descent, was born in Columbia, Maine, August 28, 1829. He was educated at Bowdoin College, from which institution he graduated in 1851, and studied medicine at the Harvard Medical College, graduating M. D. in 1854. He then settled in Bangor, where he has remained for the last forty years successfully engaged in general practice. During the war he was surgeon of a hospital for volunteers connected with the army of northern Virginia; Brigade-Surgeon under Fremont; Medical Director Eleventh Army Corps Army of the Potomac, and Medical Inspector United States Army during the campaign at Fort Wagner and of Nashville. He has been a member of the Maine Medical Association; of the Penobscot Medical Association; of the Royal Antiquarians of Northern Europe; of the Academy of Natural Sciences, Philadelphia; and Fellow of the American Association for the Advancement of Science. His contributions to medical literature consist of articles on "Alimentation," "Transfusion," "Transmission of Diseases," "Tetanus," and papers on other important subjects of medical interest. In 1878 he was Mayor of Bangor. He married in December, 1858, Helen A., daughter of Judge Jonas Cutting, of the Supreme bench of Maine.

HAMMOND, Jabez Dean, of Chicago, Illinois, son of Dr. C. H. Hammond, was born in Monroe county, New York, July 29, 1860. He descends from a line of physicians on his father's side, who were located in the vicinity of Rochester, New York. He received his classical education at the Genesee State Normal School, the Rochester Free Academy, and the University of Rochester, New York. He then pursued his medical studies at New York, Boston, Ann Arbor, and Chicago, whence he graduated from Rush Medical College, in 1884. Since graduating he has taken supplementary courses abroad, at Paris and London. He has practiced at Chicago for the last ten years. He is a member of the principal medical and scientific societies of that city, and is House Physician at the Leland Hotel and Auditorium Annex. During the years of his practice he has devoted himself to the medical and surgical treatment of the nose and throat, for which he is chiefly known.

HANDLY, James W., of Nashville, Tennessee, was graduated M. D. from the Medical Department of the University of Tennessee, Nashville, in 1887. He is now Demonstrator of Anatomy in that institution and Professor of Genito-Urinary Diseases in the Medical Department of the University of the South, Sewanee, Tennessee. Dr. Handly is secretary of the Nashville Academy of Medicine, and member of the Tennessee State Medical Society.

HARGIS, Robert B. S., of Pensacola, Florida, was born in Hillsborough, North Carolina, June 7, 1818, and is of Scotch-Irish and Anglo-Saxon descent. He received his preliminary education at the University of North Carolina; studied medicine three years in Fayetteville, in the same State, under the preceptorship of Dr. T. J. Jordan, and was graduated with honors from the Medical College of Louisiana (now the Medical Department of Tulane University, New Orleans, La.), March 21, 1844. He located in Mobile, Alabama, in 1845, where he practiced one year; had a severe attack of malarial fever, which compelled him to repair to

the country to recuperate; sojourned at Mount Pleasant, Alabama; secured a large and remunerative practice; remained there five years; married in the meantime, his wife becoming in poor health, and removed on that account to Pensacola, Florida, in September, 1851. There he also obtained an excellent practice, and in 1852 was appointed Port Physician, which office he held for several years. Yellow fever having been introduced into Pensacola about August 1, 1853, his professional labors were thereby very largely increased. While busily engaged attending the sick, he was seized with the disease on the 25th of the same month, and was sent immediately by his friends to Milton, Florida, where his family were temporarily sojourning. Having recovered, and the yellow fever having been introduced there, by the earnest appeals of the

Robert B. S. Hargis.

citizens of Milton and adjacent villages, he resumed practice and continued until the epidemic ceased (on or about the 15th day of the following December). During the epidemic his diligence and kindly ministrations to the sick obtained for him a high reputation and the gratitude of the people. In May, 1854, an United States Marine Hospital was established in Pensacola, and he was appointed Surgeon of the same in June of the same year. He held that position until the secession of Florida from the Union, which took place in 1861, when the institution was necessarily suspended. He afterwards, in 1861, took service as a medical officer in that part of the Confederate States Army under Gen. Braxton Bragg, stationed at Fort Barrancas, Florida, and held a commission afterwards as Surgeon until the end of the war. He made himself conspicuous, unconsciously, for his kindly ministrations to the wounded prisoners of the enemy, and thereby won their lasting grati-

tude. He returned to Pensacola in 1865. In 1868, associated with Dr. J. C. Whiting, he established the Pensacola Hospital, now still in successful operation. In 1878 he became a member of the Florida Medical Association, and elected president thereof in April, 1882. He was elected a member of the American Public Health Association in 1878, and became one of the advising council in 1880. In 1881 he was appointed a member of the Board of Health of Escambia county, and was elected president thereof; resigning after two years' service. In 1882 yellow fever was again introduced into Pensacola, and he again distinguished himself by his untiring devotion to the sick. He was appointed by the National Board of Health to conduct the investigation of the yellow fever of that year with Dr. William Martin of the United States Navy. In 1883 yellow fever broke out at the Navy Yard, and at the earnest solicitation of the officers and men stationed there, he was appointed, by the Secretary of the Navy, to attend the sick at that post, which he did faithfully. Dr. Hargis was appointed Acting Assistant Surgeon to the United States Marine Hospital May 26, 1885, which office he still holds. He was appointed, by Governor E. A. Perry, to represent the State of Florida at the Gulf State Quarantine Convention, held in New Orleans, July 2, 1885. In 1889 he was appointed a member of the Board of Medical Examiners for the First Judicial District of Florida, and elected president, and still holds that position. His contributions to medical literature have been very extensive, and the following constitute the most important: "Medical Olla Podrida," 1857; "Communicability of Yellow Fever," *New Orleans Medical News and Hospital Gazette* for January, 1859; "Eclampsia in a Premipara, Embriotomy Recovery," *North American Medico-Chirurgical Review* for July, 1860; "Observations on Persistent Priapism with a Case Treated Successfully by the Bromide of potassium," *New Orleans Medical and Surgical Journal*, July, 1869; "The Muriated Tincture of Iron a Specific for Erysipelas," the *American Medical Bi-Weekly*, Louisville, Kentucky, March, 1877; "Contused Wound of the Perineum, Involving Urethra and Scrotum—Bladder Aspirated Every Day for Six Days—Septicemia—Recovery," the *American Medical Bi-Weekly*, April, 1879; "History and Origin of Yellow-Fever—Its Cause, Communicability and Prevention," read before the American Public Health Association, 1879, and published in Report and Papers of the American Public Health Association, 1880; "Report on Medical Topography, Climate, Diseases and Mortuary Statistics of Pensacola," the *National Board of Health Bulletin*, July, 1880. Letters to the *Sanitarian*, New York, on "The Nautical Origin of Yellow-Fever," January, 1880; "The Ship Origin of Yellow-Fever," *Gaillard's Journal* for June, 1880; "Yellow-Fever—Its Ship Origin and Prevention," a treatise published by D. G. Brinton, M. D., Philadelphia, 1880; "Sketches of the History of Quarantine at Pensacola, Florida," *National Board of Health Bulletin*, 1881; "Yellow-Fever Recognition and Isolation," read before the American Public Health Association, 1881, Reports and Papers of the American Public Health Association, 1881; "The Genius of Medicine," an address presented to the Florida Medical Association

April, 1882, published in the *New Orleans Medical and Surgical Journal* for July, 1882; "The Pensacola Yellow-Fever Epidemic of 1882," read before American Public Health Association, 1883, printed in the Reports and Papers of the American Public Health Association; on "Malaria and the Relations of Micro-Organisms to Diseases," read to the Florida Medical Association, *New Orleans Medical and Surgical Journal* for August, 1884; "The Natural History of Plagues," an address to the Florida Medical Association, 1887; "The Topical Application of the Oil of Turpentine to Recent Wounds, with Observations Relating to the Germ Theory of Diseases," *Philadelphia Medical News*, March, 1888. He has also contributed many other papers of more or less importance to different medical periodicals, as well as various articles from time to time that were published in the secular press on "Yellow-Fever Quarantine," "Public Hygiene," "City Sanitation," and subjects connected with the collateral sciences and general literature.

HARISON, Beverley D., of Sault de Ste. Marie, Michigan, was educated at the University of Toronto, and the Toronto School of Medicine, and received the degree of M. D. from the latter institution in 1882. He is now Division Surgeon of the Duluth and Atlantic, and Memphis, St. Paul, and Sault de Ste. Marie Railway Companies; member of the National Association and Michigan Association of Railway Surgeons, Surgeon for the Hall and Munson Company, Bay Mills, Michigan; Medical Examiner and Advisor for the Canada Life Insurance Company, Union Mutual, Portland, Michigan Mutual, and Preferred Mutual Accident Associations, as well as several other leading life and accident insurance companies of the United States. Dr. Harison is also member and secretary of the Board of the Examining Surgeons for the United States Pension Bureau.

HARLAN, George C., of Philadelphia was born in that city, January 28, 1835. He was educated at Delaware College, and studied medicine in the Medical Department of the University of Pennsylvania, whence he graduated in 1858, establishing himself immediately after in Philadelphia. During the war he was for a time medical officer on the gunboat Union, and for three years surgeon of the Eleventh Pennsylvania Cavalry. In 1866 he married Mary Holman, of Boston. His practice has been for several years confined to eye and ear surgery. He is a member of the Philadelphia College of Physicians, of the Philadelphia Pathological and County Medical Societies, and of the American Ophthalmological Society. His contributions to medical literature have been papers on "Simulated Amaurosis," "Neuroparalytic Ophthalmia," "Report on Inmates of Pennsylvania Institution for the Blind," "Pulsating Exophthalmus," "Hysterical Affections of the Eye," "Albuminuric Retinitis," "Strychnia in Atrophy of the Optic Nerve," and "Hemiplopia and Decussation of the Optic Nerves," which, with several short articles, reviews and book notices, have appeared in the leading medical journals of his city and Transactions of the Philadelphia Pathological Society, the College of Physicians, of the American Ophthalmological Society and of the (Philadelphia) International Medical Congress. He was formerly Resident Physician at Wills' Hospital, St. Jo-

seph's Hospital, and Pennsylvania Hospital, and Attending Surgeon at St. Mary's Hospital. He has held for many years the position of Attending Surgeon at Wills' Hospital, and that of Ophthalmic and Aural Surgeon to the Children's Hospital.

HARMON, Elijah D., of Chicago, Ill., was born in Bennington, Vermont, August 20, 1782, and died in the former city in 1869. He commenced the practice of medicine in Burlington, Vermont, in 1806; was married to Miss Welthyan Loomis in 1808; was a volunteer surgeon on board the *Saratoga*, commanded by Commodore McDonough during the celebrated naval battle near Plattsburg September 11, 1814, and after the close of the War of 1812 he returned to resume his practice in Burlington. In 1829 he determined to seek a new home in the West, and arrived at Fort Dearborn in May, 1830, and in the absence of Assistant Surgeon Finley he served as medical officer of the garrison, and also attended to private practice. His family followed him the next year, and took up their residence in a cabin of hewn logs. On July 10, 1832, a detachment of United States troops, designed to operate against the hostile tribes of Indians, arrived under the command of General Scott on board the steamer *Sheldon Thompson*. Unfortunately violent epidemic cholera had manifested itself among the soldiers the day previous to the arrival of the steamer and was rapidly spreading. The two companies of soldiers previously occupying the fort were isolated as far as practicable, and remained under the care of Dr. Harmon. The disease, however, spread so rapidly among the newly arrived troops that Fort Dearborn speedily became a crowded hospital for the sick and dying under the superintendency of Dr. De Camp, Assistant Surgeon, previously on duty at Madison Barracks. He had been assigned duty at Fort Dearborn by official order dated February 23, 1832, and he arrived at the fort with the Companies G and I of the Second Infantry under command of Major William Whistler, June 17, 1832, only twenty-three days before the arrival of the troops of General Scott, affected with cholera. On arrival of the latter the two companies, under Major Whistler, were sent into camp two miles distant for isolation from the cholera infection, and, as already stated, placed under the medical charge of Dr. Harmon, while Assistant Surgeons De Camp and Maccomb devoted their attention most faithfully to the newly-arrived suffering troops in the fort. In one of his reports Dr. De Camp states that within one week after their arrival one-fifth of the whole force of one thousand men were admitted into the fort afflicted with the scourge. The epidemic, though severe, was of short duration, and the military forces in a few weeks resumed their campaign against the Indians, and Dr. De Camp left the fort during the following November. During the latter part of June and the first days of July, 1832, the hostile attitude of the Indians, led by Black Hawk, had caused many of the white settlers in Northern Illinois and Indiana to gather at Fort Dearborn for safety. But when it was known that the soldiers under General Scott had brought the epidemic cholera with them, not even the dread of the Indian tomahawk could deter them from fleeing from the scourge with the utmost precipitancy. The

few civilians who were obliged to remain found in Dr. Harmon a faithful physician and friend, for he extended his services to citizens and soldiers alike. He was the first medical man who had settled at the post to practice his profession without a government appointment, and he appears to have been fairly successful. In the winter of 1832 he performed the first important surgical operation at what is now the city of Chicago of which there is any record. "It consisted in the successful amputation of one foot and a part of the other for a half-breed Canadian whose feet had been frozen while carrying the mail on horseback from Green Bay to Chicago. According to a recent medical history of that city written by Dr. N. S. Davis, from which this sketch is mainly derived, we find that after the departure of Assistant Surgeon De Camp he was succeeded by Assistant Surgeon Philip Maxwell, who arrived at the fort February 3, 1833, and entered upon the performance of his duties. During the year 1832 Dr. Valentine A. Boyer, Edward S. Kimberly and John T. Temple became residents of Chicago, and these, with Dr. Harmon and Assistant Surgeon Maxwell, constituted the medical fraternity of Chicago at the time it became a corporated town, in August, 1833, with a total population of between one hundred and fifty and two hundred. Dr. Boyer, the last of these five pioneer physicians, remained a resident of Chicago nearly sixty years, and a short time ago was still living in that city. Besides his family residence Dr. Harmon pre-empted 140 acres of land located in what is now a central part of the south division of the metropolis, and one of the streets is still called Harmon Court in his honor. In 1834 he migrated to the State of Texas, and subsequently divided his time between that State and Chicago until his death.

HARMON, Julian, of Warren, Ohio, was born in that city, August 1, 1824. He was educated at the Western Reserve University, Cleveland, and received the degree of M. D. from the Medical Department of that institution in 1849. His medical training was supplemented by attending the schools and hospitals of New York City two years later. He settled in his native town, where he has since remained, engaged in an active and successful general practice of medicine. He has devoted special attention to diseases of children. For many years he was surgeon for several leading railroad companies in his State. In April, 1862, he was sent to the battle-field of Pittsburgh Landing, to take care of the soldiers from his section of Ohio. He was Trustee of the Northern Ohio Insane Asylum, from 1872 to 1874. He has taken much interest in educational affairs, and was for several years a member and secretary of the Board of Education of Warren. He has served as United States Examining Surgeon for the Pension Bureau for about twenty years, and as secretary of his county medical society for an equal length of time. He is ex-vice-president of the Northwestern Ohio Medical Association, and an active member of the Ohio State Medical Society. His contributions to medical literature consist of articles published in medical journals, and of cases reported to medical societies with which he is connected, having reference to his varied and extensive medical and surgical experience. Dr. Harmon is one of the oldest and most esteemed members of the medical

profession in Northeastern Ohio, having resided in his native city during his entire life, and practiced his profession there for forty-four years.

HARPER, John E., of Chicago, Illinois, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1878. He is now president of the Clinical College of Medicine, Chicago, and Professor of Ophthalmology and Otology in that institution; Surgeon-in-Chief of the Eye and Ear Department

J. E. Harper

in the Specialty Hospital and the Wabash Avenue Dispensary, Professor of Ophthalmology and Otology in the Chicago Medical College, Oculist to Battle Creek (Michigan) Sanitarium and St. Vincent Orphan Asylum, Consulting Oculist to Oakwood Retreat, Lake Geneva, Wisconsin, and editor of the *Western Medical Reporter*. He is an active member of the Chicago Medical Society, and the Chicago Ophthalmological, Otolological and Pathological Societies, and is also a member of the Mississippi Valley and the American Medical Association. Dr. Harper is an accomplished oculist and aurist, and his medical and surgical skill in his special field of practice is widely known.

HART, Benjamin Franklin, of Marietta, Ohio, was born in Watertown, in the same State, January 5, 1823. He is of English ancestry, and a son of Deacon Benjamin Hart, of Weathersfield, Connecticut. Under stress of extreme poverty, he gained his education by sheer force of will, and after two terms at the Ohio Medical College, Cincinnati, entered upon practice at Marietta in 1844. Twenty years later, having meanwhile successfully conducted a practice of constantly increasing extent, he entered Bellevue Hospital Medical College and graduated M. D. in March, 1864. In 1862 he was appointed by the Sanitary Commission of Washington county to visit battle-fields and

hospitals for the purpose of ministering to the needs of wounded or sick Ohio soldiers, a duty that he most satisfactorily discharged without compensation. He was appointed surgeon, with the relative rank of major, by Governor Brough, of Ohio, in 1864. He was elected a member of the Ohio State Medical Society in 1854, of the American Medical Association in 1872, and in 1876 was a delegate to the International Medical Congress at Philadelphia; has served as Censor of the Columbus Medical College, as City Physician of Marietta, as a member of the Marietta Board of Health, and as a member of the Harmar Board of Education and city councils. Dr. Hart is one of the oldest and most widely known physicians in his city and section of the State, having been established there in the general practice of his profession almost a half century.

HATCHETT, Buchanan, of Fort Smith, Arkansas, was graduated M. D. from the Medical Department of Vanderbilt University, Nashville, Tennessee, in 1882. His medical education and training were supplemented by attending the Medical Department of Tulane University, New Orleans, in 1885, New York Polyclinic in 1889, and Vienna and Heidelberg Universities in 1890. Dr. Hatchett is now engaged in an extensive and successful practice of general medicine and surgery. He is a member of Sebastian County Medical Society, Arkansas State Medical Society, American Medical Association, American Public Health Association, and the National Association of Railway Surgeons.

HAWKES, William H., of Washington City, D. C., was born in Meriden, Connecticut, October 25, 1845, and was graduated M. D. at the University of Pennsylvania, Philadelphia, in 1874. He was appointed Acting Assistant Surgeon United States Army, in 1881, and served as assistant to the attending surgeon United States Army at Washington, D. C., and as examiner of recruits at the rendezvous in that city. He is now Professor of Materia Medica and Therapeutics and Clinical Professor of Diseases of Children in the Medical Department of the University of Georgetown, Consulting Physician to Providence Hospital, secretary of the attending staff and Director of Clinic of Children's Diseases in Emergency Hospital. Dr. Hawkes has also served as Attending Physician to Garfield Memorial Hospital and Providence Hospital. He is a member of numerous local and national medical organizations.

HAWKINS, Thomas Hay, of Denver, Colorado, was graduated M. D. at Bellevue Hospital Medical College, New York, in 1873. He is now president of the Faculty of the Gross Medical College, Denver, and Professor of Gynecology, Abdominal Surgery and Clinical Midwifery in that institution. He is also editor of the *Denver Medical Times*, and a member of the American Medical Association, American Association of Obstetricians and Gynecologists, Western Association of Obstetricians and Gynecologists, Colorado State Medical Society, ex-president of Denver Medical Association, and Arapahoe County Medical Society, and also ex-president of the Denver Obstetrical and Gynecological Society.

HAWLY, Donly C., of Burlington, Vermont, was educated in medicine at the University of Vermont, from which institution he received the degree of M. D. in 1884. He is now At-

tending Surgeon to Mary Fletcher Hospital, and Attending Physician to the Home of Destitute Children, Burlington; secretary of the Local Board of United States Examining Surgeons for the Pension Bureau; secretary of the Vermont State Medical Society, and a member of the American Medical Association. Dr. Hawly has made some important contributions to professional literature, notably an article on "Heart Sounds and Cardiac Murmurs," published in the *Journal of the American Medical Association*.

HAYS, Franklin W., of Indianapolis, Indiana, was born at Eldorado, Ohio, April 2, 1858. His ancestry on his father's side made a part of the sturdy pioneers of Georgia and Tennessee, where they became largely identified with the interests of these States, representing them both in times of peace and of

Franklin W. Hays

war, with in many instances signal ability, and in the War of the Rebellion achieved distinction on both sides of the conflict. His father, James C. Hays, Esq., was a merchant, and born of the old Southern pioneer line. His mother was formerly Sarah J. Clevenger, and descends from Scotch-Irish Presbyterian stock, dating back in this country to colonial days, and numbers among her blood kin many persons who attained distinction as soldiers in the War of the Revolution, and since then in the various professions, notable among them in late years Shobal Clevenger, the well-known American sculptor, whose labors and genius have made him a name on both sides of the Atlantic. The parents of Dr. Hays removed from Ohio to Indiana, and resided during his childhood in Columbus, where he lived up to his eighteenth year, and where he acquired in the High School of that city the basis of a sound education. He then became a student in the Kentucky University at Lexington,

where, in the carrying forward of the general curriculum, he gave special attention to the study of literature and the natural sciences. Upon the completion of his collegiate course in the university he commenced the study of medicine under the preceptorship of Dr. Grove, of Columbus, and later with Drs. Howard and Martin, of Greenfield, Indiana, after which he went to Indianapolis and and pursued his studies until his graduation, with Drs. Patrick H. and Henry Jameson, of that city. He entered the Medical College of Indiana, and was graduated with distinction from that institution in 1880. While still an under-graduate in this school, he was elected an assistant to the chair of Chemistry and Toxicology. After receiving his medical degree he continued in this position, and to its duties were added that of Librarian and Registrar, which places he filled until 1883, when he received the appointment of Lecturer on Dermatology and Venereal Diseases, and was at the same time made Superintendent of Bobb's Free Dispensary. In the interval before his advancement, and prior to his acceptance of the lectureship mentioned above, he took a post-graduate course in the Medical Department of the University of Pennsylvania, and trained himself further for the duties of his profession, in the hospitals of New York and Philadelphia. His valuable labors and close connection with his *Alma Mater* made him a leading spirit in the reorganization which resulted in the establishment of the Medical College of Indiana as one of the foremost schools of the West devoted to instruction for the practice of medicine and surgery, and the general advancement of medical learning. Three years later Dr. Hays was elected to a Professorship in the Faculty, taking the chair of *Materia Medica*, Therapeutics and Dermatology, and was made secretary of the college, which positions he has filled with credit and ability. He has been honored by the Alumni Association of the College by being elected several successive terms as secretary, and also president of the same. Dr. Hays, although still a young man, is among the prominent physicians of his city, and is an active and valued member of the Marion County and Indiana State Medical Societies, and also of the American Medical Association. He is now a member of the Consulting Staff of the City Dispensary, the City Hospital and St. Vincent Hospital, and was for several years Attending Physician to the latter institution. In October, 1893, he was appointed by the Hon. Caleb S. Denny, Mayor of Indianapolis, a member of the City Board of Health, and was soon after elected president of that organization. In addition to these duties Dr. Hays is engaged in a very large general practice in his city, as well as much consultation practice in Indiana and adjoining States. Nothing less than superior, systematic, executive capacity, supplemented by a vigorous physical constitution, could serve to push through his large and constantly growing business. Still he manages to find time for social duties, and enjoys a large and enduring popularity among his society and club friends. He is an active Mason of high standing, a member of many of its orders and the Scottish Rite. He is also a member of the Mystic Shrine and other fraternal societies, as well as of the commercial and social clubs

of his city. Dr. Hays leaves nothing undone to keep abreast of his profession, and with this object in view, usually makes a yearly tour of the Eastern hospitals, and has visited those of Europe. In the city of his adoption he is held in high esteem as a public-spirited citizen who is always ready to lend his aid to her charities and enterprises in any manner that may benefit or further the interest of her people. On June 25, 1884, Dr. Hays was married to Miss Luella G. White, daughter of the late Thomas White, Esq., of Memphis, Tennessee, well known as banker and owner of extensive plantations. His accomplished wife and two interesting sons complete the family circle of his happy home.

HAYWOOD, Edmund Burke, of Raleigh, North Carolina, was born in that city January 13, 1825. He is of English ancestry, and was educated at the University of North Carolina, and studied medicine at the University of Pennsylvania, whence he graduated M. D. in 1849, settling in Raleigh in active practice. In 1861 he was appointed Surgeon of North Carolina Troops, and also in the same year President of the Board of Surgeons to examine surgeons for the same; also in the same year Surgeon in the Confederate States Army and placed in charge of Confederate States Hospitals at Raleigh and in Richmond from 1862 until 1865. He was also appointed Acting Medical Director of the Confederate States Army for the Department of North Carolina, and President of the Board of Surgeons to grant discharges from the same army. During his professional career he has successfully performed ligation of the right external iliac artery, 1869; the cesarean operation, 1874; and has operated for strangulated inguinal hernia, and cancerous tumors of the breast. He was elected a member of the Medical Society of North Carolina in 1850, was its Vice-President in 1866, and its President in 1868, and one of its Board of Censors in 1873; has frequently been a delegate to the American Medical Association, and was a delegate to the International Medical Congress, 1876, and again in 1887. He aided in the organization of the Raleigh Academy of Medicine, in 1870, and was elected its President in 1874; he was also elected a Corresponding Member of the Gynecological Society of Boston in 1873. He is the author among other articles of a report of a successful case of "Ligation of Femoral Artery," and of various other reports of successfully performed important cases in the Transactions of the Medical Society of North Carolina, such as amputations of thigh, craniotomy, vesico-vaginal fistula, and tracheotomy. He has been for many years a member of the Board of Medical Examiners of North Carolina, and in 1866 held the chair of Surgery therein, and in 1873 was appointed by the same board to examine and license druggists. He was Medical Director of the North Carolina Life Insurance Company in 1873, and a member of the Board of Directors of the Insane Asylum of North Carolina in 1865, and has held the position of its President for several years. He is State Medical Referee for the Mutual Benefit Life Insurance Company of Newark, New Jersey, and Manhattan Life Insurance Company of New York, and is Chief Medical Examiner and Advisor for several other leading life assurance companies of this country. In 1889 the University of North Carolina conferred upon Dr. Haywood the de-

gree of LL. D. in recognition of his eminent professional attainments.

HEDDENS, James Weir, of St. Joseph, Missouri, was born in Barbourville, Kentucky, in 1857. He was the son of the late Dr. W. I. Heddens, a leading physician of St. Joseph, and was reared in that city, his father having moved there from Kentucky, when he was two years of age. He received his literary education in the public and high schools of St. Joseph, and his medical education at Jefferson Medical College, Philadelphia, Pa., where he graduated as the prize student in anatomy in 1879. He was a private student of Prof. Pancoast, and served a term in the hospital, to which he was Visiting Surgeon after his graduation. He commenced the practice of medicine and surgery at the expiration of his hospital service in 1880, in partnership with his father. The Medical College of St. Joseph was organized at this time, and he was selected to

James Weir Heddens

the Professorship of the chair of Anatomy. This position he efficiently filled until 1891, when he accepted the chair of Operative Surgery and Gynecology in the Ensworth Hospital Medical College. He is also one of the life trustees to the Ensworth Hospital and College. Dr. Heddens is a man of exceptional natural ability, and this, coupled with his high educational advantages, attainments, assiduous application and close observation, soon brought him into prominence in his profession, especially in surgery, for which he possessed superior skill. His special work in the operation for the radical cure of hernia merits him special commendation. He further equipped himself in his profession by a tour of the European hospitals, during which he gave especial attention to surgery. He has performed all the capital operations, and unusual success has attended his work in this field of medicine, and although a young man, he has made for himself a reputation as one of the

leading surgeons in the State of Missouri. He has been a member of the Board of Managers of the Missouri State Lunatic Asylum, No. 2, for the past seven years, and is now president of that board. He attended as a delegate member the British Medical Association, which met in Edinburgh, Scotland, in 1880; is a member of the American Medical Association, and of the Medical Association of the State of Missouri, and has served as president of the District Medical Society of Northwest Missouri. Dr. Heddens is one of the proprietors and editors of the *St. Joseph Medical Herald*. He is a Royal Arch Mason, and member of the Knights of Pythias.

HEDDENS, William I., of St. Joseph, Missouri, was born in Preble county, Ohio, February 14, 1828, and died July 3, 1891. He was a graduate of the Jefferson Medical College, and began his practice in Kentucky. When three years had expired he removed to St. Joseph, where he engaged in practice until his death. His record as an enterprising citizen and prominent professional man is one which sheds luster upon his life and character. He was a member of the International Medical Congress, the American Medical Association, of which he served as vice-president; was president of the Northwestern Missouri Medical Association, and was also president of the St. Joseph and District Medical Society. He secured a large practice and amassed a handsome fortune. He was the editor and owner of the first medical journal published west of St. Louis. In 1879 he organized the Faculty of the College of Physicians and Surgeons in his city, of which, during its entire existence, he was president and dean. After its consolidation with the St. Joseph Hospital Medical College, he was still the president. Two years later he organized from this school the Faculty of the Ensworth Medical College and Hospital, and he was made president of the Board of Trustees and Dean of the Faculty, continuing as such until his death. It is known to many of the citizens of St. Joseph that it was due almost entirely to the influence of Dr. Heddens that the late Samuel Ensworth donated the principal of his large estate to the erection and endowment of the Ensworth Medical College and Hospital, at the corner of Seventh and Jule streets, which is recognized as one of the most important institutions of the kind in the Northwest. For thirty or more years he was a conspicuous figure in the social and professional life of St. Joseph, and no citizen ever passed away more deeply honored and regretted. Fraternally, he was a Royal Arch Mason and a member of the Independent Order of Odd Fellows.

HEISE, A. W., of Joliet, Illinois, was born in Bramsche, Hanover, in 1823, and died October 22, 1893. His education was received in the universities of Germany. He was House Surgeon in the Marine Hospital, Chicago, in 1857. He served in the army as Surgeon of the Twentieth Illinois Regiment, and on the last call as Surgeon of the One Hundredth. After Murfreesboro he was appointed Brigade Surgeon. After Chickamauga he was appointed Operator of the brigade and then Inspector of Hospitals and Consulting Surgeon of the corps. In 1872 he was appointed Prison Physician at Joliet, holding the position many years. Dr. Heise was one of the oldest and best known members of the medical

profession in the State of Illinois. He left a wife and son, with a large estate.

HELLER, Peter H., of Pueblo, Colorado, was graduated M. D. from the Medical Department of the University of Georgetown, District of Columbia, in 1874. His medical education and training were supplemented by attendance at the schools and hospitals of Vienna in 1877, and of Paris in 1878. He is now Visiting Physician to St. Mary's Hospital and member of the Staff of Physicians to the Woman's Hospital, Pueblo. Dr. Heller is an active member of the Colorado State Medical Society, and Ex-President of the Pueblo County Medical Society.

HEINEMAN, Henry N., of New York City, was graduated M. D. at the College of Physicians and Surgeons, New York, in 1874. He is now Visiting Physician to Mount Sinai Hospital and Professor of Practice of Medicine in the New York Polyclinic. He is an active member of the New York Academy of Medicine; New York Academy of Sciences; New York County Medical Society; New York Pathological Society, and the New York Neurological Society.

HENNING, Bennett G., of Memphis, Tennessee, was graduated M. D. at Bellevue Hospital Medical College, New York City, in 1870. He is now Professor of Materia Medica and Clinical Diseases of the Rectum in the Memphis Hospital Medical College, president of the Medical Staff of St. Joseph's Hospital, and proprietor of Henning's Infirmary for Rectal Diseases. He is a member of the American Medical Association, Tennessee State Medical Society, Memphis Medical Society, and the Tri-State Medical Society of Tennessee, Georgia, and Alabama.

HENRY, Joseph N., of New York City, was educated in medicine at the University of Vermont, and received the degree of M. D. from the Medical Department of that institution in 1883. He is now assistant to the chair of Dermatology in Bellevue Hospital Medical College; also Lecturer on Dermatology and Syphilology at the spring term in that institution. He is Consulting Surgeon to the hospitals of the Board of Health, member of the New York County Medical Association, and West End Medical Society.

HENRY, Morris H., of New York City, was born in London, England, July 26, 1835. He was educated in that metropolis; in arts at Somerset House; subsequently in Belgium, and in the University of Vermont; graduated in medicine from the last-named institution in 1860, and received the honorary degree of A. M. 1875. He settled in New York. During the War of the Rebellion he served as Assistant Surgeon in the United States Navy, and was with Farragut in the Mississippi, at New Orleans. He is a member of the New York Academy of Medicine, Medical Society of the County of New York, American Medical Association; president of the Alumni Association of the University of Vermont; honorary secretary for New York of the Anthropological Society of London, and was for many years Surgeon to the New York and Northern Dispensaries of New York. His contributions to medical literature consist of "Improvement in the Method of Examining Throat, Ear and Eye by Plano-Convex Lens with Reflector," *American Medical Times*, 1864. He was the originator and editor of the *American Journal*

of *Syphilography and Dermatology*, devoted to the consideration of all venereal and skin diseases, and was editor of the American edition of Dr. Tilbury Fox's work on "Skin Diseases" (adopted by the United States Government for the use of surgeons in the army; "Monographs on the Indications for Operative Surgery in Cases of Phimosis," 1870; on "Amputation of Redundant Scrotum, in the Treatment of Varicocele, with New Instrument," on "Three Cases of Psoriasis, Occurring During Lactation," "A Case of Seborrhea Sicca," 1871; "Treatment of Venereal Diseases in Vienna Hospital," "On the Dementia and Hemiplegia of Syphilis," 1872; "Cases of Induration of Os and Cervix Uteri, the Result of Syphilis," "Of Syphilitic Insanity," "Of Anomalous Localities of Chancres," "New Instrument to Remove Prepuce in Cases of Phimosis," 1874, and "Specialists and Specialties in Medicine," address before the Alumni Association of the University of Vermont, June, 1876; also numerous other articles of great medical interest. He succeeded Dr. Carnochan as Surgeon-in-chief of the State Emigrant Hospital, Ward's Island, in 1872, and has served as Consulting Surgeon to the Department of Municipal Police of New York.

HENRY, William G., of Detroit, Michigan, was graduated M. D. at the McGill University, Montreal, in 1883, and became a licentiate of the Royal College of Physicians, London, England, and also of the College of Physicians and Surgeons, Ontario, in 1885. He is a member of the Michigan State and Wayne County Medical Societies, and also of the Detroit Medical and Library Association.

HEPBURN, Neil J., of New York City, was graduated M. D. at the College of Physicians and Surgeons, New York, in 1868. He is now Ophthalmologist to Randall's Island Hospital, and president of the Medical Board of that institution. He is also Lecturer on Ophthalmology in the New York Polyclinic, and Assistant Surgeon to the Manhattan Eye and Ear Hospital. Dr. Hepburn is a member of the New York Academy of Medicine, New York County Medical Society, New York Neurological Society, American Otological Society, and the American Ophthalmological Society.

HERRICK, Everett, of New York City, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1854. He is now Consulting Physician to the New York Institution for the Deaf and Dumb; President of the Society for the Relief of Widows and Orphans of Medical Men; Fellow, and Chairman of the Board of Trustees of the New York Academy of Medicine; member of the New York County Medical Society, and Trustee of the New York Skin and Cancer Hospital.

HERRICK, Henry J., of Cleveland, Ohio, was born, January 20, 1833, in Portage county, in the same State. He prepared for college at the Twinsburg Institute, Ohio, graduated at Williams' College, Massachusetts, in 1858; and pursued his medical studies at Rush Medical College, Chicago, from which he graduated in 1861. He settled at once in Cleveland. His practice includes a number of important operations successfully performed. He is a member of the Ohio State Medical Society, of which he was president in 1874. His contributions to medicine consist of reports of cases, and a paper on the "Relation of Science to the Art of Medicine." During the Civil War he

was Assistant Surgeon and Surgeon for three years, serving actively in the field with the army of the Cumberland, and being for several months a prisoner at Libby. In 1865 he was appointed Professor of Obstetrics and Diseases of Women and Children in the Charity Hospital Medical College (since incorporated under the name of the Medical Department of the University of Wooster), filling the chair for four years; when he was appointed Professor of the Principles of Surgery in the same institution. Dr. Herrick is an accomplished physician and surgeon as well as a distinguished medical teacher, and is now one of the oldest and most widely-known members of the profession in the city of Cleveland.

HEYDECKER, Henry R., of New York City, was educated at Harvard, receiving the degree of A. M. in 1886, and that of M. D. from the same institution in 1889. His medical training was supplemented by attendance at the Charity and Maternity Hospitals, New York, in 1891. He is now Instructor in Genito-Urinary and Venereal Diseases at the New York Post-Graduate Medical School and Hospital, and Physician for Children's Diseases to DeWitt Dispensary. Dr. Heydecker is a member of the New York Academy of Medicine, New York County Medical Society, Society of the Alumni Charity Hospital, and Harvard Medical Society of New York.

HILLS, T. Morton, of Willimantic, Connecticut, was graduated M. D. from the Medical Department of Yale College, in 1863. He now devotes special attention to surgery and gynecology, and has, in connection with his office, a private hospital for the treatment of surgical and gynecological cases, in which field of practice he has excellent success, and is widely known as a skillful and accomplished member of his profession. Dr. Hills is a member of the Windham County and Connecticut State Medical Societies, and of the American Medical Association.

HIMES, Isaac N., of Cleveland, Ohio, was born at Shippensburg, Cumberland county, Pennsylvania, December 4, 1834. He was educated in Jefferson College, Cannonsburg, Pennsylvania, graduating at that college in 1853; he attended lectures in the Medical Department of the University of Pennsylvania; subsequently entered the College of Physicians and Surgeons, New York, and from the last-named institution received in 1856 his degree of M. D. During the ensuing eighteen months he was a member of the house staff of Bellevue Hospital; was appointed in 1860 Assistant Resident Physician of the Nursery Hospital on Randall's Island, serving one year in that capacity, and in the spring of 1861 established himself in private practice at Chillicothe, Ohio. In the fall of the same year he was appointed Assistant Surgeon of the Seventy-third Regiment Ohio Volunteers; was in a short time promoted to be surgeon to the same regiment, and in the latter capacity served until the close of the Civil War. He then spent two years in professional study in Germany and France, several months in travel in the United States, and in attention to private interests, residing a year in San Francisco, California, and in 1871 finally established himself in practice in Cleveland. He has been one of the Visiting Board of Cleveland City Hospital, and is a member of the Cuyahoga County Medical Society, Ohio State Medical Society, and American Medical

Association. In 1863 he was chosen Professor of Anatomy in Cleveland Medical College, and in 1871 was appointed Professor of Physiology and Physiological and Pathological Histology in the same institution. The latter chair he filled for several years.

HITCHCOCK, Charles W., of Detroit, Michigan, was graduated A. M. at the University of Michigan, Ann Arbor, in 1880. He studied medicine at the Detroit Medical College and was graduated M. D. from that institution in 1885, since which he has been successfully engaged in the general practice of his profession. He is now secretary of the Michigan State Medical Society, and is a member of the American Academy of Medicine and the Detroit Medical and Library Association. He is Chief Surgeon of the Standard Life and Accident Insurance Company, and is a well-known and accomplished physician.

HOLDEN, Edgar, of Newark, New Jersey, was born at Hingham, Massachusetts, November 3, 1838, and is of New England parentage. Having graduated from Princeton College in 1859, he entered the College of Physicians and Surgeons, New York, and received his medical degree in 1861. In the same year he entered the United States Navy, ranking three in a class of sixty-one, and was commissioned assistant surgeon. In 1862 he was surgeon of the frigate Minnesota at the engagement with the Merrimac; was one year surgeon of the monitor Passaic (his illustrated journal detailing her terrible experience off Hatteras, when the first monitor went down, having been published in *Harper's Magazine*). He took part in the siege of Charleston, in the engagement with the ram Albermarle, and served until the latter part of 1864, when he resigned and entered the volunteer army, serving until the end of the Civil War. He then established himself in Newark. He pursued the study of his profession in Europe in the winter of 1870. Dr. Holden is a member of the New Jersey State Medical Society, of the New Jersey Academy of Medicine, of the New York Laryngological Society, of the New York Society for the Advancement of Science, and of the American Medical Association. Of his more important professional publications may be mentioned the following articles, which have appeared in the *American Journal of Medical Sciences*, the *New York Medical Record*, and the *New York Medical Journal*: "Loss of the Entire Scapula from Sloughing," "Diseases of Men of War," 1866; "Vaginal and Vulval Varices," 1867; "Relation of Cancer and Tubercle," 1868; "Relation of Cardiac Pathology to the Sphygmograph," "Transactions New Jersey State Society," "Ostracism for Consumption," 1871; "Successful Treatment of Asthma," 1872; "The Sphygmograph," a prize essay, New York College of Physicians and Surgeons, 1873; "Anomalies of Cardiac Pathology," 1875; "Extraordinary Case of Intra-Cardiac Cyst," "A Discovery in Physical Diagnosis," "Unison Resonance in Auscultation," "New Instruments for Detection and Prevention of Pulmonary Disease," 1876; "Reflex Pharyngeal Neuroses due to Uterine Disease," "New Investigations in Respiratory Pathology," 1877. Also various contributions to current periodical literature. Since 1869 he has been president of the Medical Department of the Mutual Benefit Life Insurance Company. In 1874 he was appointed Consulting Surgeon to St. Barnabas Hospital of Newark,

and in 1876 was a member of the executive committee of the International Medical Congress, Philadelphia. Dr. Holden has served as Clinical Physician for Diseases of the Throat to St. Michael's Hospital, in the city where he resides, and is a member of the American Laryngological Association.

HOLLISTER, John H., of Chicago, Illinois, was born in Monroe county, New York, August 5, 1824. During his infancy the family moved to Romeo, Macomb county, Michigan. At the age of fourteen years he returned to Rochester, New York, and received his general education in the Rochester Collegiate Institute, after which he took a course in the normal department of the institution, preparatory to teaching. He was engaged chiefly in teaching the following four or five years, and in January, 1844, he commenced the study of medicine, graduating from the Berkshire Medical College in 1847. Immediately after receiving his degree of Doctor of Medicine he commenced general practice in Grand Rapids, Michigan, where he quickly acquired an extensive professional business and an excellent reputation. In 1855 he removed to Chicago, a more desirable field for professional work, and in 1857 was appointed Demonstrator of Anatomy in Rush Medical College, and discharged the duties of that position satisfactorily until the summer of 1859, when he resigned and accepted the chair of Anatomy in the Faculty just organized for the medical department of Lind University. After successfully teaching anatomy four years he accepted a transfer to the chair of Physiology, the duties of which he discharged with increasing reputation until 1867, when he was again transferred to the chair of General Pathology and Pathological Anatomy. The duties of this chair he discharged with fidelity until 1882, when he resigned it, but retained the Professorship of Clinical Medicine, and still continues to give regular clinics in the medical wards of the Mercy Hospital. He early became a member of the American Medical Association, was chairman on the Section of Practical Medicine in 1883, and has since served as a member of the Board of Trustees for the publication of the journal of the Association, and otherwise taken an active part in the proceedings of that organization. He served the Illinois State Medical Society as treasurer fourteen consecutive years, and as its president in 1874. He is an earnest supporter of the Chicago Medical Society and has been honored with its highest offices, and is a member of other scientific and literary associations. Dr. Hollister is a leading member of the Plymouth Congregational Church, and in every relation of life exhibits the highest type of a Christian gentleman.

HOLLOWAY, James M., of Louisville, Kentucky, was born at Lexington, in the same State, July 14, 1834. He acquired his literary education at Oakland College, Mississippi, and Center College, Danville, Kentucky; subsequently preparing himself for professional life in the Medical Department University of Louisiana (New Orleans). He graduated in medicine in 1857, and was the valedictorian of his class. In the same year he established himself at Vernon, Mississippi. From 1861 to 1865 he was Surgeon in the Confederate States Army. He served with the Eighteenth Mississippi Regiment, and was present at the battles of Manassas and Ball's Bluff. After

serving on the Peninsula until May, 1862, he was ordered, on account of sickness, to Richmond, Virginia, where he organized military hospitals. In 1863 he held the position of senior medical officer, and was appointed president of the Medical Examining Board for all hospitals in Richmond. At the close of the war he established himself in Louisville, where he has since remained engaged in an active and successful practice of general medicine and surgery. He is a member of the Medico-Chirurgical Society, of the Academy of Medicine, Louisville; of the Kentucky State Medical Society, and the American Medical Association. He has also served as a member of the Kentucky State Board of Medical Examiners, as Commissioner of Central Kentucky Lunatic Asylum, member of the Medical and Surgical staff of Louisville City Hospital, and as member of the Board of Health, Louisville, Ky. In 1865 he was Professor of Anatomy in the Medical Department of the University of Louisville; in 1866 Professor of Physiology in the same college; from 1867 until 1870 he was Professor of Physiology and Medical Jurisprudence in Kentucky School of Medicine; from 1870 to 1874 Professor of Physiology and Clinical Surgery in the Louisville Medical College, and in 1874 he became Professor of General and Clinical Surgery in Hospital College of Medicine, Medical Department of Central University, Kentucky, and has also held this chair several years. His contributions to medical literature consist of articles on the treatment of hemorrhage from large arteries, styptics and compression, articles on amputations of foot and excision of ankle-joint, and numerous other papers on surgical subjects in leading medical journals.

HOLMES, C. R., of Cincinnati, Ohio, was graduated in medicine at the Miami Medical College, Cincinnati, in 1886. He is now Ophthalmic and Aural Surgeon to the Cincinnati Hospital; Professor of Ophthalmology in the Presbyterian Hospital and Women's Medical College, and Clinical Lecturer on Diseases of the Eye in Miami Medical College.

HOLMES, Horatio R., of Portland, Oregon, was educated in medicine at Long Island College Hospital, Brooklyn, New York, from which institution he received the degree of M. D. in 1880, and also obtained an *ad eundem* degree from the Medical Department of Willamette University, Portland, Oregon, in 1887. He is now Professor of Gynecology in the latter institution. Dr. Holmes is an active member of the Portland Medical Society, Oregon State Medical Society, British Medical Society, American Medical Association, and of numerous other medical organizations.

HORN, Thomas G., of Colorado Springs, Colorado, was born in Martinsburg, Berkeley county, Virginia (now West Virginia), September 5, 1832, and was educated at private schools in that State. He entered the United States military service in 1861, but having been taken prisoner in November, 1862, and confined eight months in the South, he lost his health, so that he was unable to return to the regular service, although he managed to perform the duties of a contract surgeon at different forts in the West. He studied his profession at the St. Louis Medical College and the Missouri Medical College, graduating from the former in 1868, and receiving from the latter an honorary degree in 1872. In 1874

he settled in Junction City, Kansas, where he remained until the spring of 1875, when he removed to his present residence. He is a member of the American Medical Association, El Paso County Medical Society, Davis County Medical Society, of which he is ex-secretary; of the State Medical Society of Colorado, of which he is ex-president; and of the State Board of Health. He has also been for many years Trustee of Denver University. He is Assistant Surgeon of the Union Pacific railway System; Lieutenant-Colonel and Assistant Surgeon General Patriarchs' Militant. He is the author of several contributions to the *Leavenworth Medical Herald*; of various papers read before medical associations; and of a work entitled "Mineral Springs of Colorado." At different times he has been a member of the school board. He has been a steadfast worker in the cause of temperance, and is a member of the Methodist Episcopal Conference, before which, December 13, 1876, he read a paper on "The Class Leader and his Work," which was well received by that body and the public.

HOWE, James Lewis, of Louisville, Kentucky, was born in Newburyport, Massachusetts, August 4, 1859, and is of full Puritan descent. He was educated in public schools; graduated at Brown High School, 1875; A. B. of Amherst College, 1880; studied at University of Göttingen and University of Berlin; Ph. D. and A. M. of University of Göttingen, 1882; M. D. (honorary), Hospital College of Medicine, Louisville, 1886. He was chosen in 1883 Professor of Chemistry in Central University, Richmond, Kentucky; Professor of Medical Chemistry and Toxicology in Hospital College of Medicine in 1887, and Professor of Chemistry and Metallurgy in Louisville College of Dentistry, during the same year. He has been Dean of Hospital College of Medicine and of Louisville College of Dentistry since 1888. Dr. Howe has been Scientist and Lecturer to the Polytechnic Society of Kentucky since 1887, and has made occasional contributions to medical, chemical and other scientific journals.

HOWLAND, Henry H., of Denver, Colorado, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1878. He is now Professor of Laryngology and Rhinology in the Medical Department of the University of Denver. Dr. Howland is a member of the Colorado State Medical Society, and is ex-president of the Denver Medical Association and Arapahoe County Medical Society.

HUBBARD, William Ward, of Perth Amboy, New Jersey, was born at Elyria, Ohio, March 25, 1836. His father, the late Eber Ward Hubbard, M. D., who died in May, 1872, at Tuttenville, Staten Island, New York, was for three sessions a member of the Ohio Legislature, and for one session a member of the New York Legislature. During the late Civil War the subject of this sketch was hospital steward in the Confederate States army, and was actively engaged on field and hospital duty. His literary education was acquired at the High School in his native place, and at Chase's Institute, Middletown, Connecticut. He received his medical training at Bellevue Hospital Medical College, New York, graduating from that institution March 1, 1873. He subsequently entered upon the practice of his profession at Perth Amboy, where he has since remained engaged in an active and successful

practice of general medicine. He is a member of the Middlesex County Medical Society, and in 1874 became Physician and Health Officer to his city, a position he has held for several years.

HUDSON, William Miller, of Hartford, Connecticut, was born in that city March 14, 1833. He graduated at Yale College in 1853, and in 1855 received the degree of M. D. from the Jefferson Medical College, Philadelphia, Pennsylvania. In May, 1858, he married Miss Ellen H. Bryan, of that city. He settled first in New York City, where he remained until the breaking out of the War of the Rebellion, when he entered the United States Army as Acting Assistant Surgeon, in which position he served three years. He is a member of the Hartford City Medical Society, and of the Connecticut State Medical Association. He has served as Commissioner of Fisheries for the State of Connecticut; has been Medical Advisor of the Connecticut General Life Insurance Company; and subsequently of the Continental Life Insurance Company of Hartford, Connecticut.

HUNTER, Alexander S., of New York City, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1863. He is now Chairman of the Board of Censors of the Medical Society of the County of New York, and ex-President of that organization. He is also ex-President of the Obstetric Section of the New York Academy of Medicine, and New York Medical Union; member of the New York State Medical Society, and of numerous other local medical societies, among which may be mentioned the Pathological, Neurological, and Obstetrical, of New York, as well as the society of Medical Jurisprudence in that metropolis.

HUTTON, Terry J., of St. Paul, Minnesota, was educated in medicine at the Long Island College Hospital, Brooklyn, New York, and received the degree of M. D. from that institution in 1871. He has served as Assistant Physician to Brigham Hall Asylum, Burn Brae Asylum, and Resident Physician to Long Island College Hospital. He was formerly Professor of Diseases of the Mind and Nervous System in the College of Physicians and Surgeons, Chicago. His more important contributions to medical literature consist of articles entitled "Specific Treatment for First Stage of Diphtheria," "Chloroform as an Anesthetic," "Defensive Remarks on the Climate of Minnesota." Dr. Hutton is an accomplished neurologist and highly esteemed physician. He is a member of the Minnesota State Medical Society and the American Medical Association.

HYATT, Elisha H., of Delaware, Ohio, was born near Wooster, in the same State, February 19, 1827, and is of Scotch ancestry. His literary education was acquired at the Academy at Edinburgh, and he subsequently became the recipient of a literary course at Ohio Wesleyan University, graduating from that institution in 1849. His medical studies were completed at Starling Medical College, where he received the degree of M. D. in 1857. For want of means he practiced for five years before graduation, and for the expenses of his education, from first to last, he was thrown entirely upon his own resources. His first place of settlement was in the western part of

Delaware county, Ohio, whence in 1861 he removed to the city of Delaware, where he still resides, actively engaged in an extensive and successful practice of his profession. During the War of the Rebellion he entered the United States Volunteer Service, as captain Company A, Twentieth Ohio Regiment, and afterwards was appointed an assistant surgeon. While a general practitioner, he has made a specialty of surgery, and has performed almost every important operation in that branch of medical science, including two cases of trephining, the skull in fractures. In 1875 he was elected Professor of *Materia Medica* and Therapeutics in Columbus Medical College. He is a member of the American Medical Association, of the Ohio State Medical Society, and of the Central Ohio Medical Association; he is ex-president of the Medical Association of Delaware County, and an honorary member of Northwestern Medical Association. His contributions to medical literature consist of a paper on "The Therapeutics of Alcohol," classifying this agent among narcotics. He maintains that it is not in a just sense a food, and that from its known effects upon albumen and fibrine, and also upon the red blood discs, it interferes with and prevents, in a great degree, the proper nutrition of the body, by causing contraction of the red globules, emptying them of their protogen (a necessary ingredient in the nerve centers), and that therefore no nutrition can be afforded by alcohol to the nervous system; on the contrary, it lessens nerve force and weakens muscular power, and that instead of increasing the caloric of the human body, it lowers the temperature. Dr. Hyatt has also contributed several other valuable articles to the literature of his profession relating to subjects of therapeutic interest.

IRWIN, John A., of New York City, was graduated M. A. at Cambridge, England, and M. D. from Dublin University. He is a member of the Royal Chirurgical Society, England, and became a licentiate of the Dublin College of Physicians, Ireland, in 1875. He is a Fellow of the Obstetric Society, London; New York Academy of Medicine, member of the New York County Medical Society, and New York Society of Medical Jurisprudence. Dr. Irwin is late Physician to the Southern Hospital for Women and Children, Manchester, England; House Surgeon to the Royal Free Hospital, London, and Assistant Physician to Shrewsbury Asylum. He is now engaged in the practice of his profession in New York, and has given special attention to obstetrics and diseases of women and children.

ISHAM, Ralph N., of Chicago, Illinois, was born in Manheim, Herkimer County, New York, March 16, 1831. After obtaining a good academic education he entered upon the study of medicine, attended the Bellevue Hospital Medical College, New York City, and received the degree of Doctor of Medicine from that institution in 1854, and then served a full term as House Physician and Surgeon in Bellevue Hospital. After this he selected Chicago as his field for the practice of his profession, and with a high order of natural talent, coupled with thorough professional training, he readily joined with others in organizing, in 1859, a new medical college, in that city, then known as the Medical Department of Linn University, an institution which, since 1869, has been called the Chicago Medical College and

Medical Department of the Northwestern University. To Dr. Isham was assigned the Professorship of Surgical Anatomy and Operative Surgery, in which he soon acquired a high reputation as a teacher, and as expert surgical operator. He rapidly gained a large and lucrative surgical practice. For many years he was the chief surgeon of the extensive northwestern railroad system, was at one time one of the Surgeons on the Staff of Cook County Hospital, and in 1881 he was transferred to the chair of Principles and Practice of Surgery and of Clinical Surgery. Professor Isham has not only won a high reputation as teacher and practitioner in his chosen field of medicine, but enjoys an equally high social position, and has found time to gratify his literary tastes by the collection of one of the largest private libraries in Chicago.

IVES, Frank L., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York, and received the degree of M. D. from that institution in 1871. He is now Surgeon to the Throat Department of the New York Eye and Ear Infirmary, and is an active member of the American Laryngological Association, New York Academy of Medicine, and the New York County Medical Association. Dr. Ives is an accomplished physician, and has devoted special attention to diseases of the throat, in which field of practice he is widely known.

JACKSON, Frank W., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York, from which institution he received the degree of M. D. in 1879. He is now Chief of the Medical Division of Vanderbilt Clinic, Attending Physician to Roosevelt Hospital Out Door Patients, and Assistant Visiting Physician to Bellevue Hospital. Dr. Jackson is an active member of the New York County Medical Society, New York Pathological Society, and New York Physicians Mutual Aid Association. He is also a Fellow of the New York Academy of Medicine.

JACKSON, James P., of Kansas City, Missouri, was graduated M. D. at the St. Louis Medical College, St. Louis, Missouri, in 1868, and received an *ad eundem* degree from the College of Physicians and Surgeons, New York City, in 1873. He is now Professor of Surgery in the University Medical College of Kansas City. Dr. Jackson is an active member of the National Association of Railway Surgeons, American Medical Association, Missouri State, Jackson County, and Kansas City District Medical Societies.

JACKSON, William Henry, of New York City, was born in that city in 1810, and died there November 25, 1893. He was the son of the late Rev. John Frelinghuysen Jackson. After graduation from the College of Physicians and Surgeons in 1835, he traveled abroad in company with Dr. Valentine Mott. While abroad he visited the different hospitals in the large cities, and went as far as Egypt, where he made the medical institutions of that country objects of special study. On returning to this country he was made Head Surgeon of the New York Hospital. His close application to study and the duties of his important place so injured his health that he was obliged to give up active practice of medicine and devote himself almost entirely to the lighter care of managing

his large estate. Dr. Jackson was the oldest member of the College of Physicians and Surgeons, the Historical Society and the St. Nicholas Society. The last he joined in 1845. He also belonged to the New York County Medical Society, the Academy of Medicine, the Patria Club and the American Museum of Natural History, and other medical, scientific and social organizations of New York City.

JACOBUS, Arthur M., of New York City, was graduated M. D. at the Bellevue Hospital Medical College in 1876. He is now Gynecologists to the Northwestern and Presbyterian Hospital Dispensaries. He is a member of the New York County Medical Society, New York Society of Medical Jurisprudence, Northwestern Medical and Surgical Societies, American Medical Association, and is also a Fellow of the New York Obstetrical Society and Academy of Medicine.

JACOBY, George W., of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1876, and his medical education and training were supplemented by attendance at the University of Berlin, Germany, from which he also received the degree of Doctor of Medicine in 1877. He is now Clinical Professor of Nervous Diseases in the Woman's Medical College, New York. Physician for Nervous Diseases and Neurologist to the German Dispensary, and is ex-President of the New York Neurological Society, and member of the American Neurological Association, New York Academy of Medicine; Society for the Relief of Widows and Orphans of Medical Men, and the Medico-Chirurgical Society of German Physicians of the City of New York.

JANES, Henry, of Waterbury, Vermont, was born in that city January 24, 1832. His father, Henry F. Janes, was formerly Vermont State Treasurer and member of Congress, and his mother, Fanny (Butler) Janes, daughter of Ezra Butler, former governor of Vermont and also a member of Congress. He received his medical education at the College of Physicians and Surgeons in New York, and graduated M. D. in 1855. Previous to final settlement in Waterbury, he was Assistant and House Physician in Bellevue Hospital, New York, and practiced for a few months in Chelsea, Massachusetts. His specialty is nervous diseases and surgery, and in the practice of the latter branch of his profession he has performed a large number of capital operations. He is a member of the Washington County Medical, the Vermont State Medical, and the Massachusetts Medical Societies. Of the two first named he has been president. He is also a member of the American Medical Association. On various occasions he has read articles on "Gun-shot Wounds," "Accident after Amputations," "Amputations at Knee-Joint," and other surgical subjects, before the societies of which he is a member. In 1861 he became Surgeon of the Third Vermont Volunteers; in 1863 was appointed Surgeon United States Volunteers, and was in charge of hospitals at Burkettsville and Frederick, Maryland, in 1862. He also served in the capacity of Surgeon-in-Charge in the Sixth Army Corps Hospital; in charge of the hospitals of the Army of the Potomac, at Gettysburg, and afterwards in charge of the hospitals in Philadelphia and Vermont, to the close of the Civil War, when he resigned from the army and resumed private practice in his native place, where he has since remained.

JANVRIN, Joseph E., of New York City, was educated in medicine in the College of Physicians and Surgeons of New York, from which institution he received the degree of M. D. in 1864. He is now Gynecologist to the New York Skin and Cancer Hospital, and Consulting Surgeon to St. Elizabeth's Hospital, Dr. Janvrin is a member of the American Medical Association, American Gynecological Association, New York County Medical Society, New York Obstetrical Society, New York Academy of Medicine, and numerous other medical, scientific, and social organizations.

JARMAN, George W., of New York City, was graduated M. D. at the Bellevue Hospital Medical College in 1888. He is now Assistant Gynecologist to the New York Cancer Hospital and Vanderbilt Clinic, Lecturer on Gynecology in the New York Polyclinic, Assistant Obstetrical Surgeon to Charity Hospital, and Clinician to St. Bartholomew's Dispensary. He is an active member of the New York Academy of Medicine, and the New York County Medical Society, as well as numerous other medical and scientific organizations.

JENNINGS, Charles G., of Detroit, Michigan, was graduated M. D. at the Detroit Michigan College in 1879. He is now Professor of Physiology and Diseases of Children in the Detroit College of Michigan, member of the Michigan State Medical Society, Detroit Gynecological Society and Detroit Medical and Library Association. Dr. Jennings is also an active member of the American Medical Association, of which he is chairman of the Section of Diseases of Children.

JEWELL, James Stewart, of Chicago, Illinois, was born in Galena, in the same State, September 8, 1837, and died at his home in the former city April 18, 1887. He received his general education in the schools of his native city, and in 1855, at the age of eighteen, began the study of medicine under the preceptorship of Dr. S. M. Mitchell, of Williamson county, in his native State. He attended his first course of medical college instruction in Rush Medical College in 1858-59, and his second course in the Medical Department of Lind University in 1859-60, which was the first session after the establishment of that institution, and, under the teaching of Prof. Titus Deville, he became an enthusiastic student of anatomy and received the degree of Doctor of Medicine at the first public commencement of that medical school. He then engaged in a successful general practice in Williamson county until 1862, when he returned to Chicago and was appointed to the Professorship of Anatomy in his *Alma Mater*, which position he filled with unusual zeal and ability until 1869, when he resigned under the impression that he would engage in the special study and teaching of biblical history. He spent one year or more in traveling, much in Palestine and Egypt, but not neglecting to visit the chief medical institutions of Europe. On his return to Chicago in 1871 he decided to resume the practice of medicine, but gave his chief attention to the treatment of nervous and mental diseases, and the following year he was appointed Professor of Nervous and Mental Diseases in the Chicago Medical College, and, according to the testimony of Dr. N. S. Davis, his biographer, he discharged the duties of that position with all the enthusiasm and popularity that had characterized his previous work in

the chair of Anatomy in the same college. In 1874 he commenced editing and publishing the *Journal of Mental and Nervous Diseases*, a large quarterly, on which he bestowed a great amount of mental labor, and to which he soon gave a reputation unequalled by any other journal in the same department. Dr. Jewell was one of the founders of the American Neurological Society, and served as its president three successive years; he was also an active member of the American Medical Association, of the Illinois State Medical Society, the Chicago Medical Society, the Chicago Academy of Sciences and the Wisconsin Academy of Sciences. He received the degree of Master of Arts from the Northwestern University in 1869; was familiar with several modern languages, and had collected one of the most valuable private libraries in Chicago. He early began to suffer from attacks of pulmonary disease that several times interrupted his labors, and finally compelled him to transfer his journal to other hands, and in 1883 to resign his professorship in college, and spend much of his time in milder climates. He died, aged a little less than fifty years. During the twenty-seven years of his professional life, he accomplished an amount of valuable medical, scientific, moral, and religious work rarely equaled by others in the same length of time. For, continues his biographer, he was always ready and equally at home whether in his library, his lecture-room, at the bedside of the sick, in the halls of science, in the sabbath-school, or with the loved ones at his own fireside.

JOHNSON, Amos Howe, of Salem, Massachusetts, was born in Boston, August 4, 1831. He fitted for college at Phillips Academy, Andover, Massachusetts, graduated at Harvard in 1853, and also from Andover Theological Seminary in 1856. In January, 1857, he settled over the church in Middletown, Massachusetts. In the fall of 1862 he commenced the study of medicine, graduated at Harvard Medical School in 1865, commenced practice at Middleton in November, 1866, visited Europe and attended medical lectures at La Charite Hospital in Berlin, and also at Vienna, during 1869, 1870 and 1871, and on returning settled in Salem in May of the last-named year. He is a member of the Essex Institute, Salem; president of the Essex South District Medical Society, elected in May, 1877, and was a member of the International Medical Congress, held in Philadelphia in 1876. He is the author of "Correspondence of the State Medical Board of Health," "Report of Distribution of Diphtheria in Salem," State Board of Health essay on "Physiological Limitations of Religious Experience," "Sanitary Condition of Salem," "Scarlet Fever," and other important articles of professional and public interest. He has lectured in the summer school of biology connected with the Peabody Academy of Science at Salem, on "The Function of the Nervous System;" has also given a special course to the theological students at Andover on the relations of "Physiological Conditions to Mental Experience." He has held the position of Physician to Salem Hospital.

JOHNSON, Francis M., of Kansas City, Missouri, was educated in medicine at the Medical Department of the University of Louisville and received the degree of M. D. from that institution in 1852, and was granted an *ad eundem* degree from the Missouri Medical Col-

lege, St. Louis, in 1861. Dr. Johnson is now Professor of Obstetrics in the Kansas City Medical College, and is Dean of the Faculty of that institution.

JOHNSON, Frank Seward, of Chicago, Illinois, was educated in medicine at the Chicago Medical College, from which institution he received the degree of M. D. in 1881. He is now Physician to Michael Reese Hospital, Pathologist to Mercy and St. Luke's Hospitals, Consulting Physician to Woman's Hospital, and Professor of Pathology and Pathological Anatomy in the Chicago Medical College.

JOHNSON, John W., of Boston, Massachusetts, was educated at Harvard, from which institution he received his medical degree in 1877. He is now Professor of Obstetrics and Gynecology in the College of Physicians and Surgeons, Boston, and Treasurer of the same. Dr. Johnson is a member of the Massachusetts Medical Society and the American Medical Association. He has devoted special attention to obstetrics and diseases of women, and is proprietor of a private lying-in hospital in Boston.

JOHNSON, Walter Buckley, of Paterson, New Jersey, was educated in medicine at the College of Physicians and Surgeons, New York, and received the degree of M. D. from that institution in 1878. He is now Surgeon to the Paterson Eye and Ear Infirmary; member of the Medical Staff of Paterson General Hospital; St. Joseph's Hospital and the Paterson Orphan Asylum. Dr. Johnson is an active member of the American Medical Association; American Otolological Society, and Fellow of the New York Academy of Medicine.

JOHNSTON, Wirt, of Jackson, Miss., was born at Raymond, in the same State, August 31, 1846. After graduating at the Jefferson Medical College, Philadelphia, Pa., in 1868, he located at Jackson, but in 1869 moved to Tchula, Holmes county, Mississippi, where he remained until 1873, the date of his return to the former place, where he has since permanently resided. In 1876 he was elected recording secretary of the Mississippi State Medical Association, and was re-elected to fill that position in 1877; in the course of this year, also, he was elected secretary of the Mississippi State Board of Health. He has held the position of Physician to the Mississippi Penitentiary, and has served as a member of the Board of Trustees of the Mississippi State Lunatic Asylum.

JONES, J. Brummell, of Kansas City, Missouri, was graduated M. D. at the St. Louis Medical College, St. Louis, Missouri, in 1868. He is now Physician to the East Side Free Dispensary, Visiting Physician to the German Hospital, and late Professor of Clinical Medicine and Physical Diagnosis in the University Medical College of Kansas City. Dr. Jones is a member of the Missouri State Medical Society, and also of the Jackson County and Kansas City District Medical Societies.

JONES, William Palmer, of Nashville, Tennessee, was born in Adair county, Kentucky, October 17, 1819. He attended the Louisville Medical Institute in 1839-40, and received the degree of M. D. from the Medical College of Ohio in 1854, and subsequently an *ad eundem* degree from the Memphis Medical College. He established himself first at Edmuntton, Kentucky, then removed to Bowling Green, in the same State, and finally to Nashville in

1849. He is a member of the American Medical Association, the American Association for the Advancement of Science, and the Tennessee State Medical Society. In 1853, and for several years thereafter, he was one of the editors of the *Southern Journal of Medicine and Physical Sciences*, published in Nashville. His "Necessities of the Insane in Tennessee," Transactions of the Tennessee State Medical Society, "Adequate and Impartial Provision for the Insane of the State," are among public contributions to medical literature. He has also been connected with the unprofessional press in the capacity of editor and proprietor, having in 1852 established the *Parlor Visitor*, and in 1874 being associate editor of the *Tennessee School Journal*. He has held the position of Professor of Materia Medica in the Shelby Medical College, an institution founded by himself in association with a number of other physicians in 1858, and was placed in charge of the Academy Hospital, the first established in Nashville, on the arrival of the Union forces in Tennessee. In 1862 he was superintendent of the Tennessee Hospital for the Insane, the second, if not the first hospital for colored persons ever erected on this continent; and though unanimously re-elected to the same position in 1870, he declined accepting it, because of an injury which he had received from a lunatic, resulting in paralysis. In 1876 he was elected president of the Nashville Medical College, and made Professor of Psychological Medicine and Mental Hygiene in that institution. He has been president of the Nashville city council, and State Senator from the Nashville District; and while in the senate introduced the public school law, which provides "equal educational advantages for all the children of the State, without reference to race, color, or condition;" he also obtained the provision by law for two additional hospitals for the insane. In May, 1877, he was appointed and confirmed postmaster of Nashville, which position he held for several years.

JUDKINS, William, of Cincinnati, Ohio, was graduated M. D. at the Miami Medical College, Cincinnati, in 1873, and received the *ad eundem* degree from the Medical College of Ohio in 1889. He is ex-president of the Cincinnati Academy of Medicine and ex-professor of Physiology and Clinical Lecturer on Genito-Urinary Diseases in the Cincinnati College of Medicine and Surgery. He is an active member of the Congress of American Physicians and Surgeons, American Association of Andrology and Syphilology, American Medical Association and Ohio State Medical Society. Dr. Judkins is also Medical Examiner and Advisor for several of the leading life and accident insurance companies of this country.

KALISH, Richard, of New York City, was graduated M. D. at Bellevue Hospital Medical College in 1875. He has since devoted special attention to ophthalmology, and is now Visiting Surgeon to Charity Hospital, Ophthalmic Surgeon to Church Hospital and Dispensary, and secretary of the Board of Governors of the same. Dr. Kalish is secretary of the New York Academy of Medicine and member of the New York County Medical Society and of other medical organizations of New York City.

KEIPER, George Frederic, of La Fayette, Indiana, was born in that city March 26, 1866. His ancestors are of German stock, his maternal grandfather a Saxon and his paternal

great-grandfather was a soldier of the Revolution. Both father's and mother's family contained five physicians, four being uncles. His father practiced medicine fifty years. The subject of this sketch received the degree of A. B. from DePauw University, Greencastle, Ind., in 1887, and the degree of A. M. in 1890. He commenced the study of medicine with his father, and also under the preceptorship of Dr. Geo. F. Beasley, of La Fayette, and graduated in medicine in 1890 at the Department of Medicine and Surgery, University of Michigan, Ann Arbor. His medical knowledge has been supplemented by attending hospitals in various large cities. He has practiced medicine in his native city since graduation. In 1891 he withdrew from general medicine to limit his practice to the eye, ear, nose and throat. In the same year he was appointed expert eye and ear examiner for the Pension Bureau and reappointed in 1893. Dr. Keiper is now Ophthalmic and Aural Surgeon to St. Elizabeth Hospital, St. Joseph Orphan Asylum and Martha Ray Methodist Episcopal Hospital, Lafayette. He has contributed numerous articles to medical publications, among which the following have received considerable mention: "Steel in Iris for Twenty-seven Years, Sympathetic Inflammation, Operation, Recovery," "Removal of Piece of Beard of Wheat from Iris," "Etiology and Prevention of Blindness," and "Etiology and Prevention of Deafness."

KELSEY, Charles B., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York, from which institution he received the degree of M. D. in 1873. Since which time he has devoted special attention to the surgical treatment of diseases of the rectum, in which field of practice his skill and success has gained for him a wide and well-deserved reputation, and he has become, through his teaching and writing, a recognized authority. He is now Professor of Diseases of the Rectum in the New York Post-Graduate Medical School and Hospital, and formerly held the same position in the University of Vermont at Burlington. Dr. Kelsey is an active member of the New York Academy of Medicine, and of numerous other leading medical societies of that metropolis.

KETCHUM, George A., of Mobile, Alabama, was educated in medicine at the University of Pennsylvania, and received the degree of M. D. from that institution in 1846. He is now Professor of Theory and Practice of Medicine in the Medical College of Alabama and Dean of the Faculty. Dr. Ketchum is ex-president of the Medical Association of the State of Alabama, ex-president of Mobile County Medical Society, member of the American Medical Association, and member of the International Medical Congress. He is president of the Board of Health of the city and county of Mobile, and also a member of the State Board of Health of Alabama.

KIMBALL, James H., of Denver, Colorado, was graduated M. D. at Harvard University Medical School, Boston, Massachusetts, in 1867. He is now Professor of Principles and Practice of Medicine and Clinical Medicine in the University of Colorado Medical School. Dr. Kimball is an active member of the Colorado State Medical Society, Arapahoe County Medical Society, Denver Medico-Legal Society, and Denver Medical Association.

KING, Alexander T., of Pueblo, Colorado,

was graduated M. D. at the Chicago Medical College, in 1881. He is now Visiting Surgeon to the Woman's and St. Mary's Hospital, Consulting Surgeon to the Colorado Coal and Iron Company Hospital, Pueblo, and Local Surgeon for the Denver and Rio Grande and Union Pacific Railway Companies. Dr. King is a member of the Colorado State Medical Society and president of the Pueblo County Medical Society.

KING, Oscar A., of Chicago, Illinois, was educated in medicine at Bellevue Hospital Medical College, New York City, from which institution he was graduated M. D. in 1878, since which time he has devoted special attention to diseases of the nervous system, in

Oscar A. King

which field of practice his skill and success has gained for him a wide and well-deserved reputation. He is now Professor of Diseases of the Brain and Nervous System, and Clinical Medicine in the College of Physicians and Surgeons, Chicago; Physician-in-Chief of the Department for Nervous Diseases in the West-Side Free Dispensary, Chicago, and President and Superintendent of Oakwood Springs Sanitarium, Lake Geneva, Wisconsin. Dr. King is an active member of the Chicago Medical Society, Wisconsin State Medical Society and the American Medical Association.

KING, Robert Maurice. of St. Louis, Missouri, was born at Madisonville, Hopkins county, Kentucky, June 1, 1843, and is of Scotch-Irish descent. He became motherless at the age of six months, and fatherless at ten years of age. Left to carve out his own fortunes, by industry and frugality he was enabled to support himself, and pay for a literary and medical education. He took a literary course at Princeton College, Princeton, Kentucky, and then began the study of medicine under

an able preceptor, Dr. George W. Noel, of Madisonville, in the same State. He graduated in medicine at Jefferson Medical College, Philadelphia, Pa., in March, 1865, and afterward received an *ad eundem* degree from the Miami Medical College, Cincinnati, Ohio. Bethany College, of Virginia, conferred upon him the degree of A. M. For twelve years he practiced medicine in the town of his nativity, with good success. For seventeen years last past he has, with marked success, practiced his profession at St. Louis, Missouri. His practice, always good, has become large and remunerative. Of late years it has mainly been in the line of obstetrics and diseases of children, and is gradually merging into that of obstetrics exclusively. During these years he has performed many operations in minor and major surgery with brilliant success, particularly in the removal of stones and tumors from the bladder. His success in obstetrical work has been unusual and sometimes remarkable. During the epidemic of small-pox in 1865, and of cholera in 1874, in southwestern Kentucky, he was indefatigable and very successful. In 1874, Governor Leslie appointed him one of the Board of Medical Examiners for the State of Kentucky, in which position he served two years. He served a term as vice-president of the McDowell Medical Association of Kentucky. In 1876 he removed to St. Louis, Missouri, and, in 1880, was appointed to the chair of Physiology and Clinical Medicine in the College of Physicians and Surgeons of St. Louis; which position he successfully and satisfactorily filled for five years. During this time he was also a consultant physician upon the Medical Staff of the St. Louis City Hospital. In 1888 he was appointed to the chair of Materia-Medica and Clinical Therapeutics in Beaumont Hospital Medical College of St. Louis; which chair he held for two years, and was then elected to the chair of Obstetrics and Diseases of Children; which chair he now holds. He was also elected to, and now fills, the position as one of the Medical Staff of the Protestant Hospital of St. Louis. He has been the Medical Examiner of many Insurance Companies. In January, 1889, he was elected to the honorable and responsible position of Supreme Medical Director of the Legion of Honor; to which position he has been re-elected each year since. Dr. King is not only learned in the theories of his profession, but his sound judgment, enlightened by a careful study of conditions, broadened by analytical habits of thought and extended by a wide experience, enables him to apply theoretical knowledge to all the varied conditions which may surround his patients, and thus insure the highest degree of success. He brings to bear upon the performance of his professional duties, native ability, zeal, learning, experience, and correct judgment. Kind, careful, courteous, considerate, and conscientious, he has the confidence of his professional brethren, the affection of his patients, and the esteem of all his acquaintances.

KINNAMAN, Horace H., of Keokuk, Iowa, was graduated M. D. at the College of Physicians and Surgeons, Keokuk, in 1882, and received the *ad eundem* degree from Jefferson Medical College, Philadelphia, in 1884. He is now Demonstrator of Anatomy and Professor of Diseases of Children in the Keokuk Medical College. He is secretary of the Keokuk Med-

ical Society, and member of the Iowa State Medical Society, as well as other leading medical organizations.

KINNICUTT, Francis P., of New York City, was educated at Harvard, from which institution he received the degree of A. M., and subsequently entered the College of Physicians and Surgeons, New York, from which institution he received the degree of M. D. in 1871. He is now Attending Physician to St. Luke's Hospital, and the New York Cancer Hospital. He is also Consulting Physician to the Babies' Hospital, and trustee of the College of Physicians and Surgeons. Dr. Kinnicutt is an active member of the Association of American Physicians, and of other well-known medical organizations.

KIPP, Charles John, of Newark, New Jersey, was born in Hanover, Germany, October 22, 1838. He was educated in Hanover and New York, and studied medicine at the College of Physicians and Surgeons, New York City, graduating in March, 1861. He was appointed in the same year Volunteer Surgeon to the Fifth New York State National Guards; Assistant Surgeon Third Battalion New York Artillery, January, 1862; Assistant Surgeon United States Volunteers, May, 1863; Surgeon United States Volunteers, March, 1864, and brevetted Lieutenant-Colonel for faithful and meritorious services during the war, March, 1865. He served in the field till 1863, and performed hospital services after that at Nashville, Tennessee, and Indianapolis, Indiana, and was Chief of the United States Board of Inspectors of Recruits, at the general rendezvous of the State of Indiana. He also held the position of Medical Director of Freedmen's Bureau of that State from August, 1865, to February, 1868. He then began civil practice in New York and in Newark in 1869, where he has since remained, devoting special attention to diseases of the eye and ear. He is a member of the International Ophthalmological Congress; corresponding secretary of the International Otolological Society; elected in 1876 member of the American Ophthalmological, American Otolological, New York Ophthalmological, New York Pathological and Essex District Medical Societies; elected in 1877 one of the vice-presidents of the New Jersey Academy of Medicine, member of the Essex Medical Union, of the Newark Medical Association; president of the German Hospital Medical Association, elected in 1875; was also a delegate to the International Medical Congress, held in Philadelphia in 1876. His contributions to medical literature consist of contributions to the "Medical and Surgical History of the Rebellion," "On the Affection of the Eye in Small-Pox," "Proceedings of the Medical Society of New Jersey;" "A Case of Sarcoma of Iris, Cured by Excision," and clinical essays in the Transactions of the American Ophthalmological and Otolological Societies.

KNAPP, Herman, of New York City, was born at Dauborn, Prussia, March 17, 1832. His father, John Knapp, was formerly a member of the Prussian House of Representatives and the German Reichstag. He was educated at the College of Weillburg, Prussia, till he was nineteen years old, completing his education by studying in the Universities of Munich, Würzburg, Berlin, Leipzig, Zürich, Vienna, Paris, London, Utrecht and Heidelberg, until he was twenty-eight years of age. He grad-

uated at Giessen in 1854, and settling in Heidelberg was appointed Lecturer in the University in 1860, and Professor of Ophthalmology in 1865. In 1868 he resigned both these positions, and coming to this country settled in New York City. He is a member of the American Ophthalmic, the New York County Medical, and the New York Pathological Societies—being President of the latter in 1874—also member of the New York Academy of Medicine, founded in 1869; and is now, and has been for many years, Surgeon of the New York Ophthalmic and Aural Institute, a hospital and school for the treatment and study of eye and ear diseases. Dr. Knapp started, and is now editor of the *Archives of Ophthalmology and Otolology*, a purely scientific journal, published in German and English (W. Wood & Co., New York), and of which several largely illustrated volumes, in each of these languages, have appeared. He is also the author of numerous ophthalmological papers which have appeared in *Græfe's Archives* and the *Archives of Ophthalmology and Otolology*, and some otological papers in the last-named journal. His contributions to medical literature which have appeared in book form are "The Curvature of the Human Cornea," Heidelberg, 1859; "On Hospitals in General, and Ophthalmic Institutions in Particular," Heidelberg, 1866; "The Intra-Ocular Tumors," with sixteen plates, Carlsruhe, 1869, and translated into English the same year. He was appointed, in 1873, Ophthalmic Surgeon to the New York Charity Hospital, a position he resigned in 1874, and in the same year was made Consulting Oculist for the several institutions of the Department of Public Charities and Correction; also in 1876 appointed Lecturer on Eye and Ear Diseases in the Spring Faculty of the College of Physicians and Surgeons, New York. He is now Professor of Ophthalmology in that institution. His skill as an ophthalmic and aural surgeon has gained for him a world-wide reputation, and he is no less known for his ability as a clinical teacher and contributor to the literature of his special field of practice.

KNAPP, Philip C., of Boston, Massachusetts, was educated at Harvard, from which institution he received the degree of A. B. in 1878, and that of M. D. in 1883, since which time he has devoted special attention to diseases of the nervous system. He is now Clinical Instructor of Diseases of the Nervous System in Harvard Medical School, and Physician to Out Patients Diseases of the Nervous System, Boston City Hospital. Dr. Knapp is an active member of the Boston Society for Medical Improvement and for Medical Observation, Boston Medico-Psychological Society, Massachusetts Medico-Legal Society, New England Psychological Society, and the American Neurological Association.

KNIGHT, Charles H., of New York City, was graduated in medicine at the College of Physicians and Surgeons, New York, in 1874, since which time he has devoted special attention to diseases of the nose and throat, in which field of medicine he is extensively known. He is now Professor of Laryngology and Rhinology in the New York Post-Graduate Medical School and Hospital, Surgeon to Throat Department of Manhattan Eye and Ear Hospital, secretary of the American Laryngological Association and member of the New York Academy of Medicine, and of numer-

ous other leading medical societies of New York.

KNOTT, James Jerrold, of Atlanta, Georgia, was born in McDonough, Georgia, June 16, 1839. He was educated at private schools, and studied medicine and graduated M. D., at the Atlanta Medical College, in 1859, and supplemented his education and training during the following year, by attending the schools and hospitals of Paris, France. On his return from abroad he settled first in Griffin, in his native State, and after the war (1865) in Atlanta, where he has since remained engaged in an active and successful practice of his profession. He entered the Confederate Army as a private, in March, 1861; was assigned to duty as an assistant surgeon, Fourth Regiment Georgia State troops, same year; after acting on the examining medical board, near Brunswick, Georgia, was ordered to Savannah; subsequently was appointed assistant surgeon of the Fifty-third Georgia Regiment, and placed in charge of various hospitals in that State; was present with his regiment in the seven days' fight before Richmond; in the Maryland campaign, at Sharpsburg; subsequently, at Fredericksburg, remaining on hospital duty there until June, 1863; was afterwards at Gettysburg; with Bragg at Chickamauga, at Knoxville, and again with Lee at Gordonsville, Wilderness, and Petersburg; promoted to surgeon, 1864; and while sick was placed in charge of the hospital at Augusta, where he remained till Johnston's capitulation. He is a member of the Fulton County Medical Society, and of the Medical Association of Georgia. His contributions to medical literature consist of "Cases of Excision of the Elbow-Joint," "Creosote as a Remedy in Diphtheria," 1865; "Calomel in the Treatment of Tetanus," "Large Doses of Bromide of Potassium as a Remedial Agent," 1867; "Total Excision of Wrist-Joint," "Creosote as a Cure for Nurses' Sore Mouth," "Cimicifuga," "Strangulated Hernia Complicated with Hydrocele of Cord and Scrotum," 1877; "Injection of Carbonate of Ammonia into the Veins in Rattlesnake Bite," "Nitrate of Silver in Orchitis," and "Reports of Resections, Amputations, and Ligations, and Gunshot Wounds," to Surgeon-General's office. He was formerly Professor of Anatomy and Clinical Surgeon in Middle Georgia Medical College.

KNOTT, John M., of Sioux City, Iowa, was born in Clifton, Ohio, March 5, 1846. On the paternal side he is of Scotch extraction, and on the maternal of German; his parents and grandparents were natives of America. In 1865 he was appointed Second-Lieutenant in the One Hundred and Eighty-sixth Ohio Volunteer Infantry, and on the following September was promoted to a First-Lieutenancy. He acquired his academic education at Wittenberg College, Springfield, and was prepared for a professional career in the National Medical College, Washington, D. C., graduating from that institution March 2, 1870. His first place of settlement was at Joliet, Illinois, in March, 1871, but in 1872 he removed to his present location in Sioux City. He was married, May 19, 1870, to Caroline L. Van Buren, then a resident of Chatham, New York. While attending to a general practice, he bestows special attention upon diseases of women and diseases of the chest. He is a member of the Sioux City Medical Society, Iowa, and is ex-secretary and ex-president of that organization. At va-

rious times he has read before medical societies papers on "Membranous Enteritis," "Quinia in Acute Inflammatory and Acute Infectious Diseases," "Sclerosis of the Brain," "Chloral in Puerperal Eclampsia," and upon other topics of medical interest. In August, 1873, he was appointed United States Examining Surgeon for Pensions, a position he held for several years.

LAMB, Daniel Smith, of Washington City, D. C., was born in Philadelphia, Pennsylvania, May 20, 1843. His ancestry came from England before the war of the Revolution. He was educated in the public schools of his native city, and received the degree of A. B. from Central High School in 1859, and that of A. M. from the same institution in 1864. During the War of the Rebellion he enlisted as a private soldier in the Eighty-First Pennsylvania Volunteers, and served in that capacity from September, 1861, until May, 1864, when he was appointed Hospital Stewart in the United States Army, and held this position until 1868. He was then appointed Acting Assistant Surgeon United States Army, and served in that position until July, 1892, making the total period of his continued and faithful service in the United States Army over thirty years. He studied medicine under the preceptorship of Edwin Bently, Surgeon United States Volunteers, and entered the Medical Department of Georgetown University, Washington, D. C., from which institution he received the degree of M. D. in 1867. Soon after he was graduated in medicine he established himself in Washington City, where he has since remained. Dr. Lamb is a member of the Anthropological and the Microscopical Societies of Washington City, and also of the Anthropometric Society and Association for the advancement of Sciences, United States of America. In July, 1892, Dr. Lamb was appointed Pathologist to the Army Medical Museum, a position he now holds. In October, 1873, he was chosen Professor of Materia-Medica and Therapeutics, and afterwards Professor of Anatomy, in the Medical Department of Howard University, Washington, D. C., and has held this chair to the present time. He has been Secretary of the Association of American Anatomists since 1890. He was Secretary of Section on Anatomy Pan-American Congress, 1893. He is President of the Association of Acting Assistant Surgeons United States Army; Vice-President of Woman's Clinic, Washington, D. C., and is late Vice-President of the Medical Society of the District of Columbia. He has made important contributions to medical literature, among which articles may be mentioned: "On Tracheo-Esophageal Fistula," "On Eight Rib Sternums," "On Olecranon Perforation," "Reports of Post-Mortem Examination of President Garfield," "Reports of Post-Mortem Examination of Charles J. Guiteau's Mechanical Suffocation," in the new *Medical Jurisprudence*, now being published by William Wood & Co., New York. Dr. Lamb's long and faithful military service, and since then his brilliant anatomical investigations and the executive ability that he has shown in connection with the Army Medical Museum, have been highly appreciated by the national government and the medical profession. His name will always be associated honorably with the above-mentioned institution, which owes much to his energy and professional knowledge.

LANE, Levi Cooper, of San Francisco, California, was educated at Union College, New York, from which institution he received the degrees of A. M. and LL. D. He was graduated M. D. at Jefferson Medical College, Philadelphia, Pa., in 1851. He became a member of the Royal Chirurgical Society, England, in 1875, and has supplemented his education by attending the schools and hospitals of Europe. Dr. Lane is the founder and endower of the Cooper Medical College, San Francisco, California, and is now Professor of Surgery in that institution.

LANPHEAR, Emory, of Kansas City, Missouri, was born in New York July 16, 1859. He was educated at Emporia, Kansas; St. Louis, Missouri, and in Germany. He graduated in medicine at the Missouri Medical College, St. Louis, in March, 1881, receiving the prizes in anatomy, surgery and diseases of women. In 1886 he became Professor of Mental and Nervous Diseases in the Medical Department of the University of Kansas City. In 1887 he organized the Kansas City College of Pharmacy, and was elected president of the board of trustees, a position he still retains; he has also been Professor of *Materia Medica* in the same institution since the opening of the school. In 1888 and 1889 he filled the chair of *Materia Medica* and Therapeutics in the University Medical College, and having taken post-graduate instruction in the East, limited his practice to surgery and diseases of women. In 1890, 1891, and 1892 he was Professor of Orthopedic Surgery in the University Medical College of Kansas City, and acted as Surgeon to the East Side Dispensary, to All Saints Hospital, and to the German Hospital. In 1893 he resigned from the University and became Professor of Operative Surgery and Clinical Surgery in the Kansas City Medical College. Since 1885 he has been editor of the *Kansas City Medical Index*, and since 1891 of the *American Journal of Surgery and Gynecology*. He has published many papers upon surgical subjects, among which may be mentioned a report of the third operation in America for removal of the gasserian ganglion, a report of four successful amputations at the hip-joint, a rapid method of performing abdominal hysterectomy (by means of vaginal clamps), a report of sixty-four cases of cerebral surgery, and the surgical aspects of cerebral localization. In medical societies he has always taken very great interest. He is now an active member of the American Medical Association, the National Association of Railway Surgeons, the Mississippi Valley Medical Society, the Missouri Valley Medical Association, the Tri-State Illinois, Iowa and Missouri Medical Society, the Kansas City District Society, the Missouri State Medical Association, as well as honorary member of the Kansas State Medical Society, the Southern Kansas, Eastern Kansas, Golden Belt, Southwest Missouri, and many other medical organizations. He is now president of the Kansas City Academy of Medicine.

LATON, Winfield S., of Minneapolis, Minnesota, was born in Penobscot county, Maine, April 24, 1854. He acquired an education in his native State, graduating from the Eastern State Normal School at the age of nineteen, with high honors. He was a successful teacher in the high schools and academies of the State for several years before and after graduating.

After spending a year at Bowdoin College, he went to Portland to continue the study of medicine, and from there went to the Long Island College Hospital, Brooklyn, New York, where he graduated M. D. in 1877. Most of the following year was devoted to work in the hospitals of New York City, with a special course at Blackwell's Island. In the spring of 1878 he located on the frontier in Western Texas, and for four years was engaged there in a large and lucrative practice, gaining an experience which has been of inestimable value to him. At the earnest solicitation of friends, in 1882, Dr. Laton was induced to locate in Minneapolis. After spending several months in the hospitals of Chicago and taking a post-graduate course in that city, he commenced active practice in Minneapolis. He was very soon elected to the chair of Toxicology and *Materia Medica* in the Minnesota Hospital College, and shortly after to the chair of Physical Diagnosis. The years of 1884-5 were devoted to the study of the diseases of the nose and throat in the hospitals of Europe. On his return he was elected by the Regents of the State University to the chair of Laryngology and Rhinology, the position which he still retains. Dr. Laton has written several articles of merit upon medical and climatological subjects, among which may be mentioned the "Pathology and Treatment of Tubercular Laryngitis," "Laryngeal Neoplasms" and "Western Texas, the Home for Consumptives."

LEALE, John L., of Paterson, New Jersey, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1884. He is now Visiting Surgeon to Paterson General Hospital, Visiting Surgeon and Physician to the Day Nursery, and Health Officer of the city of Paterson. He is also Medical Examiner and Advisor for the New York Life and the Metropolitan Life Insurance Companies. Dr. Leale is an active member of the American Public Health Association, New Jersey State Medical Society, and other leading medical and scientific organizations.

LEE, Benjamin, of Philadelphia, Pa., was graduated at the New York Medical College, New York City, in 1857. He is now Professor of Orthopedics in the Philadelphia Polyclinic and College for Graduates in Medicine, president of the American Orthopedic Association, and secretary of the Pennsylvania State Board of Health.

LEMEN, Harrison A., of Denver, Colorado, was graduated M. D. at St. Louis Medical College in 1864. He is now Consulting Physician to St. Luke's Hospital and St. Joseph Hospital, Denver, and served as Surgeon to the Arapahoe County Hospital from 1876 to 1881. He is *Emeritus* Professor of Principles and Practice of Medicine, Medical Department of the University of Denver; member of the Colorado State Medical Society, of the Denver Medical Association, Arapahoe County Medical Society and ex-member of the Colorado State Board of Health.

Le MOND, Robert Fields, of Denver, Colorado, was educated at Central University of Kentucky, from which he received the degree of A. M., and was graduated M. D. from the Hospital College of Medicine, Louisville, Ky., in 1885. His medical education and training

were supplemented by attending the St. Louis Post-Graduate Medical School in 1888, and by serving as *Interne* at the Manhattan Eye and Ear Hospital, New York, during 1889, and also by attending the New York Post-Graduate Medical School and Hospital in 1892. He is now Professor of Ophthalmology and Otology in the Gross Medical College, Denver. He is an active member of the Colorado State Medical Society, Denver Medical Association, Arapahoe County Medical Society and the Denver Clinical and Pathological Society. His practice is limited to diseases of the eye and ear.

LEVISEUR, Frederick J., of New York City, was educated at the University of Göttingen, Germany, from which institution he received the degree of M. D. in 1884. He is now Dermatologist to Randall's Island Hospital, and to St. Bartholomew's Dispensary. Dr. Levisieur is an active member of the New York Academy of Medicine, New York County Medical Society, German Medical Society, and other medical organizations of New York City.

LEVY, Robert, of Denver, Colorado, was graduated M. D. at Bellevue Hospital Medical College, New York, in 1884. He is now Professor of Physiology and Diseases of the Nose and Throat, in Gross Medical College, Denver, and is secretary of the Faculty of that institution. He is Laryngologist to St. Luke's Hospital, Deaconess' Home and Hospital, and Arapahoe County Hospital. Dr. Levy is a member of the American Medical Association, Colorado State Medical Society, Denver Medical Association, Arapahoe County Medical Society, and the Denver Clinical and Pathological Society. His practice is limited to diseases of the nose and throat.

LEWIS, Ernest S., of New Orleans, Louisiana, was graduated M. D. at the University of Louisiana, New Orleans, in 1862. He is now Professor of Obstetrics and Diseases of Women and Children in Tulane University of Louisiana, Visiting Surgeon to Charity Hospital, and an active member of the American Medical Association, Louisiana State Medical Association, Orleans Parish Medical Society, and the New Orleans Medical and Surgical Association.

LEWIS, W. Milton, of Baltimore, Maryland, was educated in medicine at the University of Maryland, from which institution he received the degree of M. D. in 1888. He is now Chief of the Clinic, Department of Laryngology, University of Maryland; Chief of Clinic, Surgical Department of Women's Medical College; Assistant Chief of Practice of Medicine in Women's Medical College, and a member of the Clinical Society of Maryland.

LINCOLN, Nathan Smith, of Washington City, D. C., was born at Gardner, Massachusetts, April 3, 1828. He is a grandson of Dr. Nathan Smith, of Yale College, and a son of the Reverend Sumner and Eliza (Smith) Lincoln. Having Graduated A. B. from Dartmouth College in 1850, he studied medicine under his uncle, Dr. Nathan R. Smith of Baltimore; at the same time attended medical lectures at the University of Maryland, and from that institution received his degree of M. D. in 1852. Until January, 1854, he practiced his profession in Baltimore, and since that date has been established in Washington. In 1857 he was elected Professor of

Chemistry in Columbian University; in 1859 was made Professor of the Theory and Practice of Medicine; in 1860 Professor of Anatomy and Physiology; and in 1861 Professor of Surgery. The latter chair was retained until 1874, when it was relinquished on account of the pressure of private practice. He is now *Emeritus* Professor of Surgery in that institution. After serving for several years as one of the surgeons to the Washington Infirmary, he was appointed in 1861 Surgeon-in-Chief of the hospitals established at Washington by the Quartermaster's Department, a position that he held during, and for some months after the conclusion of, the War of the Rebellion. In 1866 he was appointed one of the surgeons to the Providence Hospital, an appointment that he resigned in 1875. He has also been for a number of years Physician to the Deaf Mute College, and to several other institutions. He is now Consulting Surgeon to Garfield Hospital, Children's Hospital, Providence Hospital, and to Central Dispensary. Having made a specialty of surgery, he has performed a large number of important operations, including amputations at the hip-joint, lithotomy, removal of tumors from the region of the neck, and ligation of the large arteries. He is ex-President of the District of Columbia Medical Society, and a member of the Philosophical Society of Washington; of the American Association for the Promotion of Science, and of the American Medical Association.

LINDSLEY, John Berrian, of Nashville, Tennessee, was born at Princeton, New Jersey, October 24, 1822. He is descended from the Lindsleys, who were among the first settlers of Morristown, New Jersey, and from the Lawrences, who settled at Hell Gate, Long Island, in 1860. Having graduated A. B. from the University of Nashville in 1839, he entered the Medical Department of the University of Pennsylvania, graduating thence M. D. in 1843. In 1849-50 he attended lectures in the Medical Department of the University of Louisville. In 1852 and again in 1859 he pursued his studies in France and Germany. He was appointed, in October, 1850, Professor of Chemistry and Pharmacy in the Medical Department of the University of Nashville, and at the same time Dean of the Medical Faculty, holding his professorship until March, 1873. From 1855 to 1870 he was chancellor of the university, preserving it unharmed during the war. In 1856 the College of New Jersey conferred on him the degree of D. D. He married February 9, 1857, Sarah, daughter of Jacob McGavock, Esq., of Nashville. In February, 1862, at the request of Gen. A. S. Johnson, he accepted temporarily the position of Acting Post-Surgeon at Nashville. He is a member of the Tennessee State Medical Society, a Fellow of the American Association for the Advancement of Sciences, a delegate to nine conventions of the American Medical Association, a member of the Numismatic and Antiquarian Society of Philadelphia, and of the American Chemical Society of New York. Among his published works may be mentioned contributions to the "Medical Annals of Tennessee," to the "Sources and Sketches of Cumberland Presbyterian History," and in conjunction with Dr. J. G. M. Ramsey, of Knoxville, Tennessee, "Abridged Annals of Tennessee." In 1875 he was secretary to the State Board of Education of Tennessee; in 1876 he was Health Officer of Nash-

ville, also Librarian of the Tennessee Historical Society, and April 3, 1877, on the organization of the Tennessee State Board of Health, he was appointed secretary.

LINK, John E., of Terre Haute, Indiana, was born and educated in Floyd county, that State, and at Paris, Illinois. After studying his profession he entered the Rush Medical College, Chicago, in 1860. In April, 1861, he enlisted as a private soldier in the Twelfth Illinois Volunteer Infantry and served three months in the regimental hospital and the same length of time as Hospital Steward in the Sixty-eighth Illinois Infantry. In October, 1862, he was appointed Assistant Surgeon of the Twenty-first Illinois Infantry, and in September, 1863, he became Surgeon of that regiment and served in that capacity until his command was mustered out in July, 1864. Much of his time was passed at the hospital at Murfreesboro, Tennessee, where he introduced his "hollow cone stumps" (reported to American Medical Association in 1875, at Louisville, Kentucky), and where he was appointed to special service as Operating Surgeon. He also held the same position at Nashville, Tennessee. In November, 1862, he married Miss Mary La Foe, formerly of Lexington, Kentucky. On his return from the army he attended the Chicago Medical College and was graduated M. D. from that institution in 1865. He then established himself in Terre Haute, where he has since remained engaged in an active and successful practice of general medicine and surgery, devoting special attention to the latter. He formerly held the chair of Anatomy in the College of Physicians and Surgeons of Indiana. He is late Chief Surgeon of Vandalia Railway Line and Local Surgeon of all other railroads passing through his city. He is an active member of the Vigo County Medical Society; ex-president of the Esculapian Society of Wabash Valley; ex-vice-president of the Mississippi Valley Medical Association; member of the American Medical Association and of the International Medical Congress. His contributions to professional literature mainly consist of papers and reports of cases read before the medical societies with which he is connected, based upon his extensive and varied medical and surgical experience. Articles from his pen on "The Use of Alcohol as an Anesthetic" and upon "The Pathology and Treatment of Influenza" have been widely published and are worthy of special mention.

LOBINGIER, A. Stewart, of Denver, Colorado, was graduated M. D. at the Medical Department of the University of Michigan, Ann Arbor, in 1889. He is now Professor of Pathology and Clinical Surgery in the University of Colorado, Pathologist to Arapahoe County Hospital and Surgeon Alternate to St. Luke's Hospital, Denver. Dr. Lobingier is an active member of the American Medical Association, secretary of the Colorado State Medical Society in 1892-93, and is a member of the Denver Medical Association, Arapahoe County Medical Society, Denver Obstetrical and Gynecological Society, Denver Clinical and Pathological Society, and Denver Medico-Legal Society.

LOEB, Hanau W., of St. Louis, Missouri, was graduated M. D. at St. Joseph's Hospital Medical College, St. Joseph, Missouri, in 1887, and supplemented his medical education and

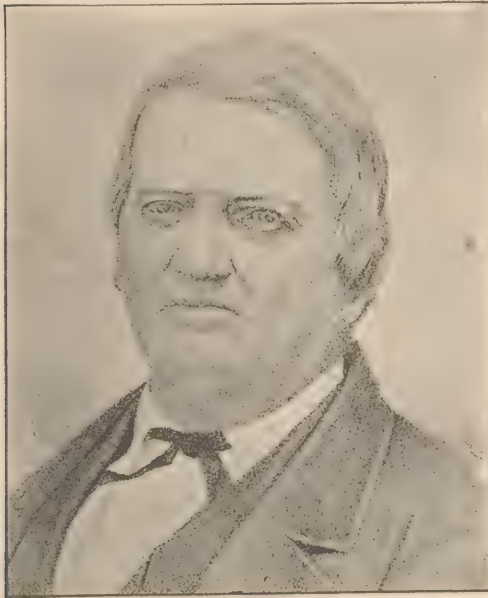

training by attendance at the College of Physicians and Surgeons, New York City, from which institution he received an *ad eundem* degree in 1888. He is now Professor of Diseases of the Nose and Throat in Marion-Sims College of Medicine, St. Louis, Missouri, and is an active member of numerous leading medical societies of this country, including the American Medical Association. Dr. Loeb has devised some very useful surgical appliances, and made important contributions to medical literature in the line of his special field of practice.

LOGAN, James E., of Kansas City, Missouri, was graduated M. D. at the University Medical College, Kansas City, Missouri, in 1883, and received an *ad eundem* degree from Bellevue Hospital Medical College, New York City in 1884. He is now Professor of Diseases of the Nose and Throat in the University Medical College, Kansas City, and is an active member of the American Medical Association, Missouri State Medical Society, Jackson County Medical Society, Kansas City District Medical Society, and Kansas City Academy of Medicine.

LOGAN, Samuel, of New Orleans, Louisiana, was born April 16, 1831, in Colleton District, South Carolina, and is descended from a Scotch family, who were among the earliest settlers of that portion of the country. He was educated in the schools of Charleston, South Carolina; State University, at Columbia, and in the South Carolina Medical College, graduating from the latter institution with the degree of M. D. in March, 1853. He spent the three years succeeding his graduation in a country practice, twelve miles from Charleston, next in Charleston, South Carolina. During the late Civil War he served as Surgeon, Medical Director and Inspector in the Confederate States army. During 1866 he practiced his profession in Richmond, Virginia, and since then in New Orleans. He was Demonstrator of Anatomy, 1857-66, in the South Carolina Medical College, Charleston; Professor of Anatomy in the Medical College of Virginia, Richmond, 1866-67; Professor of Surgery for the next three years in the New Orleans School of Medicine, and in 1872 he was made Professor of Anatomy and Clinical Surgery in the Medical Department of the University of Louisiana. He is now Professor of Surgery in Tulane University of Louisiana, Visiting Surgeon to Charity Hospital, ex-vice-president of the American Medical Association, ex-president of the Louisiana State Medical Society, and ex-president of the New Orleans Medical and Surgical Association. He is the editor of *Gedding's Surgery*, and has also contributed many articles to the leading medical journals. He was married in September, 1871, to Mary Virginia, only child of George R. King, Esq., formerly judge of the Supreme Court of the State of Louisiana.

LONG, William, of New Maysville, Indiana, was born in Shelby county, Kentucky, October 28, 1810, and died May 5, 1880. His father, Thomas Long, was an early pioneer of Kentucky, and his mother, Nancy (Jackson) Long, a cousin of President Andrew Jackson, was a lady noted for her energetic character and vigorous intellect. The subject of this sketch was the oldest of a family of six sons and two daughters. His education in early life was limited, his opportunities for attending school being only such as were offered in the rural districts, but he possessed a mind that was ever

active in the acquisition of knowledge, which he valued only in so far as it could be made available and practical. He commenced reading medicine in early life, and under the most unfavorable circumstances, performing the hardest manual labor for the smallest wages to enable him to prosecute his studies, and in after years when he had acquired a fortune by his profession he often exhibited with great pride a volume of Hooper's Medical Dictionary that he obtained when a student with the money he earned by cutting nine cords of green wood in the month of August. Many a night did he ponder over his dearly bought books by the flickering light of hickory bark. Being southern born and raised, and belonging to a family of former wealth, we can form some idea of how much of the pride and prejudice incident to his section of our country he was required to overcome in obtaining his med-

William Long.

ical education in this way; but it was his only chance, and we here find evidence of that pluck, industry, and self-reliance which characterized him through life. We mention these facts for encouragement to young men who may try to excuse themselves by lack of opportunity in acquiring professional knowledge with all the educational facilities of the present day. In 1833 he emigrated from Kentucky to Indiana, and practiced medicine near Lafayette, and from this locality he removed the following year to New Maysville, Putnam county, in the same State, where he engaged in an active and successful general practice of his profession for a period of forty years, and where he continued to live respected and honored until his death. His arrival at the latter place was in the "dead of winter," 1834, at a time when the surrounding country was a "howling wilderness," when no roads were laid out, and when there was no way of getting from one house to another to see patients except by blazed paths through the dense forests.

At this time no other towns existed, and no other physicians were located within many miles to divide the cares and responsibilities of a laborious practice. At the time of his arrival in the new settlement, he is described as a fair-haired, slender, and very tall young man, about twenty-four years of age, his entire stock of worldly possessions as consisting of one dollar in money, the horse he rode, and saddle-wallets, one side containing a loaf of bread and the other filled with a small stock of medicine. Certainly not a very bright prospect for the future, but there was a glint of energy and determination in the clear gray eye of that young man that convinced the community that he had come to stay, and would prove equal to all future emergencies. With good health, a vigorous constitution, untiring industry and indomitable energy, he was enabled to realize his ambition to meet the requirements of his profession and the multifarious duties of all good citizens. As a practitioner of medicine, he was especially noted for his diligent attention to cases and good judgment, as well as for his prudence, caution and skill, and was never misled by wild or visionary hobbies or notions. He was no theorist for the sake of theory, and only blended theory with practice when the former was confirmed by the crucial test of truth. His rule of life was to estimate any proposition or enterprise in the light of its results, and his keen perceptions, ready and correct conclusions, always made his opinion, advice and decisions valuable. For this reason, in the early settlement of his county he was not only consulted professionally, but his judgment was highly prized by his friends with reference to their business transactions, and those who availed themselves of his council rarely had cause to regret it. He made but little pretense to surgery, because with him its field was narrowed, but his remarkable success in the treatment of diseases of women and children and in combatting the various epidemics occurring during the early settlement of Indiana made the name of Dr. Long as familiar as household words in the families of the old settlers of that section of the State in which he practiced. He was an expert obstetrician, and his advice and assistance in difficult cases were often called in requisition by other members of the profession throughout his own and adjoining counties. He was the preceptor of a number of medical students, some of whom in after years became distinguished physicians and surgeons. Though the profits of his profession had been large, he was not one who believed in hoarding wealth, but was always noted for his deeds of charity, and for his liberal contributions to public enterprises, especially for institutions of learning, and for the dissemination of Christian knowledge and the support of the Missionary Baptist Church, of which he had been from early youth a constant member. It was his undeviating rule to never turn away from his door empty-handed any one seeking charity. Dr. Long; when in active life, stood over six feet in height, and in later years weighed near three hundred pounds, and was one of the largest men in western Indiana. He never personally used tobacco or spirituous liquors, and was noted for his discretion as well as temperate habits. His manners were plain and unassuming, em-

inently practical in his dealings, with a kind word and sympathy for all, he possessed the esteem and confidence of his fellow-man to an extraordinary extent. The honorary degree of Doctor of Medicine was conferred upon him by Rush Medical College, Chicago, in 1850. He retired from active practice a few years before his death. On July 24, 1834, he was married to Harriet Gregory, who proved a true and faithful companion in all the trials and achievements of his professional life. Two sons and four daughters were the result of this union, all of whom survived his death. His family was well represented in the medical profession. Three brothers and two nephews became eminent physicians and surgeons in Kentucky. One of his nephews (and namesake, the late Dr. William H. Long) was a distinguished surgeon in the United States Marine Hospital Service. Another (Dr. John L. Long) was for many years the Superintendent of the Louisville City Hospital. One of his sons, Dr. Robert W. Long, is a prominent physician of Indianapolis; and one of his daughters is married to Dr. R. French Stone, of the same city, and another daughter is the wife of Dr. George A. Biddle, the present Mayor of the City of Emporia, Kansas.

LONG, William H., of Cincinnati, Ohio, died while in charge of the Marine Hospital in that city January 5, 1892. He was a native of Kentucky, and served as medical officer with the volunteer soldiers from that State in the Union Army during the War of the Rebellion. He was a graduate of the Kentucky School of Medicine, Louisville, in 1866, and in 1875 was appointed Assistant Surgeon in the United States Marine Hospital Service and stationed at Louisville. He was promoted to surgeon while serving at that station, and subsequently commanded the marine hospitals at Detroit, Chicago and Cincinnati. He was *Emeritus* Professor of Military Surgery in the Michigan Medical College, Detroit, and in a great measure to his untiring efforts that institution owes its existence and growth. He was an officer of fine executive ability and an excellent surgical operator, his herniotomy record being second to none in the service. In person he was very tall, being six feet and four inches in height, and was a man of the most charming and genial manners. He was not only exceedingly popular in his own corps, but in the medical profession at large he was widely and favorably known. By his death, both the former and the latter have lost one of their brightest ornaments, the country one of her strongest patriots, and suffering humanity an able, sympathetic friend. His wife's death occurred a few months previous to his own. Two minor children, a son and daughter, survived him.

LONGSTRETH, Morris, of Philadelphia, Pennsylvania, was educated in medicine at the University of Pennsylvania and received the degree of M. D. from that institution in 1869. He subsequently entered the Jefferson Medical College, Philadelphia, and received an *ad eundem* degree in 1876. He is now Professor of Pathological Anatomy in Jefferson Medical College and Attending Physician to Pennsylvania Hospital. Dr. Longstreth resides during the summer months at Bar Harbor, Maine.

LONGYEAR, Howard W., of Detroit, Michigan, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree

of M. D. in 1875. He is now Visiting Gynecologist to Harper Hospital, and president of staff of the Women's Hospital. He is a member of the Detroit Medical and Library Association, ex-president of the Detroit Gynecological Society and Vice-President of the American Association of Obstetricians and Gynecologists.

LOVE, William Abram, of Atlanta, Georgia, was born in Camden, Kershaw district, South Carolina, May 16, 1824. His parents were residents of that place in colonial times and suffered much at the hands of the British Tories during the Revolutionary War. By the death of his father, in his infancy, he was left an orphan. He was educated in the schools of Camden, and at Russell Place Academy. At the age of twelve, with a view to the study of medicine, he entered the drug-store of Dr. George Reynolds, continuing his studies under private tutors. As a medical student he was for four years under the preceptorship of Dr. E. H. Anderson. In 1844 he entered the Medical Department of the University of Pennsylvania; and, as a private pupil, the office of Dr. Samuel G. Morton, of Philadelphia. With a view to ultimate special work, he entered also the Obstetrical Institute, under Dr. Joseph Warrington, served his time under the direction of the lady managers of the Lying-in Charity and Nurse Society, and graduated at this institute in 1845. During the summer of this year he attended a course of lectures at the Locust Street Schools, and the ward and clinical services of the Blockley and Pennsylvania Hospitals. In order to prepare himself more perfectly for the special work of obstetrics and diseases of women and children, he attended regularly the lectures of Prof. H. L. Hodge, in the University, and the lectures of Prof. C. D. Meigs, in the Jefferson Medical College. On April 3, 1846, he received his degree of Doctor of Medicine at the University of Pennsylvania. In July, 1846, he located at Locust Grove, Taliaferro county, Georgia, where, January 11, 1849, he was married to Marion Louisa, daughter of Hon. Abner Darden. During the following winter he, with quite a colony of friends, removed to Floyd county, locating at Cave Spring. Here in 1850, he was elected Superintendent and Physician of the Georgia Asylum for the Deaf and Dumb, which position he occupied for several years. He aided much in building up this institution, at the same time devoting himself to the practice of his profession. The failing health of himself and his family admonished him to seek a warmer climate. In 1858 he removed to southwestern Georgia, and located at Albany. Here he soon established himself as a physician, a surgeon, and a gynecologist, and was regarded as the leading practitioner in that section. During the late war he served on the medical staff of the Confederate States Army, first in the field and later in the hospital. Doubtless many Southern soldiers remember him kindly in connection with the Ocmulgee Hospital, at Macon, Georgia. In 1866 he became a member of the Georgia Medical Association, and labored to build up that body again after the war. He was subsequently elected vice-president. One of the results of this organization was the establishment of congressional district sections on practice, surgery, and gynecology. He is a permanent member of the American Medical

Association, and was president of the Section of Physiology of the Ninth International Medical Congress. In 1870 he removed to Atlanta, Georgia, for the purpose of widening his field in the special practice of gynecological and neurological medicine. In this he has been eminently successful, and by results of work has established a reputation which extends his labors and domain of usefulness through Georgia, South Carolina, Florida, Alabama, and Tennessee. In 1871 he was elected to the chair of Physiology and Pathological Anatomy in the Atlanta Medical College, which position he still occupies, and is now (1893) president of the faculty of that institution. As a practitioner, as a writer, as a speaker, and as a teacher, he has always been a strong advocate for "Principles in Medicine" and "Conservatism in Practice," and among his contributions to the medical press no production has attracted more attention than his "Plea for Principles and Conservatism in the Treatment of Diseases Peculiar to Females." He has always avoided political preferment, desiring rather to bend his energies to the interest and advancement of his profession.

LOWMAN, John H., of Cleveland, Ohio, was born in that city in 1849; graduated at the Wesleyan University in 1871, receiving from the same institution the degree of A. M. in 1874; was House Surgeon in the Charity Hospital at Cleveland from 1872 to 1874, and graduated M. D. in 1873 from the Medical Department of Wooster University at Cleveland, receiving in 1877 the *ad eundem* degree from the College of Physicians and Surgeons of New York City. He began the general practice of medicine and surgery in his native city in 1875, and has remained there. He has made a specialty of diseases of the throat and air passages. He is a member of the Cuyahoga County Medical Society and of the Ohio State Medical Society. In 1874-75 he was House Surgeon of Charity Hospital, Blackwell's Island, New York City; in 1875 Lecturer on Materia Medica in the Medical Department of Wooster University, and in 1876 chosen Professor of Materia Medica and Therapeutics in that institution. In the same year he was appointed one of the Visiting Board of Physicians and Surgeons of Charity Hospital, Cleveland.

LYMAN, Henry M., of Chicago, Illinois, was born at Hilo, Hawaiian Islands, November 26, 1835. His parents were from New England, United States of America. He received a common school and academic education at the Islands. He entered Williams College, Williamstown, Massachusetts, in 1854, and was graduated, with the valedictory oration, in 1858. He studied medicine in the Harvard Medical School during the winter of 1858-9, and then entered the College of Physicians and Surgeons in New York, where he was graduated, valedictorian of his class, in March, 1861. Dr. Lyman served as House-Surgeon in Bellevue Hospital, New York, from October, 1860, until April, 1862, when he was appointed Acting Assistant Surgeon United States Army, and was assigned to duty in the United States Hospital in Nashville, Tennessee. There he remained in active service until compelled by a severe attack of malarial fever to return North in the spring of 1863. Shortly after this he was married to Miss Sarah K. Clark, in Roxbury, Massachusetts, and in October,

1863, began the practice of medicine in Chicago, Illinois, where he has resided ever since. In 1865 he became a member of the Medical Staff of the Cook County Hospital, and held the position of Visiting Physician to that institution until 1876. In 1871 he was appointed Professor of Chemistry in Rush Medical College, holding that position until 1876, when he was made Professor of Nervous Diseases. A year later he became Professor of Physiology and of Nervous Diseases in the same institution, and in 1890 he was transferred to the chair of Theory and Practice of Medicine, which he still occupies. In 1880 he wrote a work on "Artificial Anesthesia and Anesthetics," published by Wm. Wood & Co., of New York. Three years later he issued a smaller volume, on "Insomnia and the Disorders of Sleep," published by W. T. Keener, of Chicago, and in 1892 appeared his "Treatise on the Theory and Practice of Medicine," published by Lea Brothers & Co., of Philadelphia. Dr. Lyman has been the senior Visiting Physician to the Presbyterian Hospital in Chicago since 1883. He has been the president of the Chicago Pathological Society. He was the annual president of the Association of American Physicians for the year 1891-2, and of the American Neurological Association during the year 1892-3. He is also a member of the Illinois State Medical Society. From 1881 till 1889 he was Professor of Theory and Practice of Medicine in the Woman's Medical College of Chicago.

McCORMICK, Samuel Carson, of Duluth, Minnesota, was born at Selin's Grove, Pennsylvania, September 8, 1837. He is of Scotch-Irish descent, and was educated at Tuscarora Academy, Lewisburg University, and Jefferson Medical College, having graduated M. D. from the last-named institution in March, 1862, and immediately thereafter he was appointed Surgeon in the United States Volunteer Army. On being mustered out of the service at the end of the war, he established himself in Athens county, Ohio; practiced there for a year, then, until 1868, in Mauch Chunk, Pennsylvania; in the latter year and 1869 he was Surgeon to the Union Pacific Railroad Company during the construction of its line, and since 1870 has been established in Duluth, where he has been engaged in an extensive and successful practice of general medicine and surgery. He is a member and ex-vice-president of the Minnesota State Medical Society. For several years he was Health Officer of Duluth and Physician of St. Louis county, Minnesota.

McCULLOCH, Albertis P., of Brooklyn, Iowa, of Scotch ancestry, was born in Benton, Holmes county, Ohio, April 1, 1844. His literary education was received at the University of Michigan, and his medical at Rush Medical College, Chicago, whence he graduated M. D. in March, 1868. He practiced his profession in De Soto, Dallas county, Iowa, till July, 1872, when he removed to the place of his present residence, where for over twenty years he has been engaged in an extensive and successful practice of general medicine and surgery. In November, 1874, he made a European trip, visiting the leading hospitals of Great Britain, and spending three months at the medical department of the University of Edinburgh. He is a member of the Iowa State Medical Association, and is ex-President

of the Poweshiek County Medical Association. Among his notable cases successfully treated may be mentioned that of varicocele by ligating the vein with Lister's prepared catgut; a suicidal cut throat, with trachea half severed, sutures applied and external wound sewed up; castration for encephaloid disease of testicle, the malignant growth weighing two pounds two ounces; and excision of inferior maxillary. In January, 1877, he married Susie M. Lyon, of Des Moines, Iowa.

McLAUTHLIN, Herbert W., of Denver, Colorado, was educated at Harvard University Medical School, from which institution he received the degree of M. D. in 1882. He is now Professor of Materia Medica, Therapeutics and Clinical Medicine in the University of Colorado Medical School, Denver, and secretary of the Faculty of that institution. He is a member of the Colorado State Medical Society, and during the years of 1892-93 was president of the Denver Medical Association, and of the Arapahoe County Medical Society.

McLEAN, Angus, of Detroit, Michigan, was graduated M. D. at the Detroit College of Medicine in 1886. He is now Demonstrator of Anatomy in the same institution, Pathologist to Harper Hospital, and Surgeon to Out-Door Department of Children's Free Hospital, and Medical Examiner and Adviser for several of the leading life insurance companies of this country. Dr. McLean is an active member of the Detroit Medical and Library Association, and American Medical Association.

McNARY, Hugh F., of Princeton, Kentucky, was born there January 15, 1837. He graduated at Cumberland College, in his native town, and at Harvard Medical College in 1863. He served as nurse in Military Hospitals in Louisville from about December, 1861, to September, 1862. On June 9, 1863, he was appointed Acting Assistant Surgeon United States Army, and continued in the service until August 31, 1865. He did service in several military hospitals in Louisville. He was also on duty at Camp Nelson Field Hospital, and at the large General Hospital at Jeffersonville, Indiana, and remained there until its close in August, 1865. Meantime from the Jefferson General Hospital he was ordered, with the surgeon in charge, Middleton Goldsmith, to go up the Red river to the relief of the Banks' expedition. He was appointed in May, 1867, Assistant Physician to the Western Lunatic Asylum of Kentucky, held the position two years, then returned to his native place, and has been actively engaged in the practice of general medicine since July, 1869, to the present date.

McNAUGHT, Francis H., of Denver, Colorado, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1878. His medical education was supplemented by attending the New York Polyclinic, in 1890. He is now Professor of Clinical Medicine in the Gross Medical College, Denver. He is ex-president of the Delaware County Medical Society, New York, and is an active member of the Colorado State Medical Society, Denver Medical Association, and the Arapahoe County Medical Society, Colorado.

McSHANE, Augustus, of New Orleans, Louisiana, was educated in medicine at the University of Louisiana, and received the degree of M. D. from that institution in 1882. He is

now Assistant Demonstrator of Anatomy in Tulane University, and Assistant Physician to the Eye, Ear, Nose and Throat Hospital, New Orleans. He is a member of the Orleans Parish Medical Society, Louisiana State Medical Association, and International Medical Congress. Dr. McShane is also proprietor and editor of the *New Orleans Medical and Surgical Journal*, one of the most widely-known publications in the South.

MACPHATTER, Neil, of Denver, Colorado, was graduated M. D. at the Trinity Medical College, Toronto, Ontario, and supplemented his medical education by attending the Royal College of Surgeons, Edinburgh, and Faculty of Physicians and Surgeons, Glasgow, Scotland, in 1881. He also became a Licentiate of Midwifery, Edinburgh and Glasgow in the same year. He is now Professor of Gynecology and Abdominal Surgery in the Medical Department of the University of Colorado, Denver. In 1882 he became a member of the College of Physicians and Surgeons, Ontario, member of the Ontario Medical Association, and is now a Fellow of the British Gynecological Society and member of the Colorado State Medical Society, Denver Medical Association and of numerous other medical organizations.

MAGRUDER, George L., of Washington City, D. C., was born in that city November 1, 1848. He is a descendant of Alexander Magruder, who immigrated from Scotland in 1655, and on the maternal side from Henry Morgan, who settled in Maryland prior to 1648, and who was one of Lord Baltimore's commanding officers. He graduated A. B. from Gonzaga College, District of Columbia, in 1868, and M. D. from the Medical Department of the University of Georgetown, in March, 1870, and A. M. from the same university in 1872. He then settled in Washington in general practice. He is a member of the Medical Association and Medical Society of the District of Columbia, also of the Medical Society of the Alumni of Georgetown University. He has been Treasurer of the Medical Association and corresponding secretary of the Medical Society. He was Professor of Chemistry at Gonzaga College, from 1871 to 1873; Professor to Professor of Anatomy, Georgetown University, 1870 to 1873; Lecturer in the summer school in the same institution on Minor Surgery and Bandaging, in 1870-71, and of Chemistry in 1872-73; was one of the Physicians of the Poor of the city from 1871 to 1874; one of the originators of the Central Dispensary of Washington, organized in 1871, and has been in charge of diseases of children and president of its attending staff; also Physician to Gonzaga College and Home for the Aged. Dr. Magruder is now Dean and treasurer of the Medical Department of Georgetown University and *Emeritus* Professor of Materia Medica and Therapeutics in that institution; member of the Consulting Staff of Providence and the Emergency Hospitals and Consulting Physician to Georgetown University.

MAIRE, Lewis E., of Detroit, Michigan, was graduated at the Detroit Medical College in 1881, and supplemented his medical education and training by attendance at the New York Post-Graduate Medical School and Hospital in 1888. He is now Professor of Ophthalmology and Otology in the Michigan College of Medicine and Surgery, Ophthalmic Surgeon to Emergency Hospital, and Surgeon for the Wa-

bash Railway Company. He is a member of the American Medical Association, Michigan State Medical Society, Detroit Academy of Medicine, and other leading medical organizations of that city.

MANN, Matthew Derbyshire, of Buffalo, New York, was born in Utica, New York, July 12, 1845. He is of old New England stock, except on the side of his maternal grandmother, who was English. His father, Charles A. Mann, was a prominent lawyer in Utica. He was educated in the common schools of his native city until 1861, when he went abroad, spending nearly two years in travel in Europe. Returning in 1863, he entered Yale College, graduating with honors in 1867, and receiving his degree of A. M. in 1870. After a few months spent in travel in the West he began the study of medicine in the office of his uncle, Dr. M. M. Bagg, of Utica, New York, attending his first course of lectures in the spring of 1868 in the Long Island Medical College. The following winter he entered the College of Physicians and Surgeons in New York, where he graduated in 1871. His thesis on graduation received honorable mention. In the fall of 1870 he entered the new Stranger Hospital as *Interne* on the first staff. He served there with credit for one year. In that hospital he came under the influence of Dr. T. G. Thomas, a fact which doubtless had much to do with shaping his future career. Having finished his service in the hospital in 1871 he went to Europe. While there he studied in Paris and London for a while, spent several months with Simon and Arnold in Heidelberg, and seven months in Vienna studying obstetrics under Carl Braun and pathology under Kundeat. He also spent some time in travel, visiting Germany, Switzerland and Italy, as well as Constantinople and the East. Returning to New York in 1873 he began practice in that metropolis. He was soon appointed to several dispensary positions, and also as instructor in the College of Physicians and Surgeons. After a residence of six years in New York he removed with his family to Hartford, Connecticut, in 1879. During these six years in New York he devoted himself largely to the study of pathology and gynecology. On beginning practice in Hartford he gave up all general work and devoted himself solely to the diseases of women. In 1880 he was appointed Clinical Lecturer on Gynecology in the Medical Department of Yale College, which position he held for two years. In 1882, on the death of Dr. James P. White, he was called to the chair of Obstetrics and Gynecology in the Medical Department of the University of Buffalo. He was also appointed Gynecologist to the Buffalo General Hospital, and later Obstetrician to the same. In Buffalo he has limited himself in his practice to gynecology, abdominal surgery and consultations in obstetrics. In abdominal surgery he has performed over five hundred operations, his mortality after the first hundred, which were done in the pre-antiseptic days, being about five per cent. While in New York he was an active member of the New York Obstetrical Society, and its Secretary and Pathologist. He has also been an active member of the American Gynecological Society, contributing several papers to its Transactions. His principal literary work was the editing of the "American System of Gynecology." He has been a frequent contributor

to medical periodicals. His paper (1874) on his "Immediate Treatment of Rupture of the Perineum" was about the first publication on this subject in this country. He married, in 1869, Elizabeth Pope, of St. Paul, Minnesota. They have seven children.

MARBOURG, Edgar M., of Pueblo, Colorado, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1885, since which he has devoted special attention to diseases of the eye and ear, and was formerly Clinical Assistant to the Ophthalmic and Aural Department of Germantown Hospital. He is now Oculist and Aurist for the Denver and Rio Grande Railway Company, Colorado State Insane Asylum, Colorado State Blind Asylum and Woman's Hospital, Pueblo. Dr. Marbourg is an active member of the American Medical Association, National Association of Railway Surgeons, Colorado State Medical Society, and is also a member and secretary of the Pueblo County Medical Society.

MARVIN, Joseph Benson, of Louisville, Kentucky, was born in Monticello, Florida, August 3, 1852. In 1870 he was graduated from the Virginia Military Institute, and was for three years subsequent to graduation Assistant Professor of Chemistry in that institution; he then entered the Medical Department of the Central University of Louisville, Kentucky, and was graduated thence M. D. in March, 1875. In the same year he established himself in practice in Louisville, making specialties of the diseases of the nervous system and of medical microscopy. He is a member of the Kentucky State Medical Society, of the Louisville Academy of Medicine, and the Louisville Microscopical Society, and has been secretary and president of the last two organizations, respectively. In 1874 he was chosen Professor of Medical Chemistry and Toxicology, and Clinical Lecturer on Nervous Diseases in the Louisville Hospital College of Medicine.

MASSEY, G. Betton, of Philadelphia, Pa., was educated in medicine at the University of Pennsylvania, and received the degree of M. D. from that institution in 1876. He is now Physician-in-Charge of the Sanitarium for the Treatment of Diseases of Women and Diseases of the Nervous System, Gynecologist to Howard Hospital, and member of the Philadelphia Obstetrical Society, as well as other medical organizations of that city. He is also a member of the American Neurological Association, and ex-president of the American Electro-Therapeutic Association. He has devised important instruments for the application of electricity in his special field of practice, and is the author of a recent work entitled "Electricity in Diseases of Women."

MAXWELL, James Darwin, of Bloomington, Indiana, was born at Hanover, Indiana, May 19, 1815, and died September 30, 1892. His father, Dr. David H. Maxwell, moved to Bloomington, in 1819. He came to that city because it was high ground, between the two forks of White river, and considered very healthful, and because a township had been donated at that point by Congress for a State University, while the State was yet a territory. Here the son was reared. At the age of nineteen, in 1833, he graduated at the State Seminary, and the following year became a tutor in the school. In 1836 he went to

Mississippi State College as a teacher, where he remained one year as Professor of Latin. The school closed its doors for the want of funds, and with a watch in his pocket as his only pay for his year's work, he returned to Bloomington, and began the study of medicine with his father. In the winter of 1840-41 he attended the Transylvania Medical College, at Lexington, Kentucky, where Dr. Dudley was one of the illustrious Faculty. The following year he practiced medicine with his father, and then attended the Jefferson Medical College, graduating with the Class of 1844. He then returned to Bloomington and continued the practice to within a year of his death. Dr. Maxwell was the oldest living graduate of Indiana University, except one, Judge Andrew Wylie, of Washington City, D. C. Dr. David H. Maxwell, the father, was officially connected with the Indiana University as the first president of its board of trustees, up to the time of his death, a period of more than thirty years, and died in office. The son, Dr. James D. Maxwell, was officially connected with the board seventeen years as secretary, and thirty-two years as a member of the board, making their combined service more than seventy-nine years. No one, except it be his father, ever gave so fully and unselfishly of his time, his energy and his talent to the service of his State in promoting the interest of the university. He bore its affairs upon his heart; its reverses were to him a personal sorrow; its prosperity was his delight. Dr. Maxwell was a very busy practitioner for fifty years. He endured a great many hardships, pursuing his professional work in the early times, when the country was sparsely settled. He had an iron constitution, and had remarked that his vital trinity—lungs, heart and stomach—were unusually strong. The cause of his death was epithelioma of the face. A severe septic chill occurred a few days before his death; collapse and a semi-comatose condition followed the chill. Although often urged to enter political life, he steadily refused, so firmly was he wedded to his profession. No man in Monroe county was more favorably or generally known. For many years he was one of the most prominent and useful physicians of Southern Indiana, excelling especially in diagnosis. He was highly regarded both as a friend and physician, and his acknowledged skill and cool judgment made him a desirable man at the bedside of the sick or despondent. In 1843 he married Louisa J. Howe, who, with nine children, survives him; one only of the entire family having died, his third son, Dr. James D. Maxwell, Jr., who died January 6, 1891, at the age of forty, after having acquired a lucrative practice, and the highest esteem of the community of Bloomington and the surrounding country.

MAXWELL, Philip, of Chicago, Illinois, was born in Guilford, Vermont, April 3, 1799, and died at Lake Geneva, Wisconsin, November 5, 1859. He acquired a good general education, subsequently became a graduate in medicine and commenced practice in Sackett's Harbor, New York. He was soon after elected a member of the legislature in that State, and after serving in that capacity he received the appointment of Assistant Surgeon United States Army. He was ordered to Chicago, where he arrived February 3, 1833, and entered directly upon his duties as the medical officer at Fort Dearborn; in which position he re-

mained until the fort was finally abandoned as a military post in December, 1836. In July, 1838, he was promoted to the rank of Surgeon, and subsequently served in the division of the army commanded by General Zachary Taylor in the campaign against the Indians in Florida. He resigned his position in the medical corps of the army soon afterwards, and again took up his residence in Chicago in 1844, where he entered upon the general practice of his profession. He speedily acquired a good practice, took a high social position and became fully identified with all the more important interests of the young and growing city. Of commanding personal appearance, tall, with broad shoulders, portly, always urbane and genial in manner, carrying a head and face expressive of a high order of intelligence, frankness and kindness, he occupied a conspicuous place and exercised an important influence in the social and business circles of his city. In 1848 he formed a partnership in practice with Dr. Brock McVickar, then a young man, and about that time he was elected and served one term in the Representative branch of the Illinois Legislature. A few years later he moved with his family to a beautiful country residence on the borders of Geneva Lake, in Wisconsin, where he departed from this world at the age of sixty years.

MEACHEM, John G., of Racine, Wisconsin, was born at Axbridge, Somerset, England, May 27, 1823. He was educated under the tutorship of his father, the Rev. Thomas Meachem, at the Academies of Canandaigua, New York, and Richmond, and at the Castleton, Vermont, Medical College; he graduated M. D. from the last-named institution in 1843. In 1862 he also received the degree of M. D. from the Bellevue Hospital Medical College. From 1843 to 1862 he practiced in New York, at Weathersfield, Bethany, and Warsaw, and since 1862 has been in practice at Racine. He married, June 25, 1844, Myraette, daughter of the late Reuben Doolittle, of Weathersfield, New York, and sister of Senator J. R. Doolittle, of Wisconsin. Among his notable cases have been lithotomy, ovariectomy, ligation of the common carotid for large occipital aneurism, and other capital operations. While a resident in New York he was a member of the Wyoming County Medical Society, serving for four years as its president, and for eight years as its secretary. In 1862 he was appointed Enrolling Surgeon for Wyoming District, New York; served in 1863 as Surgeon to Camp Utley. He is one of the founders and for twenty years one of the Surgeons to St. Luke's Hospital, Racine; Physician to St. Catherine's Convent and Taylor Orphan Asylum. He is a member of the Racine Medical Society, of which he has served two years as president and five years as secretary. He is also a member and ex-president of the Wisconsin State Medical Society and member of the American Medical Association. He is Medical Examiner for several of the leading life and accident insurance companies of the United States. In April, 1876, he was elected Mayor of Racine. He has been an active member of the Episcopal Church, having served as a member of the standing committee of the Diocese of Wisconsin, and of the Missionary Board; was warden of Trinity Church, Warsaw, New York, for eight years, and senior warden of St. Luke's Church, Racine, which office he has held for many years.

Among his published papers are articles treating of "Ligation of the Carotid," "Medical Education," "Strumo-Syphilis" and "Insanity Produced by Bronchial Disease."

MERRICK, Samuel K., of Baltimore, Maryland, was educated in medicine at the University of Maryland, and received the degree of M. D. from that institution in 1872. He is now Professor of Diseases of the Nose, Throat and Chest in the Baltimore Medical College, and Chief of the Throat and Chest Clinic in the Northwestern Dispensary. Dr. Merrick is an active member of the Medico-Chirurgical Faculty of Maryland, Medical and Surgical Society of Baltimore, and of all other leading medical organizations of that city.

MILES, Albert B., of New Orleans, Louisiana, was educated in medicine at the University of Louisiana, New Orleans, and received the degree of M. D. from that institution in 1875. He is an active member of the Orleans Parish Medical Society, Louisiana State Medical Association, and Southern Surgical and Gynecological Association. He is also Professor of Materia Medica and Therapeutics in the University of Louisiana, and House Surgeon of Charity Hospital.

MILLER, Albert E., of Boston, Massachusetts, was educated in medicine at the University of Pennsylvania, and received the degree of M. D. from that institution in 1864. He is now Popular Lecturer on Physiology, Hygiene and Public Health, late member of the Legislature of Massachusetts, and chairman of the Committee on Public Health. He is Medical Examiner for the Pennsylvania Mutual Life Insurance Company. Dr. Miller is also a member of the Gynecological Society of Boston, and the International Medical Congress.

MILLER, De Laskie, of Chicago, Illinois, was born in Niagara county, New York, May 29, 1818. His early life was passed on his father's farm, his elementary education being obtained at the village school during winter time. At eighteen years of age he began to teach school, and having chosen the profession of medicine he at the same time entered upon its study under the guidance of Dr. Thomas G. Catlin, of the city of Brooklyn. He graduated at Geneva Medical College in 1842, and commenced practice in Lockport. Remaining there, however, for a short time only, he removed to Flint, Michigan. Here he practiced for several years, and identified himself thoroughly with all questions of public improvement and educational development. From Flint he removed, in 1852, to Chicago. In 1859 he was called to fill the chair of Obstetrics and diseases of Women and Children in the Rush Medical College, a position he continued to fill for many years and is now *Emeritus* Professor of Obstetrics and Diseases of Women and Children in that institution. In 1863 he undertook a journey to Europe for the express purpose of procuring material for illustrating his lectures, and soon after became the most eminent teacher of his specialty in the Northwest. He has long been connected with St. Luke's Hospital as Obstetrician, and as Consulting Physician of the Woman's Hospital of the State of Illinois. He is a member of the Illinois State Medical Society and other leading medical organizations.

MILLER, Truman W., of Chicago, Illinois, was graduated M. D. at the Geneva Medical College, Geneva, New York, in 1868. He is

now Professor of Surgery in the Chicago Polyclinic, Surgeon-in-Charge of Augusta Hospital and Maurice Porter Hospital, Chicago; Medical Referee and Expert Examiner for the Mutual Life Insurance Company, New York, and Surgeon for several important railway companies in the Northwest. Dr. Miller is a member of the International Medical Congress, American Medical Association, Illinois State Medical Society, Chicago Medical, and of numerous other medical organizations in the city of his residence.

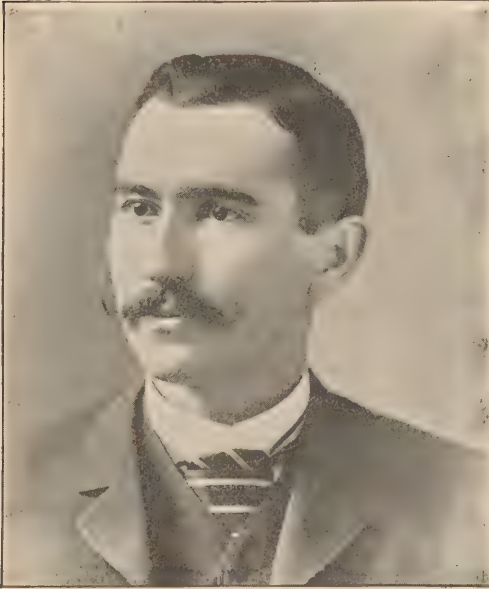

MINOT, Francis, of Boston, Massachusetts, was born in that city, April 12, 1821. He was educated at Harvard University, receiving therefrom the degree of A. M., and from the medical department of that institution the degree of M. D. in 1845. He was Visiting Physician to Massachusetts General Hospital from 1858 until 1887, and Hersey Professor of Theory and Practice of Physic in Harvard University from 1874 until 1891. Dr. Minot is now Consulting Physician to Massachusetts General Hospital, and to the Boston Lying-in Hospital, and is one of the oldest and most highly esteemed members of the medical profession in his native city.

MITCHELL, John Patton, of Clarksville, Arkansas, was born July 24, 1834, in Culpeper county, Virginia. He was educated at the University of Virginia, and graduated from the Jefferson Medical College in March, 1858, settling in Wytte county, Virginia, whence he removed, in December, 1859, to Clarksville, his present place of residence. During the Civil War he served for one year as a captain in the Confederate army, and afterward as a surgeon to the close of the war, surrendering with the Confederate forces in North Carolina in 1865. Among his notable cases may be mentioned one of a Confederate soldier across the middle of whose forehead a piece of shell had ploughed its way, breaking up nearly the whole of the frontal bone into small fragments, detaching the orbital plates, and occasioning a loss of not less than forty grains of the brain; the patient, on the removal of the fragments and the cleansing and dressing of the wound, recovering consciousness, and rapidly recovering strength and health, without loss of sight or serious impairment of mind. Dr. Mitchell is one of the oldest and one of the most successful physicians and surgeons in the State of Arkansas. He is a member of the Arkansas Medical Society, of which he was elected vice-president in May, 1876. He has been a frequent contributor to medical journals. For a number of years he has taken much interest in educational affairs, and has been a school director in the city of Clarksville.

MIXTER, Samuel J., of Boston, Massachusetts, was graduated M. D. at Harvard Medical School in 1879. He is now Demonstrator of Anatomy in the same institution, Surgeon to Carney Hospital Out-Patients, to Massachusetts General Hospital, and Consulting Surgeon to Massachusetts Charitable Eye and Ear Infirmary. He is an active member of the Massachusetts Medical Society, Boston Academy of Medical Sciences and of other leading medical and scientific organizations of that city.

MOFFETT, Edward Davis, of Indianapolis, Indiana, was born March 7, 1862, near Rushville, in the same State. He is a son of Theophilus Moffett and Gabriella (Maxwell) Moffett, and is of Scotch-Irish descent. His early

education was received in common schools and Rushville Academy. He labored on a farm, when out of school, until twenty years of age. He then began the study of medicine, under the preceptorship of his uncle, Dr. John Moffett, one of the distinguished pioneer physicians of Rush county, Indiana. In 1883 he entered the Central College of Physicians and Surgeons, Indianapolis, from which institution he was graduated M. D. with the highest honors of his class in 1886. Upon receiving his medical degree he passed the most successful competitive examination for positions in the City Dispensary and City Hospital, and having first choice, served one year as *Interne* in the latter institution. In 1887 he established himself in the city of his present residence,

Edward D. Moffett.

where he has since been engaged in a successful general practice of his profession. From 1887 to 1889 he was Lecturer on Anatomy in the Central College of Physicians and Surgeons, and then became assistant to the chair of Obstetrics in that institution, a position he now holds. In 1891-92 he was Lecturer on *Materia Medica* and Therapeutics in the Indiana Dental College, which was the first course of instruction on that branch of medical science delivered in that institution. In 1893, Dr. Moffett was elected Superintendent of the City Dispensary, a position he now holds. He is a member and ex-secretary of the Marion County Medical Society, and is also a member of the Indiana State Medical Society and American Medical Association. His contributions to professional literature consist of papers and reports which have been read before the medical organizations with which he is connected.

MONCRIEFF, D. Scott, of Portland, Oregon, was born in Edinburgh, Scotland, February 9, 1865, and was drowned in the Gulf of Tarrity in the summer of 1893. He was the younger son of D. Scott Moncrieff, Esq., of Edinburgh. He was educated at the principal

schools and colleges in Great Britain, having also passed a two years' course at Leipsic, Germany. He also took his M. D. degree at Harvard in 1889. He was an apt student, and came out of his studies with flying colors. Dr. Moncrieff was a good athlete, and obtained many prizes while pursuing his studies. He held the Royal Humane Society's medal for saving a man's life who had fallen overboard while the steamer was about to sail. His professional career started in with his appointment as Surgeon to the Anchor Line Steamer "Armenia," plying between England and Calcutta. He next acted as Surgeon on the "Ethiopia," of the same line, which sailed between Glasgow and New York. From there he was appointed as Surgeon in the Northwest Mounted Police in Canada. Leaving that place Dr. Moncrieff went to Portland, Oregon, and soon after he was appointed as Acting Assistant Surgeon to the Fourth Cavalry Regiment, stationed at Walla Walla. While here he did a great deal of important work among the Indians at the different reservations. Last, he was requested by Professor Putnam, Chief of the Department of Ethnology at the World's Fair, to go to Siberia to gather statistics and study the habits of the natives of Kamschatka. He received a special passport from the Secretary of State, besides several influential letters from important officers of the Russian Government in this country. Dr. Moncrieff left on the steamer "Kotic," in May of 1893, and reached Vladivostock, where he met with a royal reception from the people, besides receiving every assistance in his work. Everything pointed to a successful termination of his mission when his young life was suddenly cut short. The news was received in this country with much regret, as Dr. Moncrieff was a favorite with every one that came in contact with him. He was an exceedingly bright, scientific young man, and very able in his profession, being Assistant Professor of Theory and Practice of Medicine in the Medical Department of the University of Oregon.

MOORE, James Edward, of Minneapolis Minnesota, was born at Clarksville, Mercer county, Pennsylvania, March 2, 1852. His father, Rev. George W. Moore, a Methodist minister, was of Scotch-Irish and his mother was of German descent. Dr. Moore attended the public schools of Pennsylvania until he was fifteen, when he went to Poland Union Seminary, at Poland, Ohio, where he remained three years. He then attended the University of Michigan for one year, after which he entered Bellevue Hospital Medical College, where he graduated in 1873. Immediately afterward he located at Fort Wayne, Indiana, where he remained for two years and a half. He then returned to New York City, where he continued to study and walk the hospitals for seven months. He then located in Emlenton, Pennsylvania. After six busy and profitable years' practice in this location, he felt the need of a larger field of work, and in August, 1882, removed to Minneapolis, where he has enjoyed a busy practice from the very first. Since his graduation, the doctor has spent over four years in the colleges and hospitals of New York and Philadelphia. In 1885 he went abroad, spending the greater part of a year in Berlin and London Hospitals. The whole aim of his career has been to become a competent surgeon, and since the fall of 1887 he has

confined his practice exclusively to that branch. During the past few years he has been a constant contributor to various medical journals. In 1885 he was appointed Professor of Orthopedic Surgery in the Minnesota Hospital College, and was later appointed to the same chair in the St. Paul Medical College. In 1889 he was elected to the same chair in the Medical Department of the University of Minnesota, which position he still holds. He is Orthopedic Surgeon to St. Mary's and Asbury Methodist Hospitals, Surgeon-in-Charge of St. Barnabas Hospital, and Surgeon to the Northwestern Hospital for Women and Children, all of Minneapolis. He is an active member of all the leading local, State, and national medical societies.

MOORE, Richard Channing, of Omaha, Nebraska, was born at Quincy, Illinois, November 25, 1841. His professional education was received in the Chicago Medical College, whence he was graduated in March, 1865. In the ensuing September he established himself in Omaha, where he has since remained engaged in an active and successful practice of general medicine and surgery, but in recent years has given particular attention to pediatrics. In 1864 he was appointed an Acting Assistant Surgeon of United States Volunteers, and was attached to the hospital steamer D. A. January, plying on the Mississippi and Ohio rivers. He married, November 17, 1868, Eliza B., daughter of Christopher Bushnell, Esq., of Westbrook, Connecticut. Of his more important cases may be mentioned treatment of pulmonary abscess by aspiration, recovery, and case of John Thomson, scalped by Indians on the line of the Northern Pacific Railroad, in 1868, recovery, with complete exfoliation of external table of skull. He is a member of the Nebraska State Medical Society and of the Omaha Pathological and Sanitary Society; treasurer of the latter in 1877, and vice-president of the Omaha Medical Society in 1874. His professional publications have appeared in the Transactions of the Nebraska State Society, and have included reports upon ophthalmology and otology. He has been City Physician to Omaha, a member of the Omaha Board of Health, and Examining Surgeon to the United States Pension Bureau. Dr. Moore is now Professor of Diseases of Children in Omaha Medical College.

MORGAN, William V., of Indianapolis, Indiana, was born March 24, 1853, in Johnson county, Indiana. His father, Ezekiel W. Morgan, was one of the pioneers and early successful educators of that State. Later in life he was a merchant and stock dealer, and was honored by his fellow-citizens in repeated election as County Commissioner, and other important official positions. The early education of the subject of this sketch was acquired at the common schools of his native county, and by three years attendance at Nineveh High School, and in 1869, at the age of sixteen, he entered the State University at Bloomington. From there he transferred his studies to the Northwestern (now Butler) University, Indianapolis, where he remained a student from 1870 until 1872. In 1873 he entered St. Louis Medical College, where he pursued a general course of study in medicine and surgery. His studies were directed in chief by the illustrious Professor Hodgen, at that day recognized as one of the

greatest surgeons in the Mississippi Valley. Dr. Morgan enjoyed exceptional advantages in having the friendship and training of this eminent surgeon and teacher, and from him he imbibed the spirit of surgical invention as well as the determination to make himself thoroughly proficient in the knowledge and skill requisite in that field of professional practice. He was graduated M. D. with the highest honors of his class in 1875. In the year following he established himself at Julietta, a town surrounded by a wealthy farming community a few miles east of the city of his present residence. He here pursued a successful general practice of medicine and surgery, which soon extended to surrounding towns and into adjoining counties. He moved to Indianapolis in 1886, in response to a call to take the chair of Anatomy in the Central College of Physicians and Surgeons, and two years later was promoted to the chair of Surgical Anatomy and Fractures and Dislocations, a position which he still retains. The title of Dr. Morgan's professorship is the same as that of the chair filled by his distinguished preceptor, Hodgen, at St. Louis, in his lifetime. He is Consulting Surgeon to the Indianapolis City Hospital and to the City Dispensary. He has a growing reputation in mechanical surgery, and is the originator and inventor of a number of surgical instruments of recognized merit, among which may be mentioned his "Trajector," for determining the depth and location of the bullet in gunshot wounds of the skull; a modification of Hodgen's "Extension Apparatus" for fractures of the femur, and his "Goniometer," an instrument of great value in determining the angle of deformity and the shape of the wedge to be removed in straightening bones, all of which are made by Wm. H. Armstrong & Co., of his city. Dr. Morgan has also developed some important ideas in the treatment of spinal deformities, and also in the application of electricity in surgery, and has originated a number of appliances in this connection. He is a member of the Judicial Council of the Marion County Medical Society; has belonged to that organization for the past fifteen years. He is also a member of the Indianapolis Surgical Society, of the Indiana State Medical Society and of the American Medical Association. Dr. Morgan is a man of pleasing address and in the prime of life and health. He is not only a close student, but a steady worker in carrying the results of his studies into the field of practice. He was married, November 9, 1875, to Miss Amelia Menges, a daughter of J. J. Menges, a prominent railway official and banker of St. Louis, Missouri.

MOUSER, Silas Mercer, of San Francisco, California, was born in Shenandoah county, Virginia, May 7, 1823, and is of German extraction, his grandparents having emigrated from Germany to this country at an early date. He was educated primarily at the public schools of Virginia and Ohio; in 1847 he graduated at Willoughby Medical College, and in 1848 at Starling Medical College, Columbus, Ohio. His first place of settlement was at Mt. Gilead, in the same State, where he entered upon the practice of his profession; in 1850 he settled in Sacramento, California, remaining there until 1862, the date of his removal to San Francisco, where he has since resided. Although a general practitioner, he has de-

voted much time to obstetrics and diseases of women and children. He was a member of the first county medical society organized in Sacramento, California, 1856; a member of the first California State medical society, organized March 12, 1856; united himself with the San Francisco County Medical Society in 1873, and joined the San Francisco Microscopical Society in the same year. For many years he was Physician to the Ladies' Protection and Relief Society of San Francisco, a charity supported by voluntary contribution, and the guardian of about two hundred children.

MUNN, William P., of Denver, Colorado, was graduated M. D. at the Medical Department of the University of Michigan in 1886. He is now Professor of Genito-Urinary Diseases and Clinical Surgery in the Medical Department of the University of Denver; Physician in charge of City Hospital for Contagious Diseases, and Assistant Health Commissioner for Denver City. Dr. Munn is an active member of the American Medical Association, Colorado State Medical Society, Denver Medical Association, and is secretary of the Denver Medico-Legal Society. He is also a member of all the other important medical organizations of that city.

MURFREE, James Brickell, of Murfreesboro, Tennessee, of Irish-French descent, was born at Murfreesboro, September 16, 1835. He received his preparatory education at Irving College and at Union University, graduating A. M. from the latter, he attended one course of lectures in the Medical Department of the University of Nashville, and two courses at Jefferson Medical College, and in March 1859, received from the last-named institution his degree of M. D. Upon graduating in medicine he established himself in his native town, engaging in a general practice, but giving special attention to surgery, and has performed various capital operations. In May, 1861, he enlisted in the Confederate States Army, was appointed assistant surgeon in the same year, was promoted to be surgeon in July, 1862, and in the latter capacity served during the remainder of the Civil War. He is a member of the Rutherford County Medical Society and secretary, in 1865, of the Tennessee State Medical Society, president in 1874, and of the American Medical Association. Of his professional publications may be mentioned papers upon "Blood-Letting," "Diphtheria," "Cholera," and "Syphilis;" reports of a case of "Lumbar Abscess and of Amputation of the Hip-Joint," and an address before the Tennessee State Medical Society, on "Conservative Medicine."

NEELY, Eugene A., of Memphis, Tennessee, was educated in medicine at the Memphis Hospital Medical College, from which institution he received the degree of M. D. in 1886. He is a member of the Tri-State Medical Society of Tennessee, Georgia and Alabama, member of the Mississippi State Medical Society, Memphis Medical Society and National Association of Railway Surgeons. He was formerly Professor of Clinical Medicine in the Memphis Hospital Medical College.

NEWLAND, Henry, of St. Louis, Missouri, was educated at the Royal University of Berlin, Germany, from which institution he received the degree of M. D. in 1854. He is now Professor of Obstetrics and Resident Physician of the Lying-in Institute, and Dean of the

Faculty of Newland's College of Midwifery. Dr. Newland is an active member of the St. Louis Medical Society and the Mississippi Valley Medical Association.

NIXON, William Goodwyn, of Uniontown, Alabama, was born in Holmes county, Mississippi, December 20, 1834. His father, Dr. J. D. Nixon, formerly from Petersburg, Virginia—a graduate of Transylvania Medical College, Lexington, Kentucky—moved to Montgomery, Alabama, in 1839, and shortly afterwards settled near Lowndesboro, Alabama, where the subject of this sketch received his elementary education. He was sent from there to Howard College, at Marion, in the same State, and remaining there but a short while was sent to Mt. Zion College, Winnsboro, South Carolina, where he received his education under the teachings of the educators who composed the

W. G. Nixon

excellent faculty in the years 1850 to 1852. Returning home, he was placed in the office of Dr. Charles T. Quintard, at Memphis, (now Bishop of Tennessee), and attended his first course of lectures in the Memphis Medical College. Going from there to Philadelphia he entered the University of Pennsylvania, where he received his diploma, before his majority, in March, 1855. Returning to Lowndesboro, he commenced the practice of medicine. Inheriting property, he removed to Mississippi and engaged for a time in planting. During the years from 1861 to 1865 he served in the Confederate Army with the rank of Captain. At the close of the war he settled near Uniontown, where he has continuously resided, engaged in the general practice of medicine. He is a communicant in the Protestant Episcopal Church, and has been married twice. He has ever been and is still fond of books and study, and has written occasionally for the medical journals. Being of a quiet, retiring disposition, he enjoys his home and the charms which surround it, but is an active member of his county medical society, and an accomplished and highly

esteemed physician. Although he has never accumulated wealth by the practice of medicine, yet the vast benefit and relief that he has been enabled to confer on suffering humanity are such as render him well satisfied in his chosen profession.

NOBLE, Charles P., of Philadelphia, Pa., was educated in medicine at the University of Maryland, Baltimore, from which institution he was graduated M. D. in 1884, since which time he has devoted special attention to diseases of women, and is now Surgeon-in-Charge of the Kensington Hospital for Women. Dr. Noble is a member of the American Gynecological Society, and Fellow of the College of Physicians, Philadelphia.

O'DWYER, Joseph, of New York City, was educated in medicine at the College of Physicians and Surgeons, New York, from which institution he received the degree of M. D. in 1866. He is now Professor of Diseases of Children in the New York Post-Graduate Medical School and Hospital, Consulting Physician to Willard Parker Hospital, and Visiting Physician to the New York Foundling Hospital. He is an active member of the New York Academy of Medicine, New York Medical Society, and Congress of American Physicians and Surgeons.

OLIVER, John C., of Cincinnati, Ohio, was graduated M. D. at the Miami Medical College, Cincinnati, in 1885. He is now Microscopist to the Cincinnati Hospital, Clinical Lecturer on Diseases of Children in the Miami Medical College, secretary of the Miami Medical College Alumni Association and member of the American Medical Association, as well as of numerous other medical and scientific organizations.

OPPENHEIMER, Henry S., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, and received the degree of M. D. from that institution in 1876. He is now Examiner of the Blind for the City of New York, Oculist to the German Poliklinik, Montefiore Home and St. Mark's Hospital. Dr. Oppenheimer is President of the New York Ophthalmological Society, member of the New York State Medical Association, American Ophthalmological Society, Congress of American Physicians and Surgeons, the International Medical Congress and other medical and scientific organizations.

ORD, James Lyeurgus, of Fort Bowie, Arizona, was born in Washington, D. C., and graduated in medicine at Jefferson Medical College in 1846. During the same year he was appointed Acting Assistant Surgeon United States Army and served during the Mexican War in California. "On July 14, 1846, he sailed in the ship Lexington from New York for the Pacific Coast with the company F, Third Artillery, with Capt. C. T. Tompkins in command. They were six months in making the voyage, stopping at Rio Janeiro and Valparaiso about a week for water and fresh provisions, reached Monterey, California, January 27, 1847, where they landed and took possession of Monterey and the Block House, retaining the sailors and marines, who were boarded on shore. Lieutenant Baldwin, late Admiral United States Navy, was in command of the Block House, which overlooked and commanded the town. Lieutenant Maddox was in command of the marines and occupied the old barracks

(cuartel) that had been used as quarters by the Mexican troops. He remained at Monterey for one year, doing duty with Dr. Robert Murray, recently retired as surgeon-general. He was then ordered to Santa Barbara, where he remained until October, and was mustered out of service." He again entered the army in 1862, and did duty with the California volunteers who were stationed at Santa Barbara, under command of Lieutenant-Colonel Olney, for about six months. Then again, in 1879, entered the service and did duty as post surgeon at Fort Winfield Scott for over a year, then was ordered to Arizona in March, 1880, and was in the field with the Sixth Cavalry and First Infantry, which had a skirmish with Victorio, the Indian chief of the Apaches, at Sterns' ranch, midway between Forts Thomas and Apache. This was the last raid that Victorio made, as he was driven into Mexico and killed by the Mexicans while trying to escape from the American troops. His first post in Arizona was Fort Grant, then in the field, then for a short time at Camp Rucker, near the stronghold of the Apache Chief Cochise, then for nearly two years at Fort Bowie as Post Surgeon, thence to Fort Mohave, on the Colorado river, 300 miles north of Fort Yuma, which was considered to be the hottest place on this continent. It is the center of the deserts of Arizona, and is even believed to be the hottest place in the world except Aden on the Red Sea, the entrance of the Suez Canal. From the former place the story was told that one of the men died and went to "Sheol" and came back to get his blankets, as he found it too cold there without them. Dr. Ord remained on duty at the last mentioned fort five years, and then one year at Fort Thomas on the Gila river, a branch of the Colorado. In 1891 he was again assigned duty at Fort Bowie, and up to that date had the remarkable record of having served in the same capacity in the medical department of the United States Army for a period extending over forty years. If his long and efficient services for the national government have not secured official recognition, his eventful medical career certainly entitles him to be held in kind remembrance by his profession.

O'REILLY, James, of New York City, was graduated in medicine at the University of Vermont, in 1875. He is now Professor of Gynecology in the New York College of Midwifery, Consulting Surgeon of the Metropolitan Dispensary, Gynecologist to Woman's Infirmary, Medical Director of Maternity Home, Lecturer on Antiseptic Nursing at Woman's Infirmary Training School, and president of the New York Sanitarium Hospital, and member of numerous medical organizations in New York City.

OSLER, William, of Baltimore, Maryland, was educated at McGill University, Montreal, Canada, and received the degree of M. D. from that institution in 1872. He is now Professor of Medicine in Johns Hopkins University and Physician-in-Chief to the Johns Hopkins Hospital, Baltimore. Dr. Osler is a Fellow of the Royal College of Physicians, London, and member of the leading medical organizations of this country. He is the author of a recent text-book, published by D. Appleton & Co., New York, entitled, "The Principles and Practice of Medicine," designed for the use of practitioners and students of medicine, which is

based on the extensive experience of Dr. Osler in hospital and private practice. In regard to this work a prominent critic has said: "In design it is comprehensive; in classification it is elaborate; in a word, the subject is so compactly and yet so clearly treated, and the whole is brought so thoroughly in touch with the times, that it deserves to rank as the best treatise on general practice in the English language." The publication has been well received by the general profession, and has met with an extensive sale.

OUTERBRIDGE, Paul, of New York City, was educated in medicine at the University of Vermont, at Burlington, from which institution he received the degree of M. D. in 1884. He is now attending Surgeon to the New York Cancer Hospital, Assistant Surgeon to Woman's Hospital, Attending Gynecologist to Demilt Dispensary, and an active member of the New York Obstetrical Society.

PAGE, Lafayette F., of Indianapolis, Indiana, was born at Columbia, Kentucky, May 21, 1863. He is a son of Robert and Mary (Irving) Page, natives of Charlottesville, Vir-

Lafayette F. Page.

ginia. His father was a business man of prominence. Dr. Page was educated privately and at the public schools of his native town, and later pursued a classical course at Columbia College, there obtaining the degree of A. B. For two years he was teacher of higher mathematics in Kentucky, and for one year afterward in Texas. In 1885 he removed to Louisville and began the study of medicine at the Louisville University (Medical Department). After taking the first course of lectures he went to Indianapolis and entered the Indiana Medical College, from which he received the degree of M. D. in 1887, and was awarded the "Mears Gold Medal" as a mark of special honor. At the same time he entered a competitive examination for the position of *Interne* at the City Dispensary and secured the appointment for one year. He then began the

general practice of his profession which he pursued with increasing success for two years, and then devoted special attention to diseases of the nose, throat and ear, including catarrhal, bronchial and allied ailments. Later he took two post-graduate courses at New York, with the end in view of perfecting himself in a knowledge of the pathology and treatment of the class of diseases above mentioned, to which he has given almost exclusive attention since 1890. Though still a young man, he has gained a reputation in this line of practice which has made him favorably and widely known for his skill and success. Dr. Page was formerly Visiting Physician to Marion County Asylum, and is now Consulting Physician for Diseases of the Throat, Nose and Ear to the City Dispensary. He is a member of the Marion County Medical Society, Indiana State Medical Society, Mississippi Valley Medical Association and American Medical Association. He has made important contributions to the literature of his chosen field of practice, and a recent article upon "Hay Fever," read before the Mississippi Medical Association in October, 1893, has been widely published and is worthy of special mention.

PAGE, Richard C. M., of New York City, was educated in medicine at the University of Virginia, from which institution he received the degree of M. D. in 1867. His professional studies were supplemented by attendance at the University of the City of New York, and from that institution he received an *ad eundem* degree in 1868. He is now Professor of General Medicine and Diseases of the Chest in the New York Polyclinic. He is vice-president of the New York Academy of Medicine, and an active member of other medical and scientific organizations. He is the author of a "Chart on Diseases of the Chest," a work on "Physical Diagnosis," and "Practice of Medicine." He has also made other important contributions to medical literature.

PALMER, William Gray, of Washington City, D. C., was born in Montgomery county, Maryland, in 1823, and died November 23, 1893. Dr. Palmer was one of the oldest practitioners in the District of Columbia, and came of a family of medical men, all of whom attained prominence in the profession. He graduated from the Medical School of the University of Pennsylvania, in 1844, at the age of twenty, settled in Bladensburg, Maryland, and in 1850 began practice in Washington. He was a member of the American Medical Association. He leaves a wife and five children; two sons in Chicago and three daughters in Washington.

PARKHILL, Clayton, of Denver, Colorado, was graduated at the Jefferson Medical College, Philadelphia, in 1883, and also from the Pennsylvania School of Anatomy and Surgery during the same year, since which time he has been actively engaged in the general practice of his profession. He is now Professor of Principles and Practice of Surgery and Clinical Surgery in the Medical Department of the University of Colorado, ex-president of the Colorado State Board of Medical Examiners, Surgeon to Deaconess Home and Hospital, and St. Luke's Hospital, Denver, and also Visiting Surgeon to Arapahoe County Hospital. Dr. Parkhill is an active member of the American Anthro-Pometric Society, Association of American Anatomists, Colorado State

Medical Society, Denver Medical Association, Denver Medico-Legal Society, and Denver Clinical and Pathological Society.

PATTERSON, Amos W., of Indianapolis, Indiana, was born in Washington, Daviess county, Indiana, October 17, 1839. He is the only son of the late Rev. Wm. J. Patterson, a native of Pennsylvania, and Jane (Butler) Patterson, daughter of Amos Butler, a pioneer of Brookville, Indiana, and the founder of that noted town. Dr. Patterson was educated at Hanover College, from which institution he graduated in 1863. During the Civil War he was connected with the Examining Surgeon's office at Indianapolis, and was for two years in old St. John's Hospital, at Cincinnati, and began the study of medicine under the preceptorship of Dr. Theophilus Parvin, and W. B. Fletcher, in the former city, after which he entered the Medical College of Ohio, and was graduated M. D. from that institution in 1866. He commenced the practice of medicine in Bartholomew county, Indiana, where he remained one year and then removed to the city of his present residence, where he has been continuously engaged in an extensive and successful practice of general medicine and surgery. He served several years on the staff of the Indianapolis City Hospital, and is a highly esteemed physician, fully identified with the leading thought and medical progress of his city. He is a member of his County and State Medical Societies and of the American Medical Association, in all of which honorable bodies his attainments and skill in his profession are recognized and appreciated. Dr. Patterson was married to Miss Theodora Kiefer, of Miamisburg, Ohio, June 11, 1878. His accomplished wife and one child (his daughter Ruth) complete the family circle of his happy home.

PEPPER, George, of Philadelphia, Pa., was born in that city April 1, 1841, and died there September 14, 1872. He was the eldest son of the late Professor William Pepper, and was graduated at the University of Pennsylvania in 1862, and in medicine at the same institution in 1865. "On September 15, 1862, he enlisted as a private in the Sixth Pennsylvania Cavalry, was promoted to a lieutenant and saw much active service, but was disabled in 1863, and on May 22, of that year, received an honorable discharge. He was chiefly instrumental in founding the Philadelphia Obstetrical Society, and served as its secretary until illness compelled him to resign." He was a member of many professional organizations, and rapidly acquired practice in the branches to which he devoted himself. "His artistic talent, his mechanical ingenuity, his retentive memory, his industry, and devotion to his profession, gave assurance of a career of unusual brilliancy." His contributions to the Proceeding of the societies with which he was connected were numerous and important.

PERKINS, John W., of Kansas City, Missouri, was graduated M. D. at Harvard Medical School, Boston, Massachusetts, in 1886. He is now Professor of Principles and Practice of Surgery and Operative Surgery in the Kansas City Medical College, and Division Surgeon to the Union Pacific Railway Company. He is a member of the Massachusetts State Medical Society, and of the Jackson County Medical Society, State of Missouri.

PETERSON, Francis Marion, of Greensboro,

Alabama, has long held high and appropriate rank as a physician and surgeon. James Peterson, his father, was a native of South Carolina, a successful and influential planter and citizen of Pickens county, Alabama, for many years, and was the father of four sons and three daughters. He married a Miss Cox, also a native of South Carolina; both were descended from among well known and well connected families of the Palmetto State. Of their sons only he whose name forms the caption of this brief biography adopted a professional life. Francis M. Peterson received a liberal academic education, and at the early age of eighteen years he became a teacher in an academy in his native county. Three years were spent in this avocation. Predilection led him to the study of medicine. Giving up teaching, he continued his studies at the city of Columbus, Mississippi,

Francis M. Peterson

under a private preceptor. In 1845, he attended a course of lectures in the Medical Department of the University of Pennsylvania, attending, also, the Blockley Alms House. In the spring of 1846 he located at Greensboro, Alabama, and at once entered upon the practice of his profession. In this same year he was married to Miss Amanda Shivers, of Greensboro. She bore him three sons, and then passed away in death, in 1858. The oldest of these sons became a very promising physician, but died at the early age of thirty years. The other sons are ministers in the Methodist Episcopal Church, South. In 1861 Dr. Peterson was married a second time, wedding a daughter of Dr. Alexander Sledge, of Greensboro. Three daughters are the issue of this marriage. For a period of over twenty years Dr. Peterson continued in an active, successful, and remunerative practice, then, in response to his indomitable thirst for knowledge, he entered the University of New York, receiving from that institution a diploma in

1869. He immediately resumed his practice at Greensboro. For nearly a half century he has continued an ardent student as well as an active practitioner of medicine and surgery. Since the age of twenty-one years, until a few years ago, Dr. Peterson continued under the instructions of some able tutor in Latin, Greek, French, German, or the higher sciences. Hence, his education in the classics, and sciences, as well as in his profession, is of the highest order. In 1872 he became Professor of *Materia Medica* and Obstetrics in the Southern University, at Greensboro, and remained as such until the discontinuance of the medical department of that institution. As a teacher, Dr. Peterson is no less instructive than he has been successful as a practitioner. His lectures are characteristic of his learning, attractive and forcible. Dr. Peterson is an able writer, especially on medical and allied subjects. He has furnished to the literature of the profession the following important contributions: "Criticism on Dr. Draper's Theory of the Production of Butter from Clover;" "New Theory of the Production of Puerperal Eclampsia;" "Advances in Gynecology;" "Sims Drainage Tube in the Treatment of Ovariotomy;" "Monograph on Diphtheria;" "Dysentery in Alabama," and many other well accepted articles. For many years Dr. Peterson has been a prominent member of both his State and county medical associations. In 1886 he was president of the Medical Association of the State of Alabama. He is now Senior Councilor of the same association. He is very much devoted to his profession and its advancement, and well merits a place among the eminent American physicians and surgeons.

PPAFF, Orange G., of Indianapolis, Indiana, was born at Westfield, near that city, April 28, 1858. He is of German descent, and of an ancient family, whose lineage can be traced as far back as the Fourteenth century. His grandfather was a soldier in the War of the Revolution, and served gallantly in the struggle for American independence. His father, Dr. Jacob L. Pfaff, was a native of North Carolina, and a noted anti-slavery man, who removed to Indiana in 1840, and died in 1859, while the subject of this sketch was an infant. When the latter was but six years of age his mother also died, and thus doubly orphaned he was sent to Indianapolis and given a home with his elder brothers, who afforded him every advantage within their means, not the least of which was an opportunity to attend the public schools. At the age of twenty he entered the office of the late Dr. T. B. Harvey, and under the supervision of that able preceptor began the study of medicine. In 1878 he became a student of the Medical College of Indiana, and received the degree of M. D. from that institution in 1882. During the six months succeeding his graduation he practiced his profession with Dr. Harvey, and was then appointed Resident Physician to the Marion County Asylum, a position he held for eighteen months. For a short time after severing his connection with that institution he practiced medicine in the State of Wisconsin, but soon returned to Indianapolis, where he has since remained engaged in an extensive and successful practice of general medicine and surgery. He has in recent years devoted special attention to gynecology, in which field of practice his recognized skill and

ability have given him high standing in his profession. He has been connected with the Medical College of Indiana in various capacities, and has been of almost invaluable aid to that institution. At this time he is Lecturer on Diseases of Women. He is also Consulting Gynecologist to the City Dispensary and to St. Vincent Hospital. In 1890 Dr. Pfaff took a special course in gynecology at the New York Post-Graduate Medical School and Hospital, and also in 1891 at the New York Polyclinic. In 1892 he supplemented his medical education and training in gynecological surgery, under the instruction of Dr. August Martin in Berlin, Germany, and attended clinics at the university of Berlin. Dr. Pfaff is an active member of the Indianapolis Surgical Society, Marion County Medical Society, Indiana State Medical Society, Mississippi Valley Medical Association, and the American Medical Association. He was married November 24, 1885, to Miss Mary Alvy, daughter of James H. Alvy, of Indianapolis.

POLLOCK, A. M., of Pittsburgh, Pennsylvania, was graduated M. D. at the Medical College, of Ohio, in 1841, and died June 20, 1892, after a long illness, full of years and experience. Referring to Dr. Pollock, one of his professional associates writes: "I first became acquainted with this honorable gentleman in 1866, since when he has assisted me in many difficult and complicated cases at all hours of the twenty-four. I always felt that I had no ordinary prop to lean upon in trying and difficult cases. He did not practice his profession for glory, but for the benefit of his patients. He was unassuming, modest, quiet, cheerful and gentlemanly in the sick room, and rather than claim the credit himself for what assistance he might give or what light he might throw on a case, he would give the attending physician full share of the honor that might be derived from his counsel. He never belittled the attending physician to his patient, or to his friends. He always left him, after a consultation, with more of the patient's and patient's friends' confidence than before. He would not suggest a change in treatment unless it was actually necessary for the benefit of the patient, and then it would be made in such a gradual manner that it would be passed unnoticed. He had the 'touch of a lady,' and while he may not have had the other two attributes of the surgeon, 'the heart of a lion and the eye of an eagle,' yet he had other qualities which are far higher—good judgment, skill, caution and conscientiousness. He would not operate for the sake of operating." He would feel morally certain that the surgical measures would benefit the patient before he would resort to that procedure. Dr. Pollock was a permanent member of the Medical Society of Pennsylvania, to which he was admitted in 1871, and of which he was elected president in 1872. He was also a member of the American Medical Association, and was sent by it as a delegate to the International Medical Congress, Philadelphia, 1876.

PORTER, David R., of Kansas City, Missouri, was educated in medicine at the College of Physicians and Surgeons, Keokuk, Iowa, from which institution he received the degree of M. D. in 1865. He also received an *ad eundem* degree on attendance at the Bellevue Hospital Medical College, New York, in 1872. He is now Professor of Principles and Practice

of Medicine and Clinical Medicine in the Kansas City Medical College, and is a member of numerous medical and scientific organizations.

PORTER, Henry R., of Bismarck, North Dakota, was born in Lee Center, New York, in 1848. He was educated in medicine at the University of Georgetown, District of Columbia, and received the degree of M. D. from that institution in 1872. He was appointed Acting Assistant Surgeon United States Army during the same year. He served at Camp Grant, Arizona, and at Camp Hancock, Dakota. He afterward served in the field with the Custer expedition in 1876, and is the only surviving surgeon. Referring to this service, a recent writer says: Every man who took part in the fight on Reno Hill will always remember and speak kindly of Colonel Benteen. A braver man never lived, whose troops were only saved through his coolness and courage upon that occasion. Charlie Reynold, Custer's scout, was considered the "finest shot" in the Seventh United States Cavalry, and was among the first killed. He was with Reno's command, and said before the fight that more Indians were there than he ever saw together before. Of the three medical officers with Custer's command Dr. Porter was the only one who survived. Dr. Lord was killed on the hill with Custer's men, Dr. De Wolf was killed near the top of Reno Hill, and Dr. Porter had many narrow escapes while attending the wounded and dying, and though the bullets and arrows were flying around him thick and fast he did not falter in his duty. In a recent letter Colonel Benteen says: "I know of no medical officer in the regular corps who would have performed the work which Dr. Porter did with his small force of assistants; don't think there was, or is, one in the army. There was no nonsense, no gush about him, only strict attention to his duty, and he was as modest about it as a girl in her teens." The Custer battle-field is situated on the Little Big Horn river, Montana. A monument is placed where General Custer's remains were found. Only one officer's remains were buried there, those of young Lieutenant Crittenden. This was at the request of his father, General Crittenden, who said, "Bury him where he fell, on the battle-field." Comanche, the only surviving horse of the massacre, was found many miles away from the battle-field with seven wounds. The Secretary of War issued an order prohibiting any one from riding him, with instructions to detail a soldier to take care of him. He is led out, fully equipped, at all dress parades. The services of Dr. Porter as Acting Assistant Surgeon terminated in 1876, since which period he has been established in the city of his present residence, where he is engaged in a successful general practice of his profession.

PORTER, William G., of Philadelphia, Pennsylvania, was educated in medicine at the University of Pennsylvania, and received the degree of M. D. from that institution in 1868. He is now Senior Surgeon to the Philadelphia Hospital, Surgeon to Presbyterian Hospital, Consulting Physician to the Philadelphia Dispensary, and Consulting Surgeon to the Educational Home for Boys. He is Fellow of the College of Physicians, Philadelphia Obstetrical Society, Philadelphia Academy of Surgery and member of the Pennsylvania State Medical

Society, American Medical Association, American Surgical Association and other leading medical and scientific organizations of this country.

PORTER, William Henry, of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1877. He is now Professor of Clinical Medicine and Pathology in the New York Post-Graduate Medical School and Hospital, and late Curator of the Presbyterian and Bellevue Hospitals. He is an active member of the New York Academy of Medicine, New York Pathological Society, New York Neurological Society and of other leading organizations in that metropolis. Dr. Porter is editor of *Merck's Bulletin*, and author of "Renal Diseases and Urinary Analysis." He has also made other valuable contributions to the literature of his profession.

POWELL, Thomas S., of Atlanta, Georgia, was graduated M. D. at the University of Pennsylvania, Philadelphia, in 1846. He is now Professor of Obstetrics and Lecturer on Medical Ethics in the Southern Medical College, Atlanta. He is also president of the Rosebrough-Powell University, which embraces the Southern Medical College, Dental College, Pharmacy and Law Departments.

PRYOR, William R., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1881. He is now Lecturer on Gynecology in the New York Polyclinic, and Visiting Gynecologist to St. Elizabeth Hospital. He is an active member of the New York Obstetrical Society, New York Pathological Society, New York Academy of Medicine, and other medical organizations of that city. Dr. Pryor is also surgeon of the Twenty-Second Regiment of National Guards, State of New York.

PYNCHON, Edwin, of Chicago, Illinois, was graduated M. D. at the Medical College of Ohio, Cincinnati, in 1876, and supplemented his education and training by attending the hospital clinics at Berlin, Paris, and London during the years 1883, 1884 and 1885, since which time he has devoted special attention to the study and treatment of diseases of the nose and throat, in which field of medicine he has attained eminent success. He is now Instructor in Rhinology and Laryngology at the Chicago Post-Graduate Medical School, Special Lecturer on Diseases of the Nose and Throat and Their Relation to the Teeth at the United States Dental College of Chicago, and is Specialist in diseases of the nose, throat, and ear, and in genito-urinary surgery. He is a member of the American Medical Association, Chicago Medical Society and Chicago Medico-Legal Society. He is medical Examiner and Adviser for several life and accident insurance companies, has made important contributions to medical literature, and is associate editor of the *Medico-Dental Bulletin*, Chicago.

QUIMBY, Isaac N., of Jersey City, New Jersey, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1859, since which time he has been actively engaged in a successful general practice of medicine and surgery. He is now president of the medical staff of the Jersey City Hos-

pital, and is ex-president of the Hudson County District Medical Society, member of the New Jersey State Medical Society, Medico-Legal Society of New York, British Medical Society, American Medical Association, and member of the Judicial Council of that organization. Dr. Quimby is also connected with many other medical societies of this country. He is one of the most accomplished and highly-esteemed physicians and surgeons in the State of New Jersey, and is widely known in his profession.

QUINTARD, Edward, of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1887. He is Visiting Physician to St. Mary's Hospital for Children, and also Visiting Physician to Church Hospital and Dispensary. He is a member of the Columbia College Alumni Association, and Fellow of the New York Academy of Medicine.

RAHTER, Charles A., of Harrisburg, Pennsylvania, was born near Minden, Westphalia, Prussia, August 8, 1839. Having received a common school English education, supplemented by a partial course at Pennsylvania College, Gettysburg, he attended his first course of medical lectures at the University of Maryland, and his second at the Long Island College Hospital, receiving from the last named institution his degree of M. D. in July, 1864. Until the ensuing October he practiced in Washington City, D. C.; was then appointed an Acting Assistant Surgeon in the United States Army, and in this capacity served until June, 1865. After resigning his position he established himself in Harrisburg, where, save during the Franco-Prussian War, he has since remained, engaged in an extensive and successful general practice of his profession. In 1870, on the breaking out of the war between France and Germany, he returned to his native country and offered his services to the government. From September 15 to October 15 he served as Assistant Surgeon in the General Army Hospital at Coblenz; was promoted to be Staff Surgeon, and placed in charge of the Barrack Hospital at St. Johann-Saarbrücken, where he remained until July 15, 1871, when he resigned his commission. In 1873 he received from the Emperor of Germany a medal for faithful and meritorious services. He is a member of the Pennsylvania State Medical Society, and, since its foundation, of the Dauphin County Medical Society, having been elected Secretary of the latter in 1868, Treasurer in 1869, and President in 1876. From August, 1865, to August, 1870, when he resigned the position, he was Examining Surgeon for the United States Pension Bureau. He married, November 11, 1875, Mary R., daughter of P. B. Keffer, Esq., of Harrisburg, Pennsylvania.

RAUCH, John H., of Chicago, Illinois, was born in Lebanon, Pennsylvania, September 4, 1828. Matriculating at the Medical Department of the University of Pennsylvania, in 1847, he graduated from that institution in the spring of 1849. In 1850 he located in Burlington, Iowa, and commenced practice. During 1850-51 his attention was directed to the relation of ozone to diseases, and he bestowed upon the matter a careful and thorough investigation. About this time, and during the prevalence of cholera, he called the attention of Congress to the necessity of providing med-

ical aid for those engaged in maritime pursuits on the western waters, and succeeded in having established at Galena and Burlington sites—being appointed on the committee for their selection—upon which marine hospitals were subsequently erected, which were thrown open to use in 1853. In 1851, during his residence in Burlington, his attention had been called to the increase in cholera, following the burial of a number of its victims in the United States cemetery located there. With others he succeeded in securing the vacation by the government of the ground for burial purposes, and the donation of it to the Burlington University for educational purposes. During 1855-56 he devoted some time to assisting Professor Agassiz in the collection of material for his work, "The Natural History of the United States," and secured a valuable collection from the upper Mississippi and Missouri rivers, of specimens chiefly piscatorial. In 1856 he was instrumental in securing the passage of a bill through the Legislature authorizing a geological survey of Iowa. In the fall of 1870 he visited the mining districts of South America, in order to ascertain what prospects existed of improving the sanitary condition of the miners in the gold regions of Venezuela. During his sojourn there he made a large and valuable collection of natural objects for the Chicago Academy of Natural Sciences. He was a member of the Iowa State Medical Society, which was organized in 1850, and was its first delegate to the American Medical Association in 1851, and its president in 1858; also a member and one of the organizers (in 1859) of the Chicago College of Pharmacy, of the Chicago Academy of Natural Sciences, of the American Public Health Association, of which he was for several years treasurer, and in 1875-76 first vice-president, of the American Social Science Association, and one of the Agassiz memorial committee. He is the author of a report "On the Medical and Economical Botany of the State," read at the first annual meeting of the Iowa State Medical Society; of a description of the Agassiz collection above referred to, published in *Silliman's Journal of Natural Sciences*; on "Intramural Interments and their Influence on Health and Epidemics," discussed before the Historical Society of Chicago, in 1858; of a paper on "Slaughtering," and which contained his opinion respecting the Schuylkill drove-yard abattoir in Philadelphia, published in 1871; of a report of the "Texas Cattle Disease," in 1868, and numerous other papers on medical subjects, and on public hygiene. In 1852 he delivered the annual address before the State Horticultural Society of Iowa. In 1857 he was elected to fill the chair of Materia Medica in the Rush Medical College of Chicago, a position he held for three years while continuing to reside in Iowa; and in 1859 he was selected as Professor of Materia Medica and Medical Botany in the Chicago College of Pharmacy. He served throughout the Civil War as surgeon and medical director, and for his services was brevetted lieutenant-colonel. He was an active member of the Iowa Historical and Geological Institute during his residence in that State. In 1867, with others, he was instrumental in having the Board of Health organized in Chicago, became a member thereof and served until 1873, presenting, in 1868, a report on "Drainage;" in 1869, a report on "The

Chicago River and the Public Parks;" and in 1870 a "Sanitary History of Chicago," with the official report of the board of health from 1867 to 1870. During the fire of 1871, his "Report for the Board of Health," also a synopsis of the "Flora of the Northwest," his "Herbarium," his "South American Notes," and many other valuable papers on sanitary measures, were destroyed. At this time he became connected with the Relief and Aid Society of Chicago, and rendered valuable assistance as one of its associates and agents. Dr. Rauch is one of the oldest members of the American Medical Association, and is now secretary of the board of trustees of that organization. For several years past Dr. Rauch has been secretary of the Illinois State Board of Health, and his efficient services as sanitarian, and his untiring efforts in securing an elevation of the standard of medical education in this country, have gained for him not only a national reputation, but the most lasting gratitude of the public and the medical profession as well.

RAYMOND, Joseph Howard, of Brooklyn, New York, was born in that city November 18, 1845. Having received his preparatory education at the Brooklyn Collegiate and Polytechnic Institute and Williams College, whence he graduated A. B. in 1866 and A. M. in 1867, he entered the Long Island College Hospital and graduated thence M. D. in 1868. In the following year, having attended lectures in due form, he received an *ad eundem* degree from the College of Physicians and Surgeons, New York, and thereafter established himself in general practice in his native city. In 1870-71 he was House Physician and Surgeon to the Nursery Hospital on Randall's Island; in 1871-72 House Physician and Surgeon to the Brooklyn City Hospital, and has served as Visiting Physician to St. Peter's Hospital, Sanitary Inspector for the Brooklyn Board of Health, and Professor of Physiology in the Long Island College Hospital. He is now Professor of Physiology and Sanitary Science and secretary of the Faculty of the latter institution. He is also Physician for Diseases of Women to the Long Island College Hospital Dispensary, editor of the *Brooklyn Medical Journal*, director of the Department of Physiology in the Hoagland Laboratory, and Visiting Physician to the Sea-side Home.

REED, R. Harvey, of Mansfield, Ohio, was educated in medicine at the University of Pennsylvania, Philadelphia, from which institution he received the degree of M. D. in 1876. He is now Professor of Theory and Practice of Surgery and Clinical Surgery in the Ohio Medical University; Surgeon to the Baltimore and Ohio Railroad; treasurer of the National Association of Railway Surgeons; editor-in-charge of the surgical department of the *Railway Age* and *Northwestern Railroader*; Surgeon-in-chief of the Masonic Provident Association; Health Officer of Mansfield, the city of his residence; ex-president of the North Central Ohio Medical Society and Tri-State Sanitary Association; member of the Ohio State Medical Society, American Public Health Association, British Medical Association and the American Medical Association, and is a member of the Executive or Business Committee of that organization.

REYNOLDS, Dudley S., of Louisville, Kentucky, was graduated at the University of

Louisville in 1868. He is now Professor of Ophthalmology, Otology and Medical Jurisprudence in the Medical Department of the Central University of Kentucky; Professor of Medical Jurisprudence in the Louisville College of Dentistry, Dental Department of the Central University of Kentucky and president of the Joint Faculties, and Ophthalmic Surgeon to Louisville City Hospital. Dr. Reynolds is a Fellow of the Medico-Chirurgical College of Philadelphia; member of the British Medical Association, American Medical Association, American Medical Editors' Association, Kentucky State Medical Society; chairman of the Judicial Council of the Association of American Medical Colleges; ex-president of the Mississippi Valley Medical Association, and member of the International Medical Congress. He is also director of the Polytechnic Society of Kentucky, and was chairman of its Library Committee from 1879 to 1892 inclusive.

RICE, Clarence C., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1877. He is now Dean, secretary and Professor of Laryngology in the New York Post-Graduate Medical School and Hospital. Dr. Rice is an active member of the New York State Medical Society, American Laryngological Society and Laryngological Society of New York.

RIDGE, Isaac M., of Kansas City, Missouri, was born in Adair county, Kentucky, July 9, 1825. In a life sketch published in the *Magazine of Western History* Edward L. Eames, his biographer, writes as follows: "His youth was passed in Kentucky and Missouri, to which his parents had removed, and when old enough to understand the bent of his ambition and the direction of his talents, by the advice and aid of his brother, J. G. Ridge, he formed the wise conclusion to devote himself to the practice of medicine. He studied with Dr. I. S. Warren, of Dover, Missouri, and pursued the usual course at the Transylvania University, at Lexington, Kentucky, from the medical department of which he was graduated in 1848 with the honors of his class. He had already settled in his mind that upon the site of the present Kansas City there would eventually be built a notable metropolis, and with that practical wisdom that has always been one of his distinguishing characteristics he determined to have a part therein. The changes that have so marvelously followed each other in Kansas City in the four decades past have therefore had a lively witness in the subject of this sketch, who, as one has aptly said, 'was among the first to watch the shadow of the Indian as he was forced to take his departure south for his present home in the Indian Territory.' Dr. Ridge made that place his home soon after he obtained his medical degree, and in season and out of season has been the tried and true friend of the little hamlet in which his lot was cast, of the village that succeeded it, and of the great city it has at last become. In 1848 he opened an office at the corner of Main street and the Levee, and entered energetically upon the practice of both medicine and surgery. As may be imagined, to use the words of one of his biographers, the demands for his services were for a considerable time by no means frequent, for the Indians

had their own 'medicine men,' and the white settlers were few indeed. But he had come to stay, and he persevered, answering such calls as came, waiting and watching for the tide of immigration to flow in that direction. The Indians were at that time numerous and troublesome, but Dr. Ridge was fortunate in cultivating their friendship to such an extent that the Wyandottes, who then occupied that portion of the country as their hunting ground, declared him in council their 'pale-faced brother,' and bestowed upon him the name of 'Little Thunder,' and ever afterwards he exerted among them a powerful influence which extended to other tribes that lived on the western border of Missouri, as it then was, but now in eastern Kansas. For the appellation above given Dr. Ridge was indebted to the Walkers—all of whom were half Wyandotte, but men of refinement and culture; men who were his particular friends, and associates of the Wyandotte nation—particularly Governor William Walker, first provisional governor of Kansas, who was one of the most talented and educated men of his time. He indeed was the intellectual giant of the men of Indian descent of his age. His was a friendship to be courted by all true men, and Dr. Ridge has the pleasure of knowing that he possessed it. From 1850 to 1856 the country settled up quite rapidly, and the Doctor's practice was so extensive that he was often compelled to ride from a hundred to a hundred and fifty miles in twenty-four hours. During the memorable pro-slavery troubles that raged along the Missouri-Kansas border from 1856 to the days of the Rebellion, Dr. Ridge found himself called upon to act in a certain measure as a 'physician of the times,' as well as a healer of physical ills. He cast his lot with neither side during that series of struggles, wisely showing himself a friend to all, and using his great and effective personal influence in the healing of wounded feelings, in smoothing over personal difficulties, and in advising belligerents on both sides. But it must not be imagined from this that Dr. Ridge was wanting in personal courage to defend personal friends. On more than one occasion did he prove this; and one instance of a memorable character may be recorded in this connection. It was when the Governor of Kansas was arrested by a gang of marauding villains 'who would have hanged or shot him but for the timely interference of Dr. Ridge, who, being informed of the Governor's perilous situation, hastened to the rescue and found him in the hands of a gang of unprincipled partisans who were howling for their prisoner's blood. Dr. Ridge, who like the man he was defending, did not know what fear was—save the fear of wrong-doing—and who was known to the most of, if not all, the Governor's captors, defied them and declared that only by the sacrifice of his own life at their hands should they murder or harm his once strong friend. This act of daring is regarded by Dr. Ridge as having been a sacred privilege which all true men should be proud to extend to each other, particularly when one has been favored by services rendered in by-gone days by the one he saves. Ex-Governor Charles Robinson, of Kansas, is a living witness to the fact that this thrilling act of heroism in the life of Dr. Ridge was but an act of gratitude in return for

Dr. Robinson's manliness and goodness of heart, in having traveled on horseback, one stormy night in May, 1849, to administer to Dr. Ridge, who was in a collapse, and supposed to be dying of cholera. After exhausting his skill, and battling with this master of all diseases for thirty-six or forty-eight hours, Dr. Robinson left him a crazed and dying young man, and went on his journey to California. A few eventful years in California passed, Dr. Robinson returned to the East, and pitched his tent in Kansas; was made governor, and was, in 1860, deemed worthy of death by that howling mob who had made him prisoner; when that young man he had left crazed and apparently dying, in May, 1849—the knowledge of whose miraculous recovery had not reached him—made his appearance in the presence of the would-be murderers, and in vehement and determined language demanded the prisoner's release. In the words of Dr. Robinson, in a speech delivered in the National Exposition building in Kansas City, Missouri, in 1880, 'honors were easy between the two Dr. R's.' These troubles of the pre-war period had hardly passed by when the troubled days of 1860 followed, and Dr. Ridge again found himself between two fires, and for a second time forced to act as mediator, this time as both friend and adviser for Unionists and Confederates. In 1861 he was the only practicing physician left in the section, and was often forced, at the point of the bayonet or the muzzle of a pistol, to visit the sick and wounded, to administer medicine or perform surgical operations; sometimes taken blindfolded to where his services were required and returned in the same way to the place of starting. Those were indeed exciting times, and the Doctor passed through many a thrilling scene that might be dwelt upon with romantic interest, did space permit. On every hand he found opportunities to imitate the Good Samaritan, and many a luckless fellow, blue-coat and gray-coat, lives to bless him for his skill and liberality. It is said that Dr. Ridge, legitimately and through compulsion, did a business of from twenty to fifty thousand dollars during the war for which he never received a cent, and for several years after that stormy period his practice was unprecedentedly large. The labors of Dr. Ridge during his years of active service in his profession were mainly given to the demands of his avocation, and he had little leisure or desire for ventures in other paths of public usefulness. He avoided rather than sought office of any kind, despite which fact his friends compelled him to serve some time as city councilman. He was also the active City Physician for several years, and it is a noteworthy fact that during his incumbency of that office the city passed through cholera and small-pox epidemics. He was once placed by his friends in nomination for State Senator. He retired from the practice of medicine about 1875, to give attention to his numerous other interests that had been growing steadily upon his hands. He had invested the proceeds of his extensive practice in land from time to time in and about Kansas City, and the growth thereof long since placed him among the wealthy men of his State. Dr. Ridge was for many years an ardent, devoted, and prominent member of the Masonic order, and did all in his power to advance the interests and uphold the noble principles of that time-honored fraternity,

and in more than one instance during the war did its secret but powerful influence intervene to save his life and raise him up friends in the midst of enemies. Illustrations of these are cited in Masons' History of Kansas City as follows: During the first days of the Civil War Dr. Ridge had been reported to Colonel Jennison as disloyal, and the colonel sent a squad of men to 'take care' of him. It was forty against one, and as a last chance Dr. Ridge gave a Masonic sign, which was immediately recognized by a young Prussian lieutenant in command, who waved his sword over his head calling out in broken English: 'Poys, shust put up dem guns; dot man ish all right!' A second instance of Masonry saving his life is related as having occurred in the spring of 1862. In 1850 Dr. Ridge was first married to Miss Eliza A. Smart, daughter of Judge Smart, of Kansas City. Three of the five children born to this union are still living, two of his sons being prominent in the business circles of that commercial emporium. She was a devoted wife and mother, esteemed for her noble traits of character, unusual literary attainments and many acts of quiet beneficence. Her death was mourned by many in all stations of life. In 1882 Dr. Ridge was again married to Miss Mary D. Campbell, the talented and accomplished daughter of Bartlett Campbell, one of the best known of the business men of Cincinnati, Ohio. She is a highly-cultured pianist, and as a vocalist has few superiors in this country. His home is one of the notable places in Kansas City; internally, because of its culture, elegance and generous hospitality, and externally because of its commanding position. The site of 'Castle Ridge,' as it is called, is of such altitude as to afford a wide and charming view of the city and the surrounding country in every direction. In the center of this beautiful elevation is the doctor's elegant residence, the designs and plans of which were all outlined by himself. The structure is in the form of a Greek cross, and in architecture combines the Tuscan and Corinthian orders, and is beautified by a mansard roof and crowned by imposing towers and minarets. Dr. Ridge has well earned the rest and leisure he now enjoys, and in the quiet evening of his days can look back upon a long life of labor and of successful achievements filled with deeds of good to his fellow-men. Of pleasing address and courteous manners, he is a generous and warm-hearted gentleman whom all greet with pleasure, and whom many poor and unfortunate have cause to remember with gratitude. He has contributed largely in money and influence toward the upbuilding of his city. Generous and liberal in his sentiments, enjoying the confidence, respect and esteem of the community, having good health and the capacity to enjoy the comforts which his wealth can command, there are, let us hope, many years of happiness and usefulness yet before him."

RICHARDSON, Charles W., of Washington City, District of Columbia, was graduated in medicine at the University of Pennsylvania in 1884, and received an *ad eundem* degree from the medical department of the Columbian University during the same year. He is now Professor of Laryngology and Otology in the latter institution, Throat and Ear Surgeon to Providence Hospital and Foundling Asylum,

Washington City. Dr. Richardson is a member of numerous local and national medical organizations.

RILEY, Frederick C., of New York City, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1878, since which time he has devoted special attention to the treatment of the eye and ear. He is now Ophthalmologist and Otologist to the New York Institution for the Deaf and Dumb, and holds the same position for St. Benedict's Home, at Rye, New York. Dr. Riley is a Fellow of the New York Academy of Medicine, and an active member of other medical organizations in that metropolis.

RIVERS, Edmund C., of Denver, Colorado, was graduated M. D. at the University of Maryland School of Medicine, Baltimore, in 1878. He is now Professor of Ophthalmology and Otology in the Medical Department of the University of Denver. He is an active member of the American Ophthalmological Society, Colorado State Medical Society, Denver Medical Association, and Arapahoe County Medical Society.

ROBERTS, Milton J., of New York City, was educated in medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1878, since which time he has devoted special attention to mechanical therapeutics and orthopedic surgery. He is now Visiting Orthopedic Surgeon to the City Hospital, Randall's Island; Consulting Surgeon to Woman's Hospital, Brooklyn, and was Professor of Orthopedic Surgery and Mechanical Therapeutics in the New York Post-Graduate Medical School and Hospital from 1882 until 1887, also late Professor of Orthopedic Surgery in the University of Vermont. He is a Fellow of the New York Academy of Medicine, member of the New York Orthopedic Society, New York Electrical Society, New York State Medical Society, American Association for the Advancement of Science, and of numerous other important medical and scientific organizations.

ROBINSON, Paul Gervais, of St. Louis, Missouri, of Huguenot and Irish ancestry, was born in Charleston, South Carolina, August 22, 1834. He was educated at the Charleston Academic College, graduating A. B. in 1854, and studied medicine in the South Carolina Medical College, Charleston, where he received the degree of M. D. in 1856. After graduating he spent two years at the Ecole de Médecin, Paris. On returning he settled first in Charleston. He entered the service of the Confederate States in the Civil War, and was connected at various times with the First South Carolina, and Twenty-Second North Carolina, and Third Alabama Regiments as Surgeon, and served till the close of the Rebellion. In 1866 he was Chief of Clinic to Prof. E. Geddings in the South Carolina Medical College, and adjunct to the Chair of Practice of Medicine. In 1867 he removed to St. Louis. In 1869 he was elected to the Professorship of Principles of Diagnosis and Clinical Medicine in the Missouri Medical College, and in 1877 to that of Principles and Practice of Medicine, and the Deanship in the same institution; the latter position he still (1893) retains. He is a member of the Medico-Chirurgical Society of St. Louis, and has served as Chairman of the Section of Practical Medicine of the American Medical

Association. In 1858 he married Elizabeth, daughter of Samuel Henry Dickson, late Professor of Principles and Practice of Medicine at Jefferson Medical College, Philadelphia; she died in 1861. In June, 1869, he married Lina, daughter of Hon. Bernard Pratte, of St. Louis, Missouri.

ROCHESTER, De Lancey, of Buffalo, New York, was educated in medicine at the University of Buffalo, from which he received the degree of M. D. in 1884, and is now Adjunct Professor of the Principles and Practice of Medicine in that institution. He is vice-president of the Buffalo Obstetrical Society, member of Erie County Medical Society, Buffalo Medical and Surgical Association and Buffalo Pathological Society.

ROGERS, Edmund J. A., of Denver, Colorado, was graduated M. D. from the Medical Department of McGill University, Montreal, in 1881, and became a Licentiate of the Royal College of Physicians and the Royal College of Surgeons, Edinburgh, Scotland, during the same year. He is now Professor of the Principles and Practice of Surgery in the Medical Department of the University of Denver. He is a member of the American Medical Association, Colorado State Medical Society, Denver Medical Association and Arapahoe County Medical Society.

ROGERS, William B., of Memphis, Tennessee, was educated in medicine at the Bellevue Hospital Medical College, from which institution he received the degree of M. D. in 1878. He is now Professor of Surgery in the Memphis Hospital Medical College. Dr. Rogers is a member of the American Medical Association, Tri-State Medical Society (of Tennessee, Georgia and Alabama), National Association of Railway Surgeons, Southern Surgical and Gynecological Association, and the Memphis Medical Society.

ROTHWELL, William J., of Denver, Colorado, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1873, and supplemented his medical education and training by attending the New York Polyclinic in 1884. He is now Professor of Materia Medica, Therapeutics and Clinical Medicine in the Gross Medical College, Denver. Dr. Rothwell is an active member of the Colorado State Medical Society, Denver Medical Association, and other medical organizations.

RUEDI, Carl, of Denver, Colorado, was graduated in medicine at the University of Berne, Switzerland, in 1873. He is now Professor of Pathology and Clinical Medicine in the Medical Department of the University of Denver. Dr. Ruedi is a member of the American Medical Association, American Climatological Association, Colorado State Medical Society, Denver Medical Association, and other medical organizations of this country.

SANGER, Eugene F., of Bangor, Maine, was born in Waterville, Maine, October 18, 1829. He was educated at Waterville Academy and Dartmouth College, graduating A. B. from that institution in 1849. He pursued his medical studies in Jefferson Medical College, Philadelphia, from which institution he obtained the degree of M. D. in 1853. The degree of A. M. was received from Waterville College in 1857. After graduating in medicine he served as Assistant Surgeon in the United States Marine Hospital, Chelsea, Massachusetts, and as Assistant Physician and

Surgeon at Blackwell's Island Hospitals, New York, and Insane Asylum in 1853-54. During parts of that and the next year he spent in Europe, and returning to this country located himself at Ellsworth, Maine. In 1857 he removed to Bangor. During the war—June 2, 1861—he was Surgeon to the Sixth Maine Infantry; promoted to United States Brigade Surgeon in the same year; Surgeon-in-Charge St. James' Hospital, New Orleans, 1862, and Medical Purveyor of the Department of the Gulf; Chief Surgeon Second Division Nineteenth Army Corps, 1863; Medical Director of same, Department of the Gulf, 1864, and Surgeon-in-Charge of Elmira (New York) prison, in the same year; Medical Director of District of Michigan, and Surgeon-in-Charge of Harper's and St. Mary's Hospitals, Detroit, in 1864 and 1865; Medical Inspector and Medical Director of District of East Tennessee during part of 1865; and was also Surgeon-General of the State of Maine, with rank of Colonel, during 1869-70, and has served for many years as United States Examining Surgeon to the Pension Bureau. In 1876 he was elected President of the Sixth Maine Regimental Association at the grand reunion at Portland of all the regiments which served in the war from Maine. He is a member of the Loyal Legion, and has held the position of common councilman of the city of Bangor. He is a member of the Penobscot County Medical Association; of the State Medical Association, of which he was secretary in 1859, vice-president in 1871, and president in 1876; of the American Medical Association, and honorary member of the Detroit Academy of Medicine. He has contributed various articles to the Transactions of the Maine Medical Association; among them: "Eczema," "Elbow-Joint Resection," "Inversion of the Womb," "Malignant Growths," and "Abscess of Lungs."

SATTERTHWAITE, Thomas E., of New York, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1867. He was professor of Pathology and General Medicine in the New York Post-Graduate Medical School and Hospital from 1882 until 1890. He is now Consulting Physician to the Orthopedic and Babies' Hospitals and Northeastern Dispensary, New York City. He is late president of the New York Pathological Society, and member of the New York State Medical Society, New York County Medical Society, New York Academy of Medicine, American Academy of Medicine, and the International Medical Congress.

SCOTT, Clinton H., of Como, Colorado, was born at Towanda, Pennsylvania, September 29, 1855. He is the son of William Scott, a lawyer, and grandson of Hon. George Scott, one of the first judges of Bradford county, Pennsylvania. He was educated in his native State at Susquehanna Collegiate Institute, Towanda; Mansfield State Normal School, and Wyoming Seminary, Kingston. He commenced the study of medicine in 1874, and pursued it under the instruction of Dr. J. W. Lyman, of Towanda, and Drs. W. G. MacConnell and J. W. Barr, of Philadelphia. He attended medical lectures at Jefferson Medical College, Philadelphia, and was graduated at that institution in March, 1878. Dr. Scott commenced the practice of medicine at Athens, Pennsylvania, but soon after removed to

Sayre, in the same State, where he remained until 1883, when he accepted the position of Surgeon for the Union Pacific Coal Company at Como, Colorado, and removed to that place. He removed to Denver in 1888, but in 1891 failing health necessitated a change to a higher altitude, and he returned to Como. He has attained some distinction as a surgeon, and has been especially successful in orthopedic and railway surgery. He is a member of Elmira (N. Y.) Academy of Medicine, honorary member of Chemung County (N. Y.) Medical Society, and was vice-president of Bradford County (Pa.) Medical Society from 1880 till 1883. He was State Censor (Pa.) in 1883, ex-member Colorado State Medical Society, member National Association of Rail-

Clinton H. Scott

way Surgeons, and Southwestern Association of Railway Surgeons. In 1879 Governor Hoyt of Pennsylvania appointed him Coroner of Bradford county, that State, to fill a vacancy, and in 1882 he was elected to the same office. In 1884 he was elected Coroner of Park county, Colorado, and was re-elected in 1885. He served as County Physician of Park county (Colo.) during the years of 1885, 1886 and 1887. He was appointed Health Commissioner of Como in 1885, and elected Mayor of that town in 1886. In 1889 he was appointed by Mayor Londoner to the office of Health Commissioner of the city of Denver. The city charter required the appointee to have been a resident of the city for a period of two years preceding his appointment, and as Dr. Scott had only resided there a little more than one year, he was not able to qualify. He has for many years taken an active interest in politics, but never aspired to any office which would interfere with the practice of his profession. He is Union Pacific Railway Surgeon on the Denver, Leadville and Gunnison division. He was never married.

SEAMAN, Louis L., of New York City, was graduated M. D. at the Jefferson Medical College, Philadelphia, Pa., in 1876, and received an *ad eundem* degree from the University of the City of New York in 1877. He is ex-chief of the staff of Charity Hospital, Blackwell Island, and is now Visiting Physician to the New York Lying-in Asylum, Consulting Physician to the Colored Orphan Asylum, and Medical Supervisor of the Mutual Reserve Fund Life Association. Dr. Seaman is a member of the New York Academy of Medicine, New York Pathological Society, New York Medico-Legal Society, and other well known medical organizations of that Metropolis.

SELDEN, Charles W., of New York City, was graduated M. D. at the Jefferson Medical College, Philadelphia, Pa., in 1857. He was Professor of Anatomy in the National Medical College, Washington City, D. C., from 1857 until 1861. He then entered the Confederate Army, and was Surgeon-in-Charge of the Louisiana Hospital, Richmond, Virginia, during the first year of the War of the Rebellion, and subsequently served from 1861 until 1865 as Surgeon of Twenty-fourth Virginia Battalion. Since the close of the war he has been engaged in a successful general practice of medicine and surgery, and is of recognized skill and ability.

SELL, Edward H. M., of New York City, was born in Lehigh county, Pennsylvania, August 16, 1832. He was a son of Samuel Sell, whose grandfather came from Canton Berne, Switzerland, and of Mary (Miller) Sell, granddaughter of Conrad Miller, a drummer of the Revolution, who was born in Wurtemberg, Germany. His education was obtained in a Friends' school at Quakertown, Allentown Seminary (now Muhlenburg College), and at Gettysburg, and received the degree of A. B. in 1856 and A. M. in 1859 from the Pennsylvania College, at that place. He studied medicine in the Bellevue Hospital Medical College, New York, and graduated M. D. in March, 1866. He was also graduated Master of Obstetrics in the University of Vienna in March, 1872. After graduating and practicing for four and a half years, he visited, during three years, all the principal hospitals in all the large cities of Europe, viz: Paris, Vienna, Berlin, London, Edinburgh and Dublin, and on returning, located himself again in New York in general practice, but making a specialty of gynecology and obstetrics. He is a member of the County Medical Society of New York, of the Medico-Legal Society, of the American Medical Association, of the New York Pathological Society, Fellow of the New York Academy of Medicine, one of the founders of the American Academy of Medicine, 1876, and Fellow of the Obstetrical Society of London. He is also a member of the Society of German Naturalists and Physicians, and was delegate to the forty-fifth annual meeting at Leipzig, in August, 1872; also delegate to the British Medical Association, from the American Medical Association, in 1870, 1873 and 1876, and was also a delegate to the International Medical Congress in 1890. His contributions to professional literature are: "Puerperal Eclampsia," "Opium Poisoning in Children, with Recovery by Use of Electricity," "A Case of Complete Uterus Bicornis," "Fibroid Polypus Uteri," "Obstetrics in Vienna," "Tapping Ovarian Cysts," "Ovariectomy," "Ovarian Tapping," "Cystic Tumor of Vagina," "Amputation of

Neck of Uterus" and "Procidentia Uteri." He has also been editor of the *Physician and Pharmacist*. Since 1873 he has been Physician to the Northeastern Dispensary for Diseases of the Head and Abdomen, and also held the same position for diseases of women in the same institution. Since July, 1874, he has been Physician for Diseases of Women to the Eastern Dispensary.

SEMMEs, Alexander J., of Savannah, Georgia, of Anglo-Norman-Celtic lineage, was born in Georgetown, District of Columbia, December 17, 1828. He is the son of Raphael Semmes, Esq., of Nanjemoy, and Matilda Neale Jenkins, of Cobneck, on the Potomac, in Charles county, Maryland; his paternal and maternal grandfathers were officers of the Maryland line in the Revolutionary Army, direct descendants of the English Catholic gentry, who, flying from persecution in England, came to Maryland between 1636 and 1650; some of whom settled in the adjoining counties of Virginia. Dr. Semmes was a cousin of Raphael Semmes, commander of the Alabama in the Confederate Navy. He was educated at Georgetown College, District of Columbia, receiving the degree of A. M. in 1853, and in addition to three years of medical study with Dr. Grafton Tyler, Professor of the Practice of Medicine in the National Medical College, Washington, District of Columbia, attended three courses of lectures at the latter institution, graduating from it in 1851, and subsequently attending clinical lectures in the medical schools and hospitals of London and Paris. He first settled in Washington City, D. C., where he was Physician to the United States jail, but removed thence to New Orleans, Louisiana, whence, after the Civil War, he went to Savannah, Georgia. He was one of the two resident physicians of the Charity Hospital at New Orleans, in 1860. He was appointed Surgeon of the Eighth Regiment of Louisiana Volunteers, June 19, 1861, and on the 4th of the following month was commissioned a Surgeon in the Confederate Army, serving from 1861 to 1863 as surgeon and brigade surgeon in Hay's Louisiana brigade, of (Stonewall) Jackson's corps, in the army of North Virginia; as Surgeon-in-Charge of the Third Division of the Jackson Military Hospital at Richmond, Virginia; as Medical Inspector, by special order No. 6, department of North Virginia, May 21, 1862; as inspector of hospitals in the department of Virginia, by special order No. 32, A. and I. G. O., Richmond, February 7, 1863; as a member of the army board to examine medical officers, by special order No. 34, A. and I. G. O., Richmond, February 11, 1862, and as president, in January, 1865, of the Examining Boards of the Louisiana, the Jackson, the Stuart, and the Winder Hospitals, Richmond. After the close of the Civil War he returned to New Orleans and was Visiting Physician to Charity Hospital during the years 1866 and 1867, and from 1870 to 1876 Professor of Physiology in the Savannah Medical College. Subsequently he took orders in the Roman Catholic Church, and in 1886 he became president of Pio Nono College, Macon, Georgia. He has been a member of the Medical Society of the District of Columbia, the Georgia Medical Society, and the American Medical Association, of which he was one of the secretaries in 1858-59, and 1869, and was in 1852 corresponding secretary of the

American Medical Society in Paris. He is the author of "Medical Sketches in Paris," 1852; "Poisoning by Strychnine," 1855; "Medico-Legal Duties of Coroners," 1857; "Gunshot Wounds," 1864; "Notes from a Surgical Diary," 1866; "Surgical Notes of the Late War," 1867; "Medical Reviews and Criticisms," 1860-61; "Revaccination; Its Effects and Importance," 1868; "Preparations of Manganese," 1868; "The Fluid Extracts," 1869; "Evolution, the Origin of Life," two papers read before the Georgia Medical Society, 1873; the "Influence of Yellow Fever on Pregnancy and Parturition," paper read before the Georgia State Medical Association, 1875, and other papers, both numerous and important. He has also written frequently for literary and other non-professional periodicals. He was married October 4, 1864, at Savannah, Georgia, to Sarah Lowndes Berrien, daughter of the late John Macpherson Berrien, attorney-general of the United States in the cabinet of President Jackson, and for many years United States Senator from Georgia.

SENN, Nicholas, of Chicago, Illinois, was born in Canton St. Gaul, Switzerland, October 31, 1844; immigrated to this country with his parents in 1852; settled in Washington, Wisconsin; received a grammar school education at Fond du Lac, Wis., and after teaching school for two years, began the study of medicine with Dr. E. Munk, of the latter city, in 1864. He studied also in the Chicago Medical College in 1866, and graduated in the spring of 1868. After serving for eighteen months as Resident Physician to Cook County Hospital, he commenced the practice of medicine in Ashford, Wisconsin. In 1869 he married Miss Aurelia S. Muehlhauser. He removed to Milwaukee in 1874, and became Attending Physician to Milwaukee Hospital. In 1877 he visited Europe and attended the University of Munich, Germany, and was graduated at that institution in 1878. After his return to this country he established himself in Chicago, having been elected Professor of the Principles of Surgery and Surgical Pathology in Rush Medical College. He now holds the chair of Practice of Surgery and Clinical Surgery in the same institution. His specialty is surgery, and in recent years his skill in abdominal surgery, and especially in his treatment of gastro-intestinal lesions, has gained for him a world-wide reputation. He is a member of the American Medical Association and of numerous other local and national medical organizations. Soon after the inauguration of Governor Altgeld he was appointed Surgeon-General of the National Guard of Illinois. Dr. Senn is also president of the Association of Military Surgeons of the National Guard of the United States, and from his address to this organization, delivered at its second annual meeting at St. Louis in April, 1892, we here publish the following extracts: "Every good citizen takes a just pride and deep interest in the safety and prosperity of his country. His patriotism should bear a direct ratio to the degree of freedom and protection he enjoys and the richness of the natural resources within his reach. If freedom, protection and prosperity are the elements which are productive of patriotism, every citizen of the United States is, or should be, imbued with love and gratitude for his country, and ready to defend it in time of danger. It is a great privilege to be a citizen of the

greatest country on the face of the earth, and to belong to the most powerful and progressive nation in the world. Our country has taken a place in the front rank among the ruling nations. Its brief history is an unbroken record of unparalleled growth and prosperity. Its inhabitants, composed of the best elements of most every civilized nation, have made good use of the wonderful opportunities presented, and have built up cities and industries which have become a source of admiration and envy everywhere. Since the War of Independence and foundation of this great republic, a little more than a century ago, we have become the leading nation, not through the influence of a large standing army, but by developing the unlimited resources within our legitimate reach, aided by a wise administration of the laws made by the people and for the people. During this short period of our existence as a

N. Senn

nation we have taken an enviable position among the powers of the world, and our beautiful flag, the star-spangled banner, is respected and admired wherever it is unfolded. The stars and stripes are everywhere recognized as a symbol of liberty and equality. The history of the War of Independence, and more recently of the War of the Rebellion, has proved to the outside world that the American citizen is a born soldier. Within a few months, during the late conflict, large armies faced each other in deadly combat, and on each side a heroism was displayed never excelled before. Battles were fought such as the world had never seen before or since. The endurance, discipline and courage of our citizen-soldiers

have become a matter of honorable record, and have never, and are not likely to be, surpassed by any standing army. Our country came out of this great struggle greater than ever. There is no North and no South. The 'gray and the blue' celebrate their war experiences side by side, and relate their victories and defeats without sectional feeling. The star-spangled banner again floats over a harmonious and peaceful nation, and is revered and loved as dearly in the South as in the North, and should the time come when it is in danger, the whole country will rise in its defense. What a happy choice our forefathers made when they selected the eagle as the emblem of our country! Like the king of the skies, that knows no rival in his sphere, our country has outstripped the Old World in everything that pertains to the welfare of its people. The mingling of many nations has produced a race peculiarly well adapted for self-government. Our little standing army, composed of less than 25,000 men, scattered in small detachments over a vast territory, has been seldom called into active service, except occasionally to subdue a hostile band of Indians on the frontier. Should an emergency arise necessitating military interference, either in the defense of our borders or to crush anarchism, our standing army would be too small to answer the requirements. Fortunately every true American citizen regards himself as a guardian of public peace, ready to defend his rights, and ever ready to protect the country of his birth or adoption. The National Guard of the United States, numbering about 100,000 citizen soldiers, is a military body of far-reaching influence and great power. It is composed of the very best elements of society. It represents almost every profession, trade and business interests. It is composed of men who, under all circumstances, are loyal to their general and respective State governments. It constitutes an efficient police force scattered over this vast country from the Atlantic to the Pacific, and from the British possessions to the Gulf of Mexico. Should it become necessary to call out the whole force, an army of 100,000 men, well equipped and well drilled, could be concentrated in any part of the country ready for duty within three to five days. The many strikes and riots which have menaced the peace and personal and public property for a number of years have shown the necessity of an efficient National Guard. Every loyal and peace-loving citizen will consider it a privilege to contribute his share towards securing and maintaining such a force. Money paid out of the State treasury for such a purpose is well invested." Referring to the means of elevating the standing and usefulness of military surgery, Dr. Senn continues: "We live in an age of organization of united effort and concentration of work. The unparalleled advances in science, art, and literature that have characterized the last decade are largely due to systematic united work. It is true that a great discovery or an important observation comes occasionally like a flash of lightning from a clear sky, the product of some fertile brain, but the greatest advances requiring thorough scientific investigation have been accomplished by the concerted action of many laboring with the same object in view. The stimulus imported by the work and success of others is the motive which impels individual

effort, and comparison of the results realized becomes either a source of gratification or acts like a lash that arouses the latent forces to renewed action. In our country nearly every profession, trade and business has now its local and national associations. Less than a year ago about fifty surgeons of the National Guard, representing fifteen States, met in the city of Chicago and organized the association of Military Surgeons of the National Guard of the United States. All present were fully impressed with the necessity of such an association, and manifested a keen interest in its organization. To-day we have opened our first annual meeting in this beautiful city, and have received such a warm welcome on the part of the State, the city, the medical profession and citizens as is seldom extended to a scientific body. As an association we have not yet reached our first birthday, and yet we have attained a membership of over two hundred. A deep interest in the welfare and prosperity of our organization has been manifested outside of our ranks throughout the United States. The newspapers and medical journals have treated us with every mark of courtesy, and have brought our good work to the attention of military officers, the public and the medical profession. The general government has encouraged us from the very beginning by detailing for our benefit a number of the oldest and most experienced surgeons to attend our meetings. Military surgery is at present in a transitional stage. Human ingenuity has exerted itself to the utmost during the last few years in perfecting cannon, guns and other implements of destruction. The smokeless powder and the small caliber conical bullet, surrounded by a steel mantle, have revolutionized modern warfare. Rapid firing and certainty of aim at a great distance will make the battles of the future of short duration, but the loss of life and the number disabled by wounds will be fearful. The bullet wounds that will come under the treatment of the military surgeons of future wars will present an entirely different aspect, and will call for different treatment than those inflicted by the old weapons. The modern bullet, by virtue of its great penetrating power, will either produce a speedily fatal wound, or the injury it produces will be more amenable to successful treatment because it produces less confusion of the soft tissues and splintering of bone than the heavy bullet used in the past. Bruns, Bardeleben, and others have made careful experimental researches concerning the effect of the new projectile; but this subject is not exhausted, and there is plenty of room for original work by our members in this department of military surgery. The operative treatment of penetrating wounds of the chest and abdomen, on the battle-field, offers another inviting field for original investigation. The various materials devised for dressing wounds on the battle-field have all their faults and merits, but none of them are perfect. The methods of transportation of the sick and wounded, the construction of tents and movable barracks are not closed chapters, and are all susceptible of improvement by original thought and investigation. More ingenuity has been displayed of late years in perfecting fire arms and in the invention of machines for wholesale destruction of life than in devising ways and means in saving the lives of those seriously injured. It is our

duty as military surgeons to counteract as far as we can the horrors of war by devising life-saving operations, and by protecting the injured against the dangers incident to traumatic infection. Antiseptic and aseptic surgery must be made more simple than they are now in order that we may reap from them equal blessings in military as in civil practice. Enough has been said to show you that a military association of this kind can become an inestimable boon to mankind if some of the members will explore unknown regions and bring to light the priceless jewel of original thought and research. The subject of this sketch has made numerous valuable contributions to medical and surgical literature, and his reputation as a writer is no less distinguished than that of clinical teacher and operative surgeon. His books entitled "Experimental Surgery" and "Intestinal Surgery" embody Dr. Senn's own views on the results of his clinical experience and original investigation. They have met with an extensive circulation and their author is universally regarded as one of the most original and advanced workers in the field of surgical progress. Of his more recent publications the one entitled "Senn's Surgical Bacteriology" is worthy of special mention. This is a handsome octavo volume, illustrated with colored plates and fine engravings, published by Lea Brothers & Co., Philadelphia (second edition 1892). Referring to its merits the *Annals of Surgery* says: The book is valuable to the student, but its chief value lies in the fact that such a compilation makes it possible for the busy practitioner whose time for reading is limited and whose sources of information are often few, to become conversant with the most advanced ideas of surgical pathology, which have laid the foundation for the wonderful achievements of modern surgery. In concluding this sketch reference should be made to Dr. Senn's recent magnificent gift to his city and profession which consists of his great collection of medical books, donated to the Newberry Library, Chicago, the value of which can not be estimated in money, for as Milton says, "A good book is the precious life-blood of a master spirit embalmed and treasured up on purpose to a life beyond life." Dr. Senn has for many years been engaged in gathering this priceless collection of medical literature, but for most part the gems of the library were obtained by purchase from the estate of Dr. William Baum, Professor of Surgery, University of Göttingen. He was one of the founders of the German Congress of Surgeons, and for fifty years had been collecting works on anatomy, physiology, surgery, and the old classical authorities. Having died in 1886, his estate offered the library for sale. His wish was that the German Congress of Surgeons should purchase the library, but that organization did not see their way clear to meet the expenses. The administrator of his estate publicly stated that Professor Baum had spent over forty thousand dollars in its purchase. The administrator offered the library to various parties, and the Royal Library of Berlin offered an almost fabulous price for a number of antiquarian volumes contained in the collection, but the administrator, following the wishes of Prof. Baum, refused to separate the books, and announced that it would be sold by auction. This coming to the ears of Dr. Senn, he at

once secured it by making a partial payment, and then withdrew it from sale. The books were shipped to Dr. Senn, then in Milwaukee, in fifty-two cases, constituting an entire car load. Beside the works on surgery, gynecology and ophthalmology in the Baum library, the collection contains a full set of Virchow's Archives, several single volumes of which are now valued at \$50 each. Langenbeck's Archives, Jahresbericht der Gesund. Medicine, Cannstatt's Jahresbericht, Prager Vierteljahresschrift, and the Deutscher Chirurgie. (The continuation of these periodicals from time to time, by the terms of the gift, the Newberry Library must hereafter procure as published.) To the foregoing, Dr. Senn has added nearly all the modern works on surgery, which includes gynecology, and allied branches. He will retain his working library of modern works, and a few old favorites to which he is naturally attached. It is said that the first thought of this action was suggested by Mrs. Senn, who, appreciating the value of the library, pointed out the insecurity of a private house from fire and other casualties, and Dr. Senn concluded that he would place the collection at the disposal of the profession. There are thousands and thousands of pamphlets, ancient and modern, and atlases almost numberless. All of these go with the collection, the money value of which is about fifty thousand dollars. No bibliophile can part with his books without regret, and yet in this action Prof. Senn has built himself a monument more enduring than bronze or marble, for generations of medical men, long after those now on the stage shall have passed away, will draw inspiration and wisdom from the "Senn Collection" in the Newberry Library, and as often with gratitude reflect on the noble generosity of its distinguished founder.

SEWALL, Henry, of Denver, Colorado, was educated at the Wesleyan University of Middletown, Connecticut, from which institution he received the degree of B. S. in 1876, and at the Johns Hopkins University, Baltimore, Maryland, from which he obtained the degree of Ph. D. in 1879. He subsequently began the study of medicine and entered the University of Michigan, Ann Arbor, from which institution he received the degree of M. D. in 1888, and also received an *ad eundem* degree from the Medical Department of the University of Denver in 1889. He is now Professor of Physiology in the latter university, Assistant Health Commissioner of Denver, and secretary of the Colorado State Board of Health. Dr. Sewall is an active member of the American Association of Physicians, Colorado State Medical Society, Denver Medical Association and Arapahoe County Medical Society, State of Colorado.

SEXTON, Samuel, of New York City, was educated in medicine at the University of Louisville, Kentucky, from which institution he received the degree of M. D. in 1856. During the late war between the states he served as Surgeon of the Eighth Ohio Volunteers. Of recent years he has devoted special attention to the study and treatment of diseases of the ear. He is now Aural Surgeon to the New York Eye and Ear Infirmary, and is an active member of the American Otological Society and the American Medical Association.

SEYMOUR, William Pierce, of Troy, New

York, was educated at Williams College, from which he received the degree of A. B. in 1845. He then studied medicine, entered the University of Pennsylvania, receiving the degree of M. D. in 1848. He was Assistant to the Obstetric Institute of Philadelphia from 1848 to 1849, was Professor of Materia Medica and Therapeutics in Castleton Medical College from 1857 until 1862, Professor of the same chair in Berkshire Medical College from 1858 until 1863, and was then made Professor of Obstetrics and Gynecology and Diseases of Children in the same institution from 1863 until 1865. He also held the Chair of Obstetrics and Diseases of Children in the Albany Medical College from 1870 until 1873, and that of Obstetrics and Gynecology in that institution from 1873 until 1875. Dr. Seymour is a member of the American Medical Association, New York State Medical Society, member of the Union Medical Association of New York, Vermont, and Massachusetts, and other medical organizations in this country. He is also a Fellow of the American Association for the Advancement of Science.

SHAFFER, Newton M., of New York City, was educated in medicine at the University of the City of New York, receiving the degree of M. D. from that institution in 1867. He is now Attending Surgeon-in-Charge of the New York Orthopedic Dispensary and Hospital; also Consulting Orthopedic Surgeon to St. Luke's Hospital, and Consulting Surgeon to the New York Infirmary for Women and Children. He is a member of the Congress of American Physicians and Surgeons, American Obstetrical Association, Fellow of the New York Academy of Medicine, New York Neurological Society and other well-known medical organizations of that metropolis.

SHARP, Joseph, of Kansas City, Missouri, was educated in medicine at the College of Physicians and Surgeons of Kansas City, Missouri, from which institution he received the degree of M. D. 1873, since which time he has been engaged in an extensive and successful practice of general medicine. He is now secretary of the Faculty and Professor of Therapeutics and Clinical Medicine in the Kansas City Medical College and is a member of the staff of All-Saints and German Hospitals. Dr. Sharp is a member of the American Medical Association, Missouri State Medical Society and of all other leading medical organizations of his city and State.

SHRADY, George Frederick, of New York City, was born January 14, 1837. He comes from American parentage antedating the Revolution, in which both of his grandfathers, who were natives of New York, took part. He received his literary education at New York College. He graduated also at the College of Physicians and Surgeons, in New York, in 1858, and from the Surgical Division of the New York Hospital, where he was an *Interne* in 1859, after which he settled in New York and commenced practice. During the war he occupied the position of acting assistant surgeon in the United States Army. In 1866 the *Medical Record* was founded, and he became its editor-in-chief, which position he continues to hold. Yale College conferred on him the honorary degree of A. M. in 1869, for promoting the interests of medical literature. He was appointed one of the Surgeons to the Presbyterian Hospital, New York, in 1877; is

a member of the New York Pathological Society, and has served as its secretary for many years; member of the New York Academy of Medicine, permanent member of the Medical Society of the State of New York, and of the Medical Society of the County of New York. He has contributed a number of articles on surgical subjects to the *New York Journal of Medicine*, and from 1860 to 1864 was associate editor of the *American Medical Times*. Since the establishment of the *Medical Record* Dr. Shady has contributed various editorial and miscellaneous articles to its pages, and acquired a world-wide reputation as a medical journalist for, by his wise and judicious management of that periodical, it has attained a circulation and practical value to the medical profession during the past twenty-five years, which is unsurpassed by any other publication in this country, and which ranks second to no other in Europe.

SILLIMAN, Benjamin, of New Haven, Connecticut, son of Benjamin and Harriet (Trumbull) Silliman, was born in that city December 4, 1816, and died there January 14, 1885. After a sound preparatory training he entered Yale College in August, 1833, and graduated in 1837. Among his classmates were Samuel J. Tilden, William M. Evarts, Edwards Pierpont, James D. Whelpley, Morrison R. Waite, and others distinguished in professional and political life. After graduating he was employed as assistant and teacher in the departments of chemistry, mineralogy and geology in Yale College, and in original studies and investigations in these sciences, and their practical applications in the arts. In 1845 he was appointed at Yale Professor of Chemistry Applied to the Arts, the first appointment in the "Fourth Department of Philosophy and the Arts" then inaugurated. The history of this department is interesting, and is entitled to some space here, as in its later form the institution is destined to become Professor Silliman's principal monument. In 1842 he commenced to receive private pupils in analytical chemistry and mineralogy, in an apartment of the old laboratory in Yale College, which he had fitted up at his own expense for this purpose, and to conduct original investigations in science. Previous to this time there had been no provision made for the instruction of advanced students in physical and chemical science either in Yale College or elsewhere in the United States, and the academical students had been instructed in chemistry almost exclusively by public lectures. These studies under Mr. Silliman were entirely outside the college curriculum, and for some years the college took no cognizance of the effort. The students it brought to the university were not even recognized as such, nor for some years did their names appear in the college catalogue. But in 1846 a memoir asking for the official recognition and organization of the new department of advanced science teaching was presented to the corporation of the college, and at Mr. Woolsey's suggestion a committee was appointed, and the plan widened to embrace advanced instruction in other subjects. This committee reported in 1847 the plan of a "Fourth Department," devoted to philosophy and the arts, the first appointments to which had already been made in 1846, Mr. John P. Norton to agricultural chemistry, and Mr. Silliman to chemistry applied to the arts. The

Yale Scientific School, as then organized, commenced its operations in 1847, opening its laboratories in the old presidential mansion. The entire cost of fitting and furnishing the laboratories, apparatus, libraries, and cabinets was defrayed out of the private means of the two professors. But the pupils came in goodly numbers, and to-day the Sheffield Scientific School, into which the movement has developed, embraces more professors than the old academic college had in 1837, with a role of over two hundred students, and with constantly increasing power and endowments. In 1849 Dr. Silliman was elected to the Chair of Medical Chemistry and Toxicology in the medical department of Louisville University, and its duties he discharged for five winters. In 1854 he resigned this position to take up the instruction in chemistry in the Academy and medical departments at Yale, made vacant by the resignation of his father. His chair was known as that of General and Applied Chemistry. He resigned his duties in the Academic department in 1870. Apart from his collegiate labors, Professor Silliman had given much time to other means for the diffusion of scientific knowledge. In 1845-46 he gave, in New Orleans, a course of lectures on agricultural chemistry, upon the invitation of the leading professional and commercial men of that city, and this, it is believed, was the first course of lectures on that subject given in the United States. In 1853 he accepted charge of the chemical, mineralogical and geological department of the Crystal Palace in New York. He was one of the fifty original members named in the act of Congress in 1863 incorporating the National Academy of Sciences, and served the government in this capacity during the war upon some important commissions. He was also one of the trustees of the Peabody Museum of Natural History, and a member of numerous scientific societies on both sides of the Atlantic. In 1849 he received the honorary degree of M. D. from the University of Charleston, South Carolina. In 1868 he parted with his private cabinet of minerals, of his own collecting, to Cornell University, where it is now exhibited as the "Silliman Cabinet." He made important additions to the mineralogical collections of Yale College and to the metallurgical cabinet of the Scientific School, the results of his various explorations. These were largely prosecuted in California, which he visited in 1864, and again in 1867 and 1872, for professional work in the mines and for mineralogical and geological researches. His visit in 1867 was made the opportunity by the College of California to secure him for the delivery of the annual oration, which was subsequently published. The funds by which the mineralogical cabinet of the late Baron de Lederer was added to Yale College collections in 1843 were solicited by him. For several years previous to his death Dr. Silliman had been much occupied as a witness in the courts, having been employed in many important causes in which scientific testimony and investigation were called for. His aid was also constantly invoked in various matters connected with the practical arts where a knowledge of scientific principles was involved. In 1848 he became director of the New Haven Gas Works, and served in that capacity and as chairman of the Committee on Works and Distribution for

many years. He also served as a member of the Common Council of that city from 1845 until 1849, and did important work in behalf of municipal government. The honorary degree of M. D. was conferred on him by the University of South Carolina in 1849, and that of LL. D. by Jefferson College in 1884. From 1838 until 1845 Prof. Silliman was, with his father, assistant editor of the *American Journal of Science and Arts*, and was associated with James D. Dana as its editor from the latter year until his death. His scientific papers were nearly one hundred in number, of which over fifty were published in the *American Journal of Science and Arts*, and they cover a wide range of topics. In addition, he published "First Principles of Chemistry" (Philadelphia, 1846 revised edition 1856), of which more than 50,000 copies were sold; also "Principles of Physics" (1858, revised edition 1868), and in 1875 was issued his "American Contributions to Chemistry." He was married in 1840 to Susan H. Forbes, of New Haven, who bore him seven children.

SIMMONS, Gustavus Lincoln, of Sacramento, California, of Puritan and Revolutionary descent, was born in Hingham, Plymouth county, Massachusetts, March 13, 1832. He received his preliminary education in the schools and academy of his native town, and in 1849—soon after the discovery of gold, when but seventeen years of age—he became a pioneer to the Pacific coast, rounding Cape Horn, to join a brother-in-law—the late Dr. Henry B. May—in San Francisco. Soon after his arrival he removed to Sacramento, and commenced his medical reading while acting as assistant dispensing clerk to his relative. When twenty-one years of age he returned to the East, and entered the Tremont Street Preparatory Medical School in Boston, and the Medical Department of Harvard University, receiving his degree from the last-named institution in 1856. He established himself in Sacramento, and has acquired a large practice in Central California. With a view of making a specialty of surgery, he has made two visits to Europe, on each occasion spending a winter in the hospitals of the leading cities. He has, among his notable reported cases, ligated the common carotid, wired the tendon Achilles, eight times performed tracheotomy, and in 1858 reported the first case of ovariectomy in California. He is a member of the American Medical Association, and served upon the committee of arrangements at the California meeting of that body in 1871, a member of the California State Medical Society, of the Massachusetts State Medical Society, of the Sacramento Society for Medical Improvement, and the Sacramento Board of Health. He has been Surgeon of the Sacramento County Hospital, brigade surgeon of the Fourth Brigade National Guards, California, and secretary of the city board of education. His writings have been confined to reports of medical societies, and papers in the medical periodicals. He was married in June, 1863, to Celia, daughter of Rev. Peter Crocker, formerly of Richmond, Indiana.

SIMPSON, James, of San Francisco, California, was born in the northern part of Maine, August 12, 1829. He removed at an early age with his parents to Quebec, Canada, where he was educated and resided until twenty years of age. He studied medicine in

the Albany Medical College, New York, and also in the University of the City of New York, graduating from the latter in 1855. He practiced awhile at New Brunswick, and at Calais, Maine, removing to California and locating at Timbuctoo, Yuba county. Thence moved to Grass Valley, Nevada county, and in 1873 in consequence of failing health, visited Europe, and returning settled in San Francisco, where he has since remained engaged in a successful general practice of medicine. He is a member of the American Medical Association, of the California State Medical Society and of the San Francisco Medical Society. In May, 1876, he was elected president of the Board of Medical Examiners of the State Medical Society, under a law just passed to regulate the practice of medicine in the State; was appointed in 1874 a member of the Board of Health of San Francisco by the Governor, and retained both these positions for several years. In 1878 Dr. Simpson was elected Professor of Materia Medica and Therapeutics in the Medical Department of the University of California, and has filled this chair creditably to himself and to that institution.

SMITH, A. Alexander, of New York City, was graduated M. D. at the Bellevue Hospital Medical College, New York City, in 1871. He is now Professor of Materia Medica, Therapeutics and Clinical Medicine in that institution, Visiting Physician to Bellevue Hospital, Consulting Physician to Gouvener Hospital and the Hospital for Ruptured and Crippled. He is an active member of the American Physicians and Clinicians' Academy of Medicine, American Climatological Society, and New York Medical Society.

SMITH, Eugene, of Detroit, Michigan, was educated in medicine at the University of Buffalo, New York, from which institution he received the degree of M. D. in 1866, since which time he has devoted special attention to the study and treatment of diseases of the eye and ear. He is now Professor of Ophthalmology and Otology in the Detroit College of Medicine, Surgeon to St. Mary's Hospital, and St. Mary's Hospital Free Eye and Ear Infirmary. Dr. Smith is a member of the American Medical Association, and ex-president of the ophthalmic section of that organization. He is also an active member of the Detroit Medical and Library Association, and of numerous other medical societies.

SMITH, John Lawrence, of Louisville, Kentucky, was born December 17, 1818, near Charleston, South Carolina, and died in the former city October 12, 1883. His father was a Virginian, who had moved to the last-named State. The subject of this sketch received a classical education in the Charleston College, after which he was sent to the University of Virginia. Here he at first devoted much attention to pure mathematics, later concentrating himself upon the higher branches of physics, mixed mathematics and chemistry. He chose civil engineering as a profession, and after two years' study was employed as one of the assistant engineers on the then projected railroad between Charleston and Cincinnati. This pursuit not proving congenial, he began to study medicine, and in three years graduated at the Medical College of South Carolina, March, 1840. Then he went to Europe, and pursued his medical studies for an additional

three years, continuing his attention to those departments which first enlisted his scientific affections. He studied physiology under Flourens and Longet; chemistry under Orfila, Dumas and Liebig; physics under Pouillet, Desprez and Becquerel; mineralogy and geology under Elie de Beaumont and Dufrenoy. He returned to America in 1844, having already begun to earn a reputation in original scientific researches, principally in connection with fatty bodies. His paper on "Spermaceti," in 1842, at once gave him standing as an experimental inquirer. On arrival in Charleston he began the practice of medicine, and gave a course of lectures on toxicology. The State of South Carolina appointed him assayer of the bullion that came into commerce from the gold fields of Georgia, and he also gave much time to agricultural chemistry, and researches in geology and mineralogy. His attention was early drawn to the marls on which Charleston stands, and he was one of the first to ascertain the true character of this immense agricultural wealth. He published a paper on the subject, with the correspondence of Prof. Bailey, Microscopist of West Point. He also pointed out the large amount of phosphate of lime in these marls, from which there are now obtained immense quantities of phosphatic nodules. During these labors he made a thorough investigation into the meteorological conditions, character of soils and culture affecting the growth of cotton. In consequence of his report on this subject President Polk, in 1846, appointed him, in response to a request of the Sultan, to teach the Turkish agriculturists the proper method for successful management of cotton culture in Asia Minor. Finding, on arrival in Turkey, that an associate in the commission had induced the Turkish Government to undertake the culture of cotton near Constantinople, Professor Smith declined to connect his name with an enterprise he was satisfied would be a failure, and which proved so. He was about to return home when the Turkish Government tendered him an independent appointment, that of mining engineer, with most liberal provisions. This position he filled during four years, and he performed his duties with such signal success that the Turkish Government heaped upon him the decorations of the empire, and very costly presents. The results of Professor Smith's labors are a permanent advantage to the empire, and it has received ever since 1846, and continues to receive, large revenues from his discoveries of emery, chrome, ores, and coals, within the domains of Turkey. His papers on these subjects, read before learned societies, and published in the principal scientific journals of Europe and America, gave him a high position among scientific men. His labors in Asia Minor on the subject of emery, which he was the first to discover there, led to its discovery in America; and in Massachusetts and North Carolina a large industrial product of emery is now carried on. In the scientific journals of this country, the papers on emery and corundum recognize the successful researches of Professor Smith as having done almost every thing for these commercial enterprises. These discoveries of emery in Asia Minor destroyed the rapacious monopoly of the article at Naxos, in the Grecian Archipelago, increased the amount of emery used five or six fold, with a corresponding reduction in price. In many of the

arts of life the free use of emery, or corundum, has become a necessity, but this free use of these articles would have been greatly retarded without a very material reduction in price. While in the employment of the Sultan of Turkey, Professor Smith investigated a great variety of Turkish resources, besides those directly within the purview of his appointment as mining engineer. His paper on the "Thermal Waters of Asia Minor," is one of extreme interest and great scientific value. In 1851 he invented the inverted microscope, an important improvement; for, while it may do the work of any other microscope, there are very interesting fields of research which can be cultivated by no other instrument. Dr. Carpenter, in his work on "Physiology," bears strong testimony to its value. After Professor Smith's return from Turkey, his *alma mater*, the University of Virginia, elected him Professor of chemistry, and, while discharging the duties of that chair, he, in connection with his assistant, George J. Brush (subsequently one of the chief professors in the Sheffield School of Science), performed a much-needed work in revising the Chemistry of American Minerals. A full account of these labors was given in the *American Journal of Science*, and since then in a valuable and interesting work containing the scientific researches of Professor Smith, recently published by J. P. Morton & Co., Louisville. After marrying in Louisville, the youngest daughter of the Hon. James Guthrie, Professor Smith adopted that city as his home. He was elected, soon after settling in Louisville, to the chair of chemistry in the Medical Department of the University of Louisville, a position which he held for a number of years. After resigning that position he took scientific charge of the gas works of Louisville. He had a private laboratory where he devoted several hours each day, and continued his original research. He was one of the commissioners to the Paris exposition of 1867, and made an able report on "The Progress and Condition of Several Departments of Industrial Chemistry." It is very nearly exhaustive of the important subjects to which it is devoted. He was again appointed commissioner to Vienna in 1873, and discharged his duties with his usual ability. His important original researches number fifty, and his scientific reports were numerous. He was elected president of the American Association for the Advancement of Science in 1872, and was president of the American Chemical Society in 1877. In 1879 he was elected corresponding member of the Academy of Sciences of the Institute of France to succeed Sir Charles Lyell. The Baptist Orphan Home of Louisville was founded and largely endowed by him. At the Centennial exhibition in Philadelphia in 1876 he was one of the judges in the department relating to chemical arts, and contributed a valuable paper on "Petroleum" to the official reports. He was a member of the American National Academy of Sciences, of the Chemical Society of Berlin, of the Chemical Society of Paris, of the Chemical Society of London, of the Société d'Encouragement pour l'Industrie Nationale, of the Imperial Mineralogical Society of St. Petersburg, corresponding member of the Boston Society of National History, of the American Academy of Arts and Sciences, of the American Philosophical Society, American Bureau of Mines, the Société

des Sciences et des Arts de Hainaut, the Royal Society of Göttingen, a Chevalier de la Légion d'Honneur, member of the order of Nichan Iftahar of Turkey, a member of the order of Medjidiah of Turkey, and Chevalier of the Imperial order of St. Stanislas of Russia. He founded and edited the *Charleston Medical Journal* in 1846, under the name of the *Southern Journal of Medicine and Pharmacy*, which he turned over to Dr. Gaillard when he went to Turkey. His published papers were about 150 in number. The more important of them were collected and published by him under the title of "Mineralogy and Chemistry, Original Researches" (Louisville, 1873, enlarged edition, 1884). Mrs. Smith transferred to the National Academy of Sciences \$8,000, the sum that was paid by Harvard University for Dr. Smith's collection of meteorites, the interest of which is to be expended in a "Lawrence Smith Medal" valued at \$200, and presented not oftener than once in two years to any person that shall make satisfactory original investigations of meteoric bodies. The first presentation of this medal was April 18, 1888, to Prof. Hubert S. Newton.

SMITH, Samuel Parrish, of Prattville, Alabama, was born near Clinton, Georgia, September 8, 1814. His father, moving to Alabama in 1818, was one of the early pioneers of that State. Dr. Smith's early education was obtained at the common schools in the neighborhood, and his medical studies were pursued under the supervision of Dr. J. W. Withers, of Washington, Alabama, at the Jefferson Medical College, during the winter of 1835 and the summer of 1836, where he took partial courses in anatomy, materia-medica, chemistry, and practice, also paying special attention to the lectures of Dr. W. P. C. Barton on medical botany. He attended the clinics of the Pennsylvania and Blockley Hospitals, and took a full course at the Jefferson College the ensuing winter. He returned to Alabama in the spring of 1837, and commenced practice with his former preceptor. In November he visited New Orleans, and entered the medical department of the University of Louisiana, from which institution he graduated the following spring. Returning to his former location he continued in practice there till 1845, when he settled in Prattville in a general surgical and medical practice. Among his more important cases, he has successfully operated on a young lady for strangulated femoral hernia; also for the removal of a shawl-pin from the trachea of a lady, where it had lodged during laughter, an operation which took three hours to perform. There has also come under his experience a case of natural childbirth, but where, in the endeavor to remove the placenta, he found, incorporated in the secundines, a dead fetus, the cause of a supposed miscarriage with which his patient had been threatened in the fifth month of her pregnancy, leading him to the supposition that both children were conceived at the same time; also a case in which a full-blooded negro woman had given birth to twins, one within fifteen minutes of the other, the first born being black, flat-nosed thick-lipped, kinky-haired, and black-eyed, and the second being a light mulatto, with straight red hair and hazel eyes, the case illustrating the fact that the children may have had different fathers. He is a member of the Autauga County

Medical Society, of the Alabama State Medical Association, and of the American Medical Association. He was first president of the County Medical Society, and has been Counselor of the State Association. His contributions to medical literature have been a report on the "Medical Botany of Autauga County," a report of the "Medical History of Prattville and Vicinity," and a report upon the "Surgery of Autauga County." He has been road commissioner and trustee of schools of his township, and counselor of the town of Prattville; also Examining Surgeon for various life insurance companies. Dr. Smith is one of the oldest and most esteemed members of the medical profession in the State of Alabama, having been continuously engaged in the general practice of medicine and surgery for a period extending over a half century.

SOMERS, Andrew B., of Omaha, Nebraska, was graduated M. D. at the College of Physicians and Surgeons, New York City, in 1872, since which time he has been engaged in an extensive and successful practice of general medicine and surgery. He is now Physician to the Methodist and Presbyterian Hospitals, Omaha; Surgeon for the Employers' Liability Assurance Corporation, and Health Commissioner of Omaha. He is an active member of the Nebraska State Medical Society, Missouri Valley Medical Society, Omaha Medical Society and the American Public Health Association.

SPEAR, Edmund D., of Boston, Massachusetts, was educated in medicine at the Harvard Medical School, and was graduated M. D. from that institution in 1874, since which time he has devoted special attention to the study and treatment of diseases of the eye and ear. He is now Aural Surgeon to Massachusetts Charitable Eye and Ear Infirmary and Aural Surgeon to Out-Patient Department of the Boston City Hospital. He is an active member of the American Otological Society, Massachusetts Medical Society, Boston Society for Medical Observation, Boston Society for Medical Improvement and the Harvard Medical School Association.

SPENCER, Horatio N., of St. Louis, Missouri, was educated in medicine at the College of Physicians and Surgeons of the City of New York, from which institution he received the degree of M. D. in 1869, since which time he has devoted special attention to the study and treatment of aural diseases. He is now Professor of Diseases of the Ear in the Missouri Medical College and the St. Louis Post-Graduate School of Medicine. Dr. Spencer is an active member of the American Otological Society.

SPITZKA, Edward Charles, of New York City, was born in that metropolis, September 20, 1851. He was educated in New York, and received a liberal education in the New York Free Academy (now City College). He then studied medicine in the University of the city of New York, graduating from the Medical Department on February 21, 1873. After passing over two years in German universities he settled in his native city, having, while abroad become assistant to Professor Shenk in the latter's laboratory for embryology and histology at Vienna. In August, 1877, he was awarded the Tuke Prize of one hundred guineas, by the Medico-Psychological Association of Great

Britain, for the best essay on "The Somatic Etiology of Insanity," in international competition. In 1878, by his paper on the action of strychnine, he won the William A. Hammond Prize, which was awarded by the American Neurological Association. He is chiefly engaged in the practice of mental and nervous diseases, as well as in anatomical, embryological, and histological researches. He is a member of the American Neurological Association, vice-president of the New York Neurological Society, member of the Medical Journal and Library Association; also of the New York County Medical Society, and was a member of the International Medical Congress which met in Philadelphia, in 1876, and before which he read a paper. He was vice-president of the Section on Neurology at the Ninth International Medical Congress, in 1887. He was Professor of Medical Jurisprudence and Nervous Diseases in the New York Post-Graduate Medical School and Hospital, from 1881 until 1884; he then became Consulting Physician to the Northeastern Dispensary, and is now (1893) Physician to the Department of Nervous Diseases in the New York Polyclinic, and Physician to the Department of Nervous Diseases in the Metropolitan Throat Hospital. "Dr. Spitzka has been frequently consulted as a medical expert in cases where insanity, or injury of the brain or spinal cord was a subject of litigation. Conspicuous among these was his attitude in the trial of President Garfield's assassin, where both prosecution and defense endeavored to retain his services, but failing, secured his attendance through an attachment. He then testified to the prisoner's insanity, and was the only expert that did so." His original investigations in the anatomy, and physiology of the nervous system, and success in the treatment of all diseases relating to his specialty have gained for him a national reputation. He is the author of "A Second Origin of the Abducens," "On the Connection Between the Symptoms of Insanity and the Lesions on which they Depend," Transactions of the International Medical Congress; "The Psychological Pathology of Progressive Paresis," and "Contributions to Encephalic Anatomy." He was one of the editors of the *American Journal of Neurology*, from 1881 until 1884. He published a "Treatise on Insanity," New York, 1883, and the sections on diseases of the spinal cord and on inflammation, anemia, and hyperemia of the brain in Pepper's "System of Medicine," Philadelphia, 1887, were written by Dr. Spitzka.

STAFFORD, James, of New York City, was graduated in medicine at the medical department of the University of Vermont in 1885, and received an *ad eundem* degree from the medical department of Columbia College, New York City, in 1886. He is now Attending Gynecologist to the Northern Dispensary, Assistant Attending Gynecologist to Bellevue Hospital Out-Patient Department, and Clinical Assistant in Gynecology to the New York Polyclinic. Dr. Stafford is a member of the Alumni Society of Bellevue Hospital, New York County Medical Association, and other leading medical societies in his city.

STANLEY, Charles Wesley, of Chicago, Illinois, was born in Conway, New Hampshire, May 28, 1828, and died in New York City October 26, 1893. He received his early education at the Oneida Institute, and was gradu-

ated in 1866 from the medical department of the University of New York. In 1870 he removed to Chicago, where for over twenty years he was actively engaged in the practice of his profession. Dr. Stanley was quiet and retiring in disposition, and a devoted student. As a physician he was capable and sympathetic, and by his kindly nature he endeared himself to all with whom he came in contact.

STANTON, Otis, of Washington City, D. C., was born in Strafford, New Hampshire, October 22, 1837, and died in the former city April 9, 1890. He obtained his medical education at the Bowdoin College, graduating in the class of 1862. In that same year he became Acting Assistant Surgeon U. S. Army, and served in and around Washington until the latter part of 1865. He then took up practice at that city, giving special attention to gynecology. He was a member of the Board of Directors of the Columbia Hospital for Women and Lying-in Asylum. He was a corresponding member of the Gynecological Society of Boston.

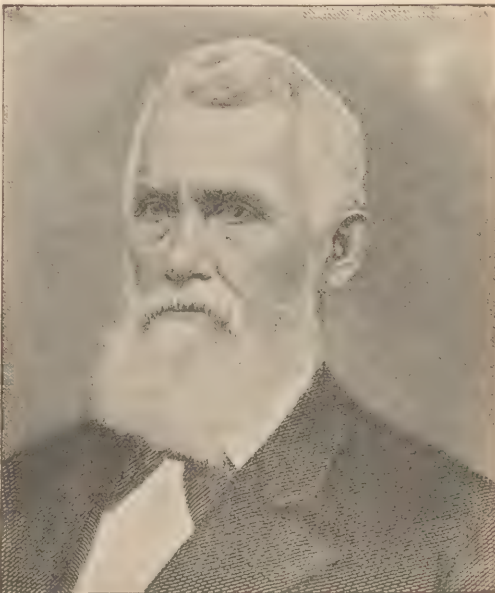

STAPLES, George McLellan, of Dubuque, Iowa, of English and Scotch-Irish descent, was born in Buxton, Maine, April 26, 1827. Having graduated A. B. from Waterville College, in 1849, he attended medical lectures at Bowdoin College in 1851 and at the Harvard Medical School in 1854, and from the latter institution received his degree of M. D. in March, 1855. Previous, and for a few months subsequent to his graduation, he practiced at Farmington, Maine, removing thence in January, 1856, and establishing himself at Dubuque. In November, 1861, he was commissioned surgeon of the Fourteenth Iowa Regiment; was Acting Medical Director of the Right Wing, Sixteenth Army Corps, from March, 1864, to November, 1864, and was honorably discharged from the service with the brevet rank of lieutenant-colonel of volunteers. He then returned to Dubuque, and has since acquired one of the largest and most lucrative practices in the State of Iowa. While engaging in a general practice, he has given especial attention to surgery, and has performed numerous capital operations, including the first successful case of ovariectomy in the Dubuque region. He is a member of the Dubuque Medical Society, president in 1859 and 1871; was a delegate to the American Medical Association in 1872, and has since been a member of that organization. Of his professional publications may be mentioned "Hysteria," "Physiological and Therapeutical Properties of Veratrum Viride," "Amputation at the Knee-Joint," "Medical Constitution of Diseases," and reports of surgical cases. He married, August 20, 1854, Abbie C., only daughter of Dr. Allen Phillips, of Farmington, Maine.

STEVENS, Thaddeus M., of Indianapolis, Indiana, was born in that city August 29, 1829, and died there November 8, 1885. He was the son of a distinguished jurist, and nephew of the illustrious statesman for whom he was named. He was educated in the private schools of his native city, and studied medicine under the preceptorship of the late Dr. J. S. Bobbs. He first attended the Indiana Central Medical College, and then entered the University of Pennsylvania, from which institution he received the degree of M. D. in 1853, settling first at Fairland, near his native city, but soon afterward established himself at Indianapolis, where he became a physician of rec-

ognized skill, and attained eminence in his profession. In 1870 he was Professor of Toxicology, Medical Jurisprudence and Chemistry in the Indiana Medical College, and in 1874 occupied the same chair in the College of Physicians and Surgeons. His taste was rather for medical literature than practice. At one time he edited the *Indiana Medical Journal*, and his pen was always ready for the leading medical subjects. The last ten years of his life were devoted to State medicine, and he was largely influential in the establishment of the State Board of Health, of which he was the first secretary and executive officer. And his last effort for the public good was to establish a State Hospital, for the benefit of the sick poor. He was a member of the County, State and Tri-States Medical Societies, and of the American Medical, and American Public Health Associations. He was a warm friend of the younger members of the profession, and favored the idea of promoting a younger class of men to the honorable positions in medical organizations. Dr. Stevens left a wife and two young sons to mourn his death.

STEVENSON, Alexander C., of Greencastle, Putnam county, Indiana, was born in Woodford county, Kentucky, November 21, 1802, and died January 2, 1889, at the advanced age of eighty-seven years. He was the eldest son of James Stevenson and Margaret (Campbell) Stevenson. His mother was a daughter of Alexander Campbell, a pioneer of Kentucky. His paternal grandfather, Benjamin Stevenson, of the Eastern shore of Maryland, was, during the War of the Revolution, a soldier of the patriot army, and soon after that conflict removed from Maryland into Kentucky, when the latter was a territory of Virginia. His son James entered the United States Army in the War of 1812, as a private soldier, and in that struggle endured such hardships that he ever afterward remained an invalid. This fact made the subject of this sketch, while yet a boy, the stay and support of the family, compelling him to supervise the servants and market the farm products. Diligence, even then, characterized him, and he often arose at 2 o'clock in the morning to be first with his products in Lexington, a market nine miles away. This training and constant labor gave to him a splendid physical and intellectual manhood. Educational advantages he had but sparingly. The common schools of Kentucky at that day were but indifferent, and seminaries and colleges were distant and expensive. He who there acquired learning usually relied upon himself and the private tutor. The latter facility he had not, and books were scarce. He therefore made nature his text-book, and acquired wisdom and diligence from her precepts. Himself a laborer and brought in contact with slavery, the injustice of that institution made strong impressions upon his mind, and determined him to seek a home in a land of free institutions, where to labor was honorable. Impelled by principle, he at the age of nineteen years, and in 1821, left Kentucky and went to Indiana, seeking a location. Railroads there were none—clay roads were but trails, and difficult even for horsemen. Young Stevenson entered lands northward from where Rockville now stands. He was not disappointed with the country, and from that time regarded Indiana as his home. After satisfactorily "prospecting" the Hoosier

State, he returned to his family in Kentucky, where he was induced to study medicine. On completing his course he entered Transylvania University at Lexington, Kentucky, and subsequently graduated M. D. at that institution in the days when the illustrious Dr. Benjamin Dudley was the head of the school and in the height of his surgical renown. After Dr. Stevenson had received his medical degree he practiced his profession for a short time in his native State, but in 1826 he set his face for his final residence in Indiana. On returning to the latter State he was favorably impressed with the situation and advantage of Greencastle and the "blue grass" lands which surrounded that town. These considerations induced him to cast his lot with the people of that place, where he remained engaged

A. C. Stevenson

in the practice of his profession and in other pursuits for a period of more than three-score years. It has been said by one familiar with the early history of Dr. Stevenson that he endured all the hardships and struggles common to pioneer settlers of western States. On his arrival at Greencastle he was without money, friends or acquaintance, but he had good health, excellent medical attainments and energy, with determination to succeed, reinforced with all the natural shrewdness and business capacity requisite to bring about that result. Riding a borrowed horse, loaned by a relative, he halted at the village tavern and said to the proprietor: "I am a doctor; my name is Stevenson, from Kentucky. I desire to locate with you, but have no ready means to pay my way; but if you will board me and my horse for the first six months and use your influence for me in the community, I will give you half I make." As there were two physicians from the East well stocked with all the necessary outfit required to practice medicine in that early day, already established in that locality the tavern-

keeper hesitated to accept his proposition, but told him to stay all night with him anyhow and he would think the matter over. Being favorably impressed with his personal address and conversational powers he concluded the following morning to accept the arrangement. Dr. Stevenson was soon actively engaged in the treatment of diseases incident to a new country. It is related that shortly after he began practice he was sent for one night in the dead of winter. The case was urgent and the weather intensely cold. In response to the call he sprang from his bed, hastily dressed, taking the blanket upon which he had slept and wrapping it around him to keep from freezing, rode several miles in that way through the wilderness, reaching the patient in time to save his life from an attack of dangerous illness. Numerous instances might be cited to show that he was a man for emergencies, and he was not required to wait long until an opportunity was presented to show his judgment, decision and ability as a surgeon. A man accidentally injured in falling a tree was seen by the two physicians mentioned, who decided that the case was beyond relief and entirely hopeless. A large crowd of men surrounded the man, and some one suggested sending for Stevenson, but others said it would be useless, as he had no instruments and was too young to know much anyhow. But he was finally sent for, but without recognition on the part of the other physicians. He examined the man carefully, finding him in a collapsed condition, suffering from a compound comminuted fracture of his right femur. He decided that the case was not necessarily fatal, but that the limb must be amputated. This was before the days of chloroform, ether or other anesthetics of modern surgery. While waiting for reaction to occur he sent for a fine-toothed carpenter's saw, which was brought from the house of a distant neighbor, and taking a sharp hunter's knife from the belt of a bystander he proceeded to remove the limb with these crude but efficient instruments in the most scientific manner, and the man made a good recovery. From that time on his skill was recognized and his opinion was valued throughout his section of the State. He rapidly rose to eminence in his profession, and as a physician and surgeon was without a peer. His parents came to him in Indiana, and he, with them, brought from Kentucky the slaves owned by his father and gave to them their freedom, and they remained in Indiana until after the Constitution of 1850 was adopted. That instrument, as he thought, restrained them of liberty and he aided them to a home in the colony of Liberia. At an early period of professional life his practice so frequently brought him in contact with the retail liquor traffic as to compel an investigation of it. This investigation convinced him that drinking was an unmitigated evil and the traffic a most flagrant wrong. In his own life total abstinence had been the rule, and he felt that *moral suasion* was the true remedy. A man of strong will and unquestioned courage, these convictions soon impelled him into conflict with intemperance, and this conflict had been life-long. He it was who delivered the first temperance lecture in his county, and the novelty of it brought friends and foes to hear. Men brought with them whisky in bottles, and drank bumpers to each other and

to the speaker, while he, in nothing daunted, hurled anathemas at the traffic, and deplored the evils of intemperance. Some who heard him reformed, and afterwards became Washingtonians; others continued their evil course, and met the fate of the drunkard. In early life he became addicted to the use of tobacco, and in later years to that of opium to counteract the effect of a painful disease. To evidence what will would do for an evil practice, he declared he would quit both, and he did. He never returned to either again. He often referred to this fact to show that a man could control his appetite for stimulants. Careful investigation and thorough study convinced him that free institutions were wholly dependent on morality, integrity and intelligence. This conviction made him the friend of common schools and higher education. In the securing of Asbury University for Greencastle he was a liberal and active co-worker and contributor; became a member of its first board of trustees; saw ten continuous years of service as such, for three years of which he was the president of the joint board. He was an active participant in securing free schools for Indiana, and did much to bring his adopted county into line in favor of that system. Some educational opinions then entertained by him were in advance of the times. Insisting that the common schools should be thorough and facilities for higher education ample, he, in an address, urged the necessity for schools in which complete training in agriculture and the mechanical arts could be acquired. This brought him in conflict with some leading educators, but time has demonstrated the wisdom of his thought, as "Rose Polytechnic Institute" and "Purdue University" evidence; and he always insisted that the idea then advanced by him would remain of imperfect execution until capital and philanthropy shall equip and thoroughly endow an institution wherein the children of the State who choose may, without cost, acquire any of the skilled mechanic arts and handicrafts without the influence or aid of guilds or trades-unions. Eminent as a physician, his lucrative practice enabled him to acquire a large estate in wild lands. This he did preparatory to returning to agriculture as a profession. From these lands the inferior timber was removed, and the lands set in blue-grass. This, at the time, was considered a waste by many, but he reaped from it afterwards abundant harvest of rich pasture and fat cattle. Though engaged in an arduous profession, he, through study, became a believer in, and an advocate of, the American system of Mr. Clay. This brought him early into political prominence, and as he had the courage of his convictions, the result was that in 1831, 1832, 1844 and 1846 he represented his county in the Indiana House of Representatives, and in the last term was Speaker of the House. In 1839, 1840 and 1841 he was the Senator from his county, and was, in 1846, the Whig candidate for Lieutenant Governor of Indiana. In 1850 he was elected to the convention which framed the Constitution of Indiana in 1851, and was active in the deliberations of that body. His services in this convention closed his political career. He sympathized with labor and with men too intensely to readily reconcile himself to the compromise measures of 1850, and never again became a candidate. In 1860, however, he

earnestly advocated the election of Lincoln, and gave to his administration an earnest, loyal and enthusiastic support. Shortly after the Civil War he was the caucus nominee of his party for United States Senator, with certainty of election to that high office, but declined the honor. In 1843 he removed from Greencastle to his farm two miles east of that town, and gave up his medical practice, as rapidly as his patients would permit. Thenceforward he sought to make agriculture and stock raising his profession, declaring that he could accomplish more in this for himself and his race than in any other calling. For a time he edited an agricultural department in a newspaper, and in this way, as well as in public addresses, sought to introduce better modes of farming. More through his efforts than that of any other, the Putnam County Agricultural Society was organized and continued. He introduced into the county and bred large flocks of Spanish merino sheep, and for a time made sheep husbandry most prominent. While thus engaged, he endeavored to organize an incorporated company for the purpose of importing and breeding Shorthorn cattle. Not succeeding in this, through defects in Indiana law, he began that enterprise alone. In 1848 he purchased and brought into Putnam county the first thoroughbred Shorthorn cattle. In 1847 he was commissioned, by Governor Whitcomb, member of the Indiana State Board of Agriculture. In this position he assisted in putting into operation the State Board proper, and was himself a member of the board for several years, during three of which he was its honored President. In this position his character, ability and energy gave him high rank as a thinker, organizer and friend of agriculture. It was while he was a member of the board that the plans were matured and action taken which have enabled that body and its agencies to accomplish so much for the stock-breeding, agricultural, mechanical and mineral interests of Indiana. And in these labors he assumed his share of responsibility, doing his full portion of the work. The field opened to his observation in this position impressed more fully upon his mind the importance to Indiana interests of thoroughbred Shorthorn cattle. In 1853, at his own instance and cost, he went to England, inspected the principal Shorthorn herds of that kingdom, bought for himself a small herd of the best, and brought them to Putnam county, and this was the first importation of Shorthorns direct from England into Indiana. The result of this venture was profit to himself and great benefit to the stock-breeding interests of Indiana. His prominence as a stock grower caused him to become prime mover in calling the Indiana Shorthorn Breeders' Convention, which assembled at Indianapolis, May 21, 1872. He was made president of the convention, and was afterward president of a national organization of the same kind. His efforts have not been confined to stock growing. He organized and built in 1867 the first gravel road in his county. The line was nineteen miles long, and is yet operated, though its success was originally doubtful. Now in the county are maintained over one hundred and fifty miles of improved roads. From 1840 until about 1880 Dr. Stevenson was a man of wealth; but, wishing to administer on his own state, he divided his lands and goods among

his twelve children, giving to each an equal share, and reserving for himself and wife a modest competency during the remainder of their lives. He was always delighted with employment, and instructed his children to labor, often himself going with them to the fields and by precept and example showing them how to accomplish the best results. He connected himself at an early period with the Methodist Episcopal Church, of which, throughout his long and eventful life, he remained a consistent member. Intellectually, Dr. Stevenson had among his contemporaries but few equals. Liberal in his views, clear in convictions, logical as a reasoner, far-sighted and methodical in business, firm and persistent in purpose, able and persuasive in argument, careful of the rights of others, of profound thought power, industrious, hospitable, courteous, courageous and generous, a good husband and a kind father, he made firm and lasting friends and led a successful life. He believed his lot had been cast in the best of the ages. He lived to see his county acquire and maintain high rank among the best in the "Hoosier State." His State (when he first knew it, the home of the savage beasts and more savage men), he had seen become sixth in the sisterhood of States; amply supplied with the avenues of trade, over which roll its and the world's commerce; a land of beautiful cities, stately mansions and happy homes; the habitat of two millions of intelligent freemen, and his country become a mighty nation of sixty-five millions of freemen, so indoctrinated and permeated with the principles of self-government and civil liberty that a majority of one commands profound respect and prompt obedience from all.

STEWART, J. Clark, of Minneapolis, Minnesota, was educated at the University of Minnesota, from which institution he received the degree of B. S. in 1875. He subsequently studied medicine and entered the College of Physicians and Surgeons, New York City, graduating M. D. in 1884. He is now Professor of Pathology in the University of Minnesota, and Consulting Surgeon to the Northwestern Hospital, Minneapolis. He is an active member of the Minnesota State Medical Society, and Minneapolis Academy of Medicine. Dr. Stewart is also Medical Examiner and Adviser for the New York Life, Fidelity, and Bankers' Insurance Companies.

STEWART, Jacob Henry, of St. Paul, Minnesota, was born in Clermont, New York, January 15, 1829, and died in the former city, August 25, 1884. He studied at Yale for three years, and was graduated M. D. from the Medical Department of the University of New York in 1851. Four years later he began the practice of medicine in Peekskill, New York, but in a short time removed to St. Paul, where he acquired the reputation of one of the most skillful physicians and surgeons in that city. In 1856 he was appointed Physician of Ramsey County, Minnesota, and from 1857 until 1863, he was Surgeon-General of Minnesota, also serving as a member of the governor's staff, and as a member of the State senate, in 1858-59. On April 17, 1861, he joined the First Minnesota Volunteers, which was the first regiment that was received by President Lincoln, thus making Dr. Stewart the ranking surgeon in the volunteer service. He remained on the battlefield of Bull Run, was paroled and allowed to care for his wounded at Sudley Church Hos-

pital until they were able to be removed to Richmond, when he was permitted to return home without exchange, "for voluntarily remaining on the battle-field in the discharge of his duty." The sword taken from him when he was made prisoner was given back to him by General Beauregard in recognition of his faithfulness to duty. On his return to Minnesota he was appointed surgeon of the board of enrollment, and held that office until the close of the war. In 1864 he was elected mayor of St. Paul, and was re-elected for four terms to that office. Dr. Stewart was the only Republican that ever held that position in St. Paul, the city being Democratic. From 1865 until 1870 he was postmaster of St. Paul, and was then elected to Congress as a Republican, serving from October 15, 1877, until March 4, 1879. He was appointed Surveyor-General of the State in 1880, and held that office for four years. Dr. Stewart was president of the Minnesota State Medical Society in 1875-76, and was also president of the Board of Physicians and Surgeons for St. Joseph's Hospital, in St. Paul.

STOKES, William H., of Baltimore, was born at Havre-de-Grace, Maryland, January 21, 1812. In 1829 he entered the junior class at Yale; was graduated thence B. A. in 1831; read medicine for a year under Drs. Donaldson and Stewart, of Baltimore; was subsequently a student in the medical department of the University of Maryland, being at the same time *Interne* at the Baltimore Infirmary; and in 1834 received from the University his degree of M. D. Soon after his graduation in medicine he was appointed Resident Physician to the Maryland Hospital, a State institution for the treatment of the insane, one of the first in this country. At the end of a year he resigned this position, and from 1835 to 1840 was engaged in a general practice in Mobile, Alabama, being from 1837 to 1840 Surgeon to the United States Marine Hospital at Mobile. The year of 1841 he spent in professional study in the hospitals of Dublin, London, and Paris, and upon returning to America in 1842 finally established himself in Baltimore, where he has since remained. In 1845 he was appointed Lecturer on Obstetrics and Diseases of Women and Children in the University of Maryland; resigned at the end of a year, and was appointed professor of the same branches in Washington University, Baltimore. In 1850 he resigned this professorship, and since that date has devoted himself exclusively to his private practice and to his duties as Physician to Mount Hope Retreat, a private insane asylum founded in 1840, and for several years thereafter known as Mount Hope Hospital, with which he has been connected since 1843. Dr. Stokes is one of the oldest and most highly esteemed physicians of Baltimore, having been engaged in the practice of his profession for a period of sixty years, and in the city of his residence for a half century. He is a member of the Medical and Chirurgical Faculty of Maryland, and of the Association of Medical Superintendents of American Institutions for the Insane.

STREET, David, of Baltimore, Maryland, was educated in medicine at the College of Physicians and Surgeons, Baltimore, from which institution he received the degree of M. D. in 1878. He is now Professor of the Principles and Practice of Medicine and Clinical Medicine in the Baltimore Medical College,

and Dean of the Faculty of that institution. Dr. Street is an active member of the Medical and Chirurgical Faculty of Maryland, Medical and Surgical Society of Baltimore, Clinical Society of Maryland and the Baltimore Medical Association.

STUCKY, Thomas H., of Louisville, Kentucky, was graduated M. D. at the Hospital College of Medicine, Louisville, in 1880. He is now Professor of Materia Medica and Therapeutics in that institution and Professor of Materia Medica in the School of Pharmacy for Women, Louisville. He is Visiting Physician to Jennie Casseday's Infirmary for Women, and Visiting Surgeon to Louisville City Hospital. Dr. Stucky is an active member of the Kentucky State Medical Association, Louisville Medical Society and Medico-Chirurgical Society of Louisville.

SUTTON, George, of Aurora, Indiana, was born in London, England, June 16, 1812, and died June 13, 1886. In 1819 his family immigrated to Cincinnati, but shortly after removed to Franklin county, Indiana, where he received his preliminary education in a country log-school-house. In 1828 he entered the Miami University, where he obtained a more extended knowledge of mathematics and the languages. In 1833 his father returned to Cincinnati, and in the same year he commenced the study of medicine in that city. In 1834 he attended a course of private lectures under Prof. S. D. Gross, then of Cincinnati; was a private student of Prof. John Eberle, and graduated at the Ohio Medical College in 1836. The same year he commenced the practice of his profession at Aurora. He was ex-president of the Dearborn County Medical Society, which was organized in 1844, and rejuvenated in 1867; of the Indiana State Medical Society, and was elected president in 1869. He was ex-President of the Rocky Mountain Medical Association. He was also delegate to the American Medical Association in 1872, and was chairman of the section on meteorology and epidemics. He was a member of the Association for the Advancement of Science; and was delegate from the Indiana State Medical Society to the International Medical Congress at Philadelphia in 1876. He was President of the Board of Trustees of the College of Physicians and Surgeons of Indiana, was Mayor of Aurora for three successive terms, a member of the Board of School Trustees for sixteen years, and filled various other responsible positions, and in every one of them was an exceptionally faithful and efficient officer. Dr. Sutton was a close observer, had a logical mind, and was full of untiring and intelligent industry. His writings, professional and scientific, have perhaps been more abundant and important than those of any other physician in Indiana. It is impossible to enumerate them all, but his contributions to professional literature consist principally of papers as follows: "Enlarged Prostate Gland," 1840; "Epidemic Erysipelas" (black tongue), 1843; "Symptoms and Treatment of Asiatic Cholera," pamphlet, 1849; "Report on Cholera in Indiana from 1849 to 1852—Advanced Views," Transactions State Medical Society, 1853; "Report on Erysipelas," 1856; "Hog Cholera;" "Diversity of Symptoms in Scarlatina Maligna," 1857; "Experimental Researches to Ascertain the Etiology and Pathology of the Epizootic among the Swine," 1858; "Report on

Cholera," Transactions Indiana State Medical Society, 1867 and 1868; "Reports on Hip-Joint Dislocation Reduced by Making a Lever of the Femur upon a Fulcrum Placed in the Groin," Indiana State Medical Society's Transactions, 1876, and the "Reduction of a Dislocation of the Hip-Joint by the Same Method, of Fourteen Weeks and Two Days Duration;" "President's Address to the Indiana State Medical Society;" "On Man's Power over Nature, and Medicine as Means by which He Aids and Controls the Laws of Life," 1870; "Report on the Diseases of Indiana for 1873," State Medical Society; "Investigations of Trichina and Trichinosis," 1874; "Report on Trichinosis to the Indiana State Medical Society, 1875." Besides the above he was the author of papers not purely of a professional character. He was a member of the State Archeological Association of Indiana, and collected a large cabinet of antiquities, fossils and geological specimens. In June, 1838, he married Sarah Folbre, of Aurora, who bore him four sons and a daughter, but only one son and the daughter were living at the time of Dr. Sutton's death. Mrs. Sutton died in 1868.

TANEYHILL, G. Lane, of Baltimore, Maryland, was educated in medicine at the University of Maryland, from which institution he received the degree of M. D. in 1865. He is now recording secretary of the Medical and Chirurgical Faculty of Maryland, ex-president of the Baltimore Medical Association, organizer and ex-recording secretary of the Baltimore Academy of Medicine. He is also an active member of the Gynecological and Obstetrical Society of Baltimore, Clinical Society of Maryland, American Medical Association, and International Medical Congress. Dr. Taneyhill is one of the most accomplished physicians of Baltimore, and is widely known in his profession.

TAUBER, Bernard, of Denver, Colorado, was graduated M. D. at the Cincinnati College of Medicine and Surgery in 1872, and from the University of Vienna, Austria, in 1875. He was Professor of Diseases of the Throat and Nose in Miami Medical College, Cincinnati, from 1877 until 1879, and was late Professor of Physiology of the Throat and Ear, in the College of Music in the same city. Dr. Tauber is a member of the American Laryngological Association, Colorado State Medical Society, Denver Medical Association, and of numerous other medical organizations of Colorado and Ohio. His practice is limited to diseases of the throat, nose and lungs, in which specialty his skill and success are favorably and widely known.

TAYLOR, J. Howard, of Philadelphia, Pennsylvania, born in Kennett Square, Chester county, Pennsylvania, received his academic education at Kennett Square and in West Chester, in the same State, and his medical education in the Medical Department of the University of Pennsylvania, graduating from the latter in March, 1852, establishing himself first at Kennett Square and afterwards in Philadelphia. He has held the positions of Port Physician and Lazaretto Physician, and has had charge of the Municipal Hospital of Philadelphia. He entered the Union Army at the outbreak of the War of the Rebellion; he was first assigned to an organization of three months men as Regimental Surgeon; was subsequently made Brigade Surgeon, and

placed in charge of the Irish Brigade; then Surgeon-in-chief First Division, Second Army Corps; Medical Director Second Army Corps; Medical Inspector Army of the Potomac, and Surgeon-in-Charge of the Summit House United States Army General Hospital. He was subsequently brevetted Lieutenant-Colonel of United States Volunteers. At the close of the Rebellion he returned to Philadelphia, where he has since remained engaged in an active and successful practice of general medicine and surgery, and is now one of the oldest and most accomplished members of his profession in that city.

TAYLOR, Robert William, of New York City, N. Y., was born in London, England, August 11, 1842. He acquired his literary and academic education in Grace Church School, Newark, New Jersey, and enjoyed also the advantage of private tutors in classics and foreign languages; he subsequently was prepared for a professional career in the College of Physicians and Surgeons, New York, under the preceptorship of Dr. Willard Parker, graduating in March, 1868. While giving attention to general practice, he has made a specialty of the study and treatment of syphilis, skin diseases, and genito-urinary diseases, and for six years was Surgeon to the Department of Venereal and Skin Diseases of the New York Dispensary. He is a member of the Dermatological Society of New York, of the County Medical Society of New York, of the Neurological Society, of the Medical Journal Association, American Association of Genito-Urinary Surgeons, and of the American Dermatological Association; was the first treasurer of the Dermatological Society of New York, and one of the first incorporators and members thereof, corresponding secretary one year, and president two years (during one of these years was also vice-president of the American Dermatological Association in its first year, secretary in its second); and has been secretary and trustee of the Medical Journal Association. He has served as Physician to the Department of Skin Diseases of Bellevue Hospital Dispensary; was for three years Professor of Diseases of the Skin in the Woman's Medical College, New York, and was formerly Professor of Skin Diseases in the University of Vermont. He is now (1893) Professor of Venereal Diseases in the College of Physicians and Surgeons, New York City; Surgeon to the Genito-Urinary Division of Bellevue Hospital, and to the Venereal Division of the New York Charity Hospital. For the past several years he has been the reader for the *Medical Record* of New York, of works upon skin and venereal diseases, and has contributed numerous editorials to that journal. In 1874 he was elected corresponding member of the Gesellschaft für Natur und Heilkunde zu Dresden, and corresponding member of the Meigs and Mason Academy of Medicine of Ohio. He has written numerous essays and reviews upon skin diseases, syphilis and genito-urinary affections, and has also published a work upon osseous lesions of syphilis in infants and young children. His principal essays are as follows: "Serpiginous Tubercular Syphilids," "On the Papulæ Syphilides," "On Dactylitis Syphilitica," "A Clinical Lecture on the Treatment of Eczema," "On the Etiology of Infantile Eczema," "On the Xeroderma of Hebra," "On Sciatica as Caused by Syphilis,"

"On Syphilis of the Nervous System," "Clinical Notes on Lichen Planus," "On Contagious Impetigo," "Transmission of Syphilis in Circumcision," "On the Hereditary Transmission of Syphilis," "On the Treatment of Pruritis Cutaneus," which have appeared in the *Boston Medical Journal*, *New York Medical Journal*, *Archives of Dermatology*, *Archives of Science and Practical Medicine*, *American Journal of Medical Science*, *American Practitioner*, *Philadelphia Medical Times* and *New York Medical Record*. He has written the quarterly reports on general questions in syphilis for the *Archives of Dermatology* since its foundation, and also many of the resums of foreign articles in the early volumes of the *American Journal of Dermatology and Syphilis*.

TAYLOR, William H., of Cincinnati, Ohio, was graduated M. D. from the Medical College of Ohio in 1858. He is now Professor of Obstetrics in the Miami Medical College, Cincinnati, and Dean of the Faculty of that institution. He is also Obstetrician to the Cincinnati Hospital. Dr. Taylor is an active member of the American Medical Association, American Association of Obstetricians, Ohio State Medical Society and Cincinnati Medical Society. He is one of the oldest and most accomplished accoucheurs in his city, and widely known in his profession.

TAYLOR, William W., of Memphis, Tennessee, was educated in medicine at Bellevue Hospital Medical College, New York, from which institution he obtained the degree of M. D. in 1876. He is now Adjunct Professor of Obstetrics and Diseases of Children in the Memphis Hospital Medical College and Gynecologist to Lucy Brinkley Hospital. Dr. Taylor is a member of American Medical Association, Memphis Medical Society and the Tri-State Medical Society of Tennessee, Georgia and Alabama.

TEBEAULT, Christopher H., of New Orleans, Louisiana, was graduated M. D. at the Medical Department of the University of Louisiana, New Orleans, in 1862. He was Health Officer of New Orleans during 1861 and 1862. During the Civil War he attained the rank of Brigadier-General, and served in the capacity of Assistant Surgeon-General on the staff of Gen. J. B. Gordon, Confederate States Army. After the close of the Rebellion he was chosen Professor of Diseases of Women and Children in the late Charity Hospital Medical College. He is an active member of the Louisiana State Medical Association, and is one of the most accomplished physicians of New Orleans.

TENNEY, John A., of Boston, Massachusetts, was graduated M. D. at Jefferson Medical College, Philadelphia, Pa., in 1883, since which time he has devoted special attention to the study and treatment of diseases of the eye and ear, in which field of practice he has gained an excellent reputation. He is now Professor of Ophthalmology and Otology in the College of Physicians and Surgeons, Boston, and is Superintendent of the Suffolk Dispensary, and Ophthalmic and Aural Surgeon in that institution. Dr. Tenney is an active member of the Massachusetts Medical Society, Boston Therapeutic Society and other medical organizations of his city.

TERRIBERRY, George W., of Paterson, New Jersey, was appointed Medical Cadet, United States Army, during the Civil War,

serving in that capacity during 1863 and 1864, and became Acting Assistant Surgeon United States Army during the last year of the Rebellion. He then entered Bellevue Hospital Medical College, New York, from which institution he was graduated M. D. in 1866, since which time he has been actively and successfully engaged in the practice of general medicine and surgery. He is now Medical Examiner and Adviser for several of the leading life and accident insurance companies of this country, and for the past twelve years has been Division Surgeon, with the rank of Colonel, in the National Guards, State of New Jersey. He is also an active member of the Passaic County District Medical Society and New Jersey State Medical Society.

THACHER, James K., of New Haven, Connecticut, died April 21, 1891, aged fifty-four years. He was the eldest son of the late Professor Thomas Thacher, of Yale, and a graduate of that University in 1869. Ten years later he took his medical degree from the Medical Institute at New Haven. The interval had been filled by several series of original investigations regarding comparative anatomy and physiology; part of the time being, also, taken up by his duties as a college instructor. The Transactions of the Connecticut Academy of Sciences contained the results of his studies, which attracted the attention of the scientists in all parts of the world. He claimed that the limbs of the higher vertebrates were developed from the fins of fishes, a view sufficiently novel at the time he advanced it, but which has since been strengthened by later investigations. He became Professor of Physiology in the medical department of Yale University soon after graduating in 1879, and engaged in general practice. He received an appointment in the New Haven Hospital, and the chair of clinical medicine was added to that of physiology. He was one of the medical editors of the new Century Dictionary.

THOMPSON, John H., of Kansas City, Missouri, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1877. Since which time he has devoted special attention to the study and treatment of diseases of the eye and ear. He is now Clinical Professor of Ophthalmology and Otology in the Kansas City Medical College. He is a member of the American Medical Association, Missouri State Medical Society, Kansas City Academy of Medicine, and Jackson County Medical Society, State of Missouri.

THOMPSON, W. Clinton, of Indianapolis, Indiana, was born in Zeillienople, Butler county, Pennsylvania, December 21, 1812. He was the grandson of James Thompson, a soldier in the War of the Revolution, a man who weighed 300 pounds, and remarkable for his feats of great strength. The parents of Dr. Thompson having died during his childhood, he was thrown entirely upon his own resources in obtaining his early education, but with that energy and earnestness that have characterized him through life this was accomplished, and he became qualified for the study of the profession to which he has long been an honor. He entered the Medical College of Ohio in 1837, and was graduated M. D. from that institution in 1839. He began the practice of medicine at St. Charles, Missouri, where he

remained until 1847. He then established himself at Indianapolis, where he has been engaged in the general practice of his profession for a period exceeding that of any other living physician in that city. On the outbreak of the Civil War he was appointed brigade surgeon, and attached to the armies of McClellan and Pope in their campaign through Virginia. He resigned this position by reason of failing health soon after the battle of Antietam. During his extended residence in Indianapolis, Dr. Thompson has been noted for his unblemished character as a citizen and excellent reputation as a skillful and successful physician. He has enjoyed the confidence and friendship of all the governors of his State, without regard to party affiliation, and was their family physician as long as he remained in active practice. He was not only exceedingly popular in the line of his chosen avocation in the pursuit

ical Men, and of other leading medical organizations in that metropolis.

TIFFANY, Flavel Benjamin, of Kansas City, Missouri, was born on the shores of Oneida Lake, New York, April 28, 1846, of Scotch-English parentage. When he was an infant, his parents emigrated, via the chain of northern lakes, to Rutland, Dane county, Wisconsin, where the first seven years of his life were spent, the last summer of which he attended the district school. From Rutland the family went to Baraboo, in the same State, a little settlement in the dense primeval forests, where the grizzly bear was often seen and the deer-lick the chief attraction on moonlight nights. Here he again had the advantage of a few months' district school. The following year his parents, desirous of availing themselves of the generosity of "Uncle Sam" in securing more lands for the family, took with them the household effects in three "prairie schooners," and, with a few head of cattle and horses, started for the rolling prairies and sky-tinted waters of Minnesota. After several weeks of romantic journeying through forests inhabited only by wild animals and the red man, over broad prairies of rich meadows bedecked with large varieties of most beautiful wild flowers, and groves of native fruits, by the side of rippling rills and laughing waterfalls of this picturesque west, they finally reached the shores of Rice Lake, a beautiful sheet of water, with dense forests on one side and the rolling prairies on the other. The lake yielded a rich field of rice, which the Indians came every fall to harvest. It was here that the family pitched their tents and laid claim to their allotted portion of our government's domain. They were the first, and for some weeks the only white family within a fifteen-mile circuit. At this time there were encamped in the forests across the lake fifteen hundred Indians. Frequently did the subject of this sketch join the little Indian boys in their wild sports, especially with the bow and arrow. Wild game—geese, ducks, brants, loons, and other birds sported on these waters. The air was dense with water birds, especially in the fall of the year; deer, elk and buffalo were frequently seen roaming over the prairies. The woods were full of game. Here one constantly heard the chattering of the squirrels, the drum of the partridge, whimpering of the coon, and barking of the foxes. Much time was spent with the fowling piece, traps and fishing-tackle, which afforded rare sport as well as opportunity for observations of nature. Several other white families came during the following summer. A school was started, which the children attended two terms; but the next winter the family was bereaved of their mother, and little interest after this was taken in the education of the children. The father soon after married a widow with two boys, and soon there were three families in one. Financial reverses came, and schooling was neglected; a few months' study, however, in different years was gained, but it was of a desultory nature. The Rebellion was now on, and at seventeen years of age young Tiffany enlisted as a recruit in Battery B, Fourth Minnesota Light Artillery. He served until the close of the war and then returned to his adopted State. With the bounty money received as a soldier he entered school at Faribault, Minnesota, living with the family of Dr. N. H. Bemis, a

W. C. Thompson.

of which he has accumulated a considerable fortune, but his genial character and interest in public affairs have been such as to demand his service in filling many offices of trust, honor and responsibility. He was for several years a member of his city council, and has served sixteen years as the representative of his county in the State Senate, serving as chairman of the committee on insane, and exercising an important influence in the enactment of laws affecting the interest of his city, his county and the people of Indiana.

THOMPSON, W. Gilman, of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1881. He is now Professor of Physiology in the New York University Medical College, and Visiting Physician to the New York and Presbyterian Hospitals. He is an active member of the Association of American Physicians, American Physiological Society, New York Academy of Medicine, New York Medical and Surgical Society, New York Society for the Relief of Widows and Orphans of Med-

venerable and able physician. Through precept and example of Dr. Bemis and the home influence of this family, he received the first incentive to study medicine. At Faribault he continued his education for several years, doing chores for his board, and working during the vacations, until he gained a certificate to teach school. After following this avocation for two years he then entered the State University of Minnesota, at Minneapolis. During his stay at the University he also read medicine with his preceptor, Dr. Johnson, at the same time earning his way by giving private instructions, and by manual labor. From stint of food and over-work his health gave way ere he had quite completed the literary course; and so without taking the degree of A. M. which he so much desired, he finally, in 1872, entered the Medical Department of the State University of Michigan, at Ann Arbor, at which school he received the degree of M. D. in 1874. After graduating he first located at Grand Haven, Michigan, but his health not being good, from study and privation, he returned again for a vacation to Minnesota. Here he met an old acquaintance and a good friend, Mrs. Esther Fuller, a refined and estimable lady, who kindly assisted in equipping him with instruments, and the necessary outfit to practice his profession. From Minnesota he went to East St. Louis, but only for a short time, as his means would not admit of his remaining long enough to build up a practice in a large city; so after a few weeks' trial, he again returned to Minnesota, pawning his trunk and the few instruments he had to secure transportation. In the fall of 1874 he located in the little town of Medford, in the latter State, where he soon built up a lucrative practice, riding day and night; and in about a year and a half he had accumulated sufficient funds to pay off all indebtedness and have a respectable bank account. In the fall of the year 1876, only a little more than a year and a half from the date of his graduation, he carried into effect his great ambition to go to Europe, and there pursue the study of medicine in some of its special branches. In November, 1876, he started for London. In the British metropolis he pursued the study of the eye, ear, and throat for nearly twelve months. The following year he spent in Paris, Berlin, and Vienna, studying the German and French languages, in connection with these same branches of medicine. At Paris he met Olive E. Fairbanks, a highly educated, refined and cultured lady, whom he afterward married in 1879. In the fall of 1878 he located at Kansas City, Missouri, limiting his practice to the diseases of the eye, ear and throat. In 1880 he took the initiatory steps of founding the Kansas City University, in which he was elected to the chair of Ophthalmology, Otology, and Microscopy, which position he held up to the year 1893, when he resigned from the branch of Microscopy. In the fall of 1887 he again, with his wife, went to Europe, where he spent nearly a year in the several eye and ear clinics with many of the most prominent oculists and aurists of that country. He has contributed many articles to medical literature, notably on "Glaucoma, its Etiology," and on "Cataract." To him is due the priority of speaking of skin grafts as a cure for cancer of the orbits and eye-lids. His work on the anomalies of the Muscles and Refraction of the Eye is now in

press, and is to be issued in December, 1893. He is a member of several State medical societies, of the American Medical Association, American Microscopic Society, Pan American Medical Congress, and the International Medical Congress.

TIFFANY, Louis McLane, of Baltimore, Maryland, was born in Baltimore October 10, 1844. His literary and classical education was obtained at the University of Cambridge, England, whence he graduated A. B. in 1866. He pursued his medical studies at the University of Maryland; graduating M. D. in 1868, and settling in Baltimore, where he has since remained, engaged in an extensive and successful practice of medicine, but of more recent years devoting especial attention to surgery, in which field he has gained a wide reputation. He is a member of the Medical and Surgical Faculty of Maryland; has been Chairman of the Surgical Section of the Baltimore Medical Association, and President of the Baltimore Clinical Society. He is also a member of the Baltimore Medical and Surgical Society. He has contributed important articles to medical journals. He has held the position of Resident Physician at the Baltimore Almshouse; Dispensary Physician to the University of Maryland; Demonstrator of Anatomy in the same institution; Professor of Anatomy in the Maryland Dental College; and has been one of the visiting medical officers to the Baltimore City Almshouse; Surgeon to Baltimore Infirmary, and Professor of Operative Surgery in the University of Maryland.

TODD, Levi L., of Indianapolis, Ind., was born in the latter part of the year 1830, near Lexington, Kentucky, in the region where his ancestors had lived since the Revolutionary times, his grandfather, General Robert Todd, being an associate of Boone, Harrod, Bryan and others in the early settlement of the State. His grandfather on his mother's side, Captain Nathaniel Asby, came from Virginia soon after the close of the seven years' war, through which he served, and settled in the same locality. His father, Judge Levi L. Todd, removed to Marion county, Ind., in 1834, settling near Indianapolis, where his long and useful career was ended by death in 1867. The subject of this sketch was the youngest of a family of nine children, all but two of whom attained adult age. His early life seems to have been of unusual toil and labor on his father's farm and marked by many vicissitudes and trials; even more than the ordinary share had fallen to his lot of the occurrences which so painfully emphasize life; still he seems to have regarded it as an uneventful one in incidents of interest to others. He worked hard during his boyhood days and up to the age of twenty-two years, when he left the farm for the last time. He had, however, availed himself of the ordinary winter-time opportunities of country schools. At the age of seventeen he took two terms in the Danville Seminary, and after that a year and a half in Wabash College. He was a student of medicine the first year with Dr. David Todd, of Danville, Ind., and the remainder of the time with his brother, the late Dr. R. N. Todd. His first course of medical lectures was at the University of Louisville, during the time when Gross, Flint and Silliman were connected with that institution, and graduated there in March, 1856. Dr. Todd was married in the following

winter to Miss Susan G. Todd, of Paris, Kentucky, and in the spring of 1858 removed to Paris, Illinois, where he lived and practiced his profession over a period of sixteen years. After the second year he was employed almost constantly, and much of the time his professional service was pressing and hard to endure, with bad roads and a climate abounding in the worst changes that western weather could supply. As we are informed, he suffered a good deal from nervous disorders incident to exposure and over-work. Dr. Todd removed to Indianapolis from Illinois in January, 1874, and during the whole time up to the present has been in the continuous practice of his profession. He was appointed Medical Examiner for Pensions at Paris, Illinois, during the late war, also Medical Inspector of drafted men. He was a member of the Edgar County Medical Society, and the Esculapian Society of the Wabash Valley, and was president and secretary of the latter. He has also been a member and an occasional attendant of the meetings of the American Medical Association, since about the year 1871. He is a member and ex-president of the Marion County Medical Society, Indianapolis, and to which he has contributed a number of papers, some of which have been published in the Transactions of the State Society. In the professional career of Dr. Todd, it will be observed that every energy was called into play in his chosen calling, with that earnestness of endeavor and will power which are the salient and strong points that determines an individuality and inspires confidence in one as a safe and conservative practitioner. Any fulsome praise or extended eulogy of the professional or social life of the subject of this sketch would be superfluous here, or in any community where he is known. The steady, persistent fondness for his profession is a marked characteristic of his every day contact with the infirm and suffering that come within range of his council and medical skill. In the varied vicissitudes of his life filled with a multiplicity of cares, he has found time, like his distinguished brother, the late Dr. R. N. Todd, to cultivate his tastes in literary pursuits; as evidenced by the fact of his active and retentive memory in calling up quotations from many distinguished authors, both of prose and poetry. Whittier, Oliver Wendell Holmes and Burns are seemingly his favorite authors. Dr. Todd is in the full fruition of his professional life and perfect manhood; the frosts of accumulated years have settled gently upon him, but have not ruffled the facial lines of a wholesome good humor. He is still found in the front rank among his contemporaries, and capable of accomplishing a large amount of labor in the pursuit of his life work, the cure of disease, the relief of human suffering, and the success and elevation of the medical profession.

TODD, Lyman Beecher, of Lexington, Kentucky, was born near that city April 16, 1832. His grandfather, General Levi Todd, came from Virginia in early, perilous times; he was a man of ability and learning, and was the first clerk of Fayette county, Kentucky. His father, James Clarke Todd, was sheriff of the same county for sixteen years. Dr. Todd graduated at Centre College, Danville, Kentucky, June, 1850, and at the Jefferson Medical College, Philadelphia, in 1854. He imme-

diately afterward settled in Lexington, and during the same year was married to Miss Sarah F. Swift, of that city. In 1857 he was elected City Physician. He is a member of the Lexington and Fayette County Medical Society, of the Kentucky State Medical Society, and was Treasurer for six years, being elected in 1869. He has contributed articles on professional subjects to Professor Gross' *Medico-Chirurgical Review*, and to the *Louisville Medical Journal*, and other periodicals. He was postmaster at Lexington from 1861 to 1870, and in 1874 was appointed Surgeon to the United States military forces stationed at Lexington. Dr. Todd is an accomplished physician and surgeon, and his professional skill has been widely known throughout his State for a period of forty years.

TODD, Simeon S., of Kansas City, Missouri, was born near Vevay, Indiana, March 10, 1826. He is a descendant in the fourth generation of John Todd, who immigrated from Scotland to Virginia, about 1740. Having received an English education and some knowledge of the classics, he entered the Indiana Medical College; was graduated thence M. D. in February, 1849; practiced in Kentucky until 1854; in California, until 1865, and since September, 1865, has been established at Kansas City. In September, 1861, he was commissioned surgeon of the Second, and subsequently of the Fourth California Infantry; was successively detailed Surgeon in charge of the Presidio Hospital, San Francisco; of the Hospital at Fort Humbolt, and of Drum Barracks, in Los Angeles county, and served until the end of the war. While engaging in a general practice, he has given especial attention to gynecology, and has successfully performed nearly all the leading operations in this branch of his profession, such as removal of uterine fibroids, restoration of the uterine cervical canal, ovariectomy extirpation of the lower two bones of the coccyx for coccydynia, with complete relief, and operations for vesico-vaginal and recto-vaginal fistula. In 1869 he was one of the founders of the Kansas City College of Physicians and Surgeons, and formerly dean of the Faculty and Professor of Obstetrics and Diseases of Women, and is now *Emeritus* Professor of Gynecology in that institution. He is a member of the Kansas City District Medical Society, an honorary member of the Kansas State Medical Society and of the Missouri State Medical Society—vice-president of the latter in 1872, and president in 1873—a corresponding member of the Boston Gynecological Society, and a member of the American Medical Association. Of his professional publications may be mentioned: "Intra Uterine Injections in Uterine Hemorrhage, 1870; "An Unappreciated Impediment to Labor in the Second Stage," 1871; "Complete Occlusion of the Os Uteri in Labor," "Extirpation of the Coccyx," 1874; "Atresia Uteri," 1876; and a report "On the Use of Anesthetics in Labor," 1875, published in the Transactions of the Missouri State Medical Society.

TOWNSEND, Wisner R., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1880, since which time he has devoted special attention to orthopedic surgery. He is now Assistant Surgeon to the Hospital for Ruptured and Crippled; Orthopedic Surgeon to the New York Infant Asylum; Consulting

Surgeon to Bayonne Hospital, and Lecturer on Orthopedic Surgery in the New York Polyclinic. He is an active member of the American Orthopedic Society, New York Academy of Medicine, and of numerous other medical organizations of New York City.

TUHOLSKE, Herman, of St. Louis, Missouri, was graduated M. D. from the Missouri Medical College, St. Louis, in 1870, since which time he has devoted special attention to the practice of general surgery. In this field of his profession his skill and success has gained for him eminent distinction. He is now Professor of Surgical Pathology and Clinical Surgery in the Missouri Medical College, and also in the St. Louis Post-Graduate School of Medicine. He is Consulting Surgeon to St. Louis City Hospital and South St. Louis Dispensary; Surgeon to Martha Parsons Free Hospital for Children and the St. Louis Polyclinic and Hospital. Dr. Tuholske is an active member of the American Medical Association, Southern Surgical and Gynecological Association, St. Louis Medico-Chirurgical Society and other leading medical and surgical organizations of this country.

TYREE, William C., of Kansas City, Missouri, was graduated M. D. at the Kansas City Medical College in 1876. He subsequently attended the University Medical College, New York City, and received an *ad eundem* degree from that institution in 1878, since which time he has devoted special attention to the treatment of diseases of the eye and ear, in which specialty he has attained eminent success. He is now Professor of Ophthalmology and Otology in the Kansas City Medical College, and is an active member of the American Medical Association, Missouri State Medical Society, Kansas City Academy of Medicine, and other leading medical organizations of this country.

VALLE, Jules F., of St. Louis, Missouri, was graduated at the Missouri Medical College, St. Louis, in 1885. He is now Consulting Gynecologist to St. Louis Female Hospital, Physician to St. Luke's Hospital and the Missouri School for the Blind. Dr. Valle is an active member of the St. Louis Medical Society, St. Louis Chirurgical Society, and other medical and social organizations of that city.

VANDENBERGH, Frank P., of Buffalo, New York, was educated in medicine at the University of Buffalo, New York, from which he received the degree of M. D. in 1884. He is now Professor of Chemistry in that institution, and Chemist to the City of Buffalo. Dr. Vandenberg is an active member of the American Public Health Association, American Clinical Society, Society of Chemical Industry (England), and the Medico-Legal Society of New York.

VANDERPOEL, Waldron B., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York, from which institution he received the degree of M. D. in 1879. He is now Attending Physician to Demilt Dispensary, and Visiting Physician to Randall's Island Hospital. He is an active member of the New York Academy of Medicine, and New York County Medical Society. He is engaged in the general practice of medicine, and is an accomplished physician and of recognized skill and ability.

VANHARLINGEN, Arthur, of Philadelphia, Pennsylvania, was born in that city October

25, 1845. He studied medicine in the Medical Department of the University of Pennsylvania, graduating in 1867, settling in Philadelphia, and devoting exclusive attention to dermatology. He is a member of the College of Physicians, and has contributed to different medical journals a number of articles on subjects connected with diseases of the skin. He was a delegate to the International Medical Congress, held in Philadelphia, 1876, and was secretary of the section on dermatology. He is also a member of other medical organizations of this country, and is a recognized authority in his special field of medicine.

VAN RENSSELAER, Howard, of Albany, New York, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1884. He is now Lecturer on Materia Medica in the Albany Medical College; Visiting Physician to St. Peter's Hospital; also to the Hospital for Incurables, Home of the Friendless, and is a member of the dispensary staff of the Child's Hospital. Dr. Van Rensselaer is an active member of the Albany County Medical Society, State of New York.

VAN RIPER, Cornelius S., of Paterson, New Jersey, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1859. Of late years he has devoted special attention to the treatment of diseases of women, and is now Attending Gynecologist to Paterson General Hospital, and also to St. Joseph's Hospital. Dr. Van Riper is Medical Examiner and Adviser for the Mutual Life, New York Life and Washington Life Insurance Companies, and is a member of the American Medical Association and the Passaic County District Medical Society, State of New Jersey.

VANSANT, Eugene L., of Philadelphia, Pa., was graduated M. D. at Jefferson Medical College in 1884. He is now Lecturer on Clinical Medicine and Demonstrator of Normal Histology in that institution. He is also Physician to Philadelphia Hospital and Rhinologist and Laryngologist to Howard Hospital. Dr. Vansant is an accomplished physician, an able clinical teacher and an active member of numerous medical organizations.

VAN VOORHIS, Isaac, of Fort Dearborn, Illinois, was born in Fishkill, New York, February 22, 1790, and was slain by the Indians at the above fort August 15, 1812. Referring to this event Dr. N. S. Davis, in "History of the Medical Profession and Medical Institutions of Chicago," recently published in the *Magazine of Western History*, says: "In July, 1803, Captain John Whistler, with a company of United States soldiers, built the original Fort Dearborn, on the south side of the Chicago river, near its mouth. When Captain Nathan Heald succeeded Captain Whistler in command of the garrison at Fort Dearborn in 1810, the name of Dr. John Cooper appears on the list of officers as Surgeon's Mate, but he only remained there two or three months, and on leaving resigned his commission and retired from the army. He was succeeded early in 1811 by Dr. Isaac Van Voorhis." The subject of this sketch received his early education at the Academy of Newburg, Orange county, New York, and subsequently entered

upon the study of medicine; soon after the completion of which he was commissioned as Assistant Surgeon in the United States Army and sent to Fort Dearborn. He is represented as having been a young man of excellent qualities, but his prospective usefulness was blighted and his military services terminated by being one of the victims of the well-known Indian massacre that took place August 15, 1812. "Four or five thousand hostile Indians had gathered in the vicinity of the fort, and when the garrison, consisting of fifty-four men and a few officers, attempted to retreat to Fort Wayne they were attacked by the Indians, and Captain Wells, Ensign Ronan, Surgeon Van Voorhis and twenty-six privates were slain, together with twelve children and all the male residents, except Mr. John Kinzie and his two sons. The original fort having been thus abandoned and destroyed in 1812, what few white inhabitants remained were left without the services of any member of the medical profession until 1816, when the fort was rebuilt and occupied for military purposes.

VAUGHAN, George Tully, of Washington City, D. C., was born in Nelson county, Virginia, June 27, 1859. He is of Welsh descent, and a son of Dr. W. L. Vaughan.

George Tully Vaughan

He was educated at Kenmore High School, and read medicine under the direction of his father until he entered the Medical Department of the University of Virginia, from which he graduated June 27, 1879. He continued his medical studies in New York City, and graduated from Bellevue Hospital Medical College in 1880. Dr. Vaughan located the same year at Lowesville, Virginia, where he practiced his profession until 1886, when he moved to Farmville, in the same State, and was associated in practice with Dr. James L. White. In 1885 he attended lectures at the New York Polyclinic, paying special attention to general

surgery. In January, 1888, he was appointed assistant surgeon in the marine hospital service, and assigned to duty at Boston, Massachusetts. He was afterwards in command of the service at Cairo, Illinois, and Evansville, Indiana. In February, 1892, he was promoted to the grade of passed assistant surgeon and ordered to Washington, District of Columbia, for duty as assistant to the Surgeon-General. Dr. Vaughan has performed amputation at the hip-joint for railway injury, which was followed by death from shock; ligation of right subclavian artery for aneurism of the arch of the aorta, Dr. Young, of Evansville, at the same time ligating the right common carotid, resulting in death on second day from asthenia. His other operations have been such as Ertlander's for pleural empyema, trephining mastoid process, and other parts of the skull, operations for abscess of the liver, and for various requirements in minor surgery. Dr. Vaughan is a member of the Medical Society of Virginia, of the Americal Medical Association, and honorary member of the Vanderburg County Medical Society, Indiana. His more important contributions to medical literature consist of a "Report of 112 Cases of Obstetrics with Use of Chloroform in Labor," "Locomotor Ataxia," "Case of Hermaphroditism," "Operations for Radical Cure of Hernia," "Fracture of Frontal Bone, no External Depression," "Organic Stricture of Urethra, Perineal Section," and "Abscess of Liver, Laparotomy, Recovery." In 1883 he married May Townsend, daughter of W. G. Venerable, Esq., of Farmville, Virginia.

VEDDER, Alexander M., of Schenectady, New York, was born in that city January 15, 1814, and died in New York City December 29, 1878. He was a direct descendant of Harmanus Albertse Vedder, who immigrated to this country from Holland in 1630 and became the progenitor of one of the oldest Dutch families of New York. He received his literary education at Union College, Schenectady, and pursued his medical studies at the University of Pennsylvania, where he graduated M. D. in 1839. In 1838 he was associated with the late Dr. J. K. Barnes, Surgeon-General United States Army, as Resident Physician of Blockley Hospital, Philadelphia. He settled in practice in his native city. In 1840 he became Lecturer at Union College, and for twenty years he held the chair of Anatomy and Physiology in that institution. In 1856 he was elected Mayor of Schenectady by the Republican party. During the war between the States he held the office of Examining Surgeon of the Eighteenth Congressional District, and in 1873 he became one of the Curators of the Albany Medical College. He was also founder, director or trustee of every institution of note in his native city. As early as 1838 he wrote an interesting paper on "Morbus Brightii" for the *Medical Intelligencer*, which was the first American contribution to the literature of Bright's disease, and in 1875 he wrote three important articles entitled "Embolism of the Axillary Artery," "Embolism of the Central Artery of the Retina," and "Tracheotomy in Diphtheria," all of which were published in the Transactions of the New York State Medical Society. Dr. Vedder gained a wide reputation in the treatment of diseases of the chest, and was one of the first physicians in the United States to acquire a comprehensive

knowledge of auscultation and percussion. He was a member of the Pathological Society of Philadelphia, of the New York State Medical Society, and of the Schenectady County Medical Society, and was president of the latter in 1870. He was elected delegate to the International Medical Congress held in Philadelphia in 1876. He was twice married; the first time to Catharine M. Viele, of Hoosick, Rensselaer county, New York, and after her death to Hannah M. Wilkinson, of New York City.

WALES, John Patten, of Wilmington, Delaware, was born there in January, 1831, his father being the late United States Senator John Wales. After a literary training in the schools of Wilmington and New Jersey Collegiate Institute, he began studying medicine under Dr. L. P. Bush, of Wilmington. He was graduated from the Medical Department of University of Pennsylvania in 1852. For a year thereafter was Hospital Physician for Baltimore City and County Almshouse. In 1853 he began practice near his native city. On the outbreak of the war he was offered a surgeoncy, but preferred to become a soldier, and was commissioned captain in the Seventeenth United States Infantry, May, 1861, and was first stationed at Fort Preble, Portland, Maine, where the regiment was organized; then sent to McClellan's army, and attached to Fifth Army Corps. He served through all the fighting on the Peninsula, the second Bull Run, Antietam, and all the campaigns of the Army of the Potomac to the close of the war, having command of his regiment at and after the battle of Fredericksburg. At the end of the war it scarcely mustered men enough for a full company. In 1865 he resigned his commission and returned to Wilmington, Delaware, where he has since remained engaged in a successful practice of his profession.

WALES, Philip Skinner, of Washington, District of Columbia, was born February 27, 1837, in Annapolis, Maryland. His parents were natives of that State. He was educated at the Baltimore City College, and the University of Maryland, graduating at the latter in March, 1856, after which he entered the medical department of the University of Pennsylvania, from which he graduated in March, 1860. Settling at Baltimore, he removed first to Philadelphia and afterwards to Washington, District of Columbia, his present residence. He entered the United States Navy as Assistant Surgeon August 7, 1856; was commissioned Surgeon October 12, 1861. Throughout the Civil War he was actively engaged, having organized and held charge of the United States Naval Hospital at New Orleans during the operations of Admiral Farragut's fleet in the Mississippi river, superintended the United States Naval Hospital ship at the capture of the forts defending Wilmington, North Carolina, and served as Operating Surgeon at the United States Naval Hospital at Portsmouth, Virginia, pending the military operations around Fortress Monroe. He was commissioned Medical Inspector United States Navy June 30, 1873, and appointed General of the Navy and Chief of the Bureau of Medicine and Surgery on January 26, 1880, serving until March 27, 1884. When President Garfield was shot he assisted in attendance for a short time. While he was Chief of the Bureau of Medicine unscrupulous clerks in his office

contrived to defraud the government, and he was tried by court-martial and suspended for five years for neglect of duty, though acquitted of all real responsibility for the acts of his subordinates. He is a member of the Academy of Natural Sciences, the American Medical Association, and the Gynecological Society of Boston. His contributions to medical literature comprise: "Surgical Operations and Appliances," 1867; "A New Method of Controlling the Velum Palati," 1875; "A New Rectal Dilator and Explorer," 1877; papers in the *American Journal of Medical Sciences* on "Cerebro-Spinal Meningitis," "Amputation of Shoulder-Joint," "Fracture of Lower Jaw," "Gunshot Wound of Stomach," "Ligature of the Femoral Artery," "Fracture of Thyroid Cartilage," "Operation for Hydrophthalmia," and "Aneurism of the Heart;" a series of papers in the *Philadelphia Medical and Surgical Reporter* on "Instrumental Diagnosis," with a paper entitled "Description of a New Endoscope;" a paper in the *New York Medical Record* on "Traumatic Tetanus;" and numerous reviews in various medical journals. He has in preparation a large work on medical science. He was married to Mary Gray, of Philadelphia, in November, 1860.

WALKER, Henry O., of Detroit, Michigan, was born in that city December 18, 1843. His parents were natives of Yorkshire, England. His preliminary education was acquired at the Detroit High School and Albion College, Michigan. He prepared for a professional career in the Medical Department of the University of Michigan, and Bellevue Hospital Medical College, New York, graduating at the latter institution February 28, 1867. In 1869 he was editor of the *Detroit Review of Medicine*. He has operated for stone, performed external perineal urethrotomy, removed half the upper jaw, and has had a varied experience in general surgery. His specialty is orthopedic surgery and diseases of genito-urinary organs and rectum. He is a member of the American Medical Association, of the Michigan State Medical Society, Detroit Medical and Library Association, and of the Detroit Academy of Medicine, of which he was secretary, 1876. For several years he held the office of Lecturer on Diseases of Genito-Urinary Organs and Rectum in the Detroit Medical College, and previous to that time was Demonstrator of Anatomy in the same institution. For nearly three years he was City Physician and member of the Board of Health in Detroit, Michigan; for two years was Surgeon of the Michigan Central railroad, was formerly Surgeon to St. Luke's Hospital, Detroit, Michigan, and was Daily Physician to Detroit Medical College Dispensary, and to St. Mary's Hospital Infirmary, Detroit, Michigan, for a period of two or three years. He is now Professor of Orthopedic Surgery, Genito-Urinary Diseases and Clinical Surgery in the Detroit College of Medicine, and secretary of the Faculty. He is also Surgeon to the Wabash Railway Company, and to Harper and St. Mary's Hospital, and Medical Examiner and Adviser for several of the leading life insurance companies of this country. His contributions to medical literature consist of a number of articles on various surgical subjects, but relating principally to his specialty. He was married November 13, 1872, to Miss Gertrude Esselstyn, of Detroit, Michigan.

WALL, Otto A., of St. Louis, Missouri, was graduated M. D. at the Missouri Medical College, St. Louis, in 1870, and entered the Bellevue Hospital Medical College, New York, from which institution he received an *ad eundem* degree in 1871. He is now Professor of Materia Medica and Botany in the St. Louis College of Pharmacy, and Lecturer on Artistic Anatomy in Washington University. Dr. Wall is a member of the St. Louis Medical Society and the St. Louis Medico-Chirurgical Society.

WALLACE, David R., of Waco, Texas, was educated at Wake Forest College, North Carolina, and then entered the University of the City of New York, from which institution he was graduated in medicine in 1854. During the Civil War he held the position of Surgeon in the Confederate States Army, since which time he has devoted special attention to psychiatry and neurology. He is ex-president of the Texas State Medical Association; member of the American Medical Association, American Association of Superintendents for the Insane, and the Medico-Legal Society of New York. Dr. Wallace was for many years Superintendent of the North Texas Hospital for Insane, located at Terrell, in that State, and as an alienist and neurologist he is widely known, and is a physician of recognized skill in the treatment of all disorders relating to his special field of medicine.

WARD, Milo B., of Topeka, Kansas, was educated in medicine at the College of Physicians and Surgeons, Keokuk, Iowa, from which institution he received the degree of M. D. in 1879, since which time he has devoted special attention to obstetrics and diseases of women. He is now Professor of Gynecology in the Kansas Medical College, Topeka, and secretary of the Faculty of that institution. He is also president of the Western Association of Obstetricians and Gynecologists; Fellow of the American Association of Obstetricians and Gynecologists; member of the Topeka Academy of Medicine and Surgery, Kansas State Medical Society, American Medical Association, and secretary of the Section on Obstetrics and Gynecology in the latter national medical organization.

WARD, Samuel Baldwin, of Albany, New York, was born in New York City, June 8, 1842. He was educated in private schools and in Columbia College, from which he received the degree of A. B. in 1861, and that of A. M. in 1864. He pursued his medical studies in the College of Physicians and Surgeons, New York City, and the Medical Department of Georgetown College, Washington, District of Columbia, and received the degree of M. D. from the latter institution in 1864, and settled first in his native city, but removed to Albany in 1876. He has contributed an article on the "Sphygmograph and its Uses," to the *New York Medical Record*, one on "Embolism of the Arteries of the Extremities," *New York Medical Journal*, and several translations of medical works and histories of cases to societies with which he is connected. He has held the position of Professor of Anatomy, and subsequently of Surgery, in the Woman's Medical College of the New York Infirmary, Professor of Surgery in the Albany Medical College, and is now Professor of Theory and Practice of Medicine in that institution; also Attending Physician to the Albany Hospital. Dr. Ward is Consulting Physician to St. Peter's Hospital and

House of the Good Shepherd, member of the Albany County Medical Society, Association of American Physicians and American Climatological Association, and is ex-president of the Medical Society of the State of New York. During the War of the Rebellion he served three years in the capacity of assistant surgeon. In October, 1871, he was married to Miss Nina N. Wheeler, of New York City.

WARE, Lyman, of Chicago, Illinois, was graduated M. D. at the Chicago Medical College in 1866, and received an *ad eundem* degree from the University of Pennsylvania, Philadelphia, in 1868, since which time he has devoted special attention to the treatment of diseases of the eye and ear. He is now Surgeon to the Illinois Charitable Eye and Ear Infirmary, Ophthalmic and Aural Surgeon to the Chicago Orphan Asylum, and is an active member of the Chicago Medical Society, Illinois State Medical Society, and the American Medical Association.

WARNER, George M., of Louisville, Kentucky, was graduated M. D. at the Louisville Medical College in 1880. He is now Professor of Materia Medica and Therapeutics in that institution, and secretary of the Faculty, also Physician to St. Vincent's Orphan Asylum, and Consulting Physician to Louisville City Hospital. Dr. Warner is an active member of the Kentucky State Medical Society, a frequent contributor to medical literature, and one of the best known and most accomplished physicians of his city.

WARREN, Edward, formerly of Baltimore, Maryland, was born in Tyrrell county, North Carolina, January 22, 1828, and died in Paris, France, in the autumn of 1893. His parents were of English descent, and natives of Virginia. His father, Dr. William C. Warren, was a man of intelligence and good professional attainments. When the subject of this sketch was but four years of age his father removed with his family to Edenton, North Carolina. At the proper time the boy was sent to the Fairfax Institution near Alexandria, Virginia, where he remained for two years, and was then placed at the University of Virginia, where he won honors and received diplomas, and by selection delivered the valedictory before the Jefferson Society. In 1851 he graduated from the Jefferson Medical College, in Philadelphia. It is stated by one of his biographers that while pursuing his studies in Philadelphia he conceived the idea of administering morphine under the skin for the relief of pain, by puncture with Anel's syringe. He had written his thesis for graduation on this method of administering medicine; but mentioning it to one of the faculty, who looked upon it as chimerical and dangerous, he was dissuaded from presenting the paper, and wrote one on another subject. He had, however, become so thoroughly convinced of the practicability of the method that he soon after put it to a practical test, and was some four years in advance of the public announcements of this very useful method of administering remedies. To further prosecute his medical studies he spent most of the years 1854 and 1855 in attending the hospitals and clinics of Paris, and during this time formed strong and lasting friendships with many of the leading medical men of France. He was a ready and graceful writer, and contributed from the French capital a number of very ac-

ceptable articles to the *American Journal of Medical Sciences*, and to other medical publications in this country. On returning to the United States he settled to practice at Edenton, North Carolina. He was thoroughly well equipped for engaging in his professional pursuits, and speedily acquired a leading position among the medical men of that region of the State. In 1856 he was selected to deliver the annual address before the North Carolina State Medical Society, which was well received, and brought him prominently before the active workers in the professional ranks. The same year he obtained the "Fisk Fund Prize" for an essay on the "Effects of Pregnancy on the Developing of Tuberculosis." This paper has passed into the permanent literature of medicine. In 1857 he was elected editor of the *North Carolina Medical Journal*, at the time the official organ of the State Medical Society. The Gynecological Society of Boston, the same year elected him a member of that organization. While in France he became a member of the American Medical Society of Paris, and this organization sent him as their delegate to the American Medical Association, but he was unable to attend or register. But he was a delegate from the State Medical Society of North Carolina to the meeting of the American Medical Association at Louisville, Kentucky, in 1859. He also attended meetings from Baltimore, where he was then practicing, in 1860, and every other year from 1866 until 1872. On November 16, 1857, he was united in marriage to Miss Elizabeth C. Johnston, of Edenton, North Carolina, a most estimable lady, whose ancestors were extensively connected with many distinguished families in the Old North State, and in Virginia. Dr. Warren's reputation for learning and scientific acquirements had become so widely known in 1860 that he was elected Professor of Materia Medica and Therapeutics in the old and prosperous University of Maryland. This led to his removal to the city of Baltimore. The same year he was elected the first vice-president of the convention for the revision of the United States Pharmacopeia. In the University of Maryland he at once took high rank as an able teacher and an attractive lecturer. On the outbreak of the Civil War he threw his fortunes with his native State and his friends in the South. He served in the field, in hospitals and on medical boards. He was chief surgeon in the North Carolina Navy, and medical director of the Cape Fear section. He was also for a time the chief medical inspector of the Department of Northern Virginia. He was twice promoted for his efficiency and courage on the field of battle. This trait of efficiency in the doctor was so notable as to attract attention, and the fact coming to the attention of the Assembly of North Carolina, an act was passed by them raising his rank from that of colonel to that of brigadier-general for "efficient services rendered to sick and wounded." Notwithstanding the engrossing official and professional duties of Dr. Warren during the war, he wrote a work to meet the needs of surgeons in the field, entitled, *Surgery for Field and Hospital*. In this publication, which was well received and speedily passed through two editions, he made some valuable original suggestions. In 1865 Dr. Warren resumed his residence in Baltimore, expecting at the same time to resume his

professional duties in the University of Maryland. But the changed conditions of the country and the status of the Southern States, the policy of the general government and local interests combined to close the doors of that institution against him. He was not only capable but ambitious and full of energy, and it was mainly at his suggestion and through his efforts that the old Washington University Medical School was revived and rapidly rose to have a commanding position and an able faculty and good patronage. In this faculty Dr. Warren filled most acceptably the chair of surgery. When the act of the Assembly of Maryland was passed requiring an examination and registration of the physicians of the State, Dr. Warren was appointed upon the board to carry the law into effect. In 1868 he was elected one of the vice-presidents of the Medical and Chirurgical Faculty of Maryland, and the same year founded the *Medical Bulletin*, which under his management acquired a large circulation. The celebrated Wharton trial, which took place in 1872, brought Dr. Warren to the forefront among specialists in criminal trials. He was confronted by able physiologists, general practitioners and chemists, and their theories and tests shown to be inconclusive. The case attracted wide attention not only in America but in Europe. Dr. Warren ably sustained himself before the court, and his testimony so completely broke down the chemical evidence relied upon by the prosecution as to compel the court to enter a *nolle prosequi* in the case. For some time after Dr. Warren was made a target for critics, not only in the medical profession, but by the bar and the public press. But it is simple justice to say that no review of his evidence and theory of the case was ever able to demonstrate that he was in error in his views. At the meeting of the American Medical Association in 1872 he was chosen chairman of the Section of Surgery for the following year. He did not, however, attend that meeting or send a report. In 1873 Dr. Warren suffered a severe domestic affliction in the death of his devoted wife. His health suffered seriously, and to change the scene, he consented to accept a medical position in the army of the Khedive of Egypt. His service, although brief in that country, was nevertheless sufficiently conspicuous to place him at the head of the surgical staff. It was his good fortune to relieve Kissim Pasha, the Minister of War, from a strangulated hernia. This operation was undertaken when the War Minister's life was despaired of by his own surgeons, and when it was almost impossible for Dr. Warren to get any of them to assist him in the operation, from a religious dread of being blamed with causing his death. But the operation was a success, and the result placed the courageous Dr. Warren in the front rank of surgeons in the Khedive's army. His splendid success where death was imminent and expected induced the Khedive to confer upon Dr. Warren the decoration of the Medjidiah and the title of Bey. Dr. Warren unfortunately contracted a severe form of ophthalmia common in the East, and it proving obstinate, he obtained a furlough for six months to visit Paris for treatment. Here he was promptly told that one eye was practically lost, and that a longer residence in Egypt would result in the loss of the other. He had no alternative but to resign, which he did. The Khedive was most kind,

and in accepting his resignation spoke of his valuable services in the Egyptian army and wished him long years of usefulness. It was then while still under treatment that he was advised to become a candidate for practice in Paris. After many conferences with friends and the earnest advice of Drs. Charcot, Breed and other eminent practitioners, he concluded to take up his permanent residence in that city. Dr. Warren's success in the metropolis of France was exceptionally rapid and gratifying. For twenty years he had been one of the leading physicians and surgeons and obtained a world-wide reputation for his skill. Both practice and honors came flowing in upon him. From Spain he received the decoration of a "Knight of the Order of Isabella the Catholic," for earnest services rendered to Spanish subjects, and from his old University of Maryland a degree of "Master of Surgery." Dr. Warren, both as a boy and through his life, proved his indomitable energy and power of work. He secured a large share of confidence with his professional brethren. And yet, like all men of force and original ideas, antagonisms were evolved by the friction. That he was a man of ability and culture his life and works attest. His house was frequented by Americans and travelers from other countries, and his attentions and hospitalities were for years generously bestowed upon numerous friends visiting Paris.

WARREN, Joseph H., of Boston, Massachusetts, was born in that city in 1831 and died there March 20, 1891. His father was the seventh son of General Warren, of Revolutionary fame. He was a Medical Director in General Casey's division, and of provisional troops during the last war as well as President Lincoln's medical attendant. He saw active service in the field before Yorktown, Virginia, and soon after was disabled while bearing special dispatches to Washington, and was obliged to resign. He was quite a traveler, for health and pleasure, and more than once served as a delegate from the American Medical Association, of which he was vice-president in 1889 and 1890. He had read papers before the British Medical Association and the French Academy of Medicine. He published in London a "Practical Treatise on Hernia," a second edition of which was issued in 1882 in America. He operated in Guy's Hospital, in London, and elsewhere, to demonstrate his method. He later published "A Plea for the Cure of Rupture," and has written very many monographs and medical papers, as well as general articles.

WATHEN, William H., of Louisville, Kentucky, was educated in medicine at the University of Louisville, from which institution he received the degree of M. D. in 1870. He is now Professor of Abdominal Surgery and Gynecology in the Kentucky School of Medicine, and Dean of the Faculty of that institution. He is also Consulting Gynecologist to the Louisville City Hospital. Dr. Wathen is ex-President of the Section on Obstetrics and Gynecology of the American Medical Association; Fellow of the American Gynecological Society, American Association of Obstetricians and Gynecologists; Southern Surgical and Gynecological Society; member of the Kentucky State Medical Society and Louisville Medical Society. His contributions to medical literature have been numerous and important.

He is widely known as a skillful and successful gynecean surgeon, an able clinical teacher, and a recognized authority upon all subjects relating to his special field of practice.

WATKINS, William B., of Portland, Oregon, was graduated M. D. at the Medical Department of Willamette University, Portland, in 1884. He is now Professor of diseases of the Eye, Ear, Nose and Throat in that institution. He is Physician and Surgeon to Portland Hospital, for all diseases connected with his special line of practice, which is that of oculist, aurist, rhinologist and laryngologist. Dr. Watkins is an active member of the Oregon State Medical Society and the Portland Hospital Clinical Society.

WATSON, William Perry, of Jersey City, New Jersey, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1878. He is now Attending Physician to St. Francis Hospital and for Diseases of Children, to the Central Dispensary, and Consulting Physician to St. Michael's Orphan Asylum, Jersey City. He is an active member of the New Jersey Academy of Medicine, New York Pathological Society, and other medical associations. Dr. Watson is also a member and secretary of the Board of Medical Examiners, State of New Jersey, and the Examiner in the Practice of Medicine. He is editor of the Archives of Pediatrics, and is a frequent and well-known contributor to medical literature.

WATERMAN, Luther Dana, of Indianapolis, Indiana, was born in Wheeling, Virginia, November 21, 1830. His literary education was obtained at Miami University, Oxford, Ohio, and his medical education at the Medical College of Ohio, where he graduated in 1853. He first established himself in practice in Cincinnati, where he remained till 1855, then removed to Kokomo, Indiana. In 1861 he entered the army. During the war he was for three years Surgeon to the Eighth Indiana Cavalry (Thirty-ninth regiment), during which period he was Medical Director of the Second, and subsequently the First Division of the (old) Twentieth Army Corps, Department of the Cumberland; also Surgeon to the Officers' Hospital at Nashville, Tennessee. He also had charge of hospitals at Huntsville, Alabama, Bridgeport, Tennessee, and at Chattanooga, Tennessee. He was captured at Newnan, Georgia, and imprisoned at Macon, and at Charleston, South Carolina. In 1864 he settled in Indianapolis, where he has since remained engaged in an extensive, successful and remunerative practice of general medicine and surgery. He is a member of the American Medical Association, the Indiana State Medical Society and the Marion County Medical Society, State of Indiana. He has been one of the Surgeons of the Indianapolis City Hospital, and was one of the incorporators of the Indiana Medical College, in which institution he filled the chair of Professor of Anatomy from 1869 to 1873, and that of Professor of Principles and Practice of Medicine from 1875 to 1877. He was elected president of the Indiana State Medical Society in 1877. His contributions to professional literature consist of important papers published in medical journals and cases reported to the various medical societies with which he is connected. He has also written a volume of poems and made

other contributions to general and scientific literature. Dr. Waterman, as a physician, has given the study of medicine profound thought. Referring to his views concerning the nature, etiology, symptoms, signs and treatment of disease, the following extracts, derived from his "Medical Notes," are here presented: "There is a fascination in the study of man, even in his accidental decomposition, more or less, by disease. Nature is forever thus offering opportunities for discoveries, by her revelations. The physician needs only more delicate tests, and keener power to observe. Every living human body contains a delicate arrangement, the nervous system, ever ready to signal the state of organs or organism. Here quickly are shown the discords which occur amidst the harmonious functions constituting health. The physician should know the individual pitch of health, and maintain concord between function and structure, between physical and intellectual. Some organizations are mobile, others firm. To read the patient, then his disturbance, is the true order. The individual is a unit, separated into physical and psychical for purposes of study, by artificiality of concept. The true physician treats the man diseased—neither the man nor the disease. His highest function is to read the organism, measure its vigor and vitality, find its weakest and strongest organs, and use the one to serve the other. He often accepts a lower plane of life for his patient; often a long upward incline to health and a new balance of physiological equilibrium. Man carries his history in his face and form, and they reveal his direction toward order or chaos, life or death. The complexity and delicacy of man's nervous system is the measure of his evolution, its disturbance the index of his derangements, and the skill to appreciate and interpret it, one of the highest accomplishments of the physician. Physical health is the perfect performance of all the bodily functions, manifested by the harmony between mind and body, and indicated by serenity of the nervous system. Whatever disturbs this relation is detrimental. Man originates as a cell, the physical body of a force, develops and ends as a unit. As by growth his organs differentiate, they are made one by the co-development of the nervous system. Structure and function are inseparably one in the original cell, as in the matured man. Life and its physical basis are never separated in all the universe. Only the provisional dies, never the real. The integrity of this union of structure and function through all the mechanism necessary to the organism, is tested by its ability to bear strains. Man's trained senses combined, more sensitive than all instruments, should appreciate every disturbance of this body, nature's most delicate mechanism. It is of the first importance, in the treatment of a person diseased, that the case should be thoroughly analyzed until the distinctive features which vary it from all others are detected to such a degree that the physician may direct his remedies to the essential morbid action. Until these features are obtained the diagnosis must be uncertain and the treatment wavering; and the local symptoms developed by the evolution of the disease, or by medication, assume undue prominence, and direct too greatly the treatment. To obtain these clinical observation is required, as well as the recog-

nition of the general causes that modify the types and tendency of disease, to measure the constitutional condition and the individual features of the case, with their cause, degree, duration and tendency. To treat every departure as disease betrays ignorance of the resistance of the organized body, and leads to meddlesome interference. The skillful physician may be known by the rarity of dangerous cases occurring under his management. It is rarely that any disturbance of an important organ continues long without involving other organs; therefore, every symptom is of value as a witness coming from the seat of morbid war to give evidence of the cause, extent and locality of the contest. Not by startling assumptions can medical science be advanced, or cases more successfully treated, but by patient accumulation and analysis of the phenomena occurring in disease as in health. Bubble theories have burst in every age; facts obtained, recognized and recorded, stand fast forever, and just deductions from their generalization are the true foundations of medical science. All untrue doctrines ultimately conduct to absurdity or helplessness, and that there are diseases without reliable or anticipated relief is proof that there is incorporated into our views error, either in the facts or the conclusions drawn therefrom. Views not profitable in application should not be held too tenaciously. Around us daily is the field to test treatments and study disease; for the silent laws are often as well seen in their extreme limits as in their center of action. We should know the individual, then the individual symptoms of his derangement, and if no error enters our facts or deductions, the results of treatment must be satisfactory and reliable." In evidence of his poetical genius, his biographer selects at random the following lines from his "Phantoms of Life:"

"I would unclasp a fiber of life's pain
By giving glimpses to the soul beguiled
Of that fair land whose boundaries lie far down
In the wild world that colors all our dreams,
Far dwelling, fragrant, flowery and bedewed,
Beyond the ken of day; but whither yet
The heart will yearn with instinct unappeased,
As yearns the child for its dead mother's breast,
And with a faith that's stronger than all sense,
Than reason clearer, longer-lived than will.
Despite the frigid clay that wraps this life,
And all the poisoned passions that betray,
The soul sends out frail gossamers of hope
To catch the radiance of that unknown clime
And thrill with the unheard music of its shores."

Dr. Waterman has made repeated visits to Europe, to Egypt and other foreign countries in the pursuit of knowledge, recreation and pleasure, and having retired from active practice, has in recent years spent considerable time in Old Mexico and Central America, where, as a result of his archeological investigations, he believes that he has found the primal home of the human race and the ruins of the most ancient cities on earth.

WEBBER, Nathaniel W., of Detroit, Michigan, was graduated M. D. at the Chicago Medical College in 1866, since which time he has devoted special attention to obstetrics and diseases of women. He is now Professor of Gynecology and Obstetrics in the Detroit College of Medicine; Gynecologist to St. Mary's Hospital; Consulting Surgeon to St. Luke's Hospital; Medical Examiner and Adviser for the Mutual Benefit Life Insurance Company of Newark, New Jersey, and Washington Life Insurance Company, of New York. Dr. Web-

ber is an active member of the Michigan State Medical Society and the Detroit Medical and Library Association.

WEBER, Gustav C. E., of Cleveland, Ohio, was born in Bonn, Prussia, May 26, 1828. His father, M. I. Weber, was Professor of Anatomy in the University of Bonn, Prussia, for more than a half-century from the foundation of that famous institution, and was the author of an "Anatomical Atlas," which has been translated into every printed language, "The Hand-Book of Anatomy of the Human Body," "The Pelves and Crania of the Different Races," "Atlas of the Bones of Domestic Animals," and many other valuable works and writings; he was decorated by several of the crowned heads of Europe for his distinguished services in the cause of science. Dr. Weber's education was chiefly obtained at Bonn University, but before matriculating, the revolutionary movement of 1848 caused him to emigrate. He came to the United States in 1849 and entered the St. Louis Medical College, St. Louis, Missouri, and received the degree of M. D. from that institution in 1851. He then returned to Europe and supplemented his medical education and training by attending the schools and hospitals of Vienna, Amsterdam and Paris. In 1853 he came again to this country and settled in New York, where his brother Edward was engaged in the practice of medicine. His brother died that year, and he assumed his practice with success. The demands upon him were so great that his health failed, and in 1856 he was obliged to relinquish professional work. That year he accepted the chair of Surgery in the Cleveland Medical College, made vacant by the resignation of Dr. Horace A. Ackley, and retained that position seven years. In 1859 he established the *Cleveland Medical Gazette*, which he conducted with ability for several years. In the autumn of 1861 one of the first acts of Governor Tod was to appoint him Surgeon-General of the Ohio forces, with special mission to organize a system for the better medical care of the troops in the field. After making arrangements for a better condition of the camps and hospitals in the State, he obtained from the Secretary of War permission to visit the Ohio soldiers in the field, and the troops were greatly benefited by his labors. In the autumn of that year his wife's health and the pressure of his professional duties compelled him to resign. Governor Tod in his reply expressed the highest appreciation of his services, and asked him before retiring to attend to the wounded upon the battle-field of Perryville, Kentucky. He obeyed these instructions, returned to Columbus, closed his official relations with the State, and resumed his duties in the college. In the spring of 1863 he closed his connection with the Cleveland Medical College, and in 1864 organized the Charity Hospital Medical College, of which he was made Professor of Clinical Surgery and also Dean of the Faculty. He was also appointed Consulting Surgeon of Charity Hospital, an institution which owed its existence mainly to his suggestions and efforts. From first to last his services to the hospital were gratuitously rendered. It was finally merged into the medical department of the University of Wooster, he being chosen to fill the same positions occupied during its independent existence. He is now Professor of Clinical Surgery in the Medical Department of

the Western Reserve University, and Dean of the Faculty of that institution. He is the originator of a new method for closing arteries of large size in surgical operations without a ligature. This consists in reflecting the wall of the artery, or folding it back upon itself (like turning back the cuff of a coat), which doubles the thickness of the arterial wall at the end of the divided artery, and enables the artery to close itself by its own contraction. Lest the wall turn back again, a very delicate silver pin, one-eighth of an inch in length, is passed through the walls of the artery at the point of reflection. This method has been frequently tested, has never failed, and promises to eventually revolutionize the existing system of closing arteries with ligatures. It prevents the introduction of foreign substances into the wound, and thereby effectually precludes the possibility of decomposition. He is also the originator of the method of removing stone from the bladder in females, by the division of the urethra as far as the sphincter and then the extraction through the dilated sphincter. Dr. Weber is a member of the Cuyahoga County Medical Society, State of Ohio, American Medical Association, and Corresponding member of the German Medical Society of Paris, France.

WEBSTER, David, of New York City, was born, July 16, 1842, at Cambridge, Cornwallis, Nova Scotia. He was educated in the district school and a private school at his native place, and at the Normal School of Truro, Nova Scotia. After teaching school six years, he attended Bellevue Hospital Medical College, New York, from which he graduated in the spring of 1868. He began practice in his native town, where he remained one year and a half, and then settled in New York, where he has since resided, engaged in the study and treatment of diseases of the eye and ear, and in which field of medicine he is widely known. He was the first house-surgeon of the Brooklyn Eye and Ear Hospital, in which he served from the fall of 1869 to the spring of 1871; serving in the same capacity at the Manhattan Eye and Ear Hospital, from the spring of 1871 to the spring of 1873. Immediately on leaving the latter institution he became associated with Dr. C. R. Agnew, with whom he remained many years. In 1873 he was appointed Assistant Surgeon to the Manhattan Eye and Ear Hospital, and Clinical Assistant to the chair of Ophthalmology and Otology in the College of Physicians and Surgeons, New York. He is now (1893), Professor of Ophthalmology in the New York Polyclinic, and in the Medical Department of Dartmouth College, Hanover, New Hampshire, Surgeon to Manhattan Eye and Ear Hospital, Ophthalmic Surgeon to the Hospital for Ruptured and Crippled, to the Skin and Cancer Hospital, House of Mercy and Hackensack Hospital. He is also Consulting Surgeon to the Paterson Eye and Ear Infirmary. Dr. Webster is an active member of the New York Academy of Medicine, New York County Medical Society, New York State Medical Society, New York Ophthalmological Society, American Ophthalmological Society, American Otological Society, and other leading medical, scientific, and social organizations of this country. He married, in June, 1876, Miss Genevieve Macfarlane, a native of Maine.

WEEKS, John E., of New York City, was graduated M. D. at the University of Michigan,

Ann Arbor, in 1881, since which time he has devoted special attention to the study and treatment of diseases of the eye and ear. He is now Professor of Clinical Ophthalmology and Otology in Woman's Medical College of the New York Infirmary, Lecturer on the Diseases of the Eye and Ear in Bellevue Hospital Medical College, Surgeon to the New York Eye and Ear Infirmary, Ophthalmic Surgeon to the Alms House and Work House Hospital, Blackwell's Island, and Consulting Oculist to the Hebrew Sheltering Guardian Society. Dr. Weeks is an active member of the New York Academy of Medicine, and numerous other medical organizations of that metropolis.

WEISS, Samuel, of Lebanon, Pennsylvania, was graduated M. D. at Bellevue Hospital Medical College, New York City, in 1871. He is now Attending Physician to Lebanon County Hospital, Gynecologist to the Good Samaritan Hospital, Lebanon, and Medical Examiner and Adviser for the New York Life Insurance Company, and also for the Mutual Reserve Insurance Company, of New York. Dr. Weiss is an active member of the Pennsylvania State Medical Society, and one of the most accomplished members of the Medical profession in his section of the State.

WELLS, Brooks H., of New York City, was educated in medicine at the College of Physicians and Surgeons, New York City, from which institution he received the degree of M. D. in 1884; since which time he has devoted special attention to obstetrics and diseases of women, in which field of practice his skill as an operative surgeon and clinical instructor has become widely recognized. He is now Lecturer on Gynecology in the New York Polyclinic, and is editor of the *American Journal of Obstetrics*. Dr. Wells is a Fellow of the New York Academy of Medicine, New York Obstetrical Society, New York County Medical Society, and at the Pan-American Congress, which convened in 1893, he was secretary of the Section on Gynecology and Abdominal Surgery.

WELLS, Frank, of Boston, Massachusetts, was graduated M. D. at Harvard Medical School in 1868, and from the University of Vienna in 1869. He is Medical Director of John Hancock Life Insurance Company; president of the American Association of Life Insurance Medical Directors; Fellow of the Massachusetts Medical Society, Boston Society for Medical Improvement, Boston Society for Medical Observation and the Boston Society of Medical Sciences.

WELSH, D. Emmett, of Grand Rapids, Michigan, was graduated M. D. from the Jefferson Medical College, Philadelphia, in 1878, since which time he has devoted special attention to the study and treatment of the diseases of the upper air passages. He is now Physician to St. John's Orphans' Asylum, St. Mark's Hospital and Masonic Home. He is also president of the Grand Rapids Academy of Medicine, ex-vice-president of the Michigan State Medical Society, member of the American Medical Association, American Rhinological Association, Mississippi Valley Medical Association, and other important medical organizations of this country.

WENDE, Ernest, of Buffalo, New York, was educated in medicine at the University of Buffalo, from which he received the degree of M. D. in 1878. He subsequently attended the

University of Pennsylvania, Philadelphia, from which institution he received an *ad eundem* degree in 1884. He is now Professor of Dermatology in the University of Buffalo, and also Professor of Botany and Microscopy in the Department of Pharmacy in the latter university. Dr. Wendt is Health Commissioner of the city of Buffalo, and Dermatologist to the Fitch Provident Dispensary. He is an active member of the Erie County Medical Society, Buffalo Medical and Surgical Association, Buffalo Pathological and Clinical Societies, and the Buffalo Medical Club.

WENDT, Edmund Charles, of New York City, was born in Milwaukee, Wisconsin. When quite young his parents took him to New York, and that city has been his home ever since. After a common school and college education he went abroad for the purpose of medical study, and matriculated at the University of Zurich. On completion of a course of study at leading universities, lasting nearly five years, he graduated at the University of Strasbourg in 1877. Three years later (1880) he secured his second medical diploma from the College of Physicians and Surgeons, Columbia College, New York. After several years' hospital experience he began active professional work in New York City, and quickly succeeded in building up a lucrative practice. In 1879 Dr. Wendt succeeded Prof. E. C. Spitzka as Professor of Comparative Anatomy at the Columbia School of Comparative Medicine. Dr. Wendt has also been Associate Professor of Clinical Medicine at various medical institutions in New York. He was Curator and Pathologist of St. Francis Hospital, New York, from 1879 until 1891; Curator and Pathologist of St. Luke's Hospital, New York, during 1882; Curator and Pathologist of the New York Infant Asylum from 1884 until 1888, and late Attending Physician to St. Joseph's Asylum. He is at present Attending Physician to the New York Infant Asylum; Fellow of the New York Academy of Medicine; member of the New York County Medical Society; member of the New York Pathological Society; late member of the New York Neurological Society; member and late president of the Manhattan Medical and Surgical Society, and a member of the German Medical Society of New York. He is also, since 1879, a member of the editorial staff of the *New York Medical Record*, and in 1891 was commissioned to visit the Riviera and the health resorts of the south of France, in order to study and report on the health conditions and the sanitary (or unsanitary) arrangements, municipal and domestic, of the towns and hotels at such places as Cannes, Nice, Pau, Hyères, Mentone, Monaco, San Remo, Allassio, Bordighera, Florence, and Naples. Dr. Wendt is also late editor of the *New York Dietetic Gazette*; contributor of numerous original articles published in the *American Journal of Medical Sciences*, *New York Medical Record*, *New York Medical Journal*, *Boston Medical Journal*, *Philadelphia Medical News*, and *American Journal of Diseases of Women and Children*. He is author of *A Treatise on Cholera* (New York, 1885), and "Contributions to Histology," editor and translator of "Gusserow's Uterine Tumors," and author of articles in the *Encyclopedic Handbook of Medical Sciences*.

WEST, Alston M., of Memphis, Tennessee, was graduated M. D. at the medical depart-

ment of the University of Pennsylvania, Philadelphia, in 1876. He is now Professor of Chemistry, Pharmacy, Toxicology and Hygiene in the Memphis Hospital Medical College. Dr. West is a member of the Memphis Medical Society, Tennessee State Medical Society, Mississippi State Medical Society, and of the Tri-State Medical Society of Tennessee, Georgia and Alabama.

WHITE, Octavius A., of New York City, was born in Charleston, South Carolina, February 8, 1826. His father was Hon. John Blake White, of the same city, a successful lawyer, amateur historical painter, and author of plays enacted at Charleston theater, whose great grandfather, Sir John White, of Kent, England, came to this country with William Penn; a son of his, the grandfather of John Blake White, named Blake Leary White, settled in South Carolina and became a planter on the great Pedee river. The preliminary education of Dr. White was received at the Academy of H. M. Burns, LL.D. in Charleston; subsequently he entered Charleston College and the South Carolina Medical College, graduating A. B. from the former in 1846, and M. D. from the latter in 1848. He settled in Charleston, commencing and continuing practice there till 1865, when he removed to New York. He served as Surgeon in the Confederate States Army during the Civil War. He first introduced the practice of superficial incisions within the os uteri for the relief of stenotic dysmenorrhea. In 1876 he was selected and delegated by the profession of New York for the relief of the yellow fever patients at Savannah. He is a member of the New York Academy of Medicine, County Medical Society, Medical Journal Association, and Historical Society. Of his more important contributions to medical literature, may be mentioned the following: "New Method of Operating for Radical Cure of Hernia," 1851; "Transfusion with Successful Result in a Case of Flooding," 1853; "A New and Safe Mode of Relief in Stenotic Dysmenorrhea," 1855; "Bradycrote Treatment of Yellow Fever," 1858; "Report on Yellow Fever Epidemic of Wilmington, North Carolina, 1862;" "Varicocele and its Radical Cure," 1872; "Report on Yellow Fever Epidemic in Savannah in 1876;" "Observations upon the Pulse, Introducing the Hemarumscope, an Instrument of Precision for Examining Venous and Arterial Currents," 1877. The instrument referred to was devised by Dr. White. He has also invented the hysterotome, for practicing safe incision within the neck of the womb; an instrument for the cure of varicocele, and improved the laryngoscope.

WILD, Edward, was born in Massachusetts in 1824, and died in Medellin, Columbia, October 25, 1891. General Edward Wild was a graduate of Harvard University and Jefferson Medical College. His was a remarkably eventful career, in which adventure was more prominent than medicine. When the Crimean war broke out he entered the Turkish army as a surgeon. And about four years after his return home our own war between the states occurred, and he took a commission as Captain in the first Massachusetts Volunteers, May, 1861. Twelve months later he was chosen Colonel of the Thirty-Fifth Massachusetts Infantry, and one year later still he was Brigadier-General, in which capacity he served

through the Rebellion. Brookline, Massachusetts, was his home, and his membership in the State Medical Society is registered as from that town. He was latterly much interested in mining, and it was in part these interests that led him to Columbia, South America, where his death took place.

WILEY, C. Chase, of Pittsburgh, Pennsylvania, was educated in medicine at the College of Physicians and Surgeons, Baltimore, Maryland, from which institution he received the degree of M. D. in 1875. His specialty is that of alienist and neurologist. He is late Assistant Superintendent of Dixmont Hospital for the Insane, and Surgeon-Major of the Eighteenth Regiment National Guard, State of Pennsylvania. Dr. Wiley is an active member of the Alleghany County Medical Association, Pittsburgh Gynecological Society, National Association for the Protection of the Insane and Preventive of Insanity, and the Medico-Legal Association of New York. He is also Medical Examiner and Adviser for the Vermont Life Insurance Company, Phenix Life Insurance Company, and for numerous beneficiary orders in the city of Pittsburgh.

WILLETT, E. Miles, of Memphis, Tennessee, was graduated M. D. at the Memphis Hospital Medical College in 1884. He is now Physician-in-Charge of St. Joseph's Hospital, Memphis, and Assistant Surgeon Second Regiment of the National Guard, State of Tennessee. Dr. Willett is an active member of the Memphis Medical Society, Tennessee State Medical Society, Tri-State Medical Society of Tennessee, Georgia and Alabama, and was a delegate to the Ninth International Medical Congress.

WILLIAMS, Daniel Hale, of Chicago, Illinois, was born in Holidaysburg, Pennsylvania,

Daniel H. Williams

nia, January 18, 1858. He is of English descent, and a son of Daniel and Sarah (Price) Williams. He removed with his parents from

Pennsylvania to Wisconsin in 1870. His education was acquired in common schools and Janesville High School, and afterwards by taking a special course in Latin, Biology, Physics, Logic, German and French, at the Wisconsin Classical Academy. He then became a medical student in the office, and under the supervision, of Surgeon-General Henry Palmer, Janesville, Wisconsin, with whom he remained for four years, and was graduated M. D. at the Chicago Medical College in 1883. Soon after completing his medical education he established himself in Chicago, where he has since remained engaged in a successful practice of general medicine. In June, 1889, he was appointed by Governor Fifer a member of the Illinois State Board of Health, and was reappointed to the same position in 1891. Dr. Williams has been Attending Physician to the Protestant Orphan Asylum for nine years. He is also Attending Surgeon to the South Side Dispensary, and Attending Surgeon to Provident Hospital. He is a member of the Chicago Medical Society, Illinois State Medical Society, and of the American Medical Association.

WILSON, George F., of Portland, Oregon, was graduated M. D. at the Medical Department of the University of Virginia in 1879. He subsequently attended the University of the City of New York, from which institution he received an *ad eundem* degree in 1880. He is now Professor of Military and Operative Surgery in the Medical Department of the University of Oregon, Surgeon to the Good Samaritan Hospital, and Medical Examiner and Adviser for the Equitable and Mutual Life Insurance Companies of New York. He is an active member of his City and State Medical Societies.

WILSON, H. Augustus, of Philadelphia, Pennsylvania, was graduated M. D. at the Jefferson Medical College, Philadelphia, in 1879. He is now Professor of General and Orthopedic Surgery in the Philadelphia Polyclinic; Professor of Orthopedic Surgery in the Jefferson Medical College and Woman's Medical College; Consulting Orthopedic Surgeon to the Lying-in Charity Hospital and to Kensington Hospital. Dr. Wilson is a Fellow of the American Orthopedic Association, Philadelphia Academy of Surgery and College of Physicians, Philadelphia.

WILSON, William E., of Denver, Colorado, was educated in Medicine at the University of the City of New York, from which institution he received the degree of M. D. in 1853. An *ad eundem* degree was also received from the University of Nashville, Tennessee, in 1855. He is now Professor of Materia-Medica, Therapeutics and Diseases of Children in the Medical Department of the University of Denver, President of the Colorado State Medical Society, Denver Medical Association, Arapahoe County Medical Society, and was formerly President of the State Board of Medical Examiners of Colorado.

WIMERMARK, Arvid H., of Chicago, Illinois, was graduated M. D. at the Rush Medical College, Chicago, in 1884. He is now Medical Examiner and Adviser for the Home Life Insurance Company, and late Superintendent of Cook County Infirmary. Dr. Wimermark is an active member of the Chicago Medical Society, and Scandinavian Medical Society.

WINDROW, Sven, of Chicago, Illinois, was

educated in Medicine at the Carolina Medical and Surgical Institute, Stockholm, from which he obtained his medical degree in 1881. Subsequent to his removal to this country he entered the University of Pennsylvania, Philadelphia, and was also graduated M. D. from that institution in 1887. He was formerly a Surgeon in the Swedish Army, and Superintendent of the Linnean Hospital. He is now director of the Chicago Midwife Institute, Oculist to the Chicago Polyclinic, president of the Scandinavian Medical Society, and an active member of the Chicago Medical Society, and other medical organizations of that metropolis.

WINSTON, Gustavus Storrs, of New York City, was born there February 15, 1834. He was educated in a private school and at Columbia College. He entered the Union Army in 1861, and was taken prisoner at the first battle of Bull Run, in July of that year. Afterward he was stationed in Central Park Army Hospital during 1862, 1863 and 1864. He left the army in 1865. He studied medicine at the College of Physicians and Surgeons, New York, and graduated in March, 1863. After the war he established himself in his native city, making a specialty of diseases of women and children. He is a member of the Medical Journal Association, of the New York Academy of Medicine, County Medical Society and State Medical Society, and permanent member of the American Medical Association; also member of the New York Obstetrical Society, of which he has been treasurer for several years. He was formerly Attendant Physician to the Woman's Hospital, to the Demilt Dispensary, to the Department of Out-door Poor, to the New York Hospital Out-patient Department, and is now Visiting Physician to St. Francis Hospital. He is Medical Director of the Mutual Life Insurance Company of New York. His most valuable contributions to medical literature have been given to the public in this connection. He is one of the authors of the "Preliminary Report of the Mortality Experience of the Mutual Life Insurance Company of New York, from 1843 to 1874." This report, in connection with that of the actuary, was published in one volume, quarto, by order of the board of trustees, and reached a second edition in 1877. Also of "Mortuary Experience of the Mutual Life Insurance Company of New York, with Tabulated Reports and an Analysis of the Causes of Death," published by order of the board of trustees in 1877. The facts in these compilations are drawn from a very wide range of medical observations, and are so analyzed and classified as, in the opinion of one of the most distinguished American actuaries, "to add largely to our knowledge of the laws by which hereditary and other diseases affect the duration of human life."

WINTERMUTE, James S., of Tacoma, Washington, was born at St. Paul, Minnesota, April 27, 1860. He is the son of Peter Wintermute, a native of the State of New York, whose ancestors emigrated to America from Germany in 1736. Dr. Wintermute received his early education in Western Ontario, and with his father's family migrated to Yankton, Dakota, in 1870. During 1878 he was exchange cashier in Stimson's Bank, Hamilton, Ontario, and in 1879 commenced the study of medicine at Ann Arbor, Michigan, where he remained during the ensuing year. He subsequently entered Rush Medical College, Chicago, from which

institution he received the degree of M. D. in February, 1883. He then crossed the continent via the Union Pacific Railway, and from San Francisco proceeded north to Portland, Oregon, taking passage on the "Queen of the Pacific," upon one of the earliest trips made by that boat. He reached Tacoma April 19, 1883, and from thenceforth has been counted among the most useful and patriotic citizens, entering into all its interests with a hearty good-will, and with a sincere belief in the greatness of its future. He has not only seen that city emerge from its embryotic condition to its present height of prosperity, but has done all that lay in the power of one man to secure that result. He came of ancestors who bequeathed him those mental and moral qualities which have aided him to the high degree of success he has attained, and given him a wide personal popularity in the city of his chosen home. In 1887 he revisited the East and spent considerable time at the Massachusetts General Hospital, at Boston, reviewing surgery, and the more thoroughly fitting himself for increased professional usefulness in the future. During the last few years he has confined himself largely to the study and practice of surgery, and has won unusual distinction and attained extraordinary success in that important field. Although so well grounded in his profession he is continually a student, learning all the new methods and developments of surgical science. He has always been an earnest supporter of medical ethics in the best meaning of the term. In 1888 he aided in the organization of the Pierce County Medical Society, and was elected First Vice-President of the Medical Society of the State of Washington in 1889. Dr. Wintermute has made himself useful in departments of labor other than that embraced in his profession. He is personally of a genial disposition, generous to a fault, ready to help in any way to advance the cause of humanity in general, and the best interests of his adopted city and state in particular. The success that has crowned his efforts is but the reward of his energy and industry. As a physician, citizen and a man he is widely known as one of the potent forces of the community of which he is a part. Dr. Wintermute was married on June 18, 1888, to Miss Florence K. Jones, of the city of Olympia, State of Washington, a worthy and cultured lady, who removed from Maryland with her family to that city in 1884.

WINTERS, Joseph E., New York City, was educated in medicine at the University of the City of New York, from which he received the degree of M. D. in 1872. He is now Professor of Diseases of Children in that institution, Professor of Diseases of Children in the New York Post-Graduate School and Hospital, Visiting Physician for Diseases of Children to Demilt Dispensary, and Consulting Physician for Diseases of Children to Bellevue Hospital, and University Dispensary, New York. Dr. Winters is an active member of the American Pediatric Association, New York Clinical Society, Alumni Association of Bellevue Hospital, and Fellow of the New York Academy of Medicine.

WOLFE, Samuel, of Philadelphia, Pa., was educated in medicine at the University of Pennsylvania, from which institution he received the degree of M. D. in 1873. He is now Professor of Physiology and Diseases of the Nervous System in the Medico-

Chirurgical College, Philadelphia. Dr. Wolfe is an active member of the Philadelphia County Medical Society, Pennsylvania State Medical Society, and the American Medical Association.

WOOD, Casey Albert, of Chicago, Illinois, was graduated M. D. at the University of Bishop's College, Faculty of Medicine, Montreal, in 1877, since which time he has devoted special attention to the study and treatment of diseases of the eye and ear. He is now Professor of Ophthalmology in the Post-Graduate

Casey A. Wood

Medical School of Chicago, and Oculist and Aurist to Alexian Brothers' Hospital of that city. He was a member of the College of Physicians and Surgeons, Ontario, in 1877, and the College of Physicians and Surgeons of Quebec, in 1878. He is now an active member of the Chicago Ophthalmological Society, Chicago Medical Society, American Medical Association, and British Medical Association. Dr. Wood is Assistant editor of *Annals of Ophthalmology and Otology*, and as a skillful oculist and aurist, is widely known in his profession.

WOOD, Thomas Fanning, of Wilmington, North Carolina, of New England parentage, was born at Nantucket, Massachusetts, February 23, 1841, and died in the former city August 22, 1892. He received a common and high school education, and pursued his medical studies in the Virginia Medical College, Richmond, obtaining an honorary degree from the University of Maryland in 1868. He established himself in practice in Wilmington. He was Physician to the Wilmington Smallpox Hospital during 1865 and 1866, and during the war, from 1863 to 1865, was Assistant Surgeon in the Confederate States Army. He was a member of the New Hanover County

Medical Association, its president in 1875, of the North Carolina State Medical Society, and Board of Medical Examiners, its secretary from 1867 to 1872, and secretary of the State Board of Health. Under his direction was published the interesting little monthly Bulletin of sanitary reports, from the various local boards and committees, throughout the State. He was one of the early members of the American Public Health Association. He was a member of the American Medical Association at various times since 1878. He was connected with the *North Carolina Medical Journal* from its inception in 1878, and for a number of years was its sole editor. He was the author of a paper on the "Non-Identity of Variola and Vaccinia," and of various papers on "Sources of Vaccinia," and "Vaccino-Syphilis," published in the Transactions of the Medical Society of North Carolina. He was a member of the Historical and Scientific Society of Wilmington, and chairman of its botanical section. Although cut down in the prime of his mental vigor, he has left a record of thirty very diligent and useful years in literary and sanitary fields of labor.

WOOD, T. Hilliard, of Nashville, Tennessee, was graduated M. D. at the Medical Department of the Vanderbilt University, Nashville, in 1885. He is now Professor of Physiology in the Medical Department of the University of Tennessee, Nashville, and Professor of Diseases of the Eye and Ear in the University of the South, Sewanee, Tennessee. Dr. Wood is an active member of the Nashville Academy of Medicine, and the Tennessee State Medical Society.

WOOD, William L., of Portland, Oregon, was graduated M. D. at the St. Louis Medical College, St. Louis, Missouri, in 1886, since which time he has devoted special attention to diseases of the eye and ear, and is now Professor of Ophthalmology and Otology in the Medical Department of Willamette University. He is an active member of the Portland Medical Society, Portland Hospital Clinical Society, and Oculist and Aurist to Portland Hospital.

WOODBURN, Frederick C., of Indianapolis, Indiana, was born in that city, April 11, 1866. He was educated in the common and High Schools and at Butler University in his native city, and was afterward graduated from the Classical Department of Racine College, Wisconsin, in 1885, when but nineteen years of age. He immediately began the study of medicine under the supervision of his father, Dr. James H. Woodburn, an eminent physician of Indianapolis. He entered the Medical College of Indiana and was graduated M. D. from that institution in 1887, and during the following year supplemented his medical education and training by attending the New York Post-Graduate Medical School and Hospital. From 1888 until 1891 he was Physician to the Indianapolis Orphan Asylum, and from 1889 until 1891, he was Superintendent of the Indianapolis City Dispensary. He is now Consulting Physician for Diseases of the Chest to the City Dispensary and Assistant to the chair of Obstetrics in the Indiana Medical College. He was formerly assistant secretary of the Marion County Medical Society, and is also ex-treasurer of that organization. For two years he has been chairman of the Committee of Arrangements of the Indiana Medical Society,

and in 1892 he held the same position in the Mississippi Valley Medical Association. In 1893 he was elected secretary of the latter organization. In addition to his membership in the medical societies mentioned he is also an active member of the Mitchell District Association of Indiana, and of the American Medical Association. Dr. Woodburn is a young man of much promise in his profession, being one who has had most favorable opportunities for receiving a thorough classical and medical education, and of which he has availed himself to the utmost extent. The honors that have come to him are indeed well deserved, and are but preludes to higher and more distinguished stations that await him. He has filled every position to which he has been called with distinguished ability. He is a studious and investigating physician of recognized skill, and is engaged in an extensive general practice. He is earnest in his convictions and has strong faith in the virtue of medical associations and interchange of views and relation of experiences. He is a gentleman of the most accomplished manners, pleasant and gifted in conversation, sympathetic and generous, traits of character which not only add greatly to his success in the practice of his profession, but, with his habits of earnest investigation, eminently fit him for the position of instructor to others. His acquaintance is a large one, especially with the profession, not only in his city, but extending throughout his State, and he has ardent friends in various parts of the country. His contributions to medical literature are of practical importance, and consist of papers read before the various medical societies with which he is connected. Dr. Woodburn was married, May 29, 1889, to Miss Grace D. Gilbert, the accomplished daughter of Rev. James E. Gilbert, formerly of Buffalo, New York. An infant son, who bears the name of his distinguished grandfather, is the result of this union.

WOODBURN, James H., of Indianapolis, Indiana, was born in Jefferson county, in the same State, January 15, 1822. His youthful days were employed in labor upon his father's farm, and in attendance at the common schools of his native county. Later he took a course at Hanover College. In 1841 he began the study of medicine, and in 1844 the practice of the same. He subsequently attended lectures at the medical department of the Louisville University, graduating M. D. from that institution in 1846. During the succeeding five years he was engaged in the practice of his profession in Shelby, Clark and Johnson counties, Indiana. In 1851 he removed to Indianapolis, where he has since remained. In 1861 he was elected Superintendent of the State Asylum for the Insane, and this position he held in a satisfactory and efficient manner until 1865, when he resigned. Dr. Woodburn is an ex-member of the Indianapolis City Board of Health, and in 1867 was elected a member of his City Council, serving in that capacity continuously for a period of eight years. He has also been identified with the Indiana Medical College, having been elected Vice-President of its Board of Trustees, a position he holds at the present time. He is a member of the American Medical Association, Indiana State Medical Society, and the Marion County Medical Society. He is ex-President

and ex-Treasurer of the last two organizations. Dr. Woodburn is one of the oldest and most highly esteemed physicians in his city and state, having been actively and successfully engaged in the general practice of his profession for a period of fifty years. He was married in 1847 to Miss Ann E. Cravens, of Madison, Indiana. The preceding Dr. F. C. Woodburn is their only living son.

WOOLSEY, Elliott H., of Oakland, California, was graduated M. D. at the Medical Department of the University of Buffalo in 1868. He is now a member of the Board of Health of the city of Oakland, Surgeon to the Southern Pacific Railway Company, Surgeon to Oakland Hospital Hotel for Invalids, Consulting Surgeon to Oakland Receiving Hospital, and Consulting Surgeon to Oakland Free Clinic. Dr. Woolsey is also an active member of the American Medical Association, National Association of Railway Surgeons, Medical Society of the State of California and Society of Physicians and Surgeons of Alameda county, California.

WOOSTER, David, of San Francisco, California, was born in Jasper, Steuben county, New York, June 10, 1825. He is son of the Rev. John Wooster, great-grandnephew of Gen. David Wooster, and a descendant of the first Earl of Worcester, England. Previous to graduation in medicine he served as Acting Assistant Surgeon in the United States Army during the Mexican War, being stationed at La Pueblo. In 1849 he was graduated M. D. from the Cleveland Medical College, and in the same year began the practice of medicine at Adrian, Mich. In 1850 he crossed the plains to California; mined, and practiced his profession on the Yuba river until 1856, and in the last-named year established himself in San Francisco, where he has since been engaged in the general pursuit of his profession. In 1858 he founded, and during the ensuing four years edited and published, *The Pacific Medical and Surgical Journal*. Besides his numerous contributions to this periodical and other literary and medical journals, he has published a monograph upon "Diphtheria," 1859, the first publication in the United States treating of this disease, and a work upon "Diseases of the Heart." He has been a member of the California State Medical Society; is a member of the American Medical Association, of the San Francisco Microscopical Society, and a corresponding member of the Royal College of Medicine and Surgery of Turin, Italy. During the years 1861, 1862 and 1863 he served as Surgeon of the California volunteers in Arizona and New Mexico. For four years, from 1867 to 1871, he was United States Appraiser of Drugs at San Francisco, and was from 1871 to 1872 Surgeon to the United States Marine Hospital at the same place. Dr. Wooster is one of the oldest and most accomplished members of the medical profession on the Pacific coast, where he has been favorably and widely known for more than forty years.

WORTHINGTON, Andrew K., of Denver, Colorado, was graduated M. D. at the St. Louis Medical College in 1883. He is now Professor of Anatomy in the Medical Department of the University of Denver, Visiting Physician in Obstetrics to Arapahoe County Hospital, and to Deaconess Home and Hospital. He is also an active member of the Colorado State Medi-

cal Society, Denver Medical Association, and Arapahoe County Medical Society, State of Colorado.

WRIGHT, George Fay, of Denver, Colorado, was graduated M. D. at the Miami Medical College, Cincinnati, Ohio, in 1873. His medical education and training were supplemented by attending the New York Polyclinic in 1886, and the New York Post-Graduate Medical School and Hospital in 1892. He is now Lecturer on Orthopedic Surgery in the Gross Medical College, Denver, and is an active member of the Colorado State Medical Society, Kansas State Medical Society, Denver Medical Association, and numerous other medical organizations of this country.

WYLIE, W. Gill, of New York City, was graduated M. D. at the Bellevue Hospital Medical College, New York City in 1871, since which time he has devoted special attention to the study of diseases of women and gynecean surgery. He is now Professor of Gynecology in the New York Polyclinic, Visiting Gynecologist to Bellevue Hospital, and Consulting Gynecologist to Seney Hospital, Brooklyn, New York. Dr. Wylie is an active member of the American Gynecological Association, and is also a member of the British Gynecological Association. He is widely and favorably known on account of his ability as clinical teacher, and skill as an operative surgeon in his special line of practice.

WYMAN, Hal C., of Detroit, Michigan, was educated in medicine at the University of Michigan, Ann Arbor, from which institution he received the degree of M. D. in 1883. He is Professor of the Principles of Surgery and Operative Surgery, in the Michigan College of Medicine and Surgery, Detroit, Surgeon to Detroit Emergency Hospital, and Surgeon to the Lake Shore and Michigan Southern Railway Company. He is an active member of the American Medical Association, Michigan State Medical Society, Detroit Academy of Medicine, and numerous other leading medical organizations of his city and State.

YARROW, Henry C., of Washington City, District of Columbia, was educated in medicine at the University of Pennsylvania and received the degree of M. D. from that institution March 15, 1861, when he was but twenty years of age, soon after which he was selected by the Surgeon-General of Pennsylvania to assist in the medical examination of the Pennsylvania Reserves. This duty completed, in July he was appointed Assistant Surgeon of the Cameron Dragoons (Fifth Pennsylvania Cavalry) and was mustered in July 18, 1861. He served with his regiment in Virginia until January, 1862, during most of the time being its only medical officer, and resigned to accept, at the solicitation of Surgeon John Neill, United States Volunteers, in charge of the military hospitals in Philadelphia, the position of Acting Assistant Surgeon United States Army, and Executive Officer of the Broad and Cherry Streets Hospital, which he assisted in organizing. While on duty in this hospital he volunteered to go south, at a time when it was thought Fort Sumter would fall, and the services of additional surgeons be needed. Returning from this duty, he remained at the Broad and Cherry Streets Hospital until the close of the war, for a brief period being the surgeon in charge, and then retired to private life, but in 1866 he was again appointed an

Acting Assistant Surgeon and ordered to Atlanta, Georgia, at which post he served through a severe epidemic of cholera, which disease was prevented from spreading to the citizens of Atlanta by the strict quarantine maintained. While here he volunteered to proceed to Tybee Island, Georgia, to attend the troops sick with cholera at that point. Having suffered with the cholera himself, and his health having become impaired, he was ordered to New York City, the duty assigned him being the examination of recruits and accompanying them to their regiments in the South. In the intervals of the journeys, he was permitted to reside at Fort Wood, New York harbor, where he acted as Assistant to the Post Surgeon, and cholera having become epidemic at the post, he voluntarily remained, and for this service was officially thanked by the post surgeon in his report, and received the verbal thanks of Surgeon-General Barnes. After this he served at Fort McHenry, Baltimore, Maryland; Fort Macon, North Carolina, and Charlotte, North Carolina, being relieved from the latter post to be assigned, at the recommendation of Prof. S. B. Baird of the Smithsonian Institution, in 1872, as surgeon and naturalist to the expedition for explorations west of the 100th meridian under Lieutenant G. M. Wheeler, Corps of Engineers United States Army. He remained on this duty until the centennial year, and was then detailed as assistant to Surgeon J. J. Woodward, United States Army, in charge of the Model Military Hospital at Philadelphia, which establishment he organized, and in which he remained on duty until the close of the centennial exhibition. Upon the completion of this duty he was ordered to the surgeon-general's office, and detailed in the section of comparative anatomy in the Army Medical Museum, and in addition to this duty he was ordered to report to Surgeon D. S. Huntington, United States Army, in charge of the Barnes Hospital Soldiers' Home whenever his services were needed. In 1879 he was ordered to report to Surgeon J. S. Billings, United States Army, in charge of the library of the surgeon-general's office, his duty consisting in preparing manuscript for, and reading the proof of the index catalogue of that library. He continued on this duty until 1888, a period of nearly nine years, when he was obliged to ask for sick leave, partial paralysis of the ciliary muscles of the eyes having supervened as a result of the long continued strain due to the proof-reading. It should be stated that in May, 1888, he was temporarily relieved from duty in the library and ordered to assist the Attending Surgeon United States Army, in the medical care of the late General Sheridan, with whom he constantly remained until within a few days of his decease. Finding he was incapacitated for further work in the library, in October, 1888, the surgeon-general assigned him to duty as Assistant to the Attending Surgeon United States Army, in whose office he still remains. In October, 1889, at the request of Secretary Blaine, he was detailed to accompany the Pan-American delegates on their journey through the United States, and he remained as the medical officer of the congress until its adjournment. For this he was officially thanked by Mr. Blaine. During the many years of his service he has embraced every opportunity offered for scientific work and research, and has prepared and

published a number of papers on anthropology and natural history. He acted as assistant in the United States Fish Commission for some years, and had charge of one of the departments of the United States National Museum, the additional labor having been performed without interference with his strictly military duty. He has been able to contribute largely to the Army Medical Museum, and during two summer vacations he led expeditions through the West to obtain needed specimens; and he has also contributed from his own library a number of works which were not possessed by the surgeon-general's office.

YEMANS, Charles C., of Detroit, Michigan, was graduated M. D. at the Detroit Medical College in 1872. He is now United States Examining Surgeon for the Pension Bureau, and Medical Examiner and Adviser for several of the leading life insurance companies of the United States. Of recent years he has devoted special attention to the treatment of diseases of the skin. He is ex-president of the Wayne County Medical Society, and Detroit Academy of Medicine, and is also an active member of the Detroit Medical and Library Association, Michigan State Medical Society, and numerous other medical organizations.

YOAKUM, Finis Ewing, of Denver, Colorado, was graduated M. D. at the Texas Medical College and Hospital, Galveston, in 1874. His medical education and training were supplemented by attendance at the Hospital College of Medicine (Medical Department of Central University), Louisville, Kentucky, from which institution he received an *ad eundem* degree in 1885. He also attended the Chicago College of Ophthalmology and Otology in 1887. He is now Professor of *Materia Medica* and Therapeutics in the Gross Medical College, Denver. He is a member of the American Medical Association, Texas, State Medical Society, Shreveport (Louisiana) Medical Society, and other important medical organizations.

YOUNG, J. Gilbert, of Philadelphia, Pa., was born June 21, 1840, at Chestnut Hill, in that city. He was educated at the Central High School, Philadelphia, from which he graduated in 1859, at the head of a class of thirty-eight. He received the degree of A. M. in 1864. He early began the study of medicine, which was pursued at the University of Pennsylvania, from which institution he was graduated in 1862. He began practice at Camden, N. J., and was for a short period at Gloucester City and Haddonfield, but in 1866 he established himself in his native city, where he has since remained, engaged in a successful practice of general medicine. In 1872 he was married to Miss Florence Albertson, of Philadelphia. Dr. Young is ex-president of Camden County Medical Society, and has been an active member of the New Jersey State Medical Society, and of other medical organizations. He has published valuable papers relating to the hygiene of school-rooms, and upon other subjects of sanitary interest. He has been one of the physicians to the Pennsylvania Widows' Asylum for many years.

YOUNG, Stephen J., of Terre Haute, Ind., was born in Cincinnati, O., March 31, 1829, and is of Scotch-Irish ancestry. His academic education was received at Paris, Ill. He began the study of medicine in early life, entered the Ohio Medical College, and received the degree of M. D. from that institution in

1851. He then established himself in the general practice of medicine and surgery at Terre Haute, where he remained until the commencement of the War of the Rebellion. He entered the United States military service as Acting Assistant Surgeon, but was soon after commissioned Assistant Surgeon and attached to the Forty-eighth Illinois Infantry; was captured and retained as a prisoner three months at Mobile and Tuscaloosa. On being exchanged, he was commissioned as full Surgeon of the Seventy-ninth Illinois Infantry. He was again captured, at Chickamauga, and held at Atlanta and Libby Prison until exchanged at City Point three months after. His service was almost entirely in the field, during which he held the position of Chief Surgeon of Brigade and Division, mainly with the Army of the Cumberland. In 1864 he married Elizabeth M. Cooper, of New Harmony, Ind. In 1865 he located in Paris, Ill., and after remaining there four years, returned to the city of his present residence, where he has since remained, engaged in the active and successful practice of his profession. He was Coroner of Edgar county, Illinois, from 1866 to 1868, and was United States Examining Surgeon for the Pension Bureau at Terre Haute from 1870 to 1872, and has served as president of the Board of Health of that city for many years. He is ex-secretary of the Esculapian Society of the Wabash Valley; ex-president of the Vigo County Medical Society, and member of the Indiana State Medical Society.

YOUNG, Theodore J., of Titusville, Pa., was born at Neustadt an der Hardt, in Palatina, Germany, December 9, 1834. He was educated at Progymnasium in his native country. After studying medicine he attended the Ohio Medical College, and afterward the Medical Department of the University of Pennsylvania, graduating from the latter institution in 1868. He then established himself in Titusville. During the progress of the Civil War he was appointed, June 30, 1863, Assistant Surgeon of the One Hundred and Twenty-fourth Pennsylvania Infantry, and on being mustered out with the regiment in the following May, was re-appointed to the same position with the Seventh Pennsylvania Cavalry, and remained on duty with this regiment until the close of the war, when he returned to the city of his present residence, and has since been engaged in the active duties of the general practice of medicine and surgery, in which field he has had excellent success. Dr. Young is ex-secretary and ex-president of the Crawford County Medical Society in his native State, and an active member of the Pennsylvania State Medical Society, and of the American Medical Association, with which he has been connected for many years. Dr. Young has taken much interest in educational affairs, and served several years as School Director at Titusville, and since 1875 has held the position of Surgery of three railroads centering in that city. In 1875 he reported to the *American Journal of Medical Science* a case of "Amputation of Clavicle and Scapula," and his other valuable contributions to medical science will be found in the Transactions of his State Medical Society.

YOUNT, Silas T., of Chicago, Illinois, was graduated M. D., at the Bellevue Hospital Medical College, New York City, in 1876, since which time he has devoted special attention

to neurology and the surgical treatment of rectal diseases. He is now Professor of Nervous Diseases in the Post-Graduate Medical School, Chicago. Dr. Yount is late vice-president of the Indiana State Medical Society, and

Silas T. Yount.

member of the American Medical Association. He is the author of a work on the "Treatment of Hemorrhoids," and has made other important contributions to medical literature.

ZIEGLER, George Jacob, of Philadelphia, Pennsylvania, was born March 6, 1821, at Berlin, New Jersey. He is the son of George E. and Elizabeth Zeigler, who removed to Philadelphia when he was young. He was educated at the public schools of that city, and under private tuition, supplemented by self-culture, reading medicine subsequently with Dr. George W. Patterson, and graduating in the Medical Department of the University of Pennsylvania in 1850, his thesis on the occasion being recommended for publication. He settled in Philadelphia. He had devoted his attention to practice of medicine, more particularly including diseases of women and children, and especially to nervous, pulmonary, and chronic diseases in general. He is a member of the Philadelphia County Medical Society, the American Medical Association, and the Philadelphia Academy of Natural Sciences. His contributions to medical literature include publications on "Zooadynamia," "Researches on Nitrous Oxide," and "Human Rights, as Exemplified in the Natural Laws of Marriage, Legitimacy, and Life in General," with articles on "Tuberculosis," "Reproduction and Reparation of Bone," and many other subjects. He was for years an editor of the *Dental Cosmos*, and later was the editor and publisher of the *Medical Cosmos*. He was Accoucheur and afterward Physician to the Philadelphia Hospital, but was compelled to resign on account of ill health, the state of his health, indeed, having long been such as greatly to restrict his professional and literary efforts.

LOCAL MEDICAL AND SURGICAL INDEX.

The following is an index of the names, business addresses and biographical sketches of a majority of the most eminent physicians, surgeons and specialists, as found in various parts of the United States and Territories. The towns and cities are arranged in alphabetical order, and the population of each is according to the census of 1890.

	PAGE.		PAGE.
ALBANY, N. Y. Population, 94,923.		Cathell D. W., Physician, 1308 N. Charles St.	77
Bailey W. H., Physician, 1 Washington Ave.	21	Chancellor C. W., Phys. and Surg., 12 E. Eager St.	79
Bigelow J. M., Phys. and Surg., 54 Eagle St.	45	Chew Samuel C., Physician, 216 W. Lanvale St.	86
Boyd J. P., Gynecologist, 152 Washington Ave.	57	Chisolm J. J., Oculist and Aurist, 114 W. Franklin St.	86
Curtis F. C., Phys. and Surg., 17 Washington Ave.	104	Cuddy J. W. C., Physician, 506 N. Carrollton Ave.	601
Merrill C. S., Oculist and Aurist, 23 Washington Ave.	323	Lewis W. M., Phys. and Surg., 1209 Presstman St.	651
Tucker W. G., Chemist Albany Medical College.	514	Merrick L. K., Rhin. and Laryng., 843 N. Eutaw St.	659
Vander Veer Albert, Gynecologist, 28 Eagle St.	517	Miltnerberger Geo. W., Phys., 319 W. Monument St.	325
Van Rensselaer H., Physician, 94 Columbia St.	632	Monmonier J. F., Physician, 824 N. Calvert St.	334
Ward Samuel B., Phys. and Surg., 135 N. Pearl St.	695	Opie Thos., Obstetrician, 600 N. Howard St.	358
ALEXANDRIA, VA. Population, 14,339.		Osler Wm., Physician, 1 W. Franklin St.	663
Brown Bedford, Phys. and Surg., 202 N. Wash. St.	592	Reuling G., Oculist and Aurist, 103 W. Monument St.	422
ALLEGHENY, PA. Population, 105,287.		Stokes Wm. H., Physician, 619 St. Paul St.	686
Rankin David N., Phys. and Surg., 85 Lincoln Ave.	417	Streett David, Physician, 403 N. Exeter St.	686
ALMA, MICH. Population, 2,400.		Taneyhill G. L., Phys. and Surg., 1103 Madison Ave.	687
Brainerd I. N., Phys. and Surg., 86 Superior St.	57	Tiffany Louis McLane, Surgeon, 331 Park Ave.	690
ALTON, TENN. Population, 25.		Welch Wm. H., Phys. and Path., Johns Hopkins Hos.	540
Abernethy Jesse T., Physician.	1	BANGOR, ME. Population, 19,103.	
AMES, IOWA. Population, 1,500.		Hamlin Augustus C., Physician and Surgeon.	632
Fairchild David S., Physician and Surgeon.	161	Sanger Eugene F., Physician and Surgeon.	672
ANN ARBOR, MICH. Population, 9,431.		BARRON, WIS. Population, 829.	
Dock George, Physician, 22 E. Jefferson St.	605	Ellis William H., Physician and Surgeon.	616
Ford Corydon L., Physician and Surgeon.	167	BATON ROUGE, LA. Population, 18,000.	
Gibbes Heneage, Pathologist, 16 Forest Ave.	621	Dupree Jas. W., Phys. and Surg., 409 Laurel St.	145
ANNISTON, ALA. Population, 10,000.		BAY CITY, MICH. Population, 27,839.	
Hill Thos. C., Phys. and Surg., 187 E. 18th St.	217	Erwin Robert W., Physician, 620 N. Monroe St.	158
ASTORIA, ORE. Population, 6,184.		BELLOWS FALLS, VT. Pop., 5,000.	
Kinney Augustus C., Physician.	268	Campbell E. R., Physician and Surgeon, 21 Henry St.	596
ATHENS, PA. Population, 3,274.		BERKELEY, CAL. Population, 1,700.	
Allen Ezra P., Surgeon.	9	LeConte Joseph, Scientist, 27 Bancroft Way.	276
ATLANTA, GA. Population, 65,533.		BINGHAMTON, N. Y. Pop., 35,005.	
Armstrong W. S., Phys. and Surg., 154 Washington St.	14	Orton J. G., Physician, 215 Main St.	359
Goldsmith W. T., Surgeon, 8 S. Broad St.	627	BIRMINGHAM, ALA. Pop., 26,241.	
Knott Jas. J., Surgeon, 3½ Whitehall St.	649	Davis W. E. B., Gynecologist, 1806 Third Ave.	113
Love Wm. A., Gynecologist, 237 Whitehall St.	654	BISMARCK, N. D. Population, 2,186.	
Powell, Thos. S., Obstetrician, 63 S. Pryor St.	667	Porter Henry R., Physician and Surgeon.	667
AUGUSTA, GA. Population, 33,300.		BLOOMINGTON, ILL. Pop., 22,242.	
Foster Eugene, Physician, 612 Broad St.	168	Guthrie Wm. E., Physician and Surgeon.	193
AUSTIN, TEX. Population, 14,575.		Vander Vort, F. C., Physician.	518
Daniel F. E., Dermatologist, 105 W. Seventh St.	105	BORDENTOWN, N. J. Pop., 4,232.	
Taylor Matthew A., Phys. and Surg., 104 W. 8th St.	502	Young Irene D., Oculist and Aurist.	574
White Frank S., Alienist and Neurologist.	542	BOSCOBEL, WIS. Population, 1,570.	
Wooten Thos. D., Surgeon, 107 E. Tenth St.	570	Armstrong Leroy G., Physician and Surgeon.	14
BAKER CITY, ORE. Population, 2,604.		BOSTON, MASS. Population, 448,477.	
Fuller H. J., Gynecologist.	177	Amory Robert, Physician, 279 Beacon St.	12
BALTIMORE, MD. Population, 434,439.		Chenery Elisha, Physician, 65 Chandler St.	85
Arnold Abraham B., Physician, 2016 Madison Ave.	14	Cheney F. E., Oculist, Hotel Bristol.	597
Atkinson A., Phys. and Surg., 2101 Maryland Ave.	15	Cushing Ernest W., Gynecologist, 168 Newbury St.	105
Caldwell, John J., Neurologist, Waverly.	72	Durgin Samuel H., Phys. and Surg., 12 Beacon St.	146
		Dwight Thomas, Physician, 235 Beacon St.	146

- Edes Robert T., Neurologist Adams Nervine Asylum, 156
 Folsom Chas. F., Phys. and Surg., 15 Marlboro St. 619
 Greenough F. B., Phys. and Surg., 10 Charles St. 680
 Holmes Oliver W., Physician, 296 Beacon St. 219
 Ingalls Wm., Physician and Surgeon, 780 Beacon St. 240
 Jeffries B. J., Oculist, 3 Exeter St. 250
 Johnson J. W., Gynecologist, 20 Worcester St. 645
 Knapp Philip C., Neurologist, 83 Marlboro St. 648
 Knight F. I., Laryngologist, 377 Boylston St. 269
 Marcy Henry O., Surgeon, 180 Commonwealth Ave. 314
 Miller Albert E., Physician, 110 Tremont St. 659
 Minot Francis, Physician, 65 Marlboro St. 659
 Mixer Samuel J., Surgeon, 180 Marlboro St. 659
 Nichols Arthur H., Physician, 55 Mt. Vernon St. 355
 Pattee A. F., Physician, 94 W. Springfield St. 376
 Shattuck F. C., Physician, 135 Marlboro St. 462
 Spear Edmund D., Oculist and Aurist, 6 Beacon St. 681
 Standish Myles, Oculist, 200 Dartmouth St. 478
 Tenney J. A., Ocul. and Aur., 2 Commonwealth Ave. 688
 Wells Frank, Physician, 178 Devonshire St. 700
- BRATTLEBORO, VT.** Pop., 6,862.
 Holton Henry D., Physician and Surgeon. 220
- BROOKLYN, IOWA.** Population, 1,400.
 McCulloch A. P., Physician and Surgeon. 655
- BROOKLYN, N. Y.** Population, 853,945.
 Bell Agrippa N., Physician, 291 Union St. 40
 Burge J. H., Hobart, Phys. and Surg., 132 Montague St. 68
 Fowler Geo. R., Surgeon, 302 Washington Ave. 620
 Raymond J. H., Physician, 173 Joralemon St. 669
 Skene, Alex. J. C., Gynecologist, 167 Clinton St. 469
- BUFFALO, N. Y.** Population, 255,664.
 Abbott F. W., Oculist and Aurist, 223 Franklin St. 575
 Fell Geo. E., Physician, 72 Niagara St. 618
 Flagg J. D., Phys. and Surg., 135 E. Eagle St. 619
 Grant H. G., Oculist and Aurist, 50 W. Tupper St. 629
 Harrington D. W., Genito-Urinary Surg., 1430 Main St. 200
 Mann M. D., Obst. and Gynecologist, 37 Allen St. 657
 Park Roswell, Surgeon, 510 Delaware Ave. 369
 Potter Wm. W., Gynecologist, 254 Franklin St. 411
 Rochester De Lancey, Physician, 469 Franklin St. 672
 Thornburg, F. J., Phys. and Surg., 610 Main St. 509
 Vandenberg F. P., Chemist, Lewis Block. 692
 Wende Ernest, Physician, 174 Franklin St. 700
 Wyckoff C. C., Phys. and Surg., 482 Delaware Ave. 573
